SINGLE-CHANNEL POWER DISTRIBUTION SWITCH WITH OUTPUT OVP

Description

The AP22815/615 are 3A, single-channel, current-limited, high-side power switches with output overvoltage protection (OVP) optimized for USB and other hot-swap applications. The AP22815/615 comply with USB standards and are available with both polarities of Enable input. The devices also possess fixed and adjustable current-limited features optimized for applications requiring precise current-limiting support. They have USB PD3.0 fast role-swap functions, and the output voltage recovers to a valid USB voltage range within 110µs during the USB PD fast role-swap event.

The devices have fast short-circuit and output overvoltage response times for improved system robustness. Both the TSOT25 and TSOT26 packages integrate discharge circuitry inside the OUT pin. They provide a complete protection solution for applications subject to heavy capacitive loads and the prospect of short circuits, and offer output overvoltage, reverse-current, overcurrent, overtemperature, and short-circuit protection, as well as controlled rise time and undervoltage lockout functionality. A 7ms deglitch capability on the open-drain flag output prevents false overcurrent, overvoltage, and overtemperature reporting, and does not require any external components.

The AP22815 is available in a standard green TSOT25 package with RoHS compliancy. The AP22615 is available in a standard Green TSOT26 package with RoHS compliancy.

TSOT26

Features

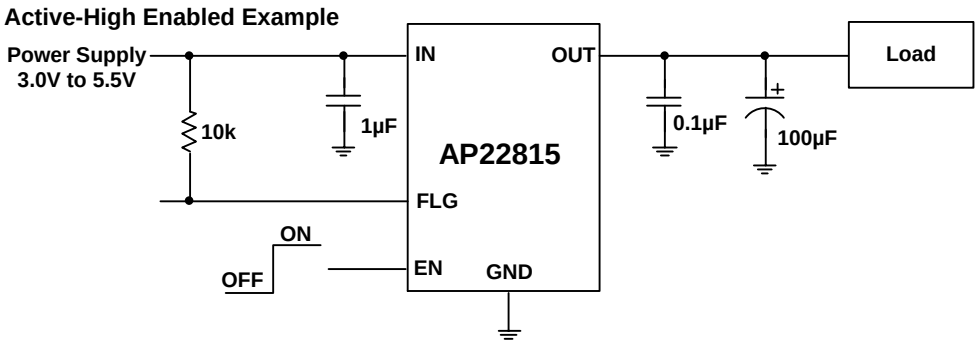
- Input Voltage Range: 3.0V to 5.5V
- 40mΩ On-Resistance
- Built-In Soft-Start with 2.1ms Typical Rise Time
- Fault Report (FLG) with Blanking Time (7ms Typ)
- Accurate Adjustable Current Limit, 0.4A to 4.0A (AP22615 Only)
- ESD Protection: 2kV HBM, 200V MM
- Active-Low or Active-High Enable
- Protection Functions:
  - Output Overvoltage with Auto Recovery
  - Overcurrent with Auto Recovery
  - Short-Circuit with Auto Recovery
  - Overtemperature with Auto Recovery
- Output Reverse Voltage/Current Protection
- Fast Role-Swap Function
- Thermally Efficient, Low-Profile Package
- UL Recognized, File Number E322375
- IEC60950-1 CB Scheme Certified
- IEC62368-1 CB Scheme Certified
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**
- **For automotive applications requiring specific change control (i.e. parts qualified to AEC-Q100/101/104/200, PPAP capable, and manufactured in IATF 16949 certified facilities), please contact us or your local Diodes representative.**
  https://www.diodes.com/quality/product-definitions/

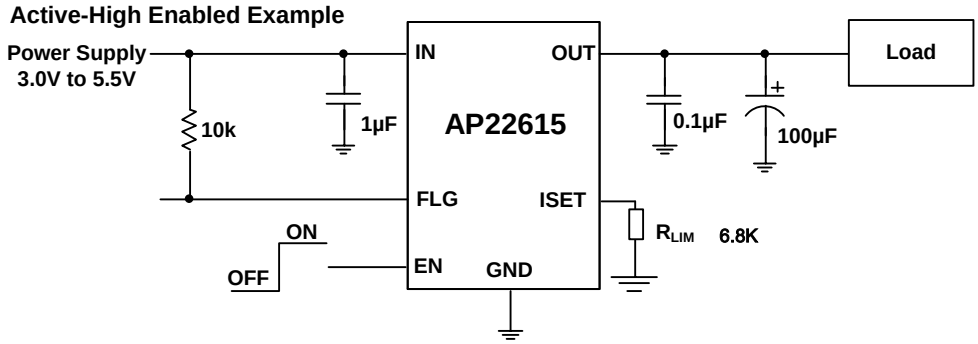
Applications

- Integrated load switches in ultrabook PCs
- Power up/down sequencing in ultrabook PCs
- Notebooks, netbook, tablet PCs, set-top boxes
- Solid state drives (SSDs)
- Consumer electronics
- USB chargers
- Telecom systems

Notes:
1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.
2. See https://www.diodes.com/quality/lead-free/ for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

Typical Applications Circuit (Note 4)



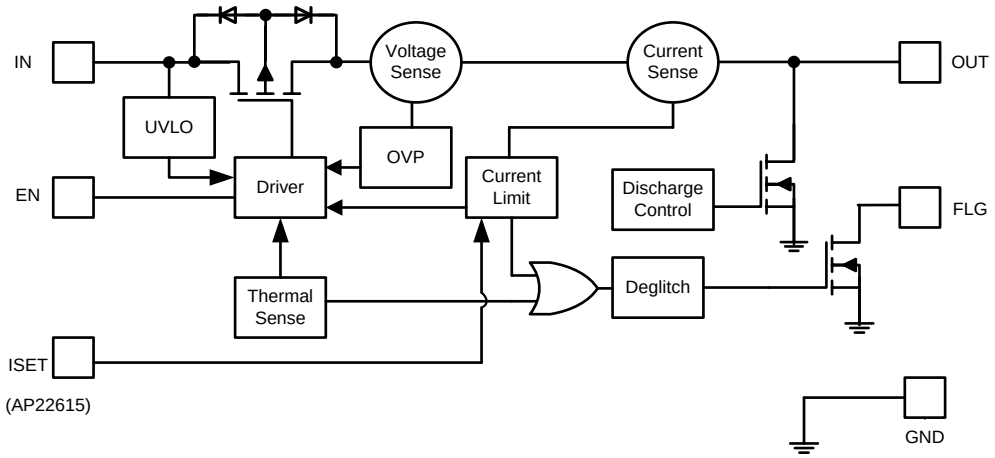


Note 4. Applying a 1µF input capacitor leads to a large V_{IN} spike, so it is recommended to use a 10µF capacitor instead.

Pin Descriptions

AP22815	AP22615	Pin Name	Pin function
TSOT25	TSOT26		
1	1	OUT	Voltage Output Pin
2	2	GND	Ground Pin of the Circuitry
3	3	FLG	Overcurrent and Overtemperature Fault Report; Open-Drain Flag is Active Low When Triggered.
4	4	EN	Enable Input (Active Low or Active High).
NC	5	ISET	AP22815: NC pin AP22615: Set OCP current by attaching resistor. The current limit: I_{LIM} (A) = 6800/R_{LIM} (Ω)
5	6	IN	Voltage Input Pin

Functional Block Diagram



Absolute Maximum Ratings (@ T_A = +25°C, unless otherwise specified.) (Note 5)

Symbol	Parameter		Ratings	Unit
ESD HBM	Human Body ESD Protection		2000	V
ESD MM	Machine Model ESD Protection		200	V
V_{IN}	Input Voltage		-0.3 to 6.0	V
V_{OUT}	Output Voltage (V_{OUT} to GND, V_{OUT} to V_{IN})		-0.3 to 28	V
V_{EN}	Enable Voltage		-0.3 to (V_{IN} +0.3)	V
V_{ISET}	ISET Voltage		-0.3 to (V_{IN} +0.3)	V
I_L	Load Current		Internal Limited	A
$T_{J(max)}$	Maximum Junction Temperature		+150	°C
T_{STG}	Storage Temperature		-65 to +150	°C
$R_{\Theta JA}$	Thermal Resistance, Junction to Ambient (Note 6)	TSOT25	85	°C/W
		TSOT26	80	
$R_{\Theta JC}$	Thermal Resistance, Junction to Case (Note 6)	TSOT25	32	°C/W
		TSOT26	30	

Note: 5. Stresses greater than the *Absolute Maximum Ratings* specified above can cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions exceeding those indicated in this specification is not implied. Device reliability can be affected by exposure to absolute maximum rating conditions for extended periods of time.

6. $R_{\Theta JA}$ and $R_{\Theta JC}$ are measured at T_A = +25°C on a high effective thermal conductivity four-layer test board per JEDEC 51-7.

Recommended Operating Conditions (Note 7)

Symbol	Parameter	Min	Max	Unit
V_{IN}	Input Voltage	3.0	5.5	V
I_{OUT}	Output Current, 4.0V ≤ V_{IN} ≤ 5.5V	0	3	A
	Output Current, 3.0V ≤ V_{IN} < 4.0V	0	1.5	A
V_{IL}	EN Input Logic Low Voltage	0	0.4	V
R_{LIM}	Current-Limit Threshold Resistor Range (1% Initial Tolerance)	1.94	6.8	kΩ
V_{OUT}	Output Voltage	0	23	V
V_{IH}	EN Input Logic High Voltage	1.2	V_{IN}	V
T_A	Operating Ambient Temperature	-40	+85	°C

Note: 7. Refer to the typical application circuit.

Electrical Characteristics (V_{IN} = 5.0V @ T_A = +25°C, C_{IN} = 1µF, C_L = 100nF, unless otherwise specified.)

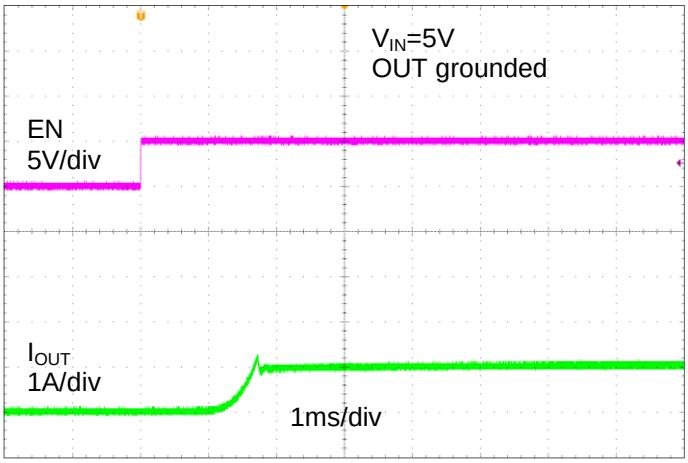
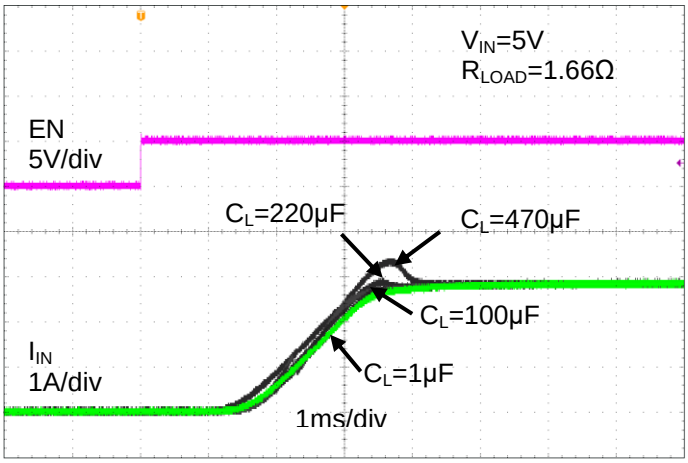
Device Enabled Into Short-Circuit



Inrush Current



Application Information

Input and Output Capacitors

It is required to place a 1µF X7R or X5R ceramic bypass capacitor between IN and GND—close to the device. It is recommended to place a high-value capacitor (10µF or 47µF) close to the input pin when the output transient load is heavy. This precaution reduces power-supply transients that can cause ringing on the input.

Connecting a minimum 100µF low ESR electrolytic or tantalum capacitor (or 22µF MLCC) between OUT and GND is also required for hot-plug applications, which is required to bypass the output with a 0.1µF ceramic capacitor that improves the immunity of the device to short-circuit transients. The bulky 100µF or larger capacitors help reduce output droop voltage when a device is plugged in. When abnormal short-circuit condition happens, these capacitors can also reduce output negative voltage due to parasitic inductive effects and avoid device damage.

Note that without the bypass capacitors, an output short can cause ringing on the input. If the voltage is over the maximum voltage rating, it will destroy the internal control circuitry even if the duration is short.

FLG Response

When an overcurrent, overtemperature, or overvoltage shutdown condition is encountered, the FLG open-drain output goes active low after a nominal 7ms deglitch timeout. The FLG output remains low until overcurrent, overtemperature, or overvoltage conditions are removed. Connecting a heavy capacitive load to the output of the device can cause a momentary overcurrent condition, which does not trigger the FLG due to the 7ms deglitch timeout. The AP22815/AP22615 is designed to eliminate false overcurrent reporting without the need for external components, removing unwanted pulses.

When V_{IN} operates below 4V, the lower V_{IN} voltage results in higher equivalent R_{ON} and can potentially cause the FLG signal to be triggered at a higher output current.

Overcurrent and Short-Circuit Protection

An internal-sensing FET is employed to check for overcurrent conditions. Unlike current-sense resistors, sense FETs do not increase the series resistance of the current path. When an overcurrent condition is detected, the device maintains a constant output current and reduces the output voltage accordingly. Complete shutdown occurs only if the fault stays long enough to activate thermal limiting.

Three possible overload conditions can occur. In the first condition, the output has been shorted to GND before the device is enabled or before V_{IN} has been applied. The AP22815/AP22615 senses the short circuit and immediately clamps the output current to a certain safe level.

In the second condition, an output short or overload occurs while the device is enabled. At the instance the overload occurs, higher current can flow for a very short period of time before the current-limit function can react. After the current-limit function has tripped, the device switches into the current-limiting mode, and the current is clamped at I_{LIMIT} or I_{SHORT}.

In the third condition, the load is gradually increased beyond the recommended operating current. The current is permitted to rise until the current-limit threshold (I_{TRIG}) is reached or until the thermal limit of the device is exceeded. The AP22815/AP22615 is capable of delivering current up to the current-limit threshold without damaging the device. Once the threshold is reached, the device switches into its current-limiting mode and is set at I_{LIMIT}.

Thermal Protection

Thermal protection prevents the IC from damage when heavy-overload or short-circuit faults are present for extended periods of time. The AP22815/AP22615 implements thermal sensing to monitor the operating junction temperature of the power distribution switch. Once the die temperature rises to approximately +140°C due to excessive power dissipation in an overcurrent or short-circuit condition the internal thermal sense circuitry turns the power switch off, thus preventing the power switch from damage. Hysteresis is built into the thermal sense circuit, allowing the device to cool down approximately +35°C before the switch turns back on. The switch continues to cycle in this manner until the load fault or input power is removed. The FLG open-drain output is asserted when an overtemperature shutdown or overcurrent occurs with 7ms deglitch.

When V_{IN} operates below 4V, the lower V_{IN} voltage results in higher equivalent R_{ON} and might potentially cause the chip to enter thermal cycling condition by higher output current.

Application Information (continued)

ON/OFF Input Operator

The EN input allows the output current to be switched on and off using a GPIO compatible input. The high signal (switch on) must be at least 1.2V and the low signal (switch off) no higher than 0.4V. This pin should *not* be left floating. It is advisable to hold the EN signal low when applying or removing power.

Undervoltage Lockout (UVLO)

Undervoltage lockout function (UVLO) keeps the internal power switch from being turned on until the power supply has reached at least 2.5V, even if the switch is enabled. Whenever the input voltage falls below approximately 2.3V, the power switch is quickly turned off. This facilitates the design of hot-insertion systems where it is not possible to turn off the power switch before input power is removed.

Discharge Function

The discharge function of the device is active when enable is disabled or de-asserted. The discharge function with the N-MOS power switch implementation is activated and offers a resistive discharge path for the external storage capacitor. This is designed for discharging any residue of the output voltage when either no external output resistance or load resistance is present at the output.

Output Reverse-Voltage/Current Protection

The output reverse-voltage protection turns off the MOSFET switch whenever the output voltage is higher than the input voltage by 65mV, and the MOSFET switch turns on when output reverse-voltage conditions are removed. When reverse voltage is lower than 65mV, the reverse current is regulated at approximately 350mA. When the reverse current continuously increases and the reverse voltage is larger than 65mV, the reverse-voltage protection is triggered.

Fast Role-Swap Function

The AP22615 and AP22815 integrate fast role-swap function, which makes the V_{OUT} recover to 4.75V within 150µs when the V_{OUT} drops from high voltage to low. When EN is high, V_{IN} is valid, and V_{OUT} is higher than V_{IN} by 65 mV; the device works at reverse-block mode, and the power FET turns off and stands by for FRS. Once V_{OUT} drops lower than V_{IN}, the power FET is turned on in 150µs.

Power Dissipation and Junction Temperature

The low on-resistance of the internal MOSFET allows the small surface-mount packages to pass large currents. Using the maximum operating ambient temperature (T_A) and $R_{DS(ON)}$, the power dissipation can be calculated by:

$$P_D = R_{DS(ON)} \times I^2$$

Finally, to calculate the junction temperature:

$$T_J = P_D \times R_{\Theta JA} + T_A$$

Where:

- T_A = Ambient temperature (°C)
- $R_{\Theta JA}$ = Thermal resistance
- P_D = Total power dissipation

Board Layout Instruction

Placing input and output capacitors, 1µF and 0.1µF+100µF respectively, close and next to the device pins must be implemented to minimize the effects of parasitic inductance. For best performance, all trace lengths must be kept as short as possible. The input and output PCB traces must be as wide as possible. Use a ground plane to enhance the power dissipation capability of the device.
