**Features**

- Oscillator boost from 10 kHz to 45 kHz
- Converts +5V Logic Supply to ±5V System
- Wide Input Voltage Range: +1.5V to +12V
- Efficient Voltage Conversion (99.9%, typical)
- Excellent Power Efficiency (98%, typical)
- Low Power Consumption: 80 µA (typical) @ VIN = 5V
- Low Cost and Easy to Use
  - Only Two External Capacitors Required
- Available in 8-Pin Small Outline (SOIC) and 8-Pin PDIP Packages
- Improved ESD Protection (10 kV HBM)
- No External Diode Required for High-Voltage Operation

**Applications**

- RS-232 Negative Power Supply
- Simple Conversion of +5V to ±5V Supplies
- Voltage Multiplication VOUT = ± n V+
- Negative Supplies for Data Acquisition Systems and Instrumentation

**General Description**

The TC7660S device is a pin-compatible replacement for the industry standard 7660 charge pump voltage converter. It converts a +1.5V to +12V input to a corresponding -1.5V to -12V output using only two low-cost capacitors, eliminating inductors and their associated cost, size and electromagnetic interference (EMI). Added features include an extended supply range to 12V, and a frequency boost pin for higher operating frequency, allowing the use of smaller external capacitors.

The on-board oscillator operates at a nominal frequency of 10 kHz. Frequency is increased to 45 kHz when pin 1 is connected to V+. Operation below 10 kHz (for lower supply current applications) is possible by connecting an external capacitor from OSC to ground (with pin 1 open).

The TC7660S is available in 8-Pin PDIP and 8-Pin Small Outline (SOIC) packages in commercial and extended temperature ranges.

Functional Block Diagram

[Diagram showing the block diagram of TC7660S, including components like RC Oscillator, Voltage Level Translator, Internal Voltage Regulator, Logic Network, and connection points (V\^+ CAP\^+, 2, 4, 5, 3, GND, CAP\^-, LV, OSC, BOOST)].
1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

Supply Voltage .................................................................+13V
LV, Boost, and OSC Inputs Voltage: (Note 1)
.................................................................-0.3V to (V+ + 0.3V) for V+ < 5.5V
.................................................................(V+ – 5.5V) to (V+ + 0.3V) for V+ > 5.5V
Current into LV .................................................................20 µA for V+ > 3.5V
Output Short Duration (V_{SUPPLY} \leq 5.5V) .................. Continuous
Package Power Dissipation: (T_A \leq +70°C) (Note 2)
8-Pin PDIP ..................................................................730 mW
8-Pin SOIC ...................................................................470 mW
Lead Temperature (Soldering, 10s) ......................... +300°C

Notice†: Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

Note 1: Connecting any input terminal to voltages greater than V+ or less than GND may cause destructive latch-up. It is recommended that no inputs from sources operating from external supplies be applied prior to “power up” of the TC7660S.

2: Derate linearly above +50°C by 5.5 mW/°C.

ELECTRICAL SPECIFICATIONS

3.1 Switching Frequency Boost Pin (Boost)

By connecting the boost pin (pin 1), the switching frequency of the charge pump is increased from 10 kHz typical to 45 kHz typical. By connecting the boost pin (pin 1), to the V+ pin (pin 8), the switching frequency of the charge pump is increased from 10 kHz typical to 45 kHz typical.

3.2 Charge Pump Capacitor (CAP*)

Positive connection for the charge pump capacitor, or flying capacitor, used to transfer charge from the input source to the output. In the voltage-inverting configuration, the charge pump capacitor is charged to the input voltage during the first half of the switching cycle. During the second half of the switching cycle, the charge pump capacitor is inverted and charge is transferred to the output capacitor and load.

It is recommended that a low ESR (equivalent series resistance) capacitor be used. Additionally, larger values will lower the output resistance.

3.3 Ground (GND)

Input and output zero volt reference.

3.4 Charge Pump Capacitor (CAP*)

Negative connection for the charge pump capacitor, or flying capacitor, used to transfer charge from the input to the output. Proper orientation is imperative when using a polarized capacitor.

3.5 Output Voltage (V_OUT)

Negative connection for the charge pump output capacitor. In the voltage-inverting configuration, the charge pump output capacitor supplies the output load during the first half of the switching cycle. During the second half of the switching cycle, charge is restored to the charge pump output capacitor.

It is recommended that a low ESR capacitor be used. Additionally, larger values will lower the output ripple.

3.6 Low Voltage Pin (LV)

The low voltage pin ensures proper operation of the internal oscillator for input voltages below 3.5V. The low voltage pin should be connected to ground (GND) for input voltages below 3.5V. Otherwise, the low voltage pin should be allowed to float.

3.7 Oscillator Control Input (OSC)

The oscillator control input can be utilized to slow down or speed up the operation of the TC7660S. Refer to Section 5.4 “Changing the TC7660S Oscillator Frequency”, for details on altering the oscillator frequency.

3.8 Power Supply (V+)

Positive power supply input voltage connection. It is recommended that a low ESR capacitor be used to bypass the power supply input to ground (GND).
4.0 DETAILED DESCRIPTION

4.1 Theory of Operation

The TC7660S contains all the necessary circuitry to implement a voltage inverter, with the exception of two external capacitors, which may be inexpensive 10 µF polarized electrolytic capacitors. Operation is best understood by considering Figure 4-2, which shows an idealized voltage inverter. Capacitor C1 is charged to a voltage V+ for the half cycle when switches S1 and S3 are closed. (Note that switches S2 and S4 are open during this half cycle.) During the second half cycle of operation, switches S2 and S4 are closed, with S1 and S3 open, thereby shifting capacitor C1 negatively by V+ volts. Charge is then transferred from C1 negatively by V+ volts. Charge is then transferred from C1 to C2, such that the voltage on C2 is exactly V+ assuming ideal switches and no load on C2.

The four switches in Figure 4-2 are MOS power switches; S1 is a P-channel device, and S2, S3 and S4 are N-channel devices. The main difficulty with this approach is that in integrating the switches, the substrates of S3 and S4 must always remain reverse-biased with respect to their sources, but not so much as to degrade their ON resistances. In addition, at circuit start-up, and under output short circuit conditions (VOUT = V+), the output voltage must be sensed and the substrate bias adjusted accordingly. Failure to accomplish this will result in high power losses and probable device latch-up.

This problem is eliminated in the TC7660S by a logic network which senses the output voltage (VOUT) together with the level translators, and switches the substrates of S3 and S4 to the correct level to maintain necessary reverse bias.

4.2 Theoretical Power Efficiency Considerations

In theory, a capacitive charge pump can approach 100% efficiency if certain conditions are met:

1. The drive circuitry consumes minimal power.
2. The output switches have extremely low ON resistance and virtually no offset.
3. The impedances of the pump and reservoir capacitors are negligible at the pump frequency.

The TC7660S approaches these conditions for negative voltage multiplication if large values of C1 and C2 are used. Energy is lost only in the transfer of charge between capacitors if a change in voltage occurs. Energy lost is defined by:

\[ E = \frac{1}{2} C_1 (V_1^2 - V_2^2) \]

V1 and V2 are the voltages on C1 during the pump and transfer cycles. If the impedances of C1 and C2 are relatively high at the pump frequency (refer to Figure 4-2) compared to the value of Rf, there will be a substantial difference in voltages V1 and V2. Therefore, it is desirable not only to make C2 as large as possible to eliminate output voltage ripple, but also to employ a correspondingly large value for C1 in order to achieve maximum efficiency of operation.

4.3 Dos and Don’ts

- Do not exceed maximum supply voltages.
- Do not connect the LV terminal to GND for supply voltages greater than 3.5V.
- Do not short circuit the output to V+ supply for voltages above 5.5V for extended periods; however, transient conditions including start-up are okay.
- When using polarized capacitors in the inverting mode, the + terminal of C1 must be connected to pin 2 of the TC7660S and the + terminal of C2 must be connected to GND.
5.0 APPLICATIONS INFORMATION

5.1 Simple Negative Voltage Converter

Figure 5-1 shows typical connections to provide a negative supply where a positive supply is available. A similar scheme may be employed for supply voltages anywhere in the operating range of +1.5V to +12V, keeping in mind that pin 6 (LV) is tied to the supply negative (GND) only for supply voltages below 3.5V.

The output characteristics of the circuit in Figure 5-1 are those of a nearly ideal voltage source in series with a 70Ω resistor. Thus, for a load current of -10 mA and a supply voltage of +5V, the output voltage would be -4.3V.

* $V_{OUT} = -V^+$ for $1.5V \leq V^+ \leq 12V$

EQUATION

The dynamic output impedance of the TC7660S is due, primarily, to capacitive reactance of the charge transfer capacitor ($C_1$). Since this capacitor is connected to the output for only half of the cycle, the equation is:

$$X_C = \frac{2}{2fC_1} = 3.18\Omega$$

where:

- $f = 10 \text{ kHz}$
- $C_1 = 10 \mu\text{F}$

5.2 Paralleling Devices

Any number of TC7660S voltage converters may be paralleled to reduce output resistance (Figure 5-2). The reservoir capacitor, $C_2$, serves all devices, while each device requires its own pump capacitor, $C_1$. The resultant output resistance would be approximately:

EQUATION

$$R_{OUT} = \frac{R_{OUT \text{ of } TC7660S}}{n \text{ (number of devices)}}$$

* $V_{OUT} = -n \cdot V^+$ for $1.5V \leq V^+ \leq 12V$

EQUATION
5.3 Cascading Devices
The TC7660S may be cascaded as shown (Figure 5-3) to produce larger negative multiplication of the initial supply voltage. However, due to the finite efficiency of each device, the practical limit is 10 devices for light loads. The output voltage is defined by:

\[ V_{OUT} = -n(V^+) \]

where \( n \) is an integer representing the number of devices cascaded. The resulting output resistance would be approximately the weighted sum of the individual TC7660S ROUT values.

5.4 Changing the TC7660S Oscillator Frequency
It may be desirable in some applications (due to noise or other considerations) to increase the oscillator frequency. Pin 1, frequency boost pin, may be connected to \( V^+ \) to increase oscillator frequency to 45 kHz from a nominal of 10 kHz for an input supply voltage of 5.0V. The oscillator may also be synchronized to an external clock as shown in Figure 5-4. In order to prevent possible device latch-up, a 1 k\( \Omega \) resistor must be used in series with the clock output. In a situation where the designer has generated the external clock frequency using TTL logic, the addition of a 10 k\( \Omega \) pull-up resistor to \( V^+ \) supply is required. Note that the pump frequency with external clocking, as with internal clocking, will be half of the clock frequency. Output transitions occur on the positive-going edge of the clock.

5.5 Positive Voltage Multiplication
The TC7660S may be employed to achieve positive voltage multiplication using the circuit shown in Figure 5-6. In this application, the pump inverter switches of the TC7660S are used to charge \( C_1 \) to a voltage level of \( V^+ - V_F \) (where \( V^+ \) is the supply voltage and \( V_F \) is the forward voltage drop of diode \( D_1 \)). On the transfer cycle, the voltage on \( C_1 \) plus the supply voltage (\( V^+ \)) is applied through diode \( D_2 \) to capacitor \( C_2 \). The voltage thus created on \( C_2 \) becomes \( (2V^+) - (2V_F) \), or twice the supply voltage minus the combined forward voltage drops of diodes \( D_1 \) and \( D_2 \).

The source impedance of the output (\( V_{OUT} \)) will depend on the output current, but for \( V^+ = 5V \) and an output current of 10 mA, it will be approximately 60\( \Omega \).
5.6 Combined Negative Voltage Conversion and Positive Supply Multiplication

Figure 5-7 combines the functions shown in Figure 5-3 and Figure 5-6 to provide negative voltage conversion and positive voltage multiplication simultaneously. For example, this approach would be suitable for generating +9V and -5V from an existing +5V supply. In this instance, capacitors $C_1$ and $C_3$ perform the pump and reservoir functions, respectively, for the generation of the negative voltage, while capacitors $C_2$ and $C_4$ are pump and reservoir, respectively, for the multiplied positive voltage. There is a penalty in this configuration which combines both functions, however, in that the source impedances of the generated supplies will be somewhat higher due to the finite impedance of the common charge pump driver at pin 2 of the device.

![FIGURE 5-7: Combined Negative Converter and Positive Multiplier.](image)

5.7 Efficient Positive Voltage Multiplication/Conversion

Since the switches that allow the charge pumping operation are bidirectional, the charge transfer can be performed backwards as easily as forwards. Figure 5-8 shows a TC7660S transforming -5V to +5V (or +5V to +10V, etc.). The only problem is that the internal clock and switch-drive section will not operate until some positive voltage has been generated. An initial inefficient pump, as shown in Figure 5-7, could be used to start this circuit up, after which it will bypass the other ($D_1$ and $D_2$ in Figure 5-7 would never turn on), or else the diode and resistor shown dotted in Figure 5-8 can be used to “force” the internal regulator on.

![FIGURE 5-8: Positive Voltage Conversion.](image)

5.8 Voltage Splitting

The same bidirectional characteristics used in Figure 5-8 can also be used to split a higher supply in half, as shown in Figure 5-9. The combined load will be evenly shared between the two sides. Once again, a high value resistor to the LV pin ensures start-up. Because the switches share the load in parallel, the output impedance is much lower than in the standard circuits, and higher currents can be drawn from the device. By using this circuit, and then the circuit of Figure 5-3, +15V can be converted (via +7.5V and -7.5V) to a nominal -15V, though with rather high series resistance (~250Ω).

![FIGURE 5-9: Splitting a Supply in Half.](image)

5.9 Negative Voltage Generation for Display ADCs

The TC7106 is designed to work from a 9V battery. With a fixed power supply system, the TC7106 will perform conversions with input signal referenced to power supply ground.

5.10 Negative Supply Generation for 4½ Digit Data Acquisition System

The TC7135 is a 4½ digit ADC operating from ±5V supplies. The TC7660S provides an inexpensive -5V source. (See AN16 and AN17 for TC7135 interface details and software routines.)

Notes:
1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. § Significant Characteristic
3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.15mm per side.
4. Dimensioning and tolerancing per ASME Y14.5M
   - BSC: Basic Dimension. Theoretically exact value shown without tolerances.
   - REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing No. C04-2057A
APPENDIX A: REVISION HISTORY

Revision C (November 2015)
The following is the list of modifications.
1. Updated Section 1.0 “Electrical Characteristics”.
2. Added Temperature Specifications table.
4. Minor typographical errors.

Revision B (August 2013)
The following is the list of modifications.
1. Added Appendix A and the “Product Identification System” page.
2. Updated Section 6.0 “Packaging Information”.

Revision A (May 2001)
• Original release of this document.
### PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

#### Examples:

a) TC7660SCPA: Commercial temperature, PDIP package
b) TC7660SCPA: Commercial temperature, PDIP package
c) TC7660SCO713: Tape and Reel, Commercial temperature, SOIC package
d) TC7660SEOA: Extended temperature, SOIC package
e) TC7660SEOA713: Tape and Reel, Extended temperature, SOIC package
f) TC7660SEOA723: Reverse Tape and Reel, Extended temperature, SOIC package

#### Note 1:
Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Trademarks
The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, flexPWR, JukeBlox, KEELOQ, KEELOQ logo, Kleer, LANCHECK, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC32 logo, RightTouch, SpyNIC, SST, SST logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

The Embedded Control Solutions Company and mTouch are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, ECAN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, KleerNet, KleerNet logo, MiWi, motorBench, MPASM, MFP, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICKit, PICKit, RightTouch logo, REAL ICE, SQI, Serial Quad I/O, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co., KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
