FEATURES

Single positive supply: 5 V at 97 mA
Conversion loss: 10 dB typical at 24 GHz to 30 GHz,
10.5 dB typical at 30 GHz to 34 GHz (upconverter)
Input IP3: 17.5 dBm typical at 24 GHz to 30 GHz,
20 dBm typical at 30 GHz to 34 GHz (upconverter)
2 × LO to RF isolation: 36 dB typical at 30 GHz to 34 GHz
Wide IF bandwidth: dc to 4 GHz
LO drive level: 4 dBm input
Subharmonically pumped 2 × LO
RoHS compliant, 24-terminal, 3.90 mm × 3.90 mm, ceramic
LCC package

APPLICATIONS

Microwave and very small aperture terminal (VSAT) radios
Test equipment
Point to point radios
Satellite communications (SATCOM)
Military electronic warfare (EW), electronic countermeasure
(ECM), and command, control, communications and
intelligence (C3I)

GENERAL DESCRIPTION

The HMC798ALC4 is a 24 GHz to 34 GHz subharmonically
pumped (×2) MMIC mixer with an integrated LO amplifier housed
in a leadless, RoHS compliant LCC package. The HMC798ALC4
can be used as an upconverter or downconverter between 24 GHz
and 34 GHz.

The 2 × LO to radio frequency (RF) isolation is typically 30 dB
in a 24 GHz to 30 GHz frequency range and 36 dB in a 30 GHz
to 34 GHz frequency range, eliminating the need for additional
filtering. The LO amplifier is single bias at a 5 V dc with a
typical 4 dBm LO drive level requirement The HMC798ALC4
eliminates the need for wire bonding, allowing use of surface-
mount technology (SMT) manufacturing techniques.

REVISION HISTORY

6/2018—Revision 0: Initial Version
SPECIFICATIONS

$V_{CC} = 5\, V$, $T_A = 25^\circ C$, upconverter ($IF_{IN}$) = 1 GHz at $-10\, \text{dBm}$, LO = 4 dBm, upper side band. All measurements performed as an upconverter, unless otherwise noted, on the evaluation printed circuit board (PCB).

¹ Based on IPC/JEDEC J-STD-20 MSL classifications.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

θJA is the natural convection junction to ambient thermal resistance measured in a one cubic foot sealed enclosure. θJC is the junction to case thermal resistance.

¹ See JEDEC Standard JESD51-2 for additional information on optimizing the thermal impedance (PCB with 3 × 3 vias).

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION
The HMC798ALC4 is a subharmonically pumped (×2) MMIC mixer with an integrated LO amplifier that can be used as an upconverter or a downconverter from 24 GHz to 34 GHz. The LO amplifier is single bias at a 5 V dc with a typical 4 dBm LO drive level.

When used as a downconverter, the HMC798ALC4 downconverts radio frequencies between 24 GHz and 34 GHz to intermediate frequencies between dc and 4 GHz.

When used as an upconverter, the mixer up converts IF between dc and 4 GHz to RF between 24 GHz and 34 GHz.
APPLICATIONS INFORMATION

TYPICAL APPLICATION CIRCUIT

Figure 80 shows the typical application circuit for the HMC798ALC4. The integrated LO amplifier is single bias at 5 V with a typical 4 dBm input. Place capacitors as close as possible to the pin to decouple the power supply. The LO and RF pins are internally ac-coupled. The IF pin is internally dc-coupled. When IF operation to dc is not required, use of an external series capacitor is recommended, of a value chosen to pass the necessary IF frequency range. When IF operation to dc is required, do not exceed the IF source or sink current rating specified in the Absolute Maximum Ratings section.

Figure 80. Typical Application Circuit

EVALUATION PCB INFORMATION

Use RF circuit design techniques for the circuit board used in the application. Ensure that signal lines have 50 Ω impedance, and connect the package ground leads and the exposed pad directly to the ground plane (see Figure 81). Use a sufficient number of via holes to connect the top and bottom ground planes. The evaluation circuit board shown in Figure 81 is available from Analog Devices, Inc., upon request.

1 126598-1 is the raw bare PCB identifier. Reference EV1HMC798ALC4 when ordering the complete evaluation PCB.

SOLDERING INFORMATION AND RECOMMENDED LAND PATTERN

Figure 81 shows the recommended land pattern for the HMC798ALC4. The HMC798ALC4 is contained in a 3.90 mm × 3.90 mm, 24-terminal, ceramic LCC package with an exposed ground pad (EPAD). This exposed pad is internally connected to the ground of the chip. To minimize thermal impedance and ensure electrical performance, solder the exposed pad to the low impedance ground plane on the PCB. It is recommended that the ground planes on all layers under the exposed pad be stitched together with vias to further reduce thermal impedance. The land pattern on the HMC798ALC4 evaluation board provides a simulated thermal resistance (θJC) of 119°C/W.

1 All models are RoHS compliant parts.

2 The peak reflow temperature is 260°C. See the Absolute Maximum Ratings section, Table 2.
