June 2016

## **GENERAL DESCRIPTION**

This reference design is a complete five-output power system designed to power a Xilinx Zynq-7020 All Programmable (AP) SoC and associated DDR3 memory in Industrial Ethernet applications. This reference design is focused on Industrial Ethernet applications leveraging HMS's Anybus IP on Xilinx. Although the power requirements of the core system building blocks remain relatively constant, the flexibility of Exar's Universal PMICs provides a power solution that can power the wider system requirements, whether a motor control board or human interface module.

The power system provides V<sub>CCPINT</sub>, V<sub>CCINT</sub> and V<sub>CCBRAM</sub> 1.00V, V<sub>CCO\_DDR</sub> programmable to 1.2/1.35/1.5V, V<sub>TT</sub> 0.60/0.675/0.75V, V<sub>CCAUX</sub> and V<sub>CCADC</sub> 1.8V and V<sub>CCO</sub> programmable from 1.8V to 3.3V. The entire power system fits in less than one square inch. The order and ramp rates for each supply are programmed to accommodate Zynq-7020 sequencing requirements. All power supply operations can be controlled over an I<sup>2</sup>C interface. Faults, output voltages and currents can also be monitored. 4 GPIO signals are available and can be programmed to provide the status of power good signals, enables, and faults. The board is supported by PowerArchitect<sup>TM</sup> 4.x and connects to the Exar Communications Module (XR77XXEVB-XCM-V80).

# FEATURES

- Xilinx Zynq-7020 All Programmable SoC Power System
  - 4 Channel Power System using XRP7714 Programmable Digital PWM Switching Controller
  - VCCPINT, VCCINT and VCCBRAM 1.0V
  - V<sub>CCO\_DDR</sub> programmable to 1.2/1.35/1.5V
  - V<sub>TT</sub> 0.60/0.675/0.75V
  - V<sub>CCO</sub> programmable to from 1.8V to 3.3V
  - $V_{CCAUX}$  and  $V_{CCADC}$  1.8V

- Programming
- Monitoring
- Control

# **ZYNQ-7020 AP SOC POWER SOLUTION**

The Zynq-7020 AP SoC power reference design provides 4 output voltages. The order and ramp rates for each output are programmed to accommodate Zynq-7020 AP SoC sequencing requirements.

The power system was designed to operate at 650kHz as a good trade-off between space and efficiency.

Vin			
Operating Max	10.0 UVLO Warn	7.5 UVLO Fault 7.0	*
ock		Faults	
	650kHz	Over Temp Shutdown (C)	155.0
Switching Freq			

## **Output 1/Channel 1 Configuration**

Channel 1 is designed to provide 1V to  $V_{CCINT}$ ,  $V_{CCBRAM}$  and  $V_{CCPINT}$  Zynq-7020 AP SoC rails at 2.0A. However, the hardware is capable of supporting output currents up to 3Amps.

# **Output 2/Channel 2 Configuration**

Channel 2 provides 1.5V to the DDR3 SDRAM subsystem as well as the DDR3 block inside the Zynq-7020 AP SoC. In addition, it sources the XRP2997 DDR Bus Termination Regulator which provides termination voltage for the DDR3 SDRAM signals. The channel is configured for a 2.0A output, but the hardware is capable of supporting up to a 3Amp load.

## **Output 3/Channel 3 Configuration**

Channel 3 provides 2.5V to Zynq-7020 AP SoC IO banks ( $V_{CCO}$ ) and peripherals in the system. The channel is configured for a 1.5A output, but the hardware is capable of supporting up to a 2Amp load.

Channel 3		
Vin 12.00	Vout	2.50
Phase (deg) Default 🔻	Iout	1.50
Tstart (ms) 16.00	Tstop (ms)	1.00
Rise (ms) 13.00	Fall (ms)	8.00
PG delay (s) 0.400 🔻	PG %	20.00
Shdn Thresh 0.10	OVP Level	2.800 🔻

## Output 4/Channel 4 Configuration

Channel 4 is designed to provide 1.8V to  $V_{CCAUX}$  and  $V_{CCADC}$  Zynq-7020 AP SoC rails at 0.5A. The channel is configured for a 0.5A output, but the hardware is capable of supporting up to a 1.5Amp load.

# LDOOUT

LDOOUT is routed to XRP2997 control pin enabling the device.

## **CHANNEL SEQUENCING**

The XRP7714 sequencing has been designed to meet the Zynq-7020 AP SoC power up sequencing requirements.

#### **Power-On Sequencing**

- 1. 1.0V supply with 0.077V/msec ramp rate
- **2. 1.8V** supply with 0.12V/msec ramp rate
- **3. 1.5V and 2.5V supplies** the 1.5V supply with 0.115V/msec ramp rate reaching the target level at the same time as the 2.5V supply with 0.192V/msec ramp rate.

#### **Power-Down Sequencing**

- 1. 1.5V and 2.5V supplies the 1.5V supply following 0.1875V/msec ramp down rate; the 2.5V supply following 0.3125V/msec ramp down rate. Both channels regulate down to the shutdown threshold of 100mV before switching stops.
- 2. 1.0V and 1.8V supplies the 1.0V supply following 0.125V/msec ramp down rate; the 1.8V supply following 0.225V/msec ramp down rate. Both channels regulate down to the shutdown threshold of 100mV before switching stops.

#### ZYNQ-7020 AP SOC POWER ON RESET

XRP7714 will generate a power on reset signal on GPIO3 to the Zynq-7020 AP SoC 400ms after the last rail is in regulation.

#### **POWERING UP THE BOARD**

The board hardware is provided capable of supporting an input voltage range of 5.5V to 15V with power connected directly to J5 (VIN) and J6 (GND).

#### I<sup>2</sup>C Interface

The Zynq-7020 AP SoC power reference design schematic shows an I<sup>2</sup>C interface connector (HDR2) to connect the Exar Communications Module (XR77XXEVB-XCM-V80 which has its own users guide available). This provides an interface with PowerArchitect<sup>TM</sup> 4.x allowing programming of the board.

Ensure the XCM is configured to use the on board pull-up resistors (check jumper settings).

If communication between Zynq-7020 AP SoC and XRP7714 is desired, ensure that the Zynq-7020 AP SoC system board has pull-up resistors installed.

For more information how to implement power subsystem control and monitoring via  $I^2C$  bus refer to ANP-31.

#### **Configuring the Board**

The board is typically delivered with a XRP7714 which has not yet had its OTP memory burned with a specific configuration. This allows the user to select a different VIO voltage or DDR memory voltage than the one used in the default configuration file available from Exar's web site.
