**MM5450/51**

LED Display Driver

**Features**

- Continuous Brightness Control
- Serial Data Input
- No Load Signal Requirement
- Enable (MM5450 Only)
- Wide Power Supply Operation
- TTL Compatibility
- 34 or 35 Outputs, 15 mA Capability
- Alphanumeric Capability

**Applications**

- Industrial Control Indicator
- Relay Driver
- Digital Clock, Thermometer, Counter, Voltmeter
- Instrumentation Readouts

**General Description**

The MM5450 and MM5451 LED display drivers are monolithic MOS IC's fabricated in an N-Channel, metal-gate process. The technology produces low-threshold, enhancement-mode, and ion-implanted depletion-mode devices.

A single pin controls the LED display brightness by setting a reference current through a variable resistor connected to the supply.

**Block Diagram**

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Voltage (Any Pin) ................................................................................................................................. $V_{SS} \text{ to } V_{SS} + 12V$

Power Dissipation (+25°C) ...................................................................................................................... 1W

Power Dissipation (+85°C) ....................................................................................................................... 560 mW

Operating Ratings ‡

Supply Voltage ($V_{DD} - V_{SS}$) .............................................................................................................. $+4.75V \text{ to } +11V$

† Notice: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

‡ Notice: The device is not guaranteed to function outside its operating ratings.
### TABLE 1-1: ELECTRICAL CHARACTERISTICS

**Electrical Characteristics:** $4.5V \leq V_{DD} \leq 11V$, $V_{SS} = 0V$; $T_A = 25^\circ C$, **bold** values valid for $-40^\circ C \leq T_A \leq +85^\circ C$, unless otherwise noted.

</tbody>
</table>

**Note 1:** With a fixed resistor on the brightness input pin, some variation in brightness will occur among devices.

**Note 2:** See Figure 2-1, Figure 2-2, and Figure 2-3 for recommended operating conditions and limits. Absolute maximum for each output should be limited to 40 mA.

**Note 3:** Output matching is calculated as the percent variation of $(I_{MAX} + I_{MIN}) / 2$.

**Note 4:** $I_{OUT}$ should be regulated by user. See Figure 2-2 and Figure 2-3 for allowabe $V_{OUT}$ vs. $I_{OUT}$ operation.

**Note 5:** AC input waveform specification for test purpose: $t_R \leq 200$ ns, $t_F \leq 20$ ns, $f = 500$ kHz, $50\% \pm 10\%$ duty cycle.

**Note 6:** Clock input rise and fall times must not exceed 300 ns.

**Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., $T_A$, $T_J$, $\theta_{JA}$). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.
2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

FIGURE 2-1: Output Current vs. Number of Segments.

FIGURE 2-2: Output Voltage vs. LED Current.

FIGURE 2-3: Power Dissipation vs. Temperature.
3.0 FUNCTIONAL DESCRIPTION

The MM5450 and MM5451 are designed to drive either 4- or 5-digit alphanumeric LED displays with the added benefit of requiring minimal interface with the display or data source.

Data is transferred serially via two signals: clock and serial data. Data transfer without the added inconvenience of an external load signal is accomplished by using a format of a leading “1” followed by the allowed 35 data bits. These 35 data bits are latched after the 36th has been transferred. This scheme provides non-multiplexed, direct drive to the LED display. Characters currently displayed (thus, data output) changes only if the serial data bits differ from those previously transferred.

Control of the output current for LED displays provides for the display brightness. To prevent oscillations, a 1 nF capacitor should be connected to pin 19, brightness control.

The Block Diagram is shown on page 1. For the MIC5450, the /DATA ENABLE is a metal option and is used instead of the 35th output. The output current is typically 20-times greater than the current into pin 19, which is set by an external variable resistor.

There is an external reset connection shown which is available on unpackaged (die) only. Connection Diagram: Die illustrates the die pad locations for bonding in “chip on board” applications.

Figure 3-1 shows the input data format. A leading “1” is followed by 35 bits of data. After the 36th had been transferred, a LOAD signal is generated synchronously with the clock high state. This loads the 35 bits of data into the latches. The low side of the clock is used to generate a RESET signal which clears all shift registers for the next set of data. All shift registers are static master-slave, with no clear for the master portion of the first register, allowing continuous operation.

There must be a complete set of 36 clocks or the shift registers will not clear.

When the chip first powers ON, an internal power ON reset signal is generated that resets all registers and all latches. The START bit and the first clock return the chip to its normal operation.

The Connection Diagram: Dual-Inline Package (DIP) and Connection Diagram: Plastic-Leaded Chip Carrier (PLCC) show the pinout of the MIC5450 and MIC5451. Bit 1 is the first bit following the start bit and it will appear on pin 18. A logical “1” at the input will turn on the appropriate LED.

Figure 3-2 shows the timing relationships between data, clock and /DATA ENABLE. A maximum clock frequency of 0.5 MHz is assumed.

There are external reset and enable connections shown which are available on the unpackaged (die) only. Connection Diagram: Die illustrates the die pad locations for bonding in “chip on board” applications.

EQUATION 3-1:

\[ T_J = V_{OUT} \times I_{LED} \times No \times 124^\circ C/W + T_A \]

Where:
- \( T_J \) Junction Temperature (+150°C max.)
- \( V_{OUT} \) Voltage at the LED driver outputs
- \( I_{LED} \) LED current
- 124°C/W Thermal resistance of the package
- \( T_A \) Ambient temperature

Equation 3-1 is used to plot Figure 2-1, Figure 2-2, and Figure 2-3.

5.0 PACKAGING INFORMATION

5.1 Package Marking Information

40-Pin PDIP* Example

Legend: XX...X Product code or customer-specific information
        Y Year code (last digit of calendar year)
        YY Year code (last 2 digits of calendar year)
        WW Week code (week of January 1 is week ‘01’)
        NNN Alphanumeric traceability code
        e3 Pb-free JEDEC® designator for Matte Tin (Sn)
        * This package is Pb-free. The Pb-free JEDEC designator (e3)
          can be found on the outer packaging for this package.
        ●, ▲, ▼ Pin one index is identified by a dot, delta up, or delta down (triangle
          mark).

Note: In the event the full Microchip part number cannot be marked on one line, it will
be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.
Underbar (_) and/or Overbar (⎯) symbol may not be to scale.

APPENDIX A: REVISION HISTORY

Revision A (October 2016)

- Converted Micrel document MM5450/51 to Microchip data sheet DS20005651A.
- Minor text changes throughout.
- Corrected Pin 26 of the MM5451YV in Connection Diagram: Plastic-Leaded Chip Carrier (PLCC) to read Output Bit 35.
- Corrected the minimum value for Reset Pad Current in Table 1-1 to be –8 µA.
PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, contact your local Microchip representative or sales office.

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
