

# **Building Firmware For CC264BPA**

## **User Guide**

**Revision 01**

## Overview

This user guide shows how existing Simplelink CC2640 projects (e.g. TI's sample project like (*simple\_peripheral*, *key\_fob*, *heart\_rate*, *hid\_emu\_kbd*, etc) can be built for CC2640BPA module hardware under BLE SDK v2.2.1. It also shows how custom board files can be created for new hardware where new or existing projects can run on.

GT-tronics' CC2640BPA module is a very cost competitive, small, ultra-low power, and pre-certified BLE module using TI's state of the art Simplelink CC2640 SoC. Customers can easily drop this module in their design to enable BLE functionality without worrying the radio performance optimization and certification challenges that the chip level integration would normally be encountered. The modules also come in different development boards that help customers to evaluate and prototype their applications quickly.

The following information links pertain to CC264BPA and its related hardware:

### CC2640BPA / CC2640BPA-S Modules

## Preparation

Prerequisites:

1. TI Simplelink CC2640 BLE SDK 2.2.1 installed
2. TI Code Composer Studio (CCS v7) installed.

You can find those software links through [TI's BluetoothLE Wiki](#).

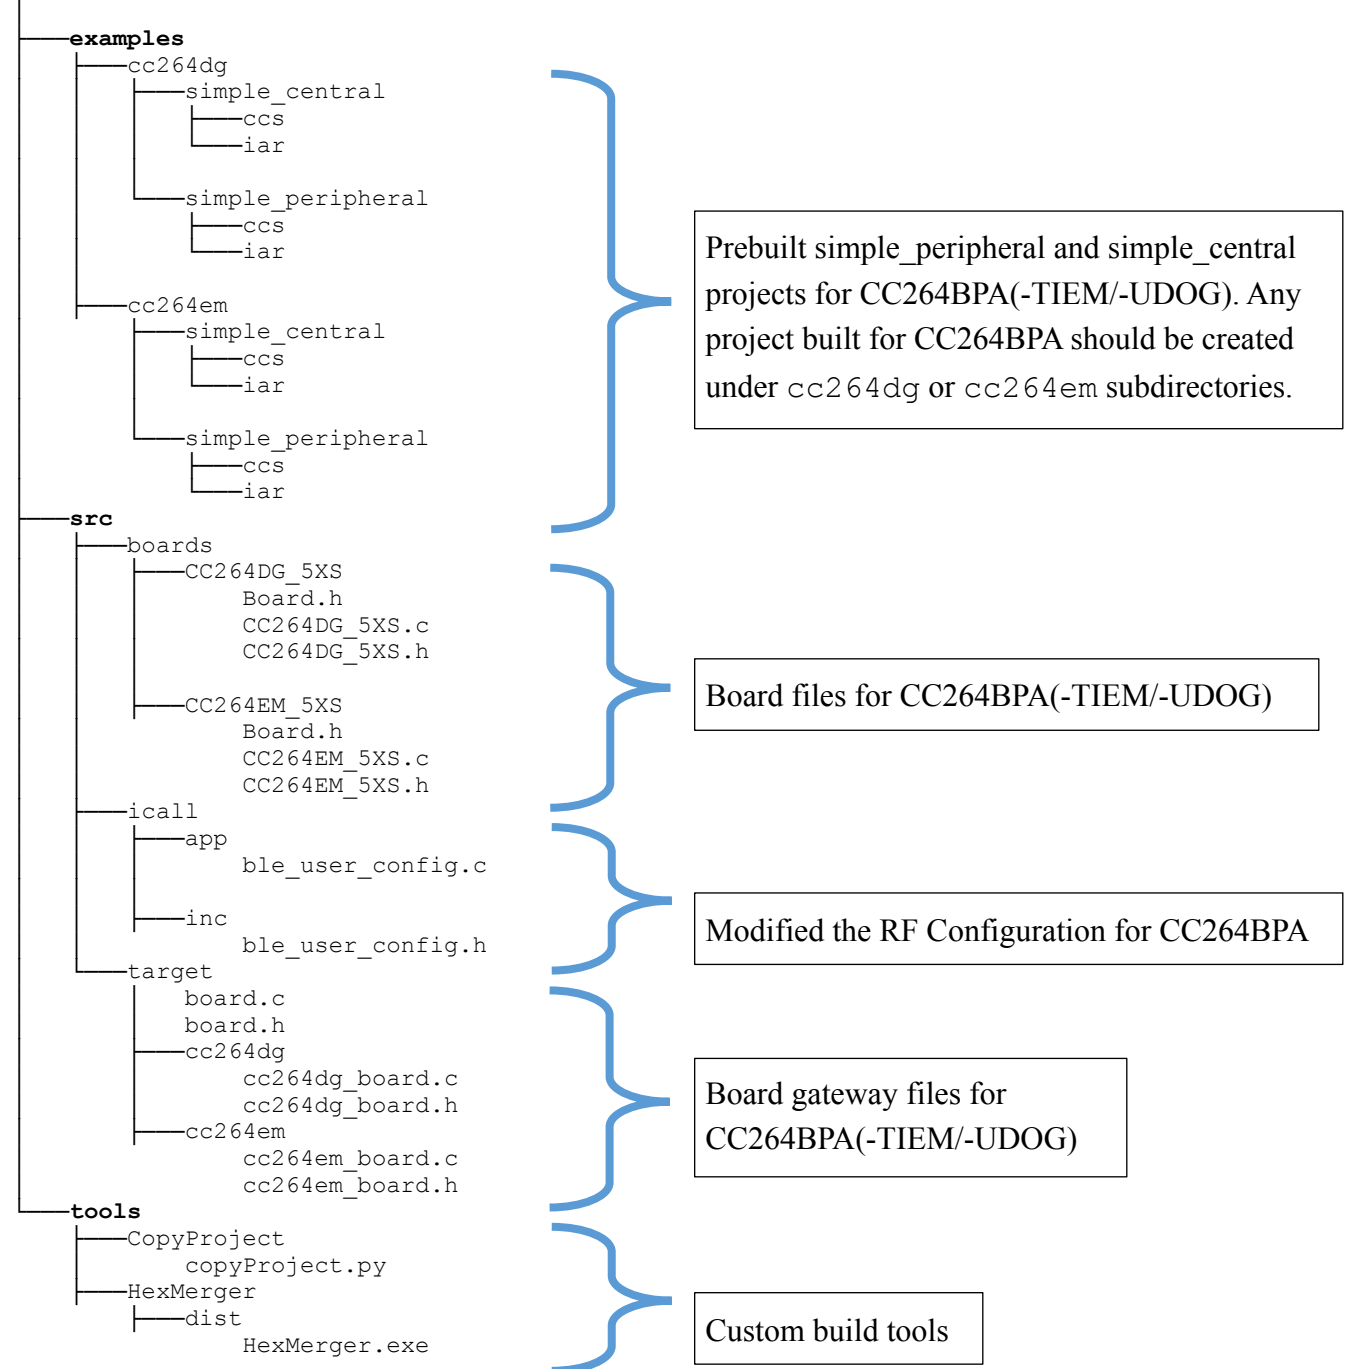

After installing the prerequisites software, you can apply the patch file `ble_sdk_2_02_01_18_patch_<timestamp>.rar` to the installed SDK directory. You can find the patch file in [CC264BPA-TIEM User Guide](#) or [CC264BPA-UDOG User Guide](#) packages.

# Understand The Patch File

ble\_sdk\_2\_02\_01\_18

# Building Simple\_Peripheral Project

Both *simple\_peripheral* projects in `examples\cc264em` and `examples\cc264dg` are copied from the original `examples\cc2650em` `\simple_peripheral` and reconfigured for CC264BPA-TIEM and CC264BPA-UDOG. These projects are the examples of how users should create or port their own projects to run on CC264BPA hardware.

We create a `copyproject.py` python tool to facilitate the copying/porting process. This tool requires python 2.7 to run.

The following steps are used to port the *simple\_peripheral* project from CC2650EM hardware to CC264BPA-TIEM hardware. The steps can be used to port other projects.

1. Start a DOS command window and execute the following in the window:  

```
cd c:\ti\simplelink\ble_sdk_2_02_01_18\tools\CopyProject
python copyproject.py -r cc2650em=cc264em,CC2650DK_7ID=CC264EM_5XS c:\ti\simplelink\ble_sdk_2_02_01_18\examples\cc2650em\simple_peripheral c:\ti\simplelink\ble_sdk_2_02_01_18\examples\cc264em\simple_peripheral
```
2. Open CCS and import CCS project from `c:\ti\simplelink\ble_sdk_2_02_01_18\examples\cc264em\simple_peripheral`
3. In Project Properties->Build->ArmCompiler->AdvanceOptions->PredefinedSymbols, reconfigure or add the following symbols:
  - `xDisplay_DISABLE_ALL`
  - `BOARD_DISPLAY_EXCLUDE_LCD`
  - `xBOARD_DISPLAY_EXCLUDE_UART`
4. In `simple_peripheral.c`, replace `Display_Type_LCD` with `Display_Type_UART`.
5. Rebuild the stack project first, then the app project.

## Explanations:

Step 1:

- The `copyproject.py` script can copy any existing project to run on CC264BPA hardware.
- The command format is:

```
python copyproject.py -r<replaceKeyWords> <copyFromDirectory>  
<copyToDirectory>
```

- The “-r” option is to replace any keyword found in the file content and file name. In this case any `cc2650em` will be replaced with `cc264em`, and `CC2650DK_7ID` will be replaced with `CC264EM_5XS`.
- The keyword `CC264EM_5XS` is a predefined symbol for determining which board file (for CC264BPA-TIEM) to be used in building the firmware.

## Step 2:

- Import CCS project

## Step 3:

- CC264BPA(-TIEM/-UDOG) supports only UART display.
- `xDisplay_DISABLE_ALL` to enable the display subsystem
- `BOARD_DISPLAY_EXCLUDE_LCD` to disable LCD
- `xBOARD_DISPLAY_EXCLUDE_UART` to enable UART

## Step 4:

- The default display configuration in *simple\_peripheral* project is LCD. Need to change it to UART.

## Step 5:

- Always build the stack project 1st before building the app project. However, once the stack project has been built once and has not been reconfigured, building stack project can be skipped.

## Important Tips

1. Follow the same steps above to copy other projects (e.g. TI's sample projects – *simple\_central*, *key\_fob*, *heart\_rate*, *hid\_emu\_kbd*, etc) to run on CC264BPA hardware.
2. Replace `CC2650DK_7ID` (or equivalent if not copying from `examples\cc2650em`) with `CC264EM_5XS` or `CC264DG_5XS` for CC264BPA-TIEM or CC264BPA-UDOG hardware, respectively. This can be specified in `copyproject.py` command or replace it directly in the predefined symbol list.
3. Make sure the display subsystem is configured as per your project requirements.

## Creating Custom Board Files

If you are using CC264BPA module or CC264BPA-TIEM and expanding it with new hardware components, likely you will want to create a new custom board files.

Follow the steps below to create a new set of gateway and board files for a new hardware called **CC264CU\_5XS** (for example).

1. Use copyproject.py python script to create the new board gateway files

```
cd c:\ti\simplelink\ble_sdk_2_02_01_18\tools\CopyProject
python copyproject.py -r cc264em=cc264cu,CC264EM=CC264CU c:\ti
\simplelink\ble_sdk_2_02_01_18\src\target\cc264em c:\ti\simplelink
\ble_sdk_2_02_01_18\src\target\cc264cu
```
2. Use copyproject.py python script to create the new board files

```
cd c:\ti\simplelink\ble_sdk_2_02_01_18\tools\CopyProject
python copyproject.py -r cc264em=cc264cu,CC264EM=CC264CU c:\ti
\simplelink\ble_sdk_2_02_01_18\src\boards\CC264EM_5XS c:\ti\simplelink
\ble_sdk_2_02_01_18\src\boards\CC264CU_5XS
```
3. Modify the new board files according to your new hardware requirements
  - a. Redefine the IO pin map (CC264CU\_5XS.h)
  - b. Redefine the initial pin configuration and state (CC264CU\_5XS.c)
  - c. Add new defines for the new hardware (Board.h)
  - d. Enable/Disable the driver blocks (CC264CU\_5XS.c/h)
4. Modify the src/target/board.c and src/target/board.h head board gateway files so the new board files can be included properly
  - a. Add the following in src/target/board.c:

```
#elif defined(CC264CU_5XS)
#include "../cc264cu/cc264cu_board.c"
```
  - b. Add the following in src/target/board.h:

```
#elif defined(CC264CU_5XS)
#include "../cc264cu/cc264cu_board.h"
```

Finally, create a new directory `examples/cc264cu` for existing (or new) projects. Then follow the previous section to copy projects for this new hardware.
