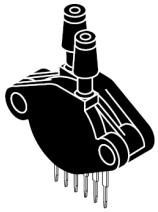
MPX5100xx, MPXV5100xx

Datasheet

0 to 100 kPa, differential, gauge, and absolute, integrated, pressure sensors

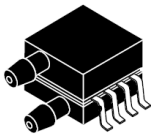
Unibody packages

MPX5100AP/GP
98ASB42796B

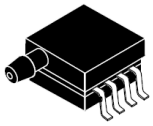


MPX5100DP
98ASA42797B

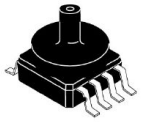
Small outline packages



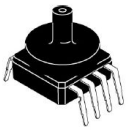
MPXV5100DP
98ASA99255D



MPXV5100GP
98ASA99303D



MPXV5100GC6U
98ASB17757C



MPXV5100GC7U
98ASB17759C

Features

- 2.5% maximum error over 0 to 85 °C
- Ideally suited for microprocessor or microcontroller-based systems
- Patented silicon shear stress strain gauge
- Available in absolute, differential and gauge configuration
- Durable epoxy unibody element
- Easy-to-use chip carrier option

Applications

- Patient monitoring
- Process control
- Pump/motor control
- Pressure switching
- White goods

Description

The MPX5100 series piezoresistive transducer is a state-of-the-art monolithic silicon pressure sensor designed for a wide range of applications, but particularly those employing a microcontroller or microprocessor with A/D inputs. This patented, single element transducer combines advanced micromachining techniques, thin-film metallization, and bipolar processing to provide an accurate, high-level, analog output signal that is proportional to the applied pressure.

1 Ordering information

Table 1. **Ordering information**

Device name	Shipping	Package	# of Ports				Pressure type		Device marking
			None	Single	Dual	Gauge	Differential	Absolute

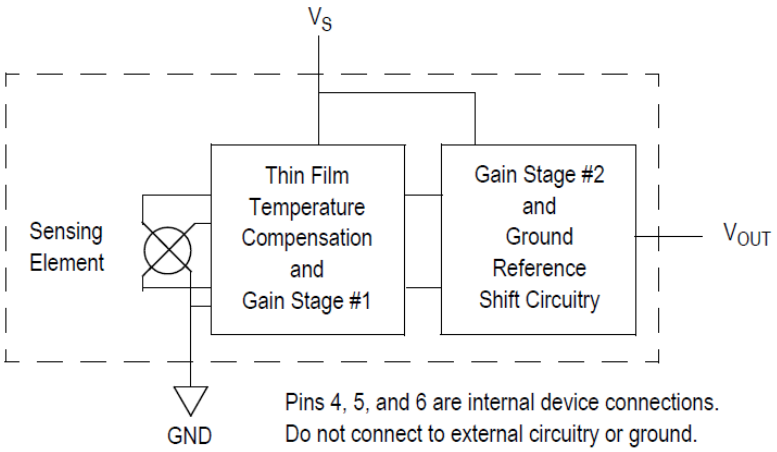
2 General description

2.1 MPX5100AP/DP/GP Block diagram

Figure 1 shows a block diagram of the internal circuitry integrated on a pressure sensor chip in a unibody package.

Figure 1. Integrated pressure sensor block diagram



2.2 MPX5100AP/DP/GP Pinout (Unibody)

Figure 2. Device pinout (top view)

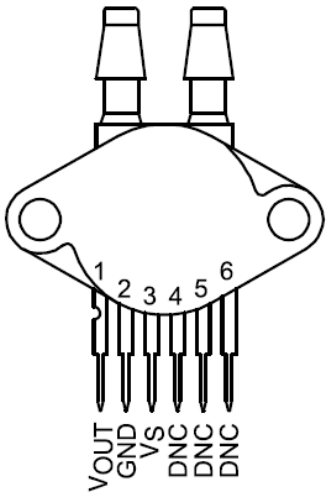


Table 2. **Pin functions**

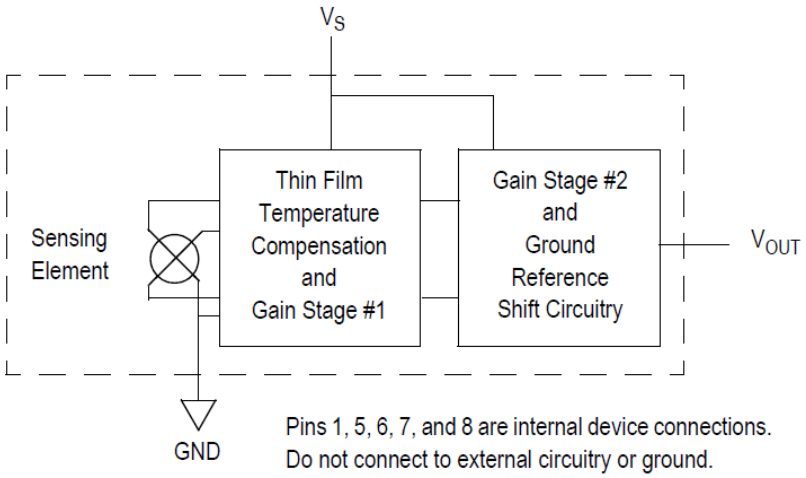
Pin	Name	Function
1	V_{OUT}	Output voltage
2	GND	Ground
3	V_S	Voltage supply
4	DNC	Do not connect to external circuitry or ground.
5	DNC	Do not connect to external circuitry or ground.
6	DNC	Do not connect to external circuitry or ground.

2.3 MPXV5100DP/GC6U/GC7U/GP block diagram

Figure 3 shows a block diagram of the internal circuitry integrated on a pressure sensor chip in a small outline package

Figure 3. **Integrated pressure sensor block diagram**



2.4 MPXV5100DP/GC6U/GC7U/GP pinout (small outline package)

Figure 4. Device pinout (top vew)

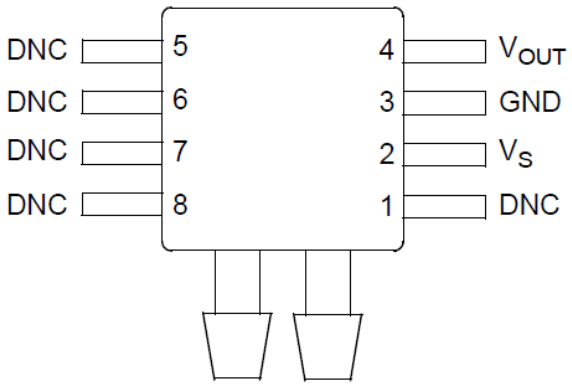


Table 3. Pin functions

Pin	Name	Function
1	DNC	Do not connect to external circuitry or ground.
2	V_S	Voltage supply
3	GND	Ground
4	VOUT	Output voltage
5	DNC	Do not connect to external circuitry or ground.
6	DNC	Do not connect to external circuitry or ground.
7	DNC	Do not connect to external circuitry or ground.
8	DNC	Do not connect to external circuitry or ground.

3 Mechanical and electrical specifications

Table 4. Table 3. Maximum ratings(1)

Rating	Symbol	Value	Unit
Maximum pressure	P_{max}	400	kPa
Storage temperature	T_{stg}	-40 to +125	°C
Operating temperature	T_A	-40 to +125	°C

1. Exposure beyond the specified limits may cause permanent damage or degradation to the device.

3.1 Operating characteristics

Table 5. Operating characteristics (V_S = 5 Vdc, T_A = 25 °C.)

Characteristic	Symbol	Min	Typ	Max	Unit
Pressure range(1) Gauge, differential: MPX5100G/MPXV5100G Absolute: MPX5100AP	P_{OP}	0 15	— —	100 115	kPa
Supply voltage(2)	V_S	4.75	5.0	5.25	V_{DC}
Supply current	I_O	—	7.0	10	mAdc
Minimum pressure offset(3), (0 to 85 °C) @ V_S = 5.0 V	V_{OFF}	0.088	0.20	0.313	V_{DC}
Full-scale output(4), differential and absolute (0 to 85 °C) @ V_S = 5.0 V	V_{FSO}	4.587	4.700	4.813	V_{DC}
Full-scale Span(5), differential and absolute (0 to 85 °C) @ V_S = 5.0 V	V_{FSS}	—	4.500	—	V_{DC}
Accuracy(6)	—	—	—	±2.5	$\%V_{FSS}$
Sensitivity	V/P	—	45	—	mV/kPa
Response time(7)	t_R	—	1.0	—	ms
Output source current at full-scale output	I_{O+}	—	0.1	—	mAdc
Warm-up time(8)	—	—	20	—	ms
Offset stability(9)	—	—	±0.5	—	$\%V_{FSS}$

1. 1.0 kPa (kiloPascal) equals 0.145 psi.
2. Device is ratiometric within this specified excitation range.
3. Offset (V_{OFF}) is defined as the output voltage at the minimum rated pressure.
4. Full-scale output (V_{FSO}) is defined as the output voltage at the maximum or full-rated pressure.
5. Full-scale span (V_{FSS}) is defined as the algebraic difference between the output voltage at full-rated pressure and the output voltage at the minimum rated pressure.

6. Accuracy (error budget) consists of the following:
   Linearity: Output deviation from a straight line relationship with pressure over the specified pressure range. Temperature hysteresis: Output deviation at any temperature within the operating temperature range, after the temperature is cycled to and from the minimum or maximum operating temperature points, with zero differential pressure applied. Pressure hysteresis: Output deviation at any pressure within the specified range, when this pressure is cycled to and from minimum or maximum rated pressure at 25 °C. TcSpan: Output deviation over the temperature range of 0 to 85 °C, relative to 25 °C. TcOffset: Output deviation with minimum pressure applied over the temperature range of 0 to 85 °C, relative to 25 °C.Variation from nominal: The variation from nominal values, for offset or full-scale span, as a percent of $_{VFSS}$ at 25 °C.
7. Response time is defined as the time for the incremental changed in the output to go from 10% to 90% of its final value when subjected to a specified step change in pressure.
8. Warm-up time is defined as the time required for the product to meet the specified output voltage after the pressure has been stabilized.
9. Offset stability is the product's output deviation when subjected to 1000 hours of pulsed pressure, temperature cycling with bias test.

4 On-chip Temperature Compensation and Calibration

Figure 5 shows the sensor output signal relative to pressure input. Typical, minimum, and maximum output curves are shown for operation over a temperature range of 0 to 85 °C using the decoupling circuit shown Figure 7. The output will saturate outside of the specified pressure range.

Figure 6 illustrates both the Differential/Gauge and the Absolute Sensing Chip in the basic chip carrier. A fluorosilicone gel isolates the die surface and wire bonds from the environment, while allowing the pressure signal to be transmitted to the sensor diaphragm.

The MPX5100 series pressure sensor operating characteristics, and internal reliability and qualification tests are based on use of dry air as the pressure media. Media, other than dry air, may have adverse effects on sensor performance and long-term reliability. Contact the factory for information regarding media compatibility in your application.

Figure 5. Output versus pressure differential

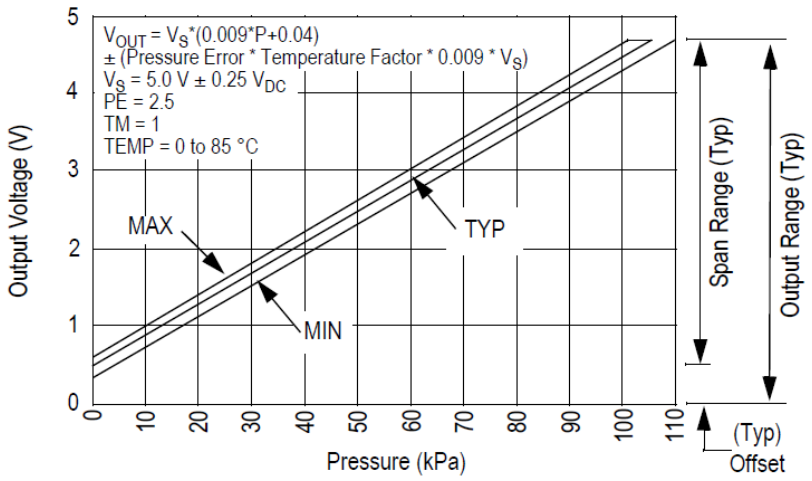

Figure 6. Cross-sectional diagrams (not-to-scale)

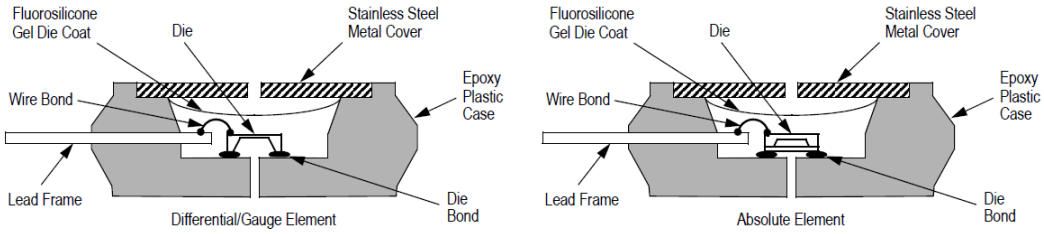

Figure 7 shows the recommended decoupling circuit for interfacing the output of the integrated sensor to the A/D input of a microprocessor or microcontroller. Proper decoupling of the power supply is recommended

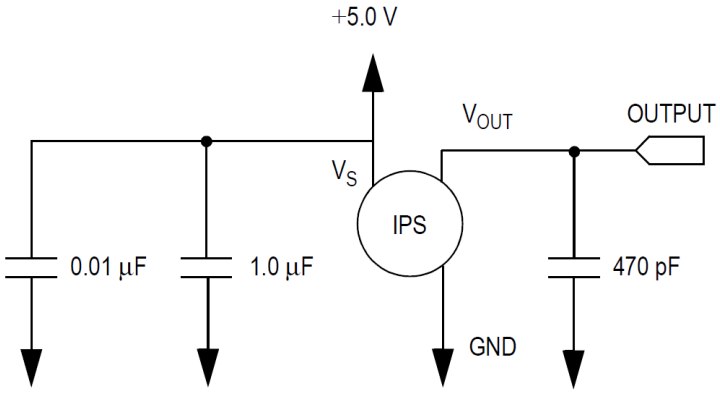
Figure 7. Recommended power supply decoupling and output filtering (For additional output filtering, please refer to application note AN1646.)

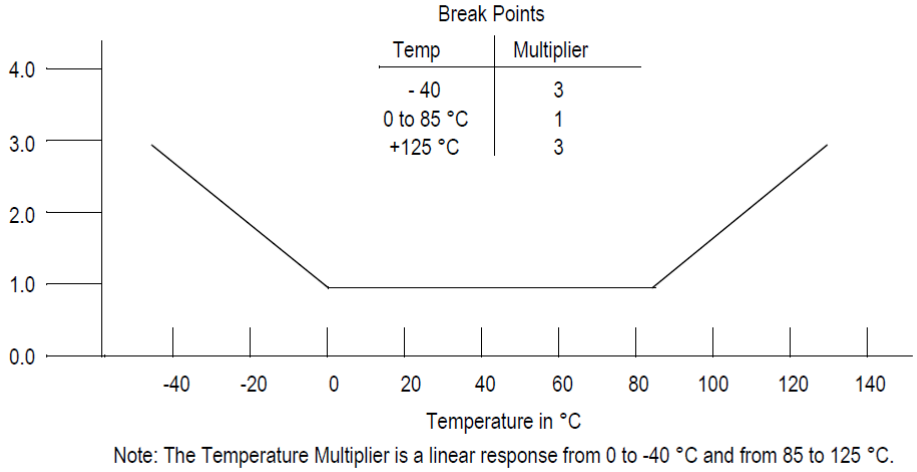


The following figures show the nominal transfer function, temperature and pressure error over the operating range for the MPX5100D,MPX5100G and MPXV5100G devices

Figure 8. Transfer function (MPX5100D, MPX5100G, MPXV5100G)

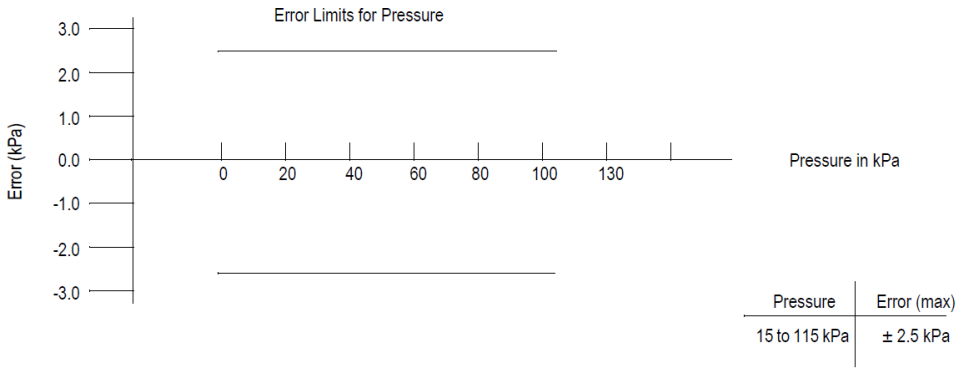
Nominal Transfer Value: $V_{OUT} = V_S (P \times 0.009 - 0.095)$
$\pm$ (Pressure Error x Temp. Mult. x 0.009 x V_S)
$V_S = 5.0\ V \pm 0.25\ V$

Figure 9. Temperature error multiplier (MPX5100D, MPX5100G, MPXV5100G)



Note: The Temperature Multiplier is a linear response from 0 to -40 °C and from 85 to 125 °C.

Figure 10. Pressure error band (MPX5100D, MPX5100G, MPXV5100G)

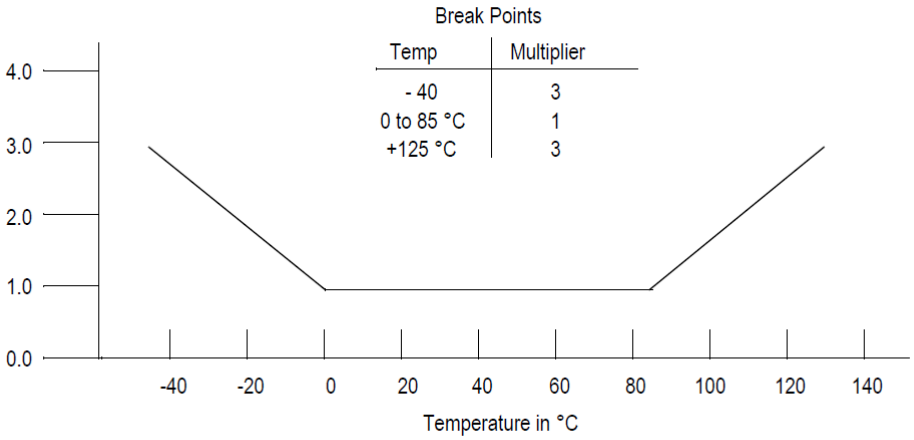


The following figures show the nominal transfer function, temperature and pressure error over the operating range for the MPX5100AP device.

Figure 11. Transfer function (MPX5100AP)

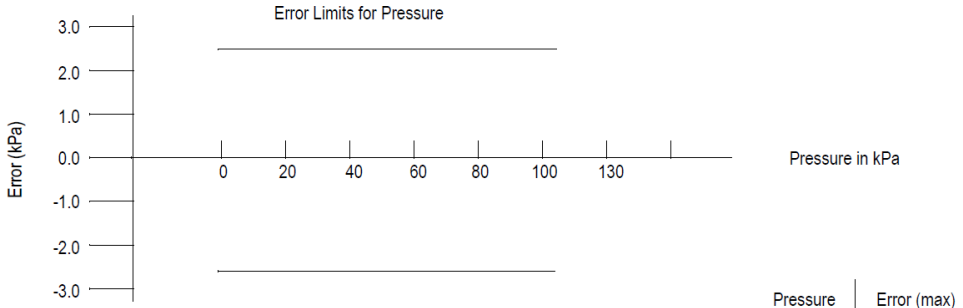
Nominal Transfer Value: $V_{OUT} = V_S (P \times 0.009 - 0.095)$
$\pm$ (Pressure Error x Temp. Mult. x 0.009 x V_S)
$V_S = 5.0\ V \pm 0.25\ V$

Figure 12. Temperature error multiplier (MPX5100AP)



Note: The Temperature Multiplier is a linear response from 0 to -40 °C and from 85 to 125 °C.

Figure 13. Pressure error band (MPX5100AP)



Pressure	Error (max)
15 to 115 kPa	± 2.5 kPa

5 Package information

5.1 Pressure (p1)/gauge (p2) side identification table

NXP designates the two sides of the pressure sensor as the Pressure (P1) side and the Gauge (P2) side. The Pressure (P1) side is the side containing fluoro-silicone gel which protects the die from harsh media. The MPX pressure sensor is designed to operate with positive differential pressure applied, P1 > P2.

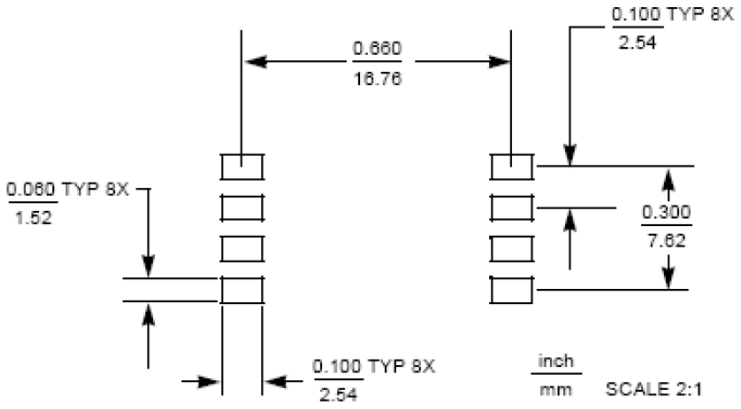
The Pressure (P1) side may be identified by using the table below.

Part number	Package	Pressure (P1) side identifier
MPX5100AP, MPX5100GP	98ASB42796B	Side with port attached
MPX5100DP	98ASB42797B	Side with part marking
MPXV5100DP	98ASA99255D	Side with part marking
MPXV5100GC6U	98ASB17757C	Side with port attached
MPXV5100GC7U	98ASB17759C	Side with port attached
MPXV5100GP	98ASA99303D	Side with port attached

5.2 Minimum recommended footprint for surface mounted applications

Surface mount board layout is a critical portion of the total design. The footprint for the surface mount packages must be the correct size to ensure proper solder connection interface between the board and the package. With the correct footprint, the packages will self align when subjected to a solder reflow process. It is always recommended to design boards with a solder mask layer to avoid bridging and shorting between solder

Figure 14. Small outline package footprint



5.3 Package dimensions
