FEATURES

- RF range: 6 GHz to 10 GHz
- LO input frequency range: 6 GHz to 10 GHz
- Conversion loss: 8 dB typical at 6 GHz to 10 GHz
- Image rejection: 23 dBc typical at 6 GHz to 10 GHz
- LO to RF isolation: 43 dB typical
- LO to IF isolation: 25 dB typical
- Input IP3: 19 dBm typical
- Input P1dB compression: 10 dBm typical at 7.1 GHz to 8.5 GHz
- Wide IF frequency range: dc to 3.5 GHz
- 24-terminal, ceramic leadless chip carrier

APPLICATIONS

- Point to point microwave radios
- Point to multipoint radios
- Video satellites
- Digital radios
- Instrumentation
- Automatic test equipment

GENERAL DESCRIPTION

The HMC520A is a compact gallium arsenide (GaAs), monolithic microwave integrated circuit (MMIC), in-phase quadrature (I/Q) mixer in a 24-terminal, RoHS compliant, ceramic leadless chip carrier (LCC) package. The device can be used as either an image reject mixer or a single sideband upconverter. The mixer uses two standard double balanced mixer cells and a 90° hybrid fabricated in a GaAs, metal semiconductor field effect transistor (MESFET) process. The HMC520A is a smaller alternative to a hybrid style image reject mixer and a single sideband upconverter assembly. The HMC520A eliminates the need for wire bonding, allowing the use of surface-mount manufacturing techniques.

- Changes to Applications Information Section and Figure 83 ................................................................. 26
- Added Performance Up to 13 GHz Section and Figure 84 Through Figure 86; Renumbered Sequentially ............... 26
- Added Figure 87 Through Figure 92 ................................. 27
- Added Figure 93 Through Figure 98 ................................. 28
- Added Figure 99 Through Figure 104 ............................... 29
- Added Soldering Information and Recommended Land Pattern Section and Figure 105 ................................. 30
- Added Note 1 and Note 2, Table 6 ................................. 31
- Updated Outline Dimensions ........................................ 32
- Changes to Ordering Guide .......................................... 32

1/2017—Revision 0: Initial Version
SPECIFICATIONS

Local oscillator (LO) = 15 dBm, intermediate frequency (IF) = 100 MHz, radio frequency (RF) = −10 dBm, and Ta = 25°C, unless otherwise noted. All measurements were made as a downconverter with the lower sideband selected (high-side LO) and an external 90° IF hybrid at the IF ports, unless otherwise noted.

1 Based on IPC/JEDEC J-STD-20 MSL classifications.  
2 $P_{D\text{iss}}$ is a theoretical number calculated by ($T_J - 85°C$)/$\theta_{JC}$.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

$\theta_{JA}$ is the natural convection, junction to ambient thermal resistance measured in a one cubic foot sealed enclosure. $\theta_{JC}$ is the junction to case thermal resistance.

</table>

¹ See JEDEC standard JESD51-2 for additional information on optimizing the thermal impedance (PCB with 3 × 3 vias).

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The HMC520A is a GaAs, MMIC, I/Q mixer in a 24-terminal, RoHS compliant, ceramic LCC package and operates over the −40°C to +85°C temperature range. The EV1HMC520ALC4 evaluation board is also available from Analog Devices, Inc. The HMC520A is a passive, wideband, I/Q MMIC mixer that can be used as either an image reject mixer for receiver operations or as a single sideband upconverter for transmitter operations. The mixer uses two standard double balanced mixer cells and a 90° hybrid fabricated in the GaAs, MESFET process.

With an RF and an LO input frequency range of 6 GHz to 10 GHz and an IF frequency range of dc to 3.5 GHz, the HMC520A is ideal for applications requiring a wide frequency range, excellent RF performance, a simple design with fewer components, and a small PCB footprint. One HMC520A can replace multiple narrow-band mixers in a design. The HMC520A eliminates the need for wire bonding, allowing the use of the surface-mount manufacturing techniques.

The inherent I/Q architecture of the HMC520A offers excellent image rejection and thereby eliminates the need for expensive filtering for unwanted sidebands. The double balanced architecture of the mixer also provides excellent LO to RF isolation and LO to IF isolation, and this architecture reduces the effect of LO leakage to ensure signal integrity. Because the HMC520A is a passive mixer, the HMC520A does not require any dc power sources. The HMC520A offers a lower noise figure compared to an active mixer, ensuring superior dynamic range for high performance and precision applications.

For both upconversion and downconversion, an external 90° hybrid is required. See the Applications Information section for details on interfacing with this external 90° hybrid.
APPLICATIONS INFORMATION

Figure 83 shows the typical application circuit for the HMC520A. To select the appropriate sideband, an external 90° hybrid is needed. For applications not requiring operation to dc, use an off chip dc blocking capacitor. For applications that require the LO signal at the output to be suppressed, use a bias tee or RF feed as shown in Figure 83. Ensure that the source or sink current used for LO suppression is <12 mA for each IF port to prevent damage to the device. The common-mode voltage for each IF port is 0 V.

To select the upper sideband when using as an upconverter, connect the IF1 pin to the 90° port of the hybrid and connect the IF2 pin to the 0° port of the hybrid. To select the lower sideband, connect the IF1 pin to the 0° port of the hybrid and connect the IF2 pin to the 90° port of the hybrid. The input is from the sum port of the hybrid, and the difference port is 50 Ω terminated.

To select the upper sideband (low-side LO) when using as a downconverter, connect the IF1 pin to the 0° port of the hybrid and connect the IF2 pin to the 90° port of the hybrid. To select the lower sideband (high-side LO), connect the IF1 pin to the 90° port of the hybrid and connect the IF2 pin to the 0° port of the hybrid. The output is from the sum port of the hybrid, and the difference port is 50 Ω terminated.

PERFORMANCE TO 13 GHz

This section provides test results at a higher frequency to 13 GHz. Board, traces, and connector losses are not de-embedded for all measurements. This performance is typical, though not guaranteed. All measurements were made under the following conditions: LO = 15 dBm, IF = 1.5 GHz, RF = −10 dBm, and TA = 25°C, with an external 90° IF hybrid at the IF ports, unless otherwise noted.

SOLDERING INFORMATION AND RECOMMENDED LAND PATTERN

Figure 105 shows the recommended land pattern for the HMC520A. The HMC520A is contained in a 24-terminal ceramic LCC package, which has an exposed ground pad. This pad is internally connected to the ground of the chip.

To minimize thermal impedance and ensure electrical performance, solder the pad to the low impedance ground plane on the PCB. To further reduce thermal impedance, stitch the ground planes together on all layers under the pad with vias.

The land pattern on the EV1HMC520ALC4 evaluation board provides a simulated thermal resistance (θ_{JC}) of 225°C/W.
EVALUATION BOARD INFORMATION

The EV1HMC520ALC4 evaluation PCB used in the application must use RF circuit design techniques. Signal lines must have 50 Ω impedance and connect the package ground leads and exposed pad directly to the ground plane (see Figure 106). Use a sufficient number of via holes to connect the top and bottom ground planes. The evaluation circuit board shown in Figure 106 is available from Analog Devices upon request.
