

# TXB0106 6-Bit Bidirectional Level-Shifting and Voltage Translator With Auto-Direction Sensing and $\pm 15$ -kV ESD Protection

## 1 Features

- 1.2 V to 3.6 V on A Port and 1.65 to 5.5 V on B Port ( $V_{CCA} \leq V_{CCB}$ )
- $V_{CC}$  Isolation Feature – If Either  $V_{CC}$  Input Is at GND, All Outputs Are in the High-Impedance State
- OE Input Circuit Referenced to  $V_{CCA}$
- Low-Power Consumption, 4  $\mu$ A Max  $I_{CC}$
- $I_{off}$  Supports Partial-Power-Down Mode Operation
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
  - A Port
    - 2500 V Human Body Model (A114-B)
    - 150 V Machine Model (A115-A)
    - 1500 V Charged-Device Model (C101)
  - B Port
    - $\pm 15$  kV Human Body Model (A114-B)
    - 150 V Machine Model (A115-A)
    - 1500 V Charged-Device Model (C101)

## 2 Applications

- Headset
- Smartphone
- Tablet
- Desktop PC

## 3 Description

This 6-bit noninverting translator uses two separate configurable power-supply rails. The A port is designed to track  $V_{CCA}$ .  $V_{CCA}$  accepts any supply voltage from 1.2 V to 3.6 V. The B port is designed to track  $V_{CCB}$ .  $V_{CCB}$  accepts any supply voltage from 1.65 V to 5.5 V. This allows for universal low-voltage bidirectional translation between any of the 1.2 V, 1.5 V, 1.8 V, 2.5 V, 3.3 V, and 5 V voltage nodes.  $V_{CCA}$  should not exceed  $V_{CCB}$ .

When the output-enable (OE) input is low, all outputs are placed in the high-impedance state.

The TXB0106 is designed so that the OE input circuit is supplied by  $V_{CCA}$ .

This device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TXB0106	TSSOP (16)	5.00 mm x 4.40 mm
	VQFN (16)	4.00 mm x 3.50 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

### Changes from Revision A (May 2012) to Revision B Page

- Added *Pin Configuration and Functions* section, *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ..... **1**

### Changes from Original (September 2008) to Revision A Page

- Added notes to pin out graphics. .... **3**

## 5 Pin Configuration and Functions

- A. The exposed center pad, if used, must be connected as a secondary ground or left electrically open.
- B. Pull up resistors are not required on both sides for Logic I/O.
- C. If pull up or pull down resistors are needed, the resistor value must be over 50 kΩ.
- D. 50 kΩ is a safe recommended value, if the customer can accept higher Vol or lower Voh, smaller pull up or pull down resistor is allowed, the draft estimation is  $V_{OL} = V_{CCOUT} \times 4.5 \text{ k} / (4.5 \text{ k} + R_{PU})$  and  $V_{OH} = V_{CCOUT} \times R_{DW} / (4.5 \text{ k} + R_{DW})$ .
- E. If pull up resistors are needed, please refer to the TXS0108 (different package with TXB0106) or contact TI.
- F. For detailed information, please refer to application note [SCEA043](#).

### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	A1		Input/output 1. Referenced to $V_{CCA}$ .
2	$V_{CCA}$	-	A-port supply voltage. $1.2 \text{ V} \leq V_{CCA} \leq 3.6 \text{ V}$ , $V_{CCA} \leq V_{CCB}$ .
3	A2	I/O	Input/output 2. Referenced to $V_{CCA}$ .
4	A3	I/O	Input/output 3. Referenced to $V_{CCA}$ .
5	A4	I/O	Input/output 4. Referenced to $V_{CCA}$ .
6	A5	I/O	Input/output 5. Referenced to $V_{CCA}$ .
7	A6	I/O	Input/output 6. Referenced to $V_{CCA}$ .
8	OE	-	Output enable. Pull OE low to place all outputs in Tri-state mode. Referenced to $V_{CCA}$ .
9	GND	-	Ground
10	B6	I/O	Input/output 6. Referenced to $V_{CCB}$ .
11	B5	I/O	Input/output 5. Referenced to $V_{CCB}$ .
12	B4	I/O	Input/output 4. Referenced to $V_{CCB}$ .
13	B3	I/O	Input/output 3. Referenced to $V_{CCB}$ .
14	B2	I/O	Input/output 2. Referenced to $V_{CCB}$ .
15	$V_{CCB}$	-	B-port supply voltage. $1.65 \text{ V} \leq V_{CCB} \leq 5.5 \text{ V}$ .
16	B1	I/O	Input/output 1. Referenced to $V_{CCB}$ .

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
$V_{CCA}$	Supply voltage	−0.5	4.6	V
$V_{CCB}$	Supply voltage	−0.5	6.5	V
$V_I$	Input voltage <sup>(2)</sup>	−0.5	6.5	V
$V_O$	Voltage applied to any output in the high-impedance or power-off state <sup>(2)</sup>	−0.5	6.5	V
$V_O$	Voltage applied to any output in the high or low state <sup>(2) (3)</sup>	A inputs	−0.5	$V_{CCA} + 0.5$
		B inputs	−0.5	$V_{CCB} + 0.5$
$I_{IK}$	Input clamp current	$V_I < 0$	−50	mA
$I_{OK}$	Output clamp current	$V_O < 0$	−50	mA
$I_O$	Continuous output current		±50	mA
	Continuous current through $V_{CCA}$ , $V_{CCB}$ , or GND		±100	mA
$T_J$	Junction Temperature	−40	150	°C
$T_{stg}$	Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The value of  $V_{CCA}$  and  $V_{CCB}$  are provided in the recommended operating conditions table.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	A Port 2500
			B Port ±15000
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	A Port	1500
		B Port	1500
	Machine model (A115-A)	A Port	150
		B Port	150

- (1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions<sup>(1) (2)</sup>

		$V_{CCA}$	$V_{CCB}$	MIN	MAX	UNIT
$V_{CCA}$	Supply voltage			1.2	3.6	V
$V_{CCB}$				1.65	5.5	
$V_{IH}$	High-level input voltage	Data inputs	1.2 V to 3.6 V	$V_{CCI} \times 0.65$ <sup>(3)</sup>	$V_{CCI}$	V
		OE				
$V_{IL}$	Low-level input voltage	Data inputs	1.2 V to 3.6 V	0	$V_{CCI} \times 0.35$ <sup>(3)</sup>	V
		OE				
$\Delta t/\Delta v$	Input transition rise or fall rate	A-port inputs	1.2 V to 3.6 V	1.65 V to 5.5 V	40	ns/V
		B-port inputs	1.2 V to 3.6 V	1.65 V to 3.6 V	40	
				4.5 V to 5.5 V	30	
$T_A$	Operating free-air temperature			−40	85	°C

- (1) The A and B sides of an unused data I/O pair must be held in the same state, i.e., both at  $V_{CCI}$  or both at GND.
- (2)  $V_{CCA}$  must be less than or equal to  $V_{CCB}$  and must not exceed 3.6 V.
- (3)  $V_{CCI}$  is the supply voltage associated with the input port.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TXB0106		UNIT
		PW (TSSOP)	RGY (VQFN)	
		16 PINS	16 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	107.2	40.7	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	34.9	54.1	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	13.3	20.9	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.5	1.1	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	13.3	20.9	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	2.7	6.7	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

over recommended operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

PARAMETER		TEST CONDITIONS	V <sub>CCA</sub>	V <sub>CCB</sub>	T <sub>A</sub> = 25°C			–40°C to 85°C		UNIT

## 6.17 Typical Characteristics

**Figure 1. Input capacitance for OE pin ( $C_I$ ) vs Power Supply ( $V_{CCA}$ )**

**Figure 2. Capacitance for A port I/O pins ( $C_{IO}$ ) vs Power Supply ( $V_{CCA}$ )**

**Figure 3. Capacitance for B port I/O pins ( $C_{IO}$ ) vs Power Supply ( $V_{CCB}$ )**

## 7 Parameter Measurement Information

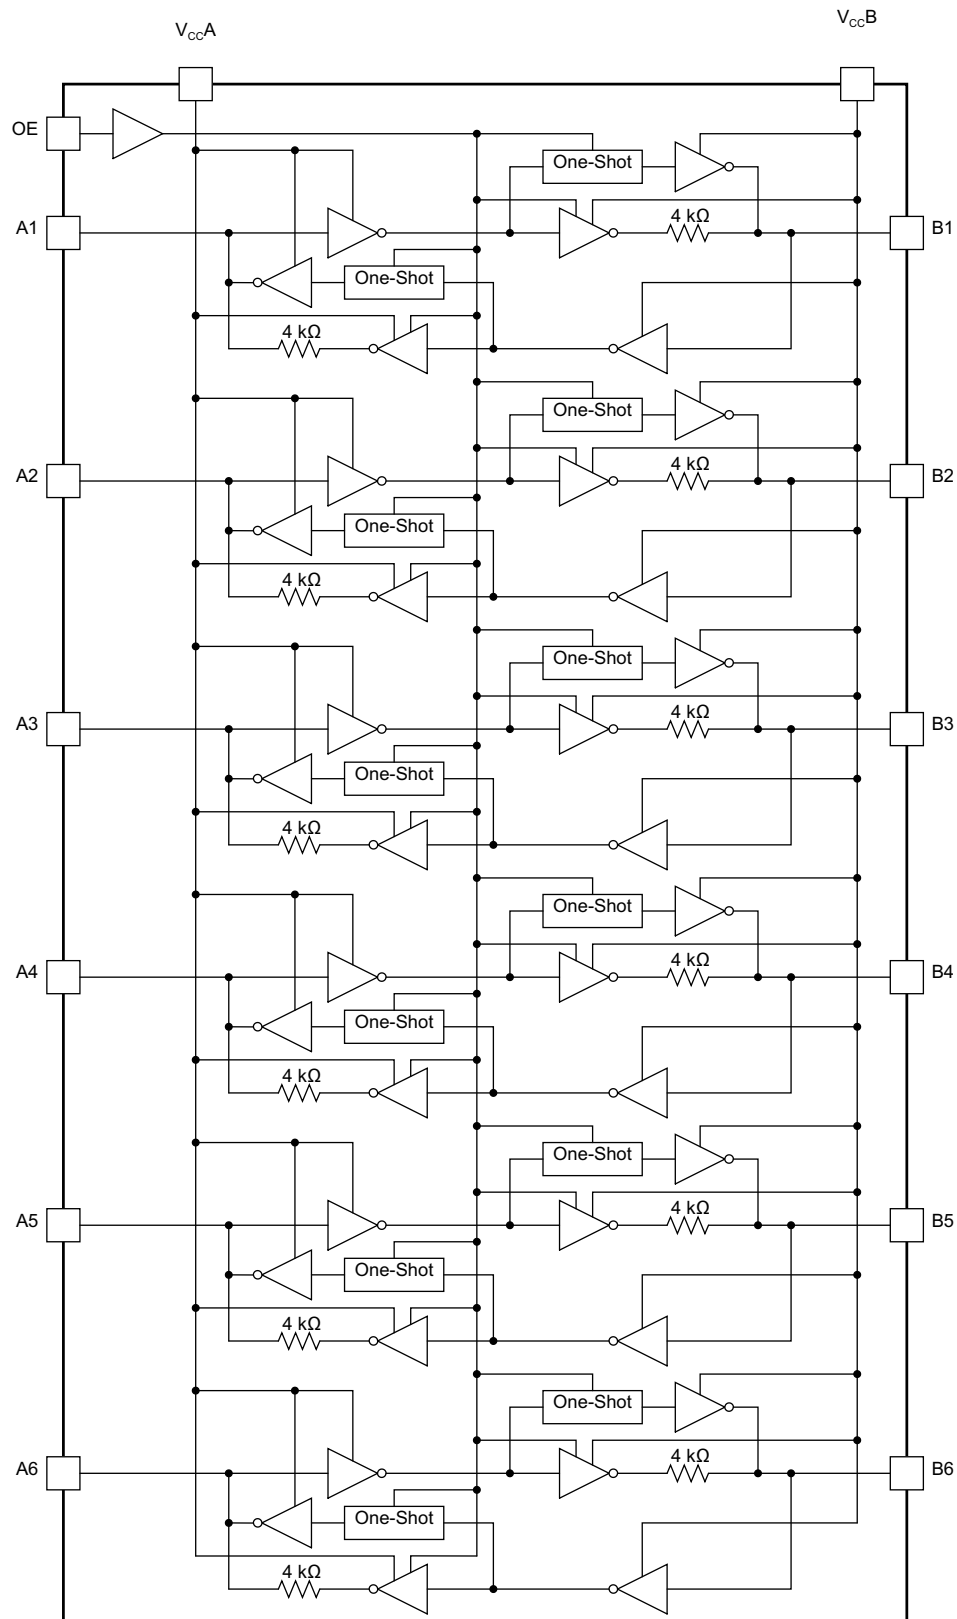

- A.  $C_L$  includes probe and jig capacitance.
- B. All input pulses are supplied by generators having the following characteristics:  $PRR \leq 10$  MHz,  $Z_O = 50 \Omega$ ,  $dv/dt \geq 1$  V/ns.
- C. The outputs are measured one at a time, with one transition per measurement.
- D.  $t_{PLH}$  and  $t_{PHL}$  are the same as  $t_{pd}$ .
- E.  $V_{CCI}$  is the  $V_{CC}$  associated with the input port.
- F.  $V_{CCO}$  is the  $V_{CC}$  associated with the output port.
- G. All parameters and waveforms are not applicable to all devices.

**Figure 4. Load Circuits and Voltage Waveforms**

## 8 Detailed Description

### 8.1 Overview

The TXB0106 device is a 6-bit, directionless voltage-level translator specifically designed for translating logic voltage levels. The A port is able to accept I/O voltages ranging from 1.2 V to 3.6 V, while the B port can accept I/O voltages from 1.65 V to 5.5 V. The device is a buffered architecture with edge-rate accelerators (one-shots) to improve the overall data rate. This device can only translate push-pull CMOS logic outputs. If for open-drain signal translation, please refer to TI's TXS010X products.

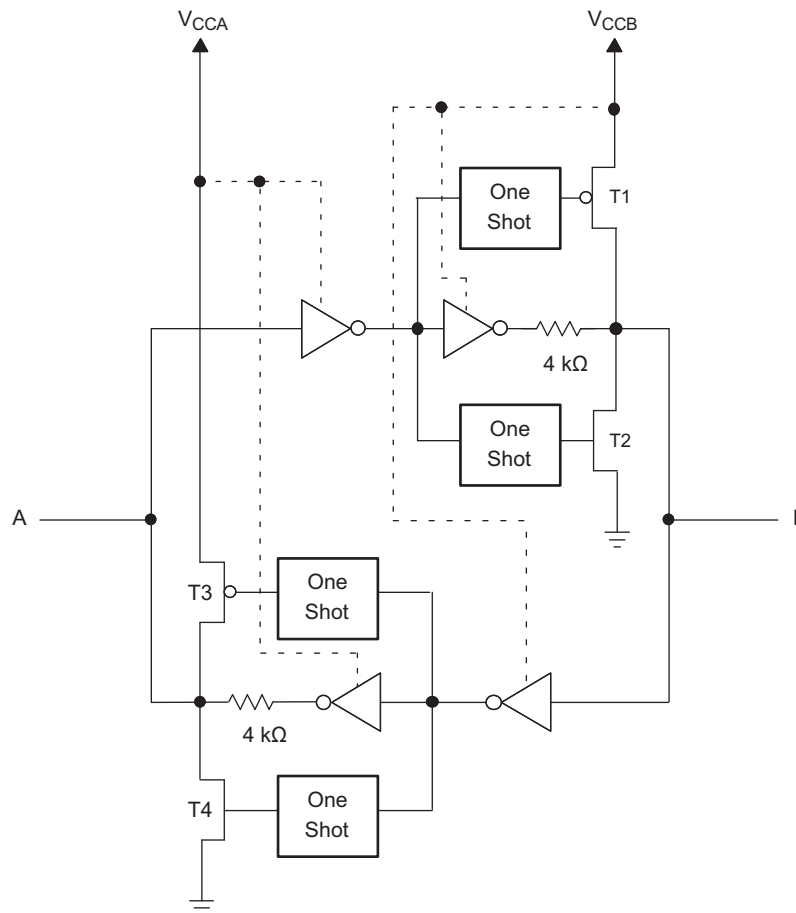

## 8.3 Feature Description

### 8.3.1 Architecture

The TXB0106 architecture (see [Figure 5](#)) does not require a direction-control signal to control the direction of data flow from A to B or from B to A. In a dc state, the output drivers of the TXB0106 can maintain a high or low, but are designed to be weak, so that they can be overdriven by an external driver when data on the bus starts flowing the opposite direction.

The output one-shots detect rising or falling edges on the A or B ports. During a rising edge, the one-shot turns on the PMOS transistors (T1, T3) for a short duration, which speeds up the low-to-high transition. Similarly, during a falling edge, the one-shot turns on the NMOS transistors (T2, T4) for a short duration, which speeds up the high-to-low transition. The typical output impedance during output transition is 70  $\Omega$  at  $V_{CCO} = 1.2\text{ V}$  to 1.8 V, 50  $\Omega$  at  $V_{CCO} = 1.8\text{ V}$  to 3.3 V, and 40  $\Omega$  at  $V_{CCO} = 3.3\text{ V}$  to 5 V.

**Figure 5. Architecture of TXB0106 I/O Cell**

### 8.3.2 Input Driver Requirements

Typical  $I_{IN}$  vs  $V_{IN}$  characteristics of the TXB0106 are shown in [Figure 6](#). For proper operation, the device driving the data I/Os of the TXB0106 must have drive strength of at least  $\pm 2\text{ mA}$ .

## Feature Description (continued)

- A.  $V_T$  is the input threshold voltage of the TXB0106 (typically  $V_{CCI}/2$ ).
- B.  $V_D$  is the supply voltage of the external driver.

**Figure 6. Typical  $I_{IN}$  vs  $V_{IN}$  Curve**

### 8.3.3 Power Up

During operation, ensure that  $V_{CCA} \leq V_{CCB}$  at all times. During power-up sequencing,  $V_{CCA} \geq V_{CCB}$  does not damage the device, so any power supply can be ramped up first. The TXB0106 has circuitry that disables all output ports when either  $V_{CC}$  is switched off ( $V_{CCA/B} = 0$  V).

### 8.3.4 Output Load Considerations

TI recommends careful PCB layout practices with short PCB trace lengths to avoid excessive capacitive loading and to ensure that proper O.S. triggering takes place. PCB signal trace-lengths should be kept short enough such that the round trip delay of any reflection is less than the one-shot duration. This improves signal integrity by ensuring that any reflection sees a low impedance at the driver. The O.S. circuits have been designed to stay on for approximately 10 ns. The maximum capacitance of the lumped load that can be driven also depends directly on the one-shot duration. With very heavy capacitive loads, the one-shot can time-out before the signal is driven fully to the positive rail. The O.S. duration has been set to best optimize trade-offs between dynamic ICC, load driving capability, and maximum bit-rate considerations. Both PCB trace length and connectors add to the capacitance that the TXB0106 output sees, so it is recommended that this lumped-load capacitance be considered to avoid O.S. retriggering, bus contention, output signal oscillations, or other adverse system-level affects.

### 8.3.5 Enable and Disable

The TXB0106 has an OE input that is used to disable the device by setting OE = low, which places all I/Os in the high-impedance (Hi-Z) state. The disable time ( $t_{dis}$ ) indicates the delay between when OE goes low and when the outputs actually get disabled (Hi-Z). The enable time ( $t_{en}$ ) indicates the amount of time the user must allow for the one-shot circuitry to become operational after OE is taken high.

## Feature Description (continued)

### 8.3.6 Pullup or Pulldown Resistors on I/O Lines

The TXB0106 is designed to drive capacitive loads of up to 70 pF. The output drivers of the TXB0106 have low dc drive strength. If pullup or pulldown resistors are connected externally to the data I/Os, their values must be kept higher than 50 k $\Omega$  to ensure that they do not contend with the output drivers of the TXB0106.

For the same reason, the TXB0106 should not be used in applications such as I<sup>2</sup>C or 1-Wire where an open-drain driver is connected on the bidirectional data I/O. For these applications, use a device from the TI TXS01xx series of level translators.

### 8.3.7 Device Functional Modes

The TXB0106 device has two functional modes, enabled and disabled. To disable the device, set the OE input to low, which places all I/Os in a high impedance state. Setting the OE input to high will enable the device.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The TXB0106 can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. It can only translate push-pull CMOS logic outputs. If for open-drain signal translation, please refer to TI TXS010X products. Any external pulldown or pullup resistors are recommended larger than 50 kΩ.

### 9.2 Typical Application

**Figure 7. Typical Operating Circuit**

#### 9.2.1 Design Requirements

For this design example, use the parameters listed in [Table 1](#). And make sure that  $V_{CCA} \leq V_{CCB}$ .

**Table 1. Design Parameters**

DESIGN PARAMETERS	EXAMPLE VALUE
Input voltage range	1.2 V to 3.6 V
Output voltage range	1.65 V to 5.5 V

#### 9.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
  - Use the supply voltage of the device that is driving the TXB0106 device to determine the input voltage range. For a valid logic high the value must exceed the  $V_{IH}$  of the input port. For a valid logic low the value must be less than the  $V_{IL}$  of the input port.

- Output voltage range
  - Use the supply voltage of the device that the TXB0106 device is driving to determine the output voltage range.
  - Don't recommend to have the external pullup or pulldown resistors. If mandatory, it is recommended the value should be larger than 50 kΩ.
- An external pulldown or pullup resistor decreases the output  $V_{OH}$  and  $V_{OL}$ . Use the below equations to draft estimate the  $V_{OH}$  and  $V_{OL}$  as a result of an external pulldown and pullup resistor.
 
$$V_{OH} = V_{CCx} \times R_{PD} / (R_{PD} + 4.5 \text{ k}\Omega)$$

$$V_{OL} = V_{CCx} \times 4.5 \text{ k}\Omega / (R_{PU} + 4.5 \text{ k}\Omega)$$
 Where
  - $V_{CCx}$  is the output port supply voltage on either  $V_{CCA}$  or  $V_{CCB}$
  - $R_{PD}$  is the value of the external pull down resistor
  - $R_{PU}$  is the value of the external pull up resistor
  - 4.5 kΩ is the counting the variation of the serial resistor 4 kΩ in the I/O line.

### 9.2.3 Application Curves

**Figure 8. Level-Translation of a 2.5-MHz Signal**

## 10 Power Supply Recommendations

During operation, ensure that  $V_{CCA} \leq V_{CCB}$  at all times. During power-up sequencing,  $V_{CCA} \geq V_{CCB}$  does not damage the device, so any power supply can be ramped up first. The TXB0106 has circuitry that disables all output ports when either  $V_{CC}$  is switched off ( $V_{CCA/B} = 0 \text{ V}$ ). The output-enable (OE) input circuit is designed so that it is supplied by  $V_{CCA}$  and when the (OE) input is low, all outputs are placed in the high-impedance state. To ensure the high-impedance state of the outputs during power up or power down, the OE input pin must be tied to GND through a pulldown resistor and must not be enabled until  $V_{CCA}$  and  $V_{CCB}$  are fully ramped and stable. The minimum value of the pulldown resistor to ground is determined by the current-sourcing capability of the driver.

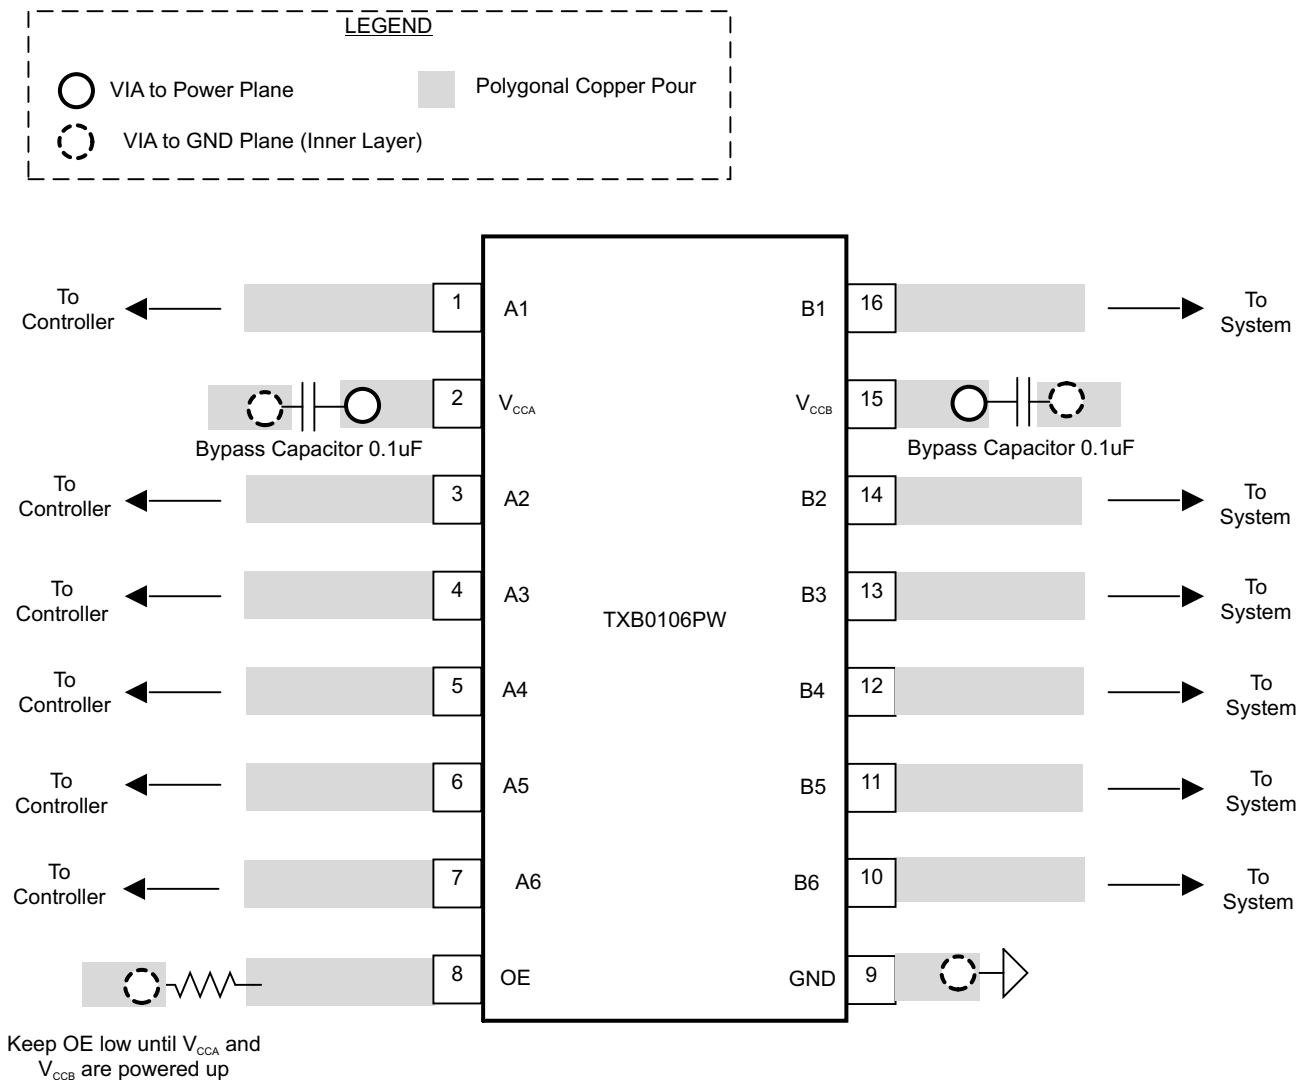

## 11 Layout

### 11.1 Layout Guidelines

To ensure reliability of the device, following common printed-circuit board layout guidelines is recommended.

- Bypass capacitors should be used on power supplies. And should be placed as close as possible to the  $V_{CCA}$ ,  $V_{CCB}$  pin and GND pin
- Short trace-lengths should be used to avoid excessive loading.
- PCB signal trace-lengths must be kept short enough so that the round-trip delay of any reflection is less than the one-shot duration, approximately 10 ns, ensuring that any reflection encounters low impedance at the source driver.

### 11.2 Layout Example

## 12 Device and Documentation Support

### 12.1 Documentation Support

For related documentation see the following:

*A Guide to Voltage Translation With TXB-Type Translators*, [SCEA043](#)

### 12.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](#), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TXB0106PWR	ACTIVE	TSSOP	PW	16	2000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	YE06	<a href="#">Samples</a>
TXB0106RGYR	ACTIVE	VQFN	RGY	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	YE06	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View
