RECOMMENDED OPERATING CONDITIONS

Input Voltage Range	2.7V to 36V
Operating Temperature Range	-40°C to +85°C

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

$T_A = +25^\circ\text{C}$, $V_{IN} = 5.3\text{V}$, $V_{OUT} = 3.3\text{V}$, $C_{IN} = C_{OUT} = 1\mu\text{F}$, unless otherwise noted.

APPLICATION INFORMATION

Input Capacitor Selection (C_{IN})

The input decoupling capacitor should be placed as close as possible to the IN pin for ensuring the device stability. A 1 μ F X7R or X5R ceramic capacitor is selected to get good dynamic performance.

When V_{IN} is required to provide large current instantaneously, a large effective input capacitor is required. Multiple input capacitors can limit the input tracking inductance. Adding more input capacitors is available to restrict the ringing and to keep it below the device absolute maximum ratings.

Output Capacitor Selection (C_{OUT})

The output capacitor should be placed as close as possible to the OUT pin. A 1 μ F to 10 μ F X7R or X5R ceramic capacitor is selected to get good dynamic performance. For ceramic capacitor, temperature, DC bias and package size will change the effective capacitance, so enough margin of C_{OUT} must be considered in design. Additionally, C_{OUT} with larger capacitance and lower ESR will help increase the high frequency PSRR and improve the load transient response.

Adjustable Regulator

The output voltage of the SGM2200H-ADJ can be adjusted from 0.8V to 5.0V. The FB pin will be connected to two external resistors as shown in Figure 2. The output voltage is determined by the following equation:

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R_1}{R_2} \right) \quad (1)$$

where:

V_{OUT} is output voltage and V_{FB} is the internal voltage reference, $V_{FB} = 0.8V$. Use $R_2 = 2M\Omega$ to maintain a 0.4 μ A minimum load.

Figure 2. Adjustable Output Voltage Application

Thermal Shutdown

The SGM2200H can detect the temperature of die. When the die temperature exceeds the threshold value of thermal shutdown, the SGM2200H will be in shutdown state.
