

## DAC5682Z 16-Bit, 1.0 GSPS 2x-4x Interpolating Dual-Channel Digital-to-Analog Converter (DAC)

### 1 Features

- 16-Bit Digital-to-Analog Converter (DAC)
- 1.0 GSPS Update Rate
- 16-Bit Wideband Input LVDS Data Bus
  - 8 Sample Input FIFO
  - Interleaved I/Q Data for Dual-DAC Mode
- High Performance
  - 73-dBc ACLR WCDMA TM1 at 180 MHz
- 2x-32x Clock Multiplying PLL/VCO
- 2x or 4x Interpolation Filters
  - Stopband Transition 0.4 to 0.6 Fdata
  - Filters Configurable in Either Low-Pass or High-Pass Mode
  - Allows Selection of Higher Order Image
- Fs/4 Coarse Mixer
- On-Chip 1.2-V Reference
- Differential Scalable Output: 2 to 20 mA
- Package: 64-Pin 9-mm × 9-mm QFN

### 2 Applications

- Cellular Base Stations
- Broadband Wireless Access (BWA)
- WiMAX 802.16
- Fixed Wireless Backhaul
- Cable Modem Termination System (CMTS)

### 3 Description

The DAC5682Z is a dual-channel 16-bit 1.0 GSPS DAC with wideband LVDS data input, integrated 2x/4x interpolation filters, onboard clock multiplier, and internal voltage reference. The DAC5682Z offers superior linearity, noise, crosstalk, and PLL phase noise performance.

The DAC5682Z integrates a wideband LVDS port with on-chip termination. Full-rate input data can be transferred to a single DAC channel, or half-rate and 1/4-rate input data can be interpolated by onboard 2x or 4x FIR filters. Each interpolation FIR is configurable in either low-pass or high-pass mode, allowing selection of a higher order output spectral image. An on-chip delay lock loop (DLL) simplifies LVDS interfacing by providing skew control for the LVDS input data clock.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DAC5682Z	VQFN (64)	9.00 mm × 9.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

Changes from Revision E (August 2012) to Revision F	Page
Added ESD Ratings table, Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section .....	<b>1</b>

Changes from Revision D (February 2011) to Revision E	Page
Changed the Revision to E, August 2012 .....	<b>1</b>
Changed the graphic entity of <a href="#">Figure 30</a> for clarification.....	<b>23</b>
Changed the first paragraph of ANALOG CURRENT OUTPUTS section for clarification.....	<b>29</b>

Changes from Revision C (November 2008) to Revision D	Page
Changed "defined by individual control bits in registers CONFIG1, CONFIG5 and CONFIG6." to "defined by individual control bits in registers CONFIG1 and CONFIG5." .....	<b>26</b>
Changed wording in second sentence of RECOMMENED....PROCEDURE section from CONFIG5 <b>clkdiv_sync_dis</b> and <b>FIFO_sync_dis</b> bits as well to CONFIG5 <b>clkdiv_sync_dis</b> as well .....	<b>35</b>
Deleted list items in first and second ordered list in RECOMMENED....PROCEDURE section .....	<b>35</b>
Changed CONFIG5 Bit4 from "FIFO_sync_dis" to "Reserved" in Register Map .....	<b>39</b>
Changed CONFIG6 Bit 7 from "Hold_sync_dis" to "Reserved" in Register Map .....	<b>39</b>
Deleted - unless----CONFIG5 register. in FIFO_offset(2:0): on page 21 .....	<b>40</b>
Changed Bit 4 in CONFIG5 table from FIFO_sync_dis to Reserved .....	<b>43</b>
Changed "FIFO_sync_dis: Disables the FIFO offset sync..... CONFIG1 register" to "Reserved (Bit 4): Set to 0 for proper operation." .....	<b>43</b>
Changed Hold_sync_dis to Reserved .....	<b>43</b>
Changed from Hold_sync_dis: When set, disables the sync to the FIFO .....control bit in CONFIG5." to "Reserved (Bit 7): Set to 0 for proper operation." .....	<b>43</b>

**Changes from Revision B (April 2008) to Revision C**
**Page**

• Changed Thermal Conductivity $\theta_{JA}$ (still air) from 22 to 20 .....	8
• Changed $\theta_{JC}$ from 7 to 0.2 .....	8
• Changed $\theta_{JP}$ from 0.2 to 3.5 .....	8
• Changed DC Spec - Analog Output test condition from "without internal reference" .....	8
• Changed DC spec. REFERENCE INPUT, Small signal bandwidth conditions .....	9
• Changed Power Supply DVDD MIN from 1.71 to 1.7 and MAX from 2.15 to 1.9 .....	9
• Changed Power Supply CLKVDD MIN from 1.71 to 1.7 and MAX from 2.15 to 1.9 .....	9
• Added "DC tested" to PSRR spec .....	10
• Added Digital latency spec. ....	10
• Added Power-up time spec .....	10
• Added D[15:0]P/N .....	11
• Changed $V_{ITH+}$ spec .....	11
• Changed $V_{ITH-}$ spec .....	11
• Changed $I_{IH}$ and $I_{IL}$ spec from –40 MIN and +40 MAX to $\pm 20$ TYP .....	12
• Changed $t_{(SCLK)}$ term to $t_{(SCLK)}$ for Low time of SCLK .....	13
• Changed Clock Input Differential voltage from 0.5V to 0.4V MIN and added footnote .....	13
• Added explanatory paragraph for LVDS Inputs; prior to <a href="#">Figure 33</a> .....	25
• Changed <a href="#">Figure 34</a> waveform label $V_{A,B}$ callout .....	26
• Added explanatory paragraph for <a href="#">Figure 35</a> .....	26
• Changed calculation for C2 <a href="#">Designing the PLL Loop Filter</a> .....	31
• Added URL link to calculator file. ....	32
• Changed last sentence of Dual-Channel Real Upconversion paragraph .....	33
• Added modes to <a href="#">Dual-Channel Real Upconversion Options</a> .....	33
• Added references to CDCE62005 (3 places) .....	33
• Added Multi-DAC Synchronization Procedure .....	35
• Changed Recommended DAC Startup Sequence .....	55

**Changes from Revision A (September 2007) to Revision B**
**Page**

• Changed $t_{r(IOUT)}$ spec. output rise time 10% to 90% typical value from 2 ns to 220 ps .....	10
• Changed $t_{f(IOUT)}$ spec. output fall time 10% to 90% typical value from 2 ns to 220 ps .....	10
• Changed $Z_T$ spec. internal termination from 100 $\Omega$ min, 120 $\Omega$ max; to 85 $\Omega$ min, 135 $\Omega$ max .....	12
• Deleted temperature deratings for $f_{DATA}$ specifications .....	12
• Added DLL operating frequency range specifications .....	12
• Changed In-Band SFDR vs IF, <a href="#">Figure 6</a> .....	15
• Changed $C_{AC}$ values from 0.1 to 0.01 $\mu F$ , <a href="#">Figure 30</a> .....	23
• Changed capacitor values from 0.1 to 0.01 $\mu F$ , <a href="#">Figure 35</a> .....	26

**Changes from Original (August 2007) to Revision A**
**Page**

• Changed from product preview to production data .....	1
---	---

## 5 Description (continued)

The DAC5682Z allows both complex or real output. An optional  $F_s/4$  coarse mixer in complex mode provides coarse frequency upconversion and the dual DAC output produces a complex Hilbert Transform pair. An external RF quadrature modulator then performs the final single sideband up-conversion. The interpolation filters and complex coarse mixers efficiently provide frequency plan flexibility while enabling higher output DAC rates to simplify image rejection filtering.

The DAC5682Z is characterized for operation over the industrial temperature range of  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  and is available in a 64-pin QFN package. Other single-channel members of the family include the interpolating DAC5681Z and the noninterpolating DAC5681.

## 6 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AVDD	51, 54, 55, 59, 62	I	Analog supply voltage. (3.3 V)
BIASJ	57	O	Full-scale output current bias. For 20-mA full-scale output current, connect a 960-Ω resistor to GND.
CLKIN	2	I	Positive external clock input with a self-bias of approximately CLKVDD/2. With the clock multiplier PLL enabled, CLKIN provides lower frequency reference clock. If the PLL is disabled, CLKIN directly provides clock for DAC up to 1 GHz.
CLKINC	3	I	Complementary external clock input. (See the CLKIN description)
CLKVDD	1	I	Internal clock buffer supply voltage. (1.8 V)
D[15..0]P	7, 11, 13, 15, 17, 19, 21, 23, 27, 29, 31, 33, 35, 37, 40, 42	I	<p>LVDS positive input data bits 0 through 15. Each positive/negative LVDS pair has an internal 100 Ω termination resistor. Order of bus can be reversed via <b>rev_bus</b> bit in CONFIG5 register. Data format relative to DCLKP/N clock is Double Data Rate (DDR) with two data samples input per DCLKP/N clock. In dual-channel mode, data for the A-channel is input while DCLKP is high.</p> <p>D15P is most significant data bit (MSB) – pin 7 D0P is least significant data bit (LSB) – pin 42</p>

**DAC5682Z**

SLLS853F – AUGUST 2007 – REVISED JANUARY 2015

[www.ti.com](http://www.ti.com)
**Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
D[15..0]N	8, 12, 14, 16, 18, 20, 22, 24, 28, 30, 32, 34, 36, 38, 41, 43	I	LVDS negative input data bits 0 through 15. (See D[15:0]P description above)  D15N is most significant data bit (MSB) – pin 8 D0N is least significant data bit (LSB) – pin 43
DCLKP	25	I	LVDS positive input clock. Unlike the other LVDS inputs, the DCLKP/N pair is self-biased to approximately DVDD/2 and does <b>not</b> have an internal termination resistor in order to optimize operation of the DLL circuit. See <a href="#">DLL Operation</a> . For proper external termination, connect a 100 $\Omega$ resistor across LVDS clock source lines followed by series 0.01 $\mu$ F capacitors connected to each of DCLKP and DCLKN pins (see ). For best performance, the resistor and capacitors should be placed as close as possible to these pins.
DCLKN	26	I	LVDS negative input clock. (See the DCLKP description)
DVDD	10, 39, 50, 63	I	Digital supply voltage. (1.8 V)
EXTIO	56	I/O	Used as external reference input when internal reference is disabled (i.e., EXTLO connected to AVDD). Used as 1.2-V internal reference output when EXTLO = GND, requires a 0.1 $\mu$ F decoupling capacitor to AGND when used as reference output.
EXTLO	58	O	Connect to GND for internal reference, or AVDD for external reference.
GND	4, Thermal Pad	I	Pin 4 and the Thermal Pad located on the bottom of the QFN package is ground for AVDD, DVDD and IOVDD supplies.
IOUTA1	52	O	A-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full scale current sink and the least positive voltage on the IOUTA1 pin. Similarly, a 0xFFFF data input results in a 0 mA current sink and the most positive voltage on the IOUTA1 pin. In single DAC mode, outputs appear on the IOUTA1/A2 pair only.
IOUTA2	53	O	A-Channel DAC complementary current output. The IOUTA2 has the opposite behavior of the IOUTA1 described above. An input data value of 0x0000 results in a 0-mA sink and the most positive voltage on the IOUTA2 pin.
IOUTB1	61	O	B-Channel DAC current output. See the IOUTA1 description above.
IOUTB2	60	O	B-Channel DAC complementary current output. See the IOUTA2 description above.
IOVDD	9	I	Digital I/O supply voltage (3.3 V) for pins RESETB, SCLK, SDENB, SDIO, SDO.
LPF	64	I	PLL loop filter connection. If not using the clock multiplying PLL, the LPF pin may be left open. Set both <b>PLL_bypass</b> and <b>PLL_sleep</b> control bits for reduced power dissipation.
RESETB	49	I	Resets the chip when low. Internal pullup.
SCLK	47	I	Serial interface clock. Internal pulldown.
SDENB	48	I	Active low serial data enable, always an input to the DAC5682Z. Internal pullup.
SDIO	46	I/O	Bi-directional serial interface data in 3-pin mode (default). In 4-pin interface mode (CONFIG5 <b>sif4</b> ), the SDIO pin is an input only. Internal pulldown.
SDO	45	O	Uni-directional serial interface data in 4-pin mode (CONFIG5 <b>sif4</b> ). The SDO pin is in high-impedance state in 3-pin interface mode (default), but can optionally be used as a status output pin via CONFIG14 <b>SDO_func_sel(2:0)</b> . Internal pulldown.
SYNCP	5	I	LVDS SYNC positive input data. The SYNCP/N LVDS pair has an internal 100 $\Omega$ termination resistor. By default, the <b>SYNCP/N input must be logic '1' to enable a DAC analog output</b> . See the <i>LVDS SYNCP/N Operation</i> paragraph for a detailed description.
SYNCN	6	I	LVDS SYNC negative input data.
VFUSE	44	I	Digital supply voltage. (1.8 V) <b>Connect to DVDD pins for normal operation</b> . This supply pin is also used for factory fuse programming.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage	DVDD <sup>(2)</sup>	−0.5	2.3	V
	VFUSE <sup>(2)</sup>	−0.5	2.3	V
	CLKVDD <sup>(2)</sup>	−0.5	2.3	V
	AVDD <sup>(2)</sup>	−0.5	4	V
	IOVDD <sup>(2)</sup>	−0.5	4	V
Supply voltage	AVDD to DVDD	−2	2.6	V
	CLKVDD to DVDD	−0.5	0.5	V
	IOVDD to AVDD	−0.5	0.5	V
	D[15..0]P, D[15..0]N, SYNCN, SYNCN <sup>(2)</sup>	−0.5	DVDD + 0.5	V
	DCLKP, DCLKN <sup>(2)</sup>	−0.3	2.1	V
	CLKIN, CLKINC <sup>(2)</sup>	−0.5	CLKVDD + 0.5	V
	SDO, SDIO, SCLK, SDENB, RESETB <sup>(2)</sup>	−0.5	IOVDD + 0.5	V
	IOUTA1/B1, IOUTA2/B2 <sup>(2)</sup>	−0.5	AVDD + 0.5	V
	LPF, EXTIO, EXTLO, BIASJ <sup>(2)</sup>	−0.5	AVDD + 0.5	V
Peak input current (any input)			20	mA
Peak total input current (all inputs)			−30	mA
Operating free-air temperature, T <sub>A</sub> : DAC5682Z		−40	85	°C
Storage temperature, T <sub>stg</sub>		−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Measured with respect to GND.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
<b>SUPPLIES</b>				
AVDD	3	3.3	3.6	V
DVDD	1.7	1.8	1.9	V
CLKVDD	1.7	1.8	1.9	V
IOVDD	3	3.3	3.6	V
<b>ANALOG OUTPUT</b>				
IOUTA1, IOUTA2, IOUTB1, IOUTB2	0	20	20	mA
V IOUTA1, IOUTA2, IOUTB1, IOUTB2 Compliance voltage	AVDD-0.5		AVDD+0.5	V

# DAC5682Z

SLLS853F – AUGUST 2007 – REVISED JANUARY 2015

www.ti.com

## Recommended Operating Conditions (continued)

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
<b>CLOCK INPUT</b>				
CLKIN ECL/PECL Frequency			1000	MHz
CLKIN Amplitude Differential	0.4	1	CLKVDD	V
CLKIN Duty Cycle		50%		
CLKIN common mode voltage		CLKDVDD /2		V
DCLK LVDS Frequency			500	MHz
<b>DIGITAL INPUTS</b>				
SYNC LVDS	1	1.2	1.4	V

LVDS Common mode		1.2		V
LVDS Differential Swing		0.4		V
SCLK, SDIO, SDENB, SDO CMOS SPI	GND		IOVDD	V

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DAC5682Z	UNIT
		QFN	
		64 PINS	
T <sub>J</sub>	Maximum junction temperature <sup>(2)</sup>	125	°C
R <sub>θJA</sub>	Theta junction-to-ambient (still air)	22	°C/W
	Theta junction-to-ambient (150 lfm)	16	
R <sub>θJC</sub>	Theta junction-to-case	0.2	°C/W
R <sub>θJP</sub>	Theta junction-to-pad	3.5	°C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

(2) Air flow or heat sinking reduces θ<sub>JA</sub> and may be required for sustained operation at 85° under maximum operating conditions.

## 7.5 Electrical Characteristics — DC Specification

over operating free-air temperature range , AVDD = 3.3 V, CLKVDD = 1.8 V, IOVDD = 3.3 V, DVDD = 1.8 V, Iout<sub>FS</sub> = 20 mA (unless otherwise noted)

unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Resolution			16			Bits
DC ACCURACY <sup>(1)</sup>						
INL	Integral nonlinearity	1 LSB = IOUTFS/2 <sup>16</sup>		±4		LSB
DNL	Differential nonlinearity			±2		
ANALOG OUTPUT						
Course gain linearity				±0.04		LSB
Offset error		Mid code offset		0.01		%FSR
Gain error		With external reference		1		%FSR
Gain error		With internal reference		0.7		%FSR
Gain mismatch		With internal reference, dual DAC	−2		2	%FSR
	Minimum full scale output current <sup>(2)</sup>			2		mA
	Maximum full scale output current <sup>(2)</sup>			20		

(1) Measured differential across IOUTA1 and IOUTA2 or IOUTB1 and IOUTB2 with 25 Ω each to AVDD.

(2) Nominal full-scale current, IoutFS, equals 16 × IBIAS current.

## Electrical Characteristics — DC Specification (continued)

over operating free-air temperature range , AVDD = 3.3 V, CLKVDD = 1.8 V, IOVDD = 3.3 V, DVDD = 1.8 V, Iout<sub>FS</sub> = 20 mA (unless otherwise noted)

I <sub>(DVDD)</sub>	Digital supply current			455		mA
I <sub>(CLKVDD)</sub>	Clock supply current			45		mA
I <sub>(IOVDD)</sub>	IO supply current			12		mA
I <sub>(AVDD)</sub>	Sleep mode, AVDD supply current	Mode 6 (below)		1.0		mA
I <sub>(DVDD)</sub>	Sleep mode, DVDD supply current			1.5		mA
I <sub>(CLKVDD)</sub>	Sleep mode, CLKVDD supply current			2.5		mA
I <sub>(IOVDD)</sub>	Sleep mode, IOVDD supply current			2.0		mA

- (3) The lower limit of the output compliance is determined by the CMOS process. Exceeding this limit may result in transistor breakdown, resulting in reduced reliability of the DAC5682Z device. The upper limit of the output compliance is determined by the load resistors and full-scale output current. Exceeding the upper limit adversely affects distortion performance and integral nonlinearity.
- (4) Use an external buffer amplifier with high impedance input to drive any external load.

## 8.3 Feature Description

### 8.3.1 FIR Filters

Figure 24 shows the magnitude spectrum response for the identical 47-tap FIR0 and FIR1 filters. The transition band is from  $0.4$  to  $0.6 \times F_{IN}$  (the input data rate for the FIR filter) with  $<0.002$  dB of pass-band ripple and approximately 76 dB of stop-band attenuation. Figure 25 shows the region from  $0.35$  to  $0.45 \times F_{IN}$  – up to  $0.44 \times F_{IN}$  there is less than 0.4 dB attenuation. The composite spectrum for x4 interpolation mode, the cascaded response of FIR0 and FIR1, is shown in Figure 26. The filter taps for both FIR0 and FIR1 are listed in Table 1.

Figure 24. Magnitude Spectrum for FIR0 and FIR1

### 8.3.2 Coarse Mixers: CMIX0 and CMIX1

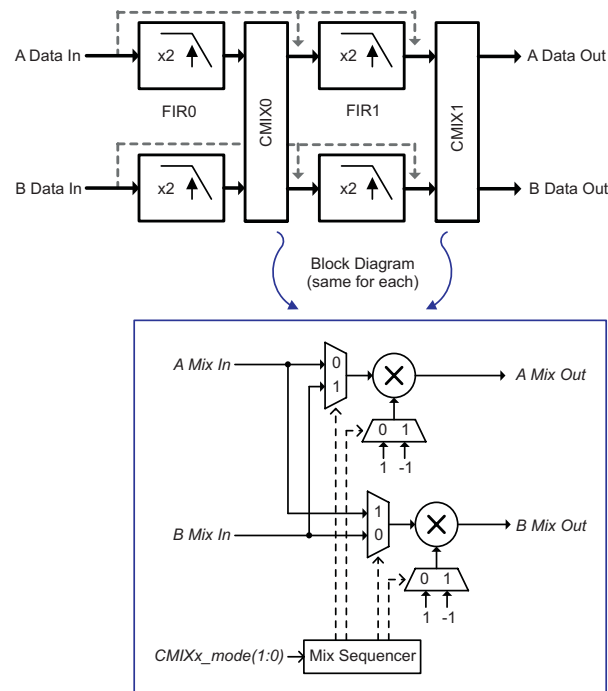

The DAC5682Z has two coarse mixer (CMIX) blocks: CMIX0 follows FIR0 and CMIX1 follows FIR1. (See [Figure 27](#)) Each CMIX block provides mixing capability of fixed frequencies  $F_s/2$  (real) or  $\pm F_s/4$  (complex) with respect to the output frequency of the preceding FIR block. Because FIR0 and CMIX0 are only used in x4 interpolation modes, the output is half-rate relative to the DAC output frequency. Therefore, an  $\pm F_s/4$  mixing sequence results in  $\pm F_{DAC}/8$  frequency shift at the DAC output.

**Table 2. CMIX0 Mixer Sequences**

Mode	CMIX0_mode(1)	CMIX0_mode(0)	MIXING SEQUENCE
Normal (Low Pass, No Mixing)	0	0	FIR0A = { +A, +A, +A, +A } FIR0B = { +B, +B, +B, +B }
High Pass	0	1	FIR0A = { +A, –A, +A, –A } FIR0B = { +B, –B, +B, –B }
$+F_{DAC}/8$ ( $+F_s/4$ )	1	0	FIR0A = { +A, –B, –A, +B } FIR0B = { +B, +A, –B, –A }
$-F_{DAC}/8$ ( $-F_s/4$ )	1	1	FIR0A = { +A, +B, –A, –B } FIR0B = { +B, –A, –B, +A }

**Table 3. CMIX1 Mixer Sequences**

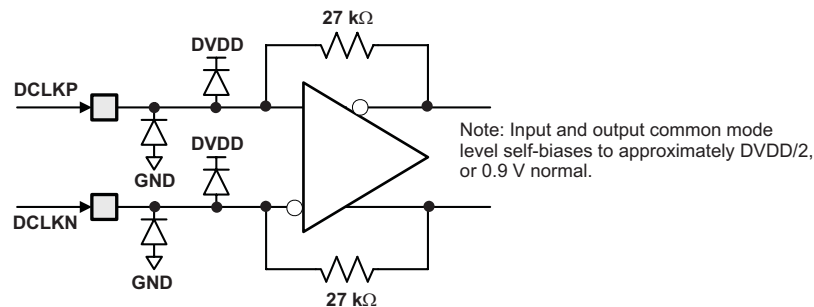

Mode	CMIX1_mode(1)	CMIX1_mode(0)	MIXING SEQUENCE
Normal (Low Pass, No Mixing)	0	0	DACA = { +A, +A, +A, +A } DACB = { +B, +B, +B, +B }
High Pass ( $F_s/2$ )	0	1	DACA = { +A, –A, +A, –A } DACB = { +B, –B, +B, –B }
$+F_{DAC}/4$	1	0	DACA = { +A, –B, –A, +B } DACB = { +B, +A, –B, –A }
$-F_{DAC}/4$	1	1	DACA = { +A, +B, –A, –B } DACB = { +B, –A, –B, +A }

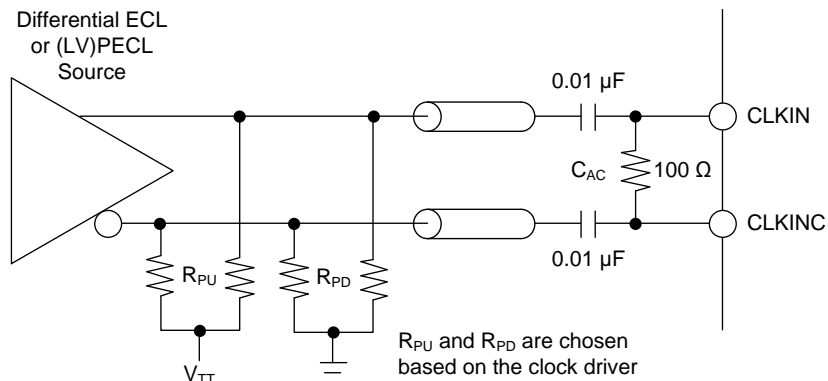

Figure 30. Preferred Clock Input Configuration With a Differential ECL/PECL Clock Source

### 8.3.4 LVDS Data Interfacing

Interfacing very high-speed LVDS data and clocks presents a big challenge to system designers as they have unique constraints and are often implemented with specialized circuits to increase bandwidth. One such specialized LVDS circuit used in many FPGAs and ASICs is a SERIALIZER-DESERIALIZER (SERDES) block. For interfacing to the DAC5682Z, only the SERIALIZER functionality of the SERDES block is required. SERDES drivers accept lower rate parallel input data and output a serial stream using a shift register at a frequency multiple of the data bit width. For example, a 4-bit SERDES block can accept parallel 4-bit input data at 250 MSPS and output serial data 1000 MSPS.

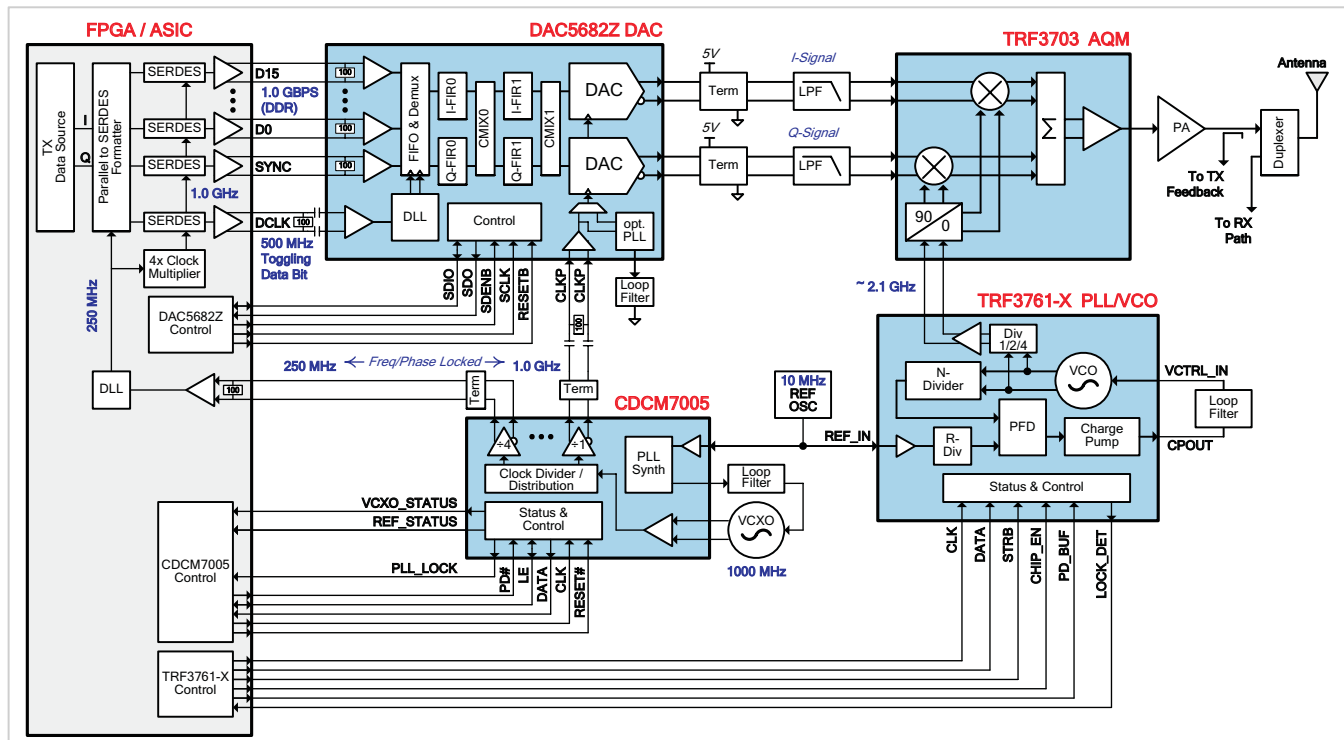

External clock distribution for FPGA and ASIC SERDES drivers often have a chip-to-chip system constraint of a limited input clock frequency compared to the desired LVDS data rate. In this case, an internal clock multiplying PLL is often used in the FPGA or ASIC to drive the high-rate SERDES outputs. Due to this possible system clocking constraint, the DAC5682Z accommodates a scheme where a toggling LVDS SERDES data bit can provide a “data driven” half-rate clock (DCLK) from the data source. A DLL onboard the DAC is used to shift the DCLK edges relative to LVDS data to maintain internal setup and hold timing.

To increase bandwidth of a single 16-bit input bus, the DAC5682Z assumes Double Data Rate (DDR) style interfacing of data relative to the half-rate DCLK. Refer to Figure 31 and Figure 32 for an example implementation using FPGA-based LVDS data and clock interfaces to drive the DAC5682Z. In this example, an assumed system constraint is that the FPGA can only receive a 250 MHz maximum input clock while the desired DAC clock is 1000 MHz. A clock distribution chip such as the CDCM7005 or the CDCE62005 is useful in this case to provide frequency and phase locked clocks at 250 MHz and 1000 MHz.

## DAC5682Z

SLLS853F – AUGUST 2007 – REVISED JANUARY 2015

[www.ti.com](http://www.ti.com)

**Figure 31. Example Direct Conversion System Diagram**

From the example provided by [Figure 32](#), driving LVDS data into the DAC using SERDES blocks requires a parallel load of 4 consecutive data samples to shift registers. Color is used in the figure to indicate how data and clocks flow from the FPGA to the DAC5682Z. The figure also shows the use of the SYNC/N input, which along with DCLK, requires 18 individual SERDES data blocks to drive the input data FIFO of the DAC that provides an elastic buffer to the DAC5682Z digital processing chain.

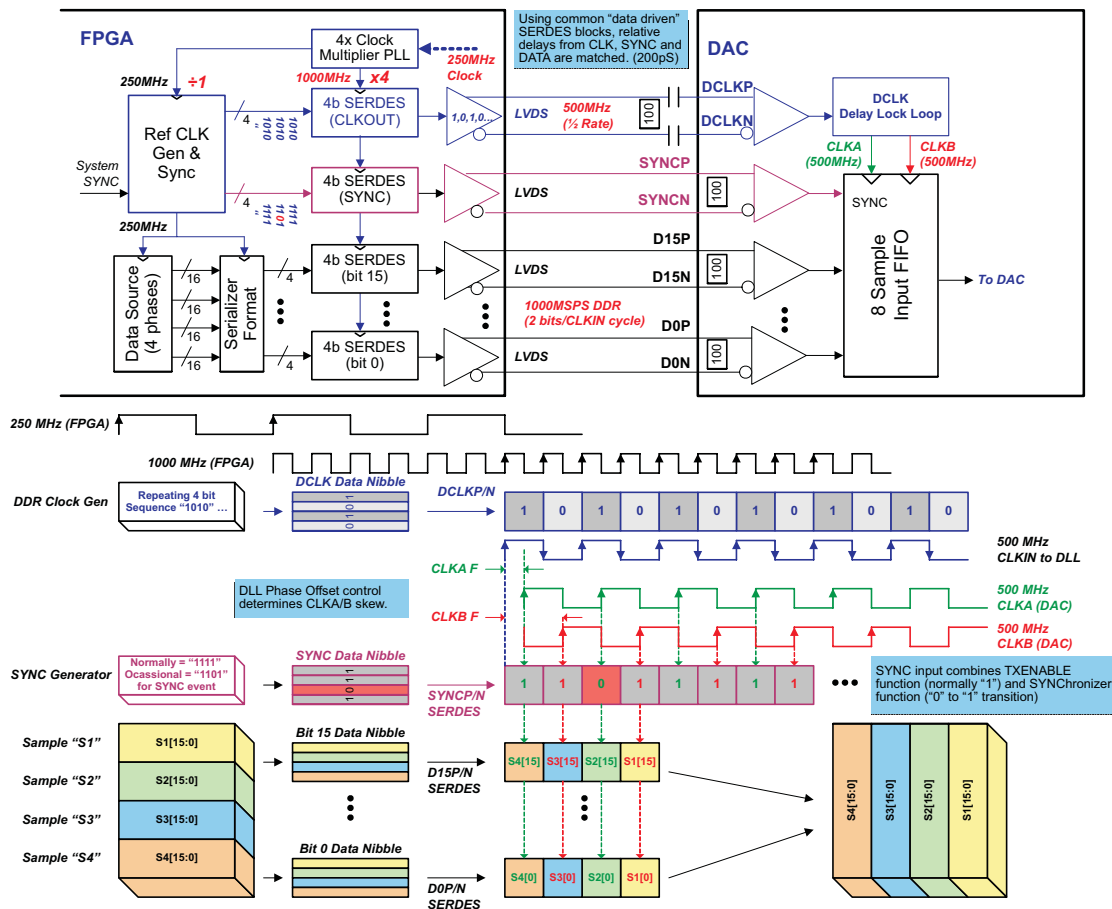

Figure 32. Example FPGA-Based LVDS Data Flow to DAC

### 8.3.5 LVDS Inputs

The D[15:0]P/N and SYNCP/N LVDS pairs have the input configuration shown in Figure 33. Figure 34 shows the typical input levels and common-mode voltage used to drive these inputs.

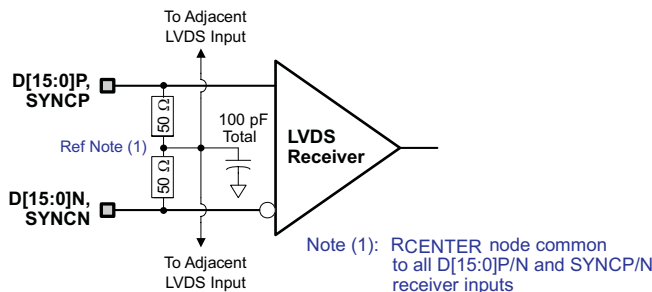

Figure 33. D[15:0]P/N and SYNCP/N LVDS Input Configuration

## DAC5682Z

SLLS853F – AUGUST 2007 – REVISED JANUARY 2015

www.ti.com

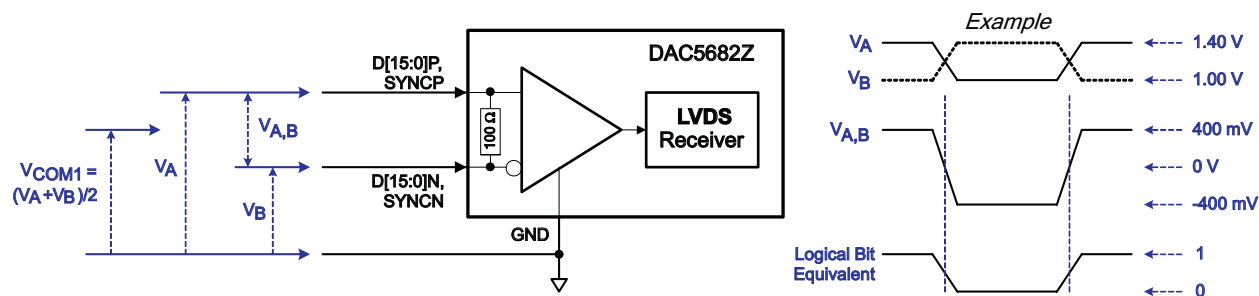

Figure 34. LVDS Data (DxP/N, D[15:0]P/N SYNCN/P Pairs) Input Levels

Table 4. Example LVDS Data Input Levels

APPLIED VOLTAGES		RESULTING DEFERENTIAL VOLTAGE	RESULTING COMMON-MODE VOLTAGE	LOGICAL BIT BINARY EQUIVALENT
$V_A$	$V_B$	$V_{A,B}$	$V_{COM1}$	
1.4 V	1.0 V	400 mV	1.2 V	1
1.0 V	1.4 V	-400 mV		0
1.2 V	0.8 V	400 mV	1.0 V	1
0.8 V	1.2 V	-400 mV		0

Figure 35 shows the DCLKP/N LVDS clock input levels. Unlike the D[15:0]P/N and SYNCN/P LVDS pairs, the DCLKP/N pair does not have an internal resistor and the common-mode voltage is self-biased to approximately DVDD/2 in order to optimize the operation of the DLL circuit. For proper external termination a 100-Ω resistor needs to be connected across the LVDS clock source lines followed by series 0.01-μF capacitors connected to each of the DCLKP and DCLKN pairs. For best performance, the resistor and capacitors should be placed as close as possible to these pins.

Figure 35. LVDS Clock (DCLKP/N) Input Levels

### 8.3.6 LVDS SYNCN/P Operation

The SYNCN/P LVDS input control functions as a combination of Transmit Enable (TXENABLE) and Synchronization trigger. If SYNCN is low, the transmit chain is disabled so input data from the FIFO is ignored while zero amplitude samples are inserted into the data path. If SYNCN is raised from low to high, a synchronization event occurs with behavior defined by individual control bits in registers CONFIG1 and CONFIG5. The SYNCN/P control is sampled and input into the FIFO along with the other LVDS data to maintain timing alignment with the data bus. Refer to Figure 32.

The software\_sync\_sel and software\_sync controls in CONFIG3 provide a substitute for external SYNCN/P control; however, because the serial interface is used, no timing control is provided with respect to the DAC clock.

### 8.3.7 DLL Operation

The DAC5682Z provides a digital delay lock loop (DLL) to skew the LVDS data clock (DCLK) relative to the data bits, D[15:0] and SYNC, in order to maintain proper setup and hold timing. Because the DLL operates closed-loop, it requires a stable DCLK to maintain delay lock. Refer to the description of DLL\_ifixed(2:0) and DLL\_delay(3:0) control bits in the CONFIG10 register. Prior to initializing the DLL, the DLL\_ifixed value should be programmed to match the expected DCLK frequency range. To initialize the DLL, refer to the DLL\_Restart programming bit in the CONFIG8 register. After initialization, the status of the DLL can be verified by reading the DLL\_Lock bit from STATUS0. See [Recommended Start-up Sequence](#) below.

### 8.3.8 CMOS Digital Inputs

Figure 36 shows a schematic of the equivalent CMOS digital inputs of the DAC5682Z. SDIO and SCLK have pulldown resistors while RESETB and SDENB have pullup resistors internal the DAC5682Z. See the specification table for logic thresholds. The pullup and pulldown circuitry is approximately equivalent to 100kΩ.

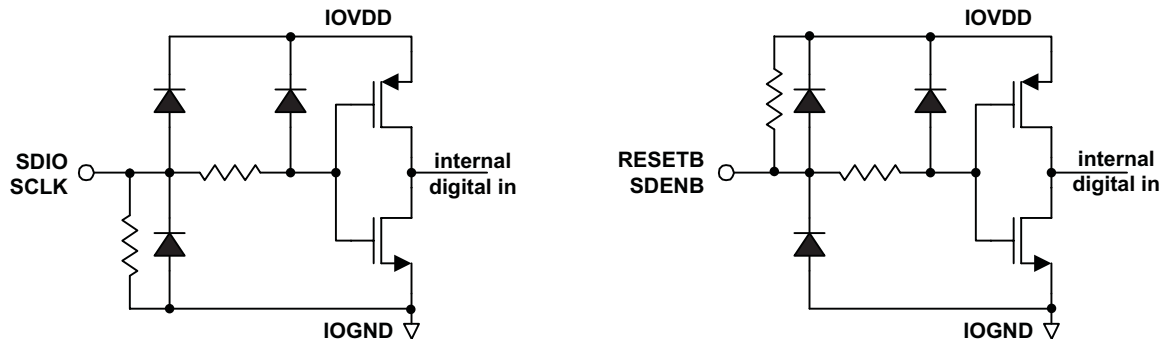

Figure 36. CMOS/TTL Digital Equivalent Input

### 8.3.9 Reference Operation

The DAC5682Z uses a bandgap reference and control amplifier for biasing the full-scale output current. The full-scale output current is set by applying an external resistor  $R_{BIAS}$  to pin BIASJ. The bias current  $I_{BIAS}$  through resistor  $R_{BIAS}$  is defined by the on-chip bandgap reference voltage and control amplifier. The default full-scale output current equals 16 times this bias current and can thus be expressed as:

$$I_{OUT_{FS}} = 16 \times I_{BIAS} = 16 \times V_{EXTIO} / R_{BIAS} \quad (1)$$

Each DAC has a 4-bit independent coarse gain control via DACA\_gain(3:0) and DACB\_gain(3:0) in the CONFIG7 register. Using gain control, the  $I_{OUT_{FS}}$  can be expressed as:

$$I_{OUTA_{FS}} = (DACA\_gain + 1) \times I_{BIAS} = (DACA\_gain + 1) \times V_{EXTIO} / R_{BIAS} \quad (2)$$

$$I_{OUTB_{FS}} = (DACB\_gain + 1) \times I_{BIAS} = (DACB\_gain + 1) \times V_{EXTIO} / R_{BIAS} \quad (3)$$

where  $V_{EXTIO}$  is the voltage at terminal EXTIO. The bandgap reference voltage delivers an accurate voltage of 1.2 V. This reference is active when terminal EXTLO is connected to AGND. An external decoupling capacitor  $C_{EXT}$  of 0.1  $\mu$ F should be connected externally to terminal EXTIO for compensation. The bandgap reference can additionally be used for external reference operation. In that case, an external buffer with high impedance input should be applied in order to limit the bandgap load current to a maximum of 100 nA. The internal reference can be disabled and overridden by an external reference by connecting EXTLO to AVDD. Capacitor  $C_{EXT}$  may hence be omitted. Terminal EXTIO thus serves as either input or output node.

The full-scale output current can be adjusted from 20 mA down to 2 mA by varying resistor  $R_{BIAS}$  or changing the externally applied reference voltage. The internal control amplifier has a wide input range, supporting the full-scale output current range of 20 dB.

### 8.3.10 DAC Transfer Function

The CMOS DAC's consist of a segmented array of NMOS current sinks, capable of sinking a full-scale output current up to 20 mA. Differential current switches direct the current to either one of the complementary output nodes IOUT1 or IOUT2. (DACA = IOUTA1 or IOUTA2 and DACB = IOUTB1 or IOUTB2.) Complementary output currents enable differential operation, thus canceling out common mode noise sources (digital feed-through, on-chip and PCB noise), dc offsets, even order distortion components, and increasing signal output power by a factor of two.

The full-scale output current is set using external resistor  $R_{BIAS}$  in combination with an on-chip bandgap voltage reference source (+1.2 V) and control amplifier. Current  $I_{BIAS}$  through resistor  $R_{BIAS}$  is mirrored internally to provide a maximum full-scale output current equal to 16 times  $I_{BIAS}$ .

The relation between IOUT1 and IOUT2 can be expressed as:

$$IOUT1 = -IOUT_{FS} - IOUT2 \quad (4)$$

We will denote current flowing into a node as – current and current flowing out of a node as + current. Because the output stage is a current sink the current can only flow from AVDD into the IOUT1 and IOUT2 pins. The output current flow in each pin driving a resistive load can be expressed as:

$$IOUT1 = IOUT_{FS} \times (65536 - CODE) / 65536 \quad (5)$$

$$IOUT2 = IOUT_{FS} \times CODE / 65536 \quad (6)$$

where CODE is the decimal representation of the DAC data input word.

For the case where IOUT1 and IOUT2 drive resistor loads  $R_L$  directly, this translates into single ended voltages at IOUT1 and IOUT2:

$$VOUT1 = AVDD - |IOUT1| \times R_L \quad (7)$$

$$VOUT2 = AVDD - |IOUT2| \times R_L \quad (8)$$

Assuming that the data is full scale (65536 in offset binary notation) and the  $R_L$  is 25  $\Omega$ , the differential voltage between pins IOUT1 and IOUT2 can be expressed as:

$$VOUT1 = AVDD - |-0 \text{ mA}| \times 25 \Omega = 3.3 \text{ V} \quad (9)$$

$$VOUT2 = AVDD - |-20 \text{ mA}| \times 25 \Omega = 2.8 \text{ V} \quad (10)$$

$$VDIFF = VOUT1 - VOUT2 = 0.5 \text{ V} \quad (11)$$

Do not exceed the compliance voltages at node IOUT1 and IOUT2, which would lead to increased signal distortion.

### 8.3.11 DAC Output SINC Response

Due to sampled nature of a high-speed DAC, the well known  $\sin(x)/x$  (or SINC) response can significantly attenuate higher frequency output signals. See the [Figure 37](#) which shows the unitized SINC attenuation roll-off with respect to the final DAC sample rate in 4 Nyquist zones. For example, if the final DAC sample rate  $F_S = 1.0$  GSPS, then a tone at 440MHz is attenuated by 3.0dB. Although the SINC response can create challenges in frequency planning, one side benefit is the natural attenuation of Nyquist images. The increased over-sampling ratio of the input data provided by the 2x and 4x digital interpolation modes of the DAC5682Z improve the SINC roll-off (droop) within the band of interest of the original signal.

**Figure 37. Unitized DAC  $\sin(x)/x$  (SINC) Response**

### 8.3.12 Analog Current Outputs

Figure 38 shows a simplified schematic of the current source array output with corresponding switches in a current sink configuration. Differential switches direct the current into either the positive output node, IOUT1, or its complement, IOUT2, then through the individual NMOS current sources. The output impedance is determined by the stack of the current sources and differential switches, and is typically  $>300\text{ k}\Omega$  in parallel with an output capacitance of 5 pF.

The external output resistors are referred to an external ground. The minimum output compliance at nodes IOUT1 and IOUT2 is limited to  $AVDD - 0.5\text{ V}$ , determined by the CMOS process. Beyond this value, transistor breakdown may occur resulting in reduced reliability of the DAC5682Z device. The maximum output compliance voltage at nodes IOUT1 and IOUT2 equals  $AVDD + 0.5\text{ V}$ . Exceeding the minimum output compliance voltage adversely affects distortion performance and integral non-linearity. The optimum distortion performance for a single-ended or differential output is achieved when the maximum full-scale signal at IOUT1 and IOUT2 does not exceed 0.5 V.

### 8.3.13 Designing the PLL Loop Filter

To minimize phase noise given for a given fDAC and M/N, the values of PLL\_gain and PLL\_range are selected so that  $G_{VCO}$  is minimized and within the MIN and MAX frequency for a given setting.

The external loop filter components C1, C2, and R1 are set by the  $G_{VCO}$ , M/N, the loop phase margin  $\phi_d$  and the loop bandwidth  $\omega_d$ . Except for applications where abrupt clock frequency changes require a fast PLL lock time, it is suggested that  $\phi_d$  be set to at least 80 degrees for stable locking and suppression of the phase noise side lobes. Phase margins of 60 degrees or less can be sensitive to board layout and decoupling details.

See [Figure 41](#), the recommend external loop filter topology. C1, C2, and R1 are calculated by the following equations:

$$C1 = \tau1 \left( 1 - \frac{\tau2}{\tau3} \right) \quad C2 = \frac{\tau1 \times \tau2}{\tau3} \quad R1 = \frac{\tau3^2}{\tau1(\tau3 - \tau2)} \quad (12)$$

where,

$$\tau_1 = \frac{K_d K_{VCO}}{\omega_d^2} (\tan \Phi_d + \sec \Phi_d) \quad \tau_2 = \frac{1}{\omega_d (\tan \Phi_d + \sec \Phi_d)} \quad \tau_3 = \frac{\tan \Phi_d + \sec \Phi_d}{\omega_d} \quad (13)$$

charge pump current:  $i_{qp} = 1 \text{ mA}$

vco gain:  $K_{VCO} = 2\pi \times G_{VCO} \text{ rad/V}$

PFD Frequency:  $\omega_d \leq 160 \text{ MHz}$

phase detector gain:  $K_d = i_{qp} \div (2 \times \pi \times M) \text{ A/rad}$

An Excel spreadsheet is available from Texas Instruments for automatically calculating the values for C1, R1 and C2 in the *DAC5682 LPF Calculator* ([SLAC169](#)).

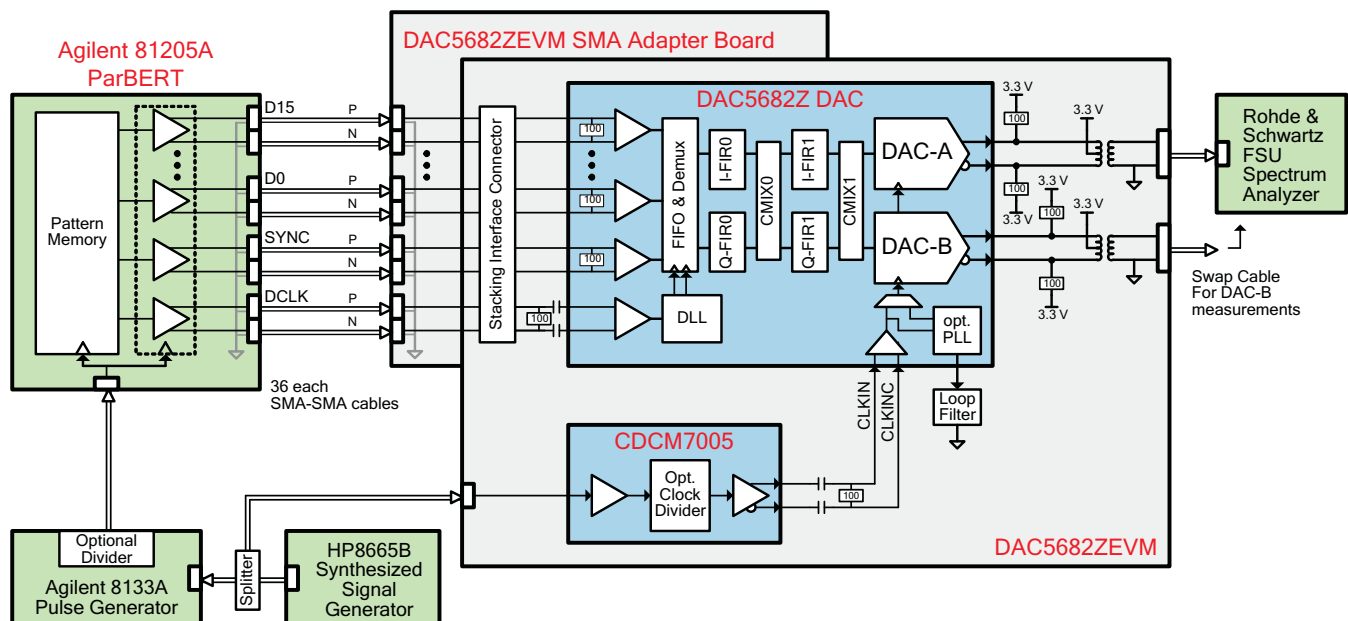

**Figure 41. Recommended External Loop Filter Topology**

### 8.3.14 Test Methodology

Typical AC specifications were characterized with the DAC5682ZEVM using the test configuration shown in [Figure 42](#). A sinusoidal master clock frequency is generated by an HP8665B signal generator and into a splitter. One output drives an Agilent 8133A pulse generator, and the other drives the CDCM7005 clock driver. The 8133A converts the sinusoidal frequency into a square wave output clock and drives an Agilent ParBERT 81250A pattern-generator clock. On the EVM, the DAC5682Z CLKIN/C input clock is driven by an CDCM7005 clock distribution chip that is configured to simply buffer the external 8665B clock or divide it down for PLL test configurations.

The DAC5682Z output is characterized with a Rohde and Schwarz FSU spectrum analyzer. For WCDMA signal characterization, it is important to use a spectrum analyzer with high IP3 and noise subtraction capability so that the spectrum analyzer does not limit the ACPR measurement. For all specifications, both DACA and DACB are measured and the lowest value used as the specification.

**Figure 42. DAC5682Z Test Configuration for Normal Clock Mode**

## 8.4 Device Functional Modes

### 8.4.1 Dual-Channel Real Upconversion

The DAC5682Z can be used in a dual channel mode with real upconversion by mixing with a 1, –1, ... sequence in the signal chain to invert the spectrum. This mixing mode maintains isolation of the A and B channels. The two points of mixing, CMIX0 and CMIX1, follow each FIR filter. The mixing modes for each CMIX block are controlled by CMIX0\_mode(1:0) and CMIX1(1:0) in register CONFIG2. The wide bandwidths of both FIR0 and FIR1 (40% passband) provide options for setting the frequency ranges listed in [Table 5](#). With the High Pass (2x2 HP mode), High Pass/Low Pass (2X4 HP/LP mode) and Low Pass/High Pass (2X4 LP/HP mode) settings, the upconverted signal is spectrally inverted.

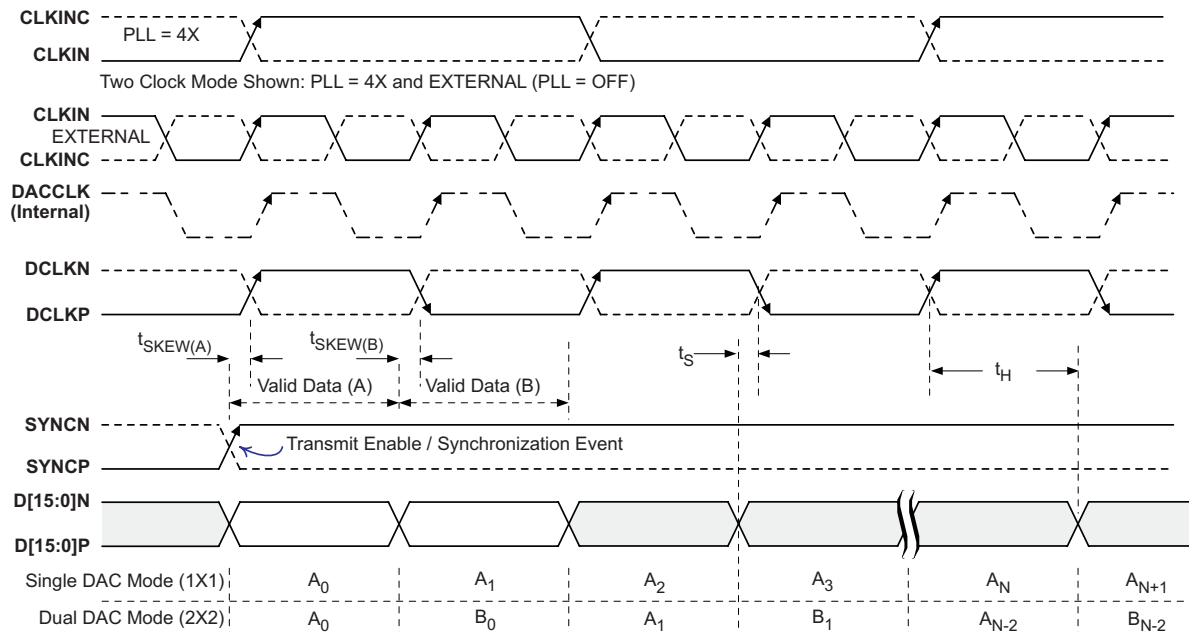

**Table 5. Dual-Channel Real Upconversion Options**

MODE NAME	INTERP. FACTOR	FIR0, CMIX0 MODE	FIR1, CMIX1 MODE	INPUT FREQUENCY <sup>(1)</sup>	OUTPUT FREQUENCY <sup>(1)</sup>	SIGNAL BANDWIDTH <sup>(1)</sup>	SPECTRUM INVERTED?
2X2	X2	--	LP	0.0 to $0.4 \times f_{\text{DATA}}$	0.0 to $0.4 \times f_{\text{DATA}}$	$0.4 \times f_{\text{DATA}}$	No
2X2 HP	X2	--	HP	0.0 to $0.4 \times f_{\text{DATA}}$	0.6 to $1.0 \times f_{\text{DATA}}$	$0.4 \times f_{\text{DATA}}$	Yes
1X4	X4	LP	LP	0.0 to $0.4 \times f_{\text{DATA}}$	0.0 to $0.4 \times f_{\text{DATA}}$	$0.4 \times f_{\text{DATA}}$	No
2X4	X4	LP	LP	0.0 to $0.4 \times f_{\text{DATA}}$	0.0 to $0.4 \times f_{\text{DATA}}$	$0.4 \times f_{\text{DATA}}$	No
2X4 HP/LP	X4	HP	LP	0.2 to $0.4 \times f_{\text{DATA}}$	0.6 to $0.8 \times f_{\text{DATA}}$	$0.2 \times f_{\text{DATA}}$	Yes
2X4 HP/HP	X4	HP	HP	0.2 to $0.4 \times f_{\text{DATA}}$	1.2 to $1.4 \times f_{\text{DATA}}$	$0.2 \times f_{\text{DATA}}$	No
2X4 LP/HP	X4	LP	HP	0.0 to $0.4 \times f_{\text{DATA}}$	1.6 to $2.0 \times f_{\text{DATA}}$	$0.4 \times f_{\text{DATA}}$	Yes

(1)  $f_{\text{DATA}}$  is the input data rate of each channel after de-interleaving.

### 8.4.2 Clock and Data Modes

There are two modes of operation to drive the internal clocks on the DAC5682Z. Timing diagrams for both modes are shown in [Figure 43](#). EXTERNAL CLOCK MODE accepts an external full-rate clock input on the CLKIN/CLKINC pins to drive the DACs and final logic stages while distributing an internally divided down clock for lower speed logic such as the interpolating FIRs. PLL CLOCK MODE uses an internal clock multiplying PLL to derive the full-rate clock from an external lower rate reference frequency on the CLKIN/CLKINC pins. In both modes, an LVDS half-rate data clock (DCLKP/DCLKN) is provided by the user and is typically generated by a *toggling data bit* to maintain LVDS data to DCLK timing alignment. LVDS data relative to DCLK is input using Double Data Rate (DDR) switching using both rising and falling edges as shown in the both figures below. The CONFIG10 register contains user controlled settings for the DLL to adjust for the DCLK input frequency and various  $t_{\text{SKEW}}$  timing offsets between the LVDS data and DCLK. The CDCM7005 and CDCE62005 from Texas Instruments are recommended for providing phase aligned clocks at different frequencies for device-to-device clock distribution and multiple DAC synchronization.

**Figure 43. Clock and Data Timing Diagram**

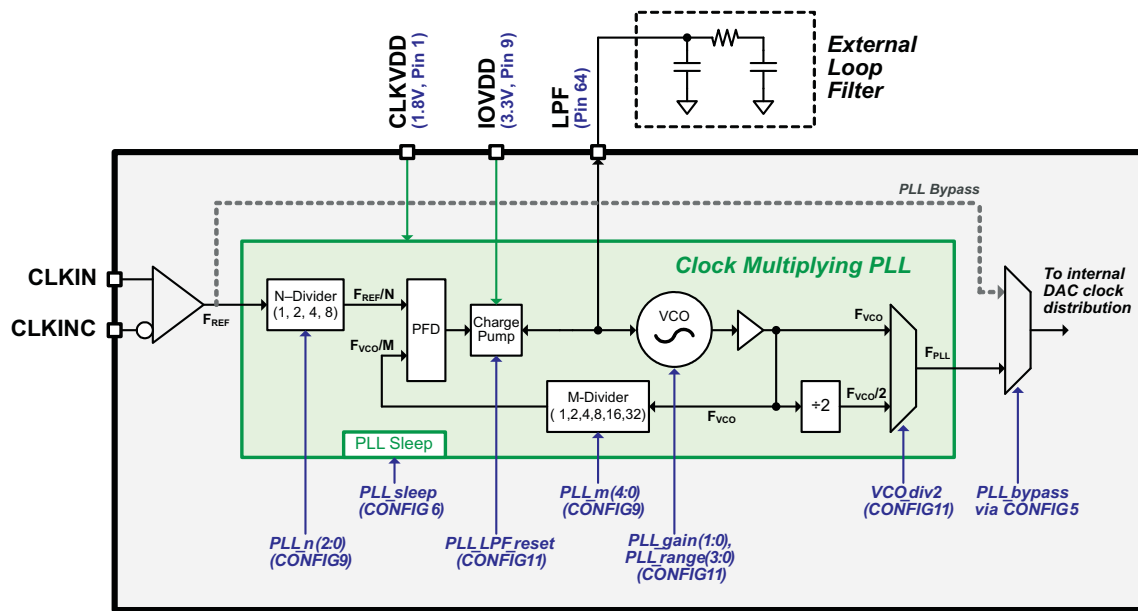

### 8.4.3 PLL Clock Mode

In PLL Clock Mode, the user provides an external reference clock to the CLKIN/C input pins. Refer to [Figure 44](#). An internal clock multiplying PLL uses the lower-rate reference clock to generate a high-rate clock for the DAC. This function is very useful when a high-rate clock is not already available at the system level; however, the internal VCO phase noise in PLL Clock Mode may degrade the quality of the DAC output signal when compared to an external low jitter clock source.

The internal PLL has a type four phase-frequency detector (PFD) comparing the CLKIN/C reference clock with a feedback clock to drive a charge pump controlling the VCO operating voltage and maintaining synchronization between the two clocks. An external low-pass filter is required to control the loop response of the PLL. See [Designing the PLL Loop Filter](#) for the filter setting calculations. This is the only mode where the LPF filter applies.

The input reference clock N-Divider is selected by CONFIG9 **PLL\_n(2:0)** for values of  $\div 1$ ,  $\div 2$ ,  $\div 4$  or  $\div 8$ . The VCO feedback clock M-Divider is selected by CONFIG9 **PLL\_m(4:0)** for values of  $\div 1$ ,  $\div 2$ ,  $\div 4$ ,  $\div 8$ ,  $\div 16$  or  $\div 32$ . The combination of M-Divider and N-Divider form the clock multiplying ratio of M/N. If the reference clock frequency is greater than 160 MHz, use a N-Divider of  $\div 2$ ,  $\div 4$  or  $\div 8$  to avoid exceeding the maximum PFD operating frequency.

For DAC sample rates less than 500MHz, the phase noise of DAC clock signal can be improved by programming the PLL for twice the desired DAC clock frequency, and setting the CONFIG11 **VCO\_div2** bit. If not using the PLL, set CONFIG5 **PLL\_bypass** and CONFIG6 **PLL\_sleep** to reduce power consumption. In some cases, it may be useful to reset the VCO control voltage by toggling CONFIG11 **PLL\_LPF\_reset**.

### Figure 44. Functional Block Diagram for PLL

#### 8.4.4 Recommended Multi-DAC Synchronization Procedure

The DAC5682Z provides a mechanism to synchronize multiple DAC devices in a system. The procedure has two steps involving control of the CONFIG5 **clkdiv\_sync\_dis** as well as external control of the LVDS SYNC/P/N input. (All DACs involved need to be configured to accept the external SYNC/P/N input and not "software" sync mode).

1. Synchronize Clock Dividers (for each DAC):
  - (a) Set CONFIG5 **clkdiv\_sync\_dis** = 0.
  - (b) Toggle SYNCP/N input to all DACs simultaneously (same input to all DACs).
2. Synchronize FIFO pointers (for each DAC):
  - (a) Set CONFIG5 **clkdiv\_sync\_dis** = 1 (Disable clock divider re-sync).
  - (b) Wait a minimum of 50 CLKIN cycles from previous SYNCP/N toggle. In practice, the time required to write the above register value will typically occupy more than 50 cycles.
  - (c) Assert SYNCP/N input and hold at 1 to all DACs simultaneously. Holding this at 1 is effectively the TXENABLE for the chip so data will be output on the analog pins.
3. After the normal pipeline delay of the device, the outputs of all DACs will be synchronized to within  $\pm 1$  DAC clock cycle.

#### 8.4.5 Digital Self Test Mode

The DAC5682Z has a Digital Self Test (SLFTST) mode to designed to enable board level testing without requiring specific input data test patterns. The SLFTST mode is enabled via the CONFIG1 **SLFTST\_ena** bit and results are only valid when CONFIG3 **SLFTST\_err\_mask** bit is cleared. An internal Linear Feedback Shift Register (LFSR) is used to generate the input test patterns for the full test cycle while a checksum result is computed on the digital signal chain outputs. The LVDS input data bus is ignored in SLFTST mode. After the test cycle completes, if the checksum result does not match a hardwired comparison value, the STATUS4 **SLFTST\_err** bit is set and will remain set until cleared by writing a '0' to the **SLFTST\_err** bit. A full self test cycle requires no more than 400,000 CLKIN/C clock cycles to complete and will automatically repeat until the **SLFTEST\_ena** bit is cleared.

To initiate a the Digital Self Test:

1. Provide a normal CLKIN/C input clock. (The PLL is not used in SLFTST mode)
2. Provide a RESETB pulse to perform a hardware reset on device.
3. Program the registers with the values shown in [Table 6](#). These register values contain the settings to properly configure the SLFTST including **SLFTST\_ena** and **SLFTST\_err\_mask** bits
4. Provide a '1' on the SYNCP/N input to initiate TXENABLE.
5. Wait at a minimum of 400,000 CLKIN/C cycles for the SLFTST to complete. Example: If CLKIN = 1GHz, then the wait period is  $400,000 \times 1 / 1\text{GHz} = 400 \mu\text{Sec}$ .
6. Read STATUS4 **SLFTST\_err** bit. If set, a self test error has occurred. The **SLFTST\_err** status may optionally be programmed to output on the SDO pin if using the 3-bit SIF interface. See [Table 6](#) Note (1).
7. (Optional) The SLFTST function automatically repeats until **SLFTST\_ena** bit is cleared. To the loop the test, write a '0' to STATUS4 **SLFTST\_err** to clear previous errors and continue at step 5 above.
8. To continue normal operating mode, provide another RESETB pulse and reprogram registers to the desired normal settings.

**Table 6. Digital Self Test (SLFTST) Register Values**

REGISTER	ADDRESS (hex)	VALUE (Binary)	VALUE (Hex)
CONFIG1	01	00011000	18
CONFIG2	02	11101010	EA
CONFIG3	03	10110000	B0
STATUS4	04	00000000	00
CONFIG5	05	00000110	06
CONFIG6	06	00001111	0F
CONFIG12	0C	00001010	0A
CONFIG13	0D	01010101	55
CONFIG14 <sup>(1)</sup>	0E	00001010	0A
CONFIG15	0F	10101010	AA
All others	–	Default	Default

- (1) If using a 3-bit SIF interface, the SDO pin can be programmed to report **SLFTST\_err** status via the **SDO\_fun\_sel(2:0)** bits. In this case, set CONFIG14 = '10101010' or AA hex.

## 8.5 Programming

### 8.5.1 Serial Interface

The serial port of the DAC5682Z is a flexible serial interface which communicates with industry standard microprocessors and microcontrollers. The interface provides read/write access to all registers used to define the operating modes of DAC5682Z. It is compatible with most synchronous transfer formats and can be configured as a 3 or 4 pin interface by **SIF4** in register **CONFIG5**. In both configurations, **SCLK** is the serial interface input clock and **SDENB** is serial interface enable. For 3 pin configuration, **SDIO** is a bidirectional pin for both data in and data out. For 4 pin configuration, **SDIO** is data in only and **SDO** is data out only. Data is input into the device with the rising edge of **SCLK**. Data is output from the device on the falling edge of **SCLK**.

Each read/write operation is framed by signal **SDENB** (Serial Data Enable Bar) asserted low for 2 to 5 bytes, depending on the data length to be transferred (1–4 bytes). The first frame byte is the instruction cycle which identifies the following data transfer cycle as read or write, how many bytes to transfer, and what address to transfer the data. indicates the function of each bit in the instruction cycle and is followed by a detailed description of each bit. Frame bytes 2 to 5 comprise the data transfer cycle.

	MSB							LSB
Bit	7	6	5	4	3	2	1	0
Description	R/W	N1	N0	A4	A3	A2	A1	A0

- R/W** Identifies the following data transfer cycle as a read or write operation. A high indicates a read operation from DAC5682Z and a low indicates a write operation to DAC5682Z.
- [N1 : N0]** Identifies the number of data bytes to be transferred per Table 5 below. Data is transferred MSB first.

**Table 7. Number of Transferred Bytes Within One Communication Frame**

N1	N0	Description
0	0	Transfer 1 Byte
0	1	Transfer 2 Bytes
1	0	Transfer 3 Bytes
1	1	Transfer 4 Bytes

- [A4 : A0]** Identifies the address of the register to be accessed during the read or write operation. For multi-byte transfers, this address is the starting address. Note that the address is written to the DAC5682Z MSB first and counts down for each byte.

Figure 45 shows the serial interface timing diagram for a DAC5682Z write operation. **SCLK** is the serial interface clock input to DAC5682Z. Serial data enable **SDENB** is an active low input to DAC5682Z. **SDIO** is serial data in. Input data to DAC5682Z is clocked on the rising edges of **SCLK**.

**Figure 45. Serial Interface Write Timing Diagram**

Figure 46 shows the serial interface timing diagram for a DAC5682Z read operation. **SCLK** is the serial interface clock input to DAC5682Z. Serial data enable **SDENB** is an active low input to DAC5682Z. **SDIO** is serial data in during the instruction cycle. In 3 pin configuration, **SDIO** is data out from DAC5682Z during the data transfer cycle(s), while **SDO** is in a high-impedance state. In 4 pin configuration, **SDO** is data out from DAC5682Z during the data transfer cycle(s). At the end of the data transfer, **SDO** will output low on the final falling edge of **SCLK** until the rising edge of **SDENB** when it will 3-state.

DAC_delay(1:0)		Unused	FIR_ena	SLFTST_ena		FIFO_offset(2:0)	
0	0	0	1	0	0	0	0

**DAC\_delay(1:0):** DAC data delay adjustment. (0–3 periods of the DAC clock) This can be used to adjust system level output timing. The same delay is applied to both DACA and DACB data paths.

**FIR\_ena:** When set, the interpolation filters are enabled.

**SLFTST\_ena:** When set, a Digital Self Test (SLFTST) of the core logic is enabled. Refer to [Digital Self Test Mode](#) for details on SLFTST operation.

**FIFO\_offset(2:0):** Programs the output pointer location of the FIFO, allowing the input pointer to be shifted –4 to +3 positions upon SYNC. Default offset is 0 and is updated upon each sync event.

FIFO_offset(2:0)	Offset
011	+3
010	+2
001	+1
000	0
111	–1
110	–2
101	–3
100	–4

### 8.6.3 Register Name: CONFIG2 – Address: 0x02, Default = 0xC0

7	6	5	4	3	2	1	0
Twos_comp	dual_DAC	FIR2x4x	Unused	CMIX1_mode(1:0)		CMIX0_mode(1:0)	
1	1	0	0	0	0	0	0

**Twos\_comp:** When set (default) the input data format is expected to be 2's complement, otherwise offset binary format is expected.

**dual\_DAC:** Selects between dual DAC mode (default) and single DAC mode. This bit is also used to select input interleaved data.

**FIR2x4x:** When set, 4X interpolation of the input data is performed, otherwise 2X interpolation.

**CMIX1\_mode(1:0):** Determines the mode of FIR1 and final CMIX1 blocks. Settings apply to both A and B channels. Refer to [Table 3](#) for a detailed description of CMIX1 modes.

Mode	CMIX1_mode(1)	CMIX1_mode(0)
Normal (Low Pass)	0	0
High Pass	0	1
+F <sub>DAC</sub> /4	1	0
–F <sub>DAC</sub> /4	1	1

**CMIX0\_mode(1:0):** Determines the mode of FIR0 and CMIX0 blocks. Because CMIX0 is located between FIR0 and FIR1, its output is half-rate. Refer to [Table 2](#) for a detailed description of CMIX0 modes. The table below shows the effective Fs/4 or ±Fs/8 mixing with respect to the final DAC sample rate. Settings apply to both A and B channels.

Mode	CMIX1_mode(1)	CMIX1_mode(0)
Normal (Low Pass)	0	0
High Pass	0	1
+F <sub>DAC</sub> /8	1	0
–F <sub>DAC</sub> /8	1	1

**DAC5682Z**

SLLS853F – AUGUST 2007 – REVISED JANUARY 2015

[www.ti.com](http://www.ti.com)
**8.6.4 Register Name: CONFIG3 – Address: 0x03, Default = 0x70**

7	6	5	4	3	2	1	0
DAC_offset_ena	SLFTST_err_mask	FIFO_err_mask	Pattern_err_mask	SwapAB_out	B_equals_A	SW_sync	SW_sync_sel
0	1	1	1	0	0	0	0

- DAC\_offset\_ena:** When set, the values of **OffsetA(12:0)** and **OffsetB(12:0)** in CONFIG12 through CONFIG15 registers are summed into the DAC-A and DAC-B data paths. This provides a system-level offset adjustment capability that is independent of the input data.
- SLFTST\_err\_mask:** When set, masks out the **SLFTST\_err** bit in STATUS4 register. Refer to [Digital Self Test Mode](#) for details on SLFTST operation.
- FIFO\_err\_mask:** When set, masks out the **FIFO\_err** bit in STATUS4 register.
- Pattern\_err\_mask:** When set, masks out the **Pattern err** bit in STATUS4 register.
- SwapAB\_out:** When set, the A/B data paths are swapped prior to routing to the DAC-A and DAC-B outputs.
- B\_equals\_A:** When set, the data routed to DAC-A is also routed to DAC-B. This allows wire OR'ing of the two DAC outputs together at the board level to create a 2X drive strength single DAC output.
- SW\_sync:** This bit can be used as a substitute for the LVDS external SYNC input pins for both synchronization and transmit enable control.
- SW\_sync\_sel:** When set, the SW\_sync bit is used as the only synchronization input and the LVDS external SYNC input pins are ignored.

**8.6.5 Register Name: STATUS4 – Address: 0x04, Default = 0x00**

7	6	5	4	3	2	1	0
Unused	SLFTST_err	FIFO_err	Pattern_err	Unused	Unused	Unused	Unused
0	0	0	0	0	0	0	0

- SLFTST\_err:** Asserted when the Digital Self Test (SLFTST) fails. To clear the error, write a '0' to this register bit. This bit is also output on the SDO pin when the Self Test is enabled via **SLFTST\_ena** control bit in CONFIG1. Refer to [Digital Self Test Mode](#) for details on SLFTST operation.
- FIFO\_err:** Asserted when the FIFO pointers over run each other causing a sample to be missed. To clear the error, write a '0' to this register bit.
- Pattern\_err:** A digital checkerboard pattern compare function is provided for board level confidence testing and DLL limit checks. If the **Pattern\_err\_mask** bit via CONFIG3 is cleared, logic is enabled to continuously monitor input FIFO data. Any received data pattern other than 0xAAAA or 0x5555 causes this bit to be set. To clear the error, flush out the previous pattern error by inputting at least 8 samples of the 0xAAAA and/or 0x5555, then write a '0' to this register bit.

### 8.6.6 Register Name: CONFIG5 – Address: 0x05, Default = 0x00

7	6	5	4	3	2	1	0
SIF4	rev_bus	clkdiv_sync_dis	Reserved	Reserved	DLL_bypass	PLL_bypass	Reserved
0	0	0	0	0	0	0	0

- SIF4:** When set, the serial interface is in 4 pin mode, otherwise it is in 3 pin mode. Refer to **SDO\_func\_sel (2:0)** bits in CONFIG14 register for options available to output status indicator data on the SDO pin.
- rev\_bus:** Reverses the LVDS input data bus so that the MSB to LSB order is swapped. This function is provided to ease board level layout and avoid wire crossovers in case the LVDS data source output bus is mirrored with respect to the input data bus of the DAC.
- clkdiv\_sync\_dis:** Disables the clock divider sync when this bit is set.
- Reserved (Bit 4):** Set to 0 for proper operation.
- Reserved (Bit 3):** Set to 0 for proper operation.
- DLL\_bypass:** When set, the DLL is bypassed and the LVDS data source is responsible for providing correct setup and hold timing.
- PLL\_bypass:** When set, the PLL is bypassed.
- Reserved (Bit 0):** Set to 0 for proper operation.

### 8.6.7 Register Name: CONFIG6 – Address: 0x06, Default = 0x0C

7	6	5	4	3	2	1	0
Reserved	Unused	Sleep_B	Sleep_A	BiasLPF_A	BiasLPF_B	PLL_sleep	DLL_sleep
0	0	0	0	1	1	0	0

- Reserved (Bit 7):** Set to 0 for proper operation.
- Sleep\_B:** When set, DACB is put into sleep mode. DACB is not automatically set into sleep mode when configured for single DAC mode through **dual\_DAC** bit in CONFIG2. Set this **Sleep\_B** bit for the lowest power configuration in single DAC mode because output is on DACA only.
- Sleep\_A:** When set, DACA is put into sleep mode.
- BiasLPF\_A:** Enables a 95 kHz low pass filter corner on the DACA current source bias when cleared. If this bit is set, a 472 kHz filter corner is used.
- BiasLPF\_B:** Enables a 95 kHz low pass filter corner on the DACB current source bias when cleared. If this bit is set, a 472 kHz filter corner is used.
- PLL\_sleep:** When set, the PLL is put into sleep mode.
- DLL\_sleep:** When set, the DLL is put into sleep mode.

**DAC5682Z**

SLLS853F – AUGUST 2007 – REVISED JANUARY 2015

[www.ti.com](http://www.ti.com)
**8.6.8 Register Name: CONFIG7 – Address: 0x07, Default = 0xFF**

7	6	5	4	3	2	1	0
DACA_gain(3:0)				DACB_gain(3:0)			
1	1	1	1	1	1	1	1

**DACA\_gain(3:0):** Scales DACA output current in 16 equal steps.

$$\frac{V_{EXTIO}}{R_{bias}} \times (DACA\_gain + 1)$$

**DACB\_gain(3:0):** Same as above except for DACB.

**8.6.9 Register Name: CONFIG8 – Address: 0x08, Default = 0x00**

7	6	5	4	3	2	1	0
Reserved				DLL_restart	Reserved		
0	0	0	0	0	0	0	0

**Reserved (7:3):** Set to '00000' for proper operation.

**DLL\_restart:** This bit is used to restart the DLL. When this bit is set, the internal DLL loop filter is reset to zero volts, and the DLL delay line is held at the center of its bias range. When cleared, the DLL will acquire lock to the DCLK signal. A DLL restart is accomplished by setting this bit with a serial interface write, and then clearing this bit with another serial interface write. Any interruption in the DCLK signal or changes to the DLL programming in the CONFIG10 register must be followed by this DLL restart sequence. Also, when this bit is set, the **DLL\_lock** indicator in the STATUS0 register is cleared.

**Reserved (1:0):** Set to '00' for proper operation

**8.6.10 Register Name: CONFIG9 – Address: 0x09, Default = 0x00**

7	6	5	4	3	2	1	0
PLL_m(4:0)					PLL_n(2:0)		
0	0	0	0	0	0	0	0

**PLL\_m:** M portion of the M/N divider of the PLL thermometer encoded:

PLL_m(4:0)	M value
00000	1
00001	2
00011	4
00111	8
01111	16
11111	32
All other values	Invalid

**PLL\_n:** N portion of the M/N divider of the PLL thermometer encoded. If supplying a high rate CLKIN frequency, the PLL\_n value should be used to divide down the input CLKIN to maintain a maximum PFD operating of 160 MHz.

PLL_n(2:0)	N value
000	1
001	2
011	4
111	8
All other values	Invalid

**PLL Function:**

$$f_{vco} = \left[ \frac{(M)}{(N)} \right] \times f_{ref}$$

where  $f_{ref}$  is the frequency of the external DAC clock input on the CLKIN/CLKINC pins.

**DAC5682Z**

SLLS853F – AUGUST 2007 – REVISED JANUARY 2015

[www.ti.com](http://www.ti.com)
**8.6.11 Register Name: CONFIG10 – Address: 0x0A, Default = 0x00**

7	6	5	4	3	2	1	0
DLL_delay(3:0)				DLL_invclk	DLL_ifixed(2:0)		
0	0	0	0	0	0	0	0

**DLL\_delay(3:0):** The DCLKP/N LVDS input data clock has a DLL to automatically skew the clock to LVDS data timing relationship, providing proper setup and hold times. **DLL\_delay(3:0)** is used to manually adjust the DLL delay  $\pm$  from the fixed delay set by **DLL\_ifixed(2:0)**. Adjustment amounts are approximate.

DLL_delay(3:0)	Delay Adjust (degrees)
1000	50°
1001	55°
1010	60°
1011	65°
1100	70°
1101	75°
1110	80°
1111	85°
0000	90° (Default)
0001	95°
0010	100°
0011	105°
0100	110°
0101	115°
0110	120°
0111	125°

**DLL\_invclk:** When set, used to invert an internal DLL clock to force convergence to a different solution. This can be used in the case where the DLL delay adjustment has exceeded the limits of its range.

**DLL\_ifixed(2:0):** Adjusts the DLL delay line bias current. Refer to the Electrical Characteristics table. Used in conjunction with the DLL\_invclk bit to select appropriate delay range for a given DCLK frequency:

'011' – maximum bias current and minimum delay range

'000' – mid scale bias current

'101' – minimum bias current and maximum delay range

'100' – do not use.

**8.6.12 Register Name: CONFIG11 – Address: 0x0B, Default = 0x00**

7	6	5	4	3	2	1	0
PLL_LPF_reset	VCO_div2	PLL_gain(1:0)		PLL_range(3:0)			
0	0	0	0	0	0	0	0

- PLL\_LPF\_reset:** When a logic high, the PLL loop filter (LPF) is pulled down to 0V. Toggle from '1' to '0' to restart the PLL if an over-speed lock-up occurs. Over-speed can happen when the process is fast, the supplies are higher than nominal, etc., resulting in the feedback dividers missing a clock.
- VCO\_div2:** When set, the PLL CLOCK output is 1/2 the PLL VCO frequency. Used to run the VCO at 2X the needed clock frequency to reduce phase noise for lower input clock rates.
- PLL\_gain(1:0):** Used to adjust the PLL Voltage Controlled Oscillator (VCO) gain,  $K_{VCO}$ . Refer to the Electrical Characteristics table. By increasing the **PLL\_gain**, the VCO can cover a broader range of frequencies; however, the higher gain also increases the phase noise of the PLL. In general, lower **PLL\_gain** settings result in lower phase noise. The  $K_{VCO}$  of the VCO can also affect the PLL stability and is used to determine the loop filter components. See section on determining the PLL filter components for more detail.
- PLL\_range(3:0):** Programs the PLL VCO fixed bias current. Refer to the Electrical Characteristics table. This setting, in conjunction with the PLL\_gain(1:0), sets the achievable frequency range of the PLL VCO:  
'000' – minimum bias current and lowest VCO frequency range  
'111' – maximum bias current and highest VCO frequency range

**8.6.13 Register Name: CONFIG12 – Address: 0x0C, Default = 0x00**

7	6	5	4	3	2	1	0
Reserved(1:0)		Offset_sync	OffsetA(12:8)				
0	0	0	0	0	0	0	0

- Reserved(1:0):** Set to '00' for proper operation.
- Offset\_sync:** On a change from '0' to '1' the values of the OffsetA(12:0) and OffsetB(12:0) control registers are transferred to the registers used in the DAC-A and DAC-B offset calculations. This double buffering allows complete control by the user as to when the change in the offset value occurs. This bit does not auto-clear. Prior to updating new offset values, it is recommended that the user clear this bit.
- OffsetA(12:8):** Upper 5 bits of the offset adjustment value for the A data path. (**SYNCED via Offset\_sync**)

**8.6.14 Register Name: CONFIG13 – Address: 0x0D, Default = 0x00**

7	6	5	4	3	2	1	0
OffsetA(7:0)							
0	0	0	0	0	0	0	0

- OffsetA(7:0):** Lower 8 bits of the offset adjustment value for the A data path. (**SYNCED via Offset\_sync**)

**DAC5682Z**

SLLS853F – AUGUST 2007 – REVISED JANUARY 2015

[www.ti.com](http://www.ti.com)
**8.6.15 Register Name: CONFIG14 – Address: 0x0E, Default = 0x00**

7	6	5	4	3	2	1	0
SDO_func_sel(2:0)			OffsetB(12:8)				
0	0	0	0	0	0	0	0

**SDO\_func\_sel(2:0):** Selects the signal for output on the SDO pin. When using the 3 pin serial interface mode, this allows the user to multiplex several status indicators onto the SDO pin. In 4 pin serial interface mode, programming this register to view one of the 5 available status indicators will override normal SDO serial interface operation.

SDO_func_sel (2:0)	Output to SDO
000, 110, 111	Normal SDO function
001	PLL_lock
010	DLL_lock
011	Pattern_err
100	FIFO_err
101	SLFTST_err

**OffsetB(12:8):** Upper 5 bits of the offset adjustment value for the B data path. (**SYNCED via Offset\_sync**)

**8.6.16 Register Name: CONFIG15 – Address: 0x0F, Default = 0x00**

7	6	5	4	3	2	1	0
OffsetB(7:0)							
0	0	0	0	0	0	0	0

**OffsetB(7:0):** Lower 8 bits of the offset adjustment value for the B data path. (**SYNCED via Offset\_sync**)

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The DAC5682z is a high-speed, wide bandwidth Digital-to-Analog converter. The dual DAC outputs can sample at 1Gsps allowing synthesis of complex IQ signals from -400 to 400 MHz with a complex bandwidth of up to 400 MHz. When the DAC is operated in single channel bypass mode, the maximum data rate is 1Gsps and can sustain a signal bandwidth of 500 MHz. The interpolation modes of the DAC allow the input baseband rates to be 2-4 times slower than the DAC output rate reducing the processing requirements of the digital baseband processor and simplifies the DAC image filtering requirements. The coarse mixing blocks within the DAC allow power efficient placement of the final carrier at the DAC output. Typically this dual DAC with its digital features is very well equipped for complex quadrature communications applications, however it is also suitable for use in applications that require arbitrary waveform generation.

### 9.2 Typical Application

A typical application for the DAC5682z is a wideband transmitter. The DAC is provided with some input digital baseband signal and it outputs an analog carrier. A typical configuration is described below.

- Dual DAC mode
- Datarate = 491.52 Msps (DCLK LVPECL or LVDS)
- 2x Interpolation
- External clock mode = 983.04 MHz (CLKIN LVPECL or LVDS)
- Input data = 4C WCDMA with IF frequency at 184.32 MHz
- AVDD/IOVDD = 3.3 V
- DVDD/CLKVDD=1.8 V
- SYNC P/N = LVDS "1"
- IOUTAP/N and IOUTBP/N to transformers

## Typical Application (continued)

- (1) Power supply decoupling capacitors not shown.
- (2) Internal Reference configuration shown.

**Figure 47. Typical Application Schematic**

### 9.2.1 Design Requirements

The requirements for this design were to generate a 4-carrier WCDMA signal at an intermediate frequency of 184.32 MHz. The ACPR needs to be better than 65 dBc.

### 9.2.2 Detailed Design Procedure

The 4-carrier signal with an intermediate frequency of 184.32 MHz must be created in the digital processor at a sample rate of 491.52 Msps for channels A and B. These 16 bit samples must be interleaved into ABAB... format and placed on the 16b LVDS input port of the DAC.

A differential DAC clock must be generated from a clock source at 983.04 MHz and a data clock at 491.52 MHz. This must be provided to the CLKIN and DCLK pins of the DAC respectively.

The DAC register map must be reset, then programmed for 2x interpolation and external clock mode as per the data sheet. The digital sample format (2s complement or offset binary) must match the incoming data from the processor. The SYNC signal must be held high for the DAC to have an analog output.

The IOUTA and IOUTB differential connections must be connected to a transformer to provide a single ended output. A typical 2:1 impedance transformer is used on the device EVM. The DAC5682zEVM provides a good reference for this design example.

### 9.2.3 Application Curves

This spectrum analyzer plot shows the ACPR for the transformer output using x2 interpolation, PLL Off mode. The results meet the system requirements for a minimum of 65 dBc ACPR.

## Typical Application (continued)

Figure 48. Four Carrier W-CDMA Test Model 1

## 9.3 System Examples

### 9.3.1 Digital Interface and Clocking Considerations for Application Examples

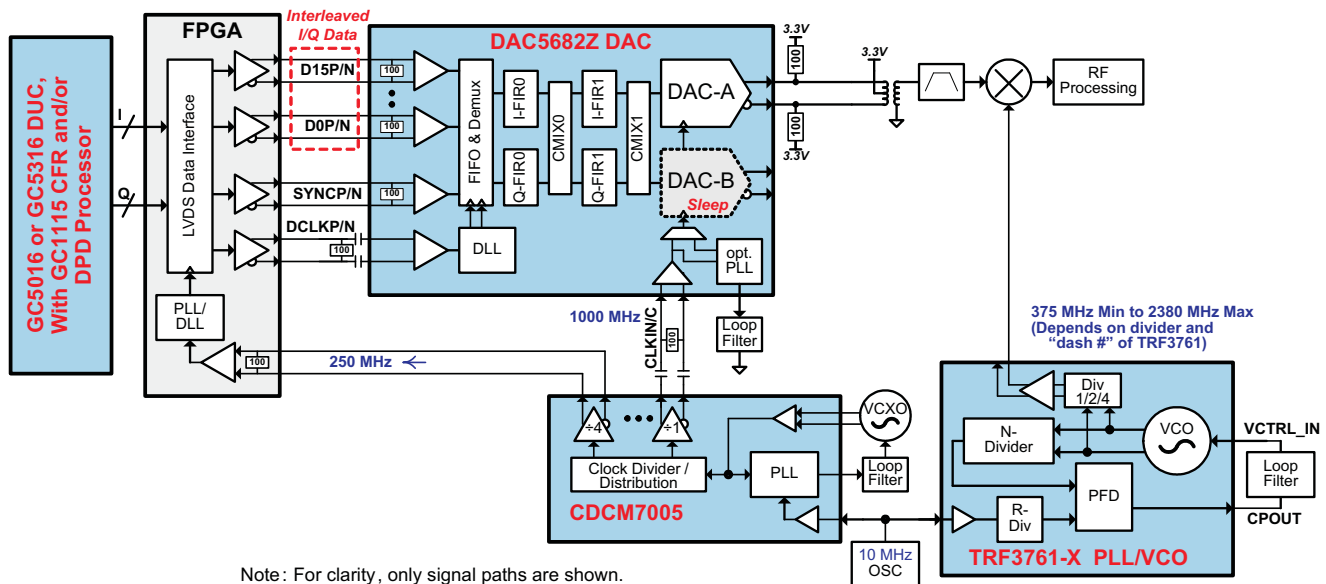

The DAC5682Z's LVDS digital input bus can be driven by an FPGA or digital ASIC. This input signal can be generated directly by the FPGA, or fed by a Texas Instruments Digital Up Converter (DUC) such as the GC5016 or GC5316. Optionally, a GC1115 Crest Factor Reduction (CFR) or Digital Pre-Distortion (DPD) processor may be inserted in the digital signal chain for improving the efficiency of high-power RF amplifiers. For the details on the high-rate digital interface of the DAC, refer to [LVDS Data Interfacing](#).

A low phase noise clock for the DAC at the final sample rate can be generated by a VCXO and a Clock Synchronizer/PLL such as the Texas Instruments CDCM7005 or CDCE62005, which can also provide other system clocks. An optional system clocking solution can use the DAC in clock multiplying PLL mode in order to avoid distributing a high-frequency clock at the DAC sample rate; however, the internal VCO phase noise of the DAC in PLL mode may degrade the quality of the DAC output signal.

### 9.3.2 Single Complex Input, Real IF Output Radio

Refer to [Figure 49](#) for an example Single Complex Input, Real IF Output Radio. The DAC5682Z receives an interleaved complex I/Q baseband input data stream and increases the sample rate through interpolation by a factor of 2 or 4. By performing digital interpolation on the input data, undesired images of the original signal can be pushed out of the band of interest and more easily suppressed with analog filters. Complex mixing is available at each stage of interpolation using the CMIX0 and CMIX1 blocks to up-convert the signal to a frequency placement at a multiple of  $\pm F_{dac}/8$  or  $\pm F_{dac}/4$ . Only the real portion of the digital signal is converted by DAC-A while DAC-B can be programmed to sleep mode for reduced power consumption. The DAC output signal would typically be terminated with a transformer (see [Analog Current Outputs](#)). An IF filter, either LC or SAW, is used to suppress the DAC Nyquist zone images and other spurious signals before being mixed to RF with a mixer. The TRF3671 Frequency Synthesizer, with integrated VCO, may be used to drive the LO input of the mixer for frequencies between 375 and 2380 MHz.

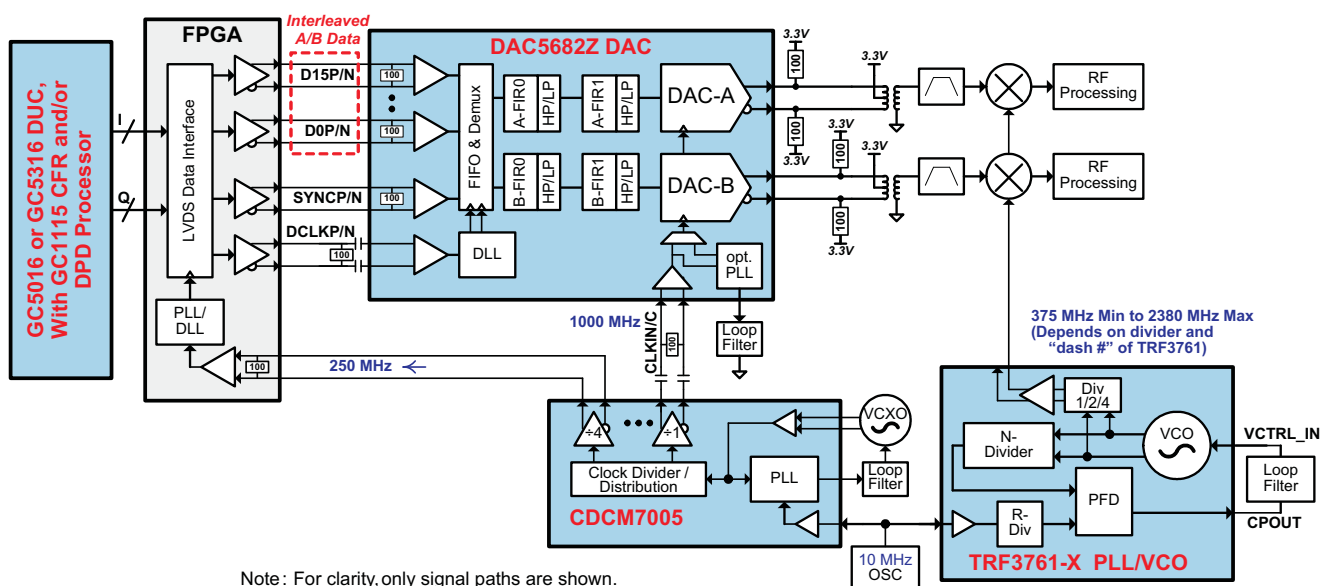

## System Examples (continued)

**Figure 49. System Diagram of a Complex Input, Real IF Output Radio**

### 9.3.3 Dual Channel Real IF Output Radio

Refer to [Figure 50](#) for an example Dual-Channel Real IF Output Radio. The DAC5682Z receives an interleaved A/B input data stream and increases the sample rate through interpolation by a factor of 2 or 4. By performing digital interpolation on the input data, undesired images of the original signal can be pushed out of the band of interest and more easily suppressed with analog filters. Real mixing is available at each stage of interpolation using the CMIX0 and CMIX1 blocks to up-convert the signal (see [Dual-Channel Real Upconversion](#)). Both DAC output signals would typically be terminated with a transformer (see [Analog Current Outputs](#)). An IF filter, either LC or SAW, is used to suppress the DAC Nyquist zone images and other spurious signals before being mixed to RF with a mixer. The TRF3761 Frequency Synthesizer, with integrated VCO, may be used to drive a common LO input of the mixers for frequencies between 375 and 2380 MHz. Alternatively, two separate TRF3761 synthesizers could be used for independent final RF frequency placement.

**Figure 50. System Diagram of a Dual-Channel Real IF Output Radio**

## System Examples (continued)

### 9.3.4 Direct Conversion Radio

Refer to [Figure 51](#) for an example Direct Conversion Radio. The DAC5682Z receives an interleaved complex I/Q baseband input data stream and increases the sample rate through interpolation by a factor of 2 or 4. By performing digital interpolation on the input data, undesired images of the original signal can be pushed out of the band of interest and more easily suppressed with analog filters.

For a Zero IF (ZIF) frequency plan, complex mixing of the baseband signal is not required. Alternatively, for a Complex IF frequency plan the input data can be placed at an IF within the bandwidth limitations of the interpolation filters. In addition, complex mixing is available at each stage of interpolation using the CMIX0 and CMIX1 blocks to up-convert the signal to a frequency placement at a multiple  $\pm F_{DAC}/8$  or  $\pm F_{DAC}/4$ . The output of both DAC channels is used to produce a Hilbert transform pair and can be expressed as:

$$A(t) = I(t)\cos(\omega_c t) - Q(t)\sin(\omega_c t) \quad m(t) \quad (14)$$

$$A(t) = I(t)\cos(\omega_c t) - Q(t)\sin(\omega_c t) \quad m_h(t) \quad (15)$$

where  $m(t)$  and  $m_h(t)$  connote a Hilbert transform pair and  $\omega_c$  is the sum of the CMIX0 and CMIX1 frequencies. The complex output is input to an analog quadrature modulator (AQM) such as the Texas Instruments TRF3703-33 for a single side-band (SSB) up conversion to RF. A passive (resistor only) interface to the AQM is recommended, with an optional LC filter network. The TRF3671 Frequency Synthesizer with integrated VCO may be used to drive the LO input of the TRF3703-33 for frequencies between 375 and 2380 MHz. Upper single-sideband upconversion is achieved at the output of the analog quadrature modulator, whose output is expressed as:

$$RF(t) = I(t)\cos(\omega_c + \omega_{LO})t - Q(t)\sin(\omega_c + \omega_{LO})t \quad (16)$$

Flexibility is provided to the user by allowing for the selection of negative CMIX mixing sequences to produce a lower-sideband upconversion. Note that the process of complex mixing translates the signal frequency from 0 Hz means that the analog quadrature modulator IQ imbalance produces a sideband that falls outside the signal of interest. DC offset error in DAC and AQM signal path may produce LO feed-through at the RF output which may fall in the band of interest. To suppress the LO feed-through, the DAC5682Z provides a digital offset correction capability for both DAC-A and DAC-B paths. (See DAC\_offset\_ena bit in CONFIG3.)

The complex IF architecture has several advantages over the real IF architecture:

- Uncalibrated side-band suppression ~ 35 dBc compared to 0 dBc for real IF architecture.
- Direct DAC to AQM interface – no amplifiers required
- Nonharmonic clock-related spurious signals fall out-of-band
- DAC 2nd Nyquist zone image is offset  $f_{DAC}$  compared with  $f_{DAC} - 2 \times IF$  for a real IF architecture, reducing the need for filtering at the DAC output.
- Uncalibrated LO feed through for AQM is ~ 35 dBc and calibration can reduce or completely remove the LO feed through.

## System Examples (continued)

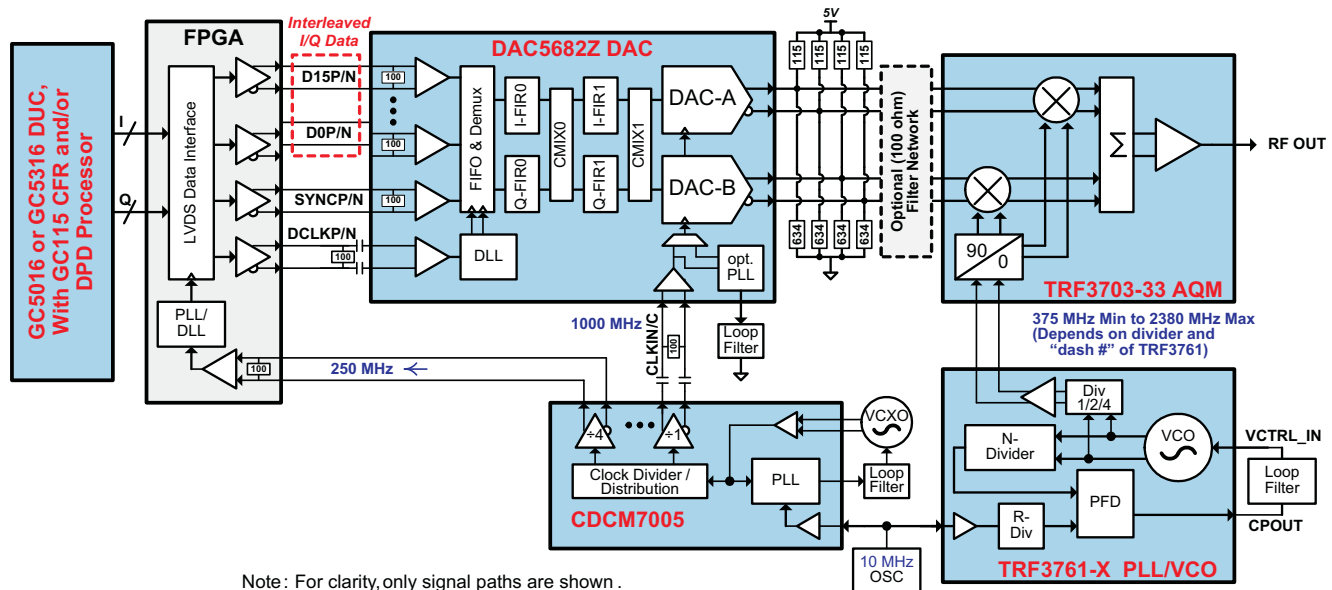

Figure 51. System Diagram of Direct Conversion Radio

### 9.3.5 CMTS/VOD Transmitter

The exceptional SNR of the DAC5682Z enables a dual-cable modem termination system (CMTS) or video on demand (VOD) QAM transmitter in excess of the stringent DOCSIS specification, with >74 dBc and 75 dBc in the adjacent and alternate channels.

Refer to Figure 50 for an example Dual Channel Real IF Output Radio – this signal chain is nearly identical to a typical system using the DAC5682Z for a cost optimized dual channel two QAM transmitter. A GC5016 would take four separate symbol rate inputs and provide pulse shaping and interpolation to ~ 128 MSPS. The four QAM carriers would be combined into two groups of two QAM carriers with intermediate frequencies of approximately 30 MHz to 40 MHz. The GC5016 would output two real data streams to one DAC5682Z through an FPGA for CMOS to LVDS translation. The DAC5682Z would function as a dual-channel device and provide 2x or 4x interpolation to increase the frequency of the 2nd Nyquist zone image. The two signals are then output through the two DAC outputs, through a transformer and to an RF upconverter.

### 9.3.6 High-Speed Arbitrary Waveform Generator

The 1GSPS bandwidth input data bus combined with the 16-bit DAC resolution of the DAC5682Z allows wideband signal generation for test and measurement applications. In this case, interpolation is not desired by the FPGA-based waveform generator as it can make use of the full Nyquist bandwidth of up to 500MHz.

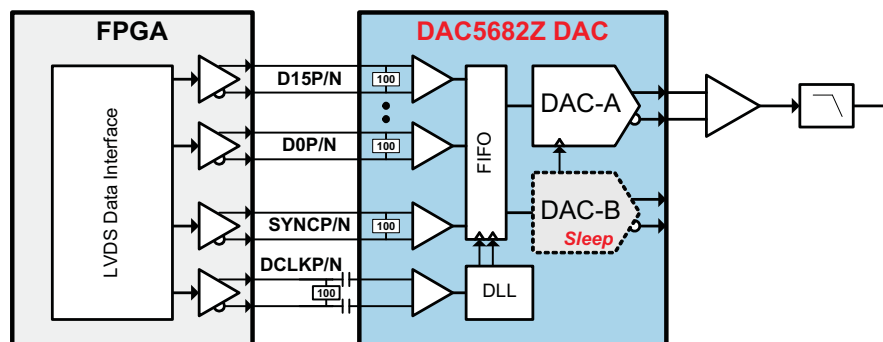

Figure 52. System Diagram of Arbitrary Waveform Generator

## 9.4 Initialization Set Up

### 9.4.1 Recommended Start-up Sequence

The following start-up sequence is recommended to initialize the DAC5682Z:

1. Supply all 1.8 V (CLKVDD, DVDD, VFUSE) voltages simultaneously followed by all 3.3 V (AVDD and IOVDD) voltages.
2. Provide stable CLKIN/C clock.
3. Toggle RESETB pin for a minimum 25 nSec active low pulse width.
4. Program all desired SIF registers. Set **DLL\_Restart** bit during this write cycle. The CONFIG10 register value should match the corresponding DCLKP/N frequency range in the Electrical Characteristics table.
5. Provide stable DCLKP/N clock. (This can also be provided earlier in the sequence)
6. Clear the **DLL\_Restart** bit when the DCLKP/N clock is expected to be stable.
7. Verify the status of **DLL\_Lock** and repeat until set to '1'. **DLL\_Lock** can be monitored by reading the STATUS0 register or by monitoring the SDO pin in 3-wire SIF mode. (See description for CONFIG14 **SDO\_func\_sel**.)
8. Enable transmit of data by asserting the LVDS SYNC/N input or setting CONFIG3 **SW\_sync** bit. (See description for CONFIG3 **SW\_sync** and **SW\_sync\_sel**) The SYNC source must be held at a logic '1' to enable data flow through the DAC. If multiple DAC devices require synchronization, refer to the "Recommended Multi-DAC Synchronization Procedure" below.
9. Provide data flow to LVDS D[15:0]P/N pins. If using the LVDS SYNC/N input, data can be input simultaneous with the logic '1' transition of SYNC/N.

## 10 Power Supply Recommendations

It is recommended that the device be powered with the nominal supply voltages as indicated in the [Recommended Operating Conditions](#).

In most instances the best performance is achieved with LDO supplies. However the supplies may be driven with direct outputs from a DC-DC switcher as long as the noise performance of the switcher is acceptable.

For an LDO power supply reference, it is best to refer to the DAC5682zEVM.

## 11 Layout

### 11.1 Layout Guidelines

The DAC5682Z EVM layout should be used as a reference for the layout to obtain the best performance. A sample layout is shown in Figure 53. Some important layout recommendations are:

1. Use a single ground plane. Keep the digital and analog signals on distinct separate sections of the board. This may be virtually divided down the middle of the device package when doing placement and layout.
2. Keep the analog outputs as far away from the switching clocks and digital signals as possible. This will keep coupling from the digital circuits to the analog outputs to a minimum.
3. Decoupling caps should be kept close to the power pins of the device.

### 11.2 Layout Example

**Figure 53. Top Layer of DAC5682zEVM Layout**

## 12 Device and Documentation Support

### 12.1 Device Support

#### 12.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

#### 12.1.2 Device Nomenclature

**Adjacent Carrier Leakage Ratio (ACLR):** Defined for a 3.84Mcps 3GPP W-CDMA input signal measured in a 3.84MHz bandwidth at a 5MHz offset from the carrier with a 12dB peak-to-average ratio.

**Analog and Digital Power Supply Rejection Ratio (APSSR, DPSSR):** Defined as the percentage error in the ratio of the delta IOUT and delta supply voltage normalized with respect to the ideal IOUT current.

**Differential Nonlinearity (DNL):** Defined as the variation in analog output associated with an ideal 1 LSB change in the digital input code.

**Gain Drift:** Defined as the maximum change in gain, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

**Gain Error:** Defined as the percentage error (in FSR%) for the ratio between the measured full-scale output current and the ideal full-scale output current.

**Integral Nonlinearity (INL):** Defined as the maximum deviation of the actual analog output from the ideal output, determined by a straight line drawn from zero scale to full scale.

**Intermodulation Distortion (IMD3, IMD):** The two-tone IMD3 or four-tone IMD is defined as the ratio (in dBc) of the worst 3rd-order (or higher) intermodulation distortion product to either fundamental output tone.

**Offset Drift:** Defined as the maximum change in DC offset, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

**Offset Error:** Defined as the percentage error (in FSR%) for the ratio of the differential output current (IOUT1–IOUT2) and the mid-scale output current.

**Output Compliance Range:** Defined as the minimum and maximum allowable voltage at the output of the current-output DAC. Exceeding this limit may result reduced reliability of the device or adversely affecting distortion performance.

**Reference Voltage Drift:** Defined as the maximum change of the reference voltage in ppm per degree Celsius from value at ambient (25°C) to values over the full operating temperature range.

**Spurious Free Dynamic Range (SFDR):** Defined as the difference (in dBc) between the peak amplitude of the output signal and the peak spurious signal.

**Signal to Noise Ratio (SNR):** Defined as the ratio of the RMS value of the fundamental output signal to the RMS sum of all other spectral components below the Nyquist frequency, including noise, but excluding the first six harmonics and dc.

### 12.2 Trademarks

All trademarks are the property of their respective owners.

### 12.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## 12.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC5682ZIRGC	ACTIVE	VQFN	RGC	64	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC5682ZI	<a href="#">Samples</a>
DAC5682ZIRGCR	ACTIVE	VQFN	RGC	64	2000	RoHS & Green	NIPDAU   NIPDAUAG	Level-3-260C-168 HR	-40 to 85	DAC5682ZI	<a href="#">Samples</a>
DAC5682ZIRGCT	ACTIVE	VQFN	RGC	64	250	RoHS & Green	NIPDAU   NIPDAUAG	Level-3-260C-168 HR	-40 to 85	DAC5682ZI	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
