

**3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS**

March 2007

Rev 2.0.0

**GENERAL DESCRIPTION**

The XRT94L33 is a highly integrated SONET/SDH terminator designed for E3/DS3/STS-1 mapping/de-mapping functions from either the STS-3 or STM-1 data stream. The XRT94L33 interfaces directly to the optical transceiver

The XRT94L33 processes the section, line and path overhead in the SONET/SDH data stream and also performs ATM and PPP PHY-layer processing. The processing of path overhead bytes within the STS-1s or TUG-3s includes 64 bytes for storing the J1 bytes. Path overhead bytes can be accessed through the microprocessor interface or via serial interface.

The XRT94L33 uses the internal E3/DS3 De-Synchronizer circuit with an internal pointer leak algorithm for clock smoothing as well as to remove the jitter due to mapping and pointer movements. These De-Synchronizer circuits do not need any external clock reference for its operation.

The SONET/SDH transmit blocks allow flexible insertion of TOH and POH bytes through both Hardware and Software. Individual POH bytes for the transmitted SONET/SDH signal are mapped either from the XRT94L33 memory map or from external interface. A1, A2 framing pattern, C1 byte and H1, H2 pointer byte are generated.

The SONET/SDH receive blocks receive SONET STS-3 signal or SDH STM-1 signal and perform the necessary transport and path overhead processing.

The XRT94L33 provides a line side APS (Automatic Protection Switching) interface by offering redundant receive serial interface to be switched at the frame boundary.

The XRT94L33 provides 3 Mappers for performing STS-1/VC-3 to STS-1/DS3/E3 mapping function, one for each STS-1/DS3/E3 framers.

A PRBS test pattern generation and detection is implemented to measure the bit-error performance.

A general-purpose microprocessor interface is included for control, configuration and monitoring.

**APPLICATIONS**

- Network switches
- Add/Drop Multiplexer
- W-DCS Digital Cross Connect Systems

**FEATURES**

- Provides DS3/ E3 mapping/de-mapping for up to 3 tributaries through SONET STS-1 or SDH AU-3 and/or TUG-3/AU-4 containers
- Generates and terminates SONET/SDH section, line and path layers
- Integrated SERDES with Clock Recovery Circuit
- Provides SONET frame scrambling and descrambling
- Integrated Clock Synthesizer that generates 155 MHz and 77.76 MHz clock from an external 12.96/19.44/77.76 MHz reference clock
- Integrated 3 E3/DS3/STS-1 De-Synchronizer circuit that de-jitter gapped clock to meet 0.05UIpp jitter requirements
- Access to Line or Section DCC
- Level 2 Performance Monitoring for E3 and DS3
- Supports mixing of STS-1E and DS3 or E3 and DS3 tributaries
- UTOPIA Level 2 interface for ATM or level 2P for Packets
- E3 and DS3 framers for both Transmit and Receive directions
- Complete Transport/Section Overhead Processing and generation per Telcordia and ITU standards
- Single PHY and Multi-PHY operations supported
- Full line APS support for redundancy applications
- Loopback support for both SONET/SDH as well as E3/DS3/STS-1
- Boundary scan capability with JTAG IEEE 1149
- 8-bit microprocessor interface
- 3.3 V  $\pm$  5% Power Supply; 5 V input signal tolerance
- -40°C to +85°C Operating Temperature Range
- Available in a 504 Ball TBGA package

**3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS**
**Block Diagram of the XRT94L33**

**ORDERING INFORMATION**

| PART NUMBER | PACKAGE TYPE          | OPERATING TEMPERATURE RANGE |
|-------------|-----------------------|-----------------------------|
| XRT94L33IB  | 27 x 27 504 Lead TBGA | -40°C to +85°C              |

## 1.0 XRT94L33 REGISTERS FOR SONET

### 1.1 THE OVERALL REGISTER MAP WITHIN THE XRT94L33

The XRT94L33 employs a direct Addressing Scheme. The Address Locations for each of the “Register Groups” (or Register pages) is presented in the Table below.

**Table 1: The Address Register Map for the XRT94L33**

| ADDRESS LOCATION                         | REGISTER NAME                                                            | DEFAULT VALUE |
|------------------------------------------|--------------------------------------------------------------------------|---------------|
| <b>OPERATION CONTROL BLOCK REGISTERS</b> |                                                                          |               |
| 0x0000 – 0x00FF                          | Reserved                                                                 |               |
| 0x0100                                   | Operation Control Register – Byte 3                                      | 0x00          |
| 0x0101                                   | Operation Control Register – Byte 2                                      | 0x00          |
| 0x0102                                   | Reserved                                                                 | 0x00          |
| 0x0103                                   | Operation Control Register – Byte 0                                      | 0x00          |

## 1.2 THE OPERATION CONTROL BLOCK

The Operation Control Block is responsible for the following functions.

- Control of the Interrupt Structure (at the Highest Level within the XRT94L33)
- Control of the Clock Synthesizer block
- Control of the STS-3/STM-1 Telecom Bus Interface
- Control of the STS-1 Telecom Bus Interfaces

The register map for the Operation Control block is presented in the Table below. Additionally, a detailed description of each of the “Operation Control” Block registers is presented below.

### 1.2.1 OPERATION CONTROL BLOCK REGISTER

**Table 2: Operation Control Register Address Map**

| ADDRESS LOCATION | REGISTER NAME                                                   | DEFAULT VALUE |
|------------------|-----------------------------------------------------------------|---------------|
| 0x0000 – 0x00FF  | Reserved                                                        | 0x00          |
| 0x0100           | Operation Control Register – Byte 3                             | 0x00          |
| 0x0101           | Operation Control Register – Byte 2                             | 0x00          |
| 0x0102           | Reserved                                                        | 0x00          |
| 0x0103           | Operation Control Register – Byte 0                             | 0x00          |
| 0x0104           | Operation Status Register – Byte 3 (Device ID)                  | 0xE3          |
| 0x0105           | Operation Status Register – Byte 2 (Revision ID)                | 0x01          |
| 0x0106 – 0x010A  | Reserved                                                        | 0x00          |
| 0x010B           | Operation Interrupt Status Register – Byte 0                    | 0x00          |

| Bit 0      | SW<br>Reset | R/W  | <p><b>Software Reset – SONET Block:</b></p> <p>This READ/WRITE bit-field permits the user to command a software reset to the SONET/SDH block. If the user invokes a software reset to the SONET/SDH blocks then all of the internal state machines will be reset to their default conditions; and each of the Receive STS-1/STS-3 TOH Processor blocks will undergo a re-frame operation.</p> <p>A “0” to “1” transition, within this bit-field commands this Software Reset.</p> <p><b>Notes:</b> <i>This Software Reset does not reset the command registers to their default state. This can only be achieved by executing a “Hardware RESET” (e.g., by pulling the RESET_L* input pin “LOW”). This Software Reset does not affect the DS3/E3 Framer blocks. The Software Reset bit-field, for the DS3/E3 Framer block can be found in each of the 3 “DS3/E3 Operating Mode” registers (Address Location= 0xNF00).</i></p> |

| 7          | DISFASTLOCK  | R/W  | <p><b>Disable Jitter Attenuator Fast lock:</b></p> <p>This READ/WRITE bit field is used to disable the fast lock feature for the Jitter Attenuator block</p> <p>0 – Fast Lock feature is enabled</p> <p>1 – Fast Lock feature is disabled</p> <p><b>Note:</b> To configure the XRT94L33 such that it will comply with the Telcordia GR-253-CORE APS Recovery time requirements of 50ms, then the “Fast Lock” feature MUST be enabled within the Jitter Attenuator block, by setting this bit-field to “0”</p>                                                                                                                                                                                                                      |
| 6          | TBUS0_IS_SDH |      | <p><b>Telecom Bus 0 operating in SDH Mode</b></p> <p>This bit is used to qualify and process a Highrate SDH signal for Subrate Telecom Bus 0 operation.</p> <p>0 - Clearing this bit will disable SDH format signal validation on Telecom Bus 0. Subrate Telecom Bus 0 RxD[7:0] data bus output will be disabled.</p> <p>1 - Setting this bit will enable SDH format signal validation on Telecom Bus 0. It enables RxD[7:0] data bus output upon reception of a valid SDH signal format structure.</p> <p><b>Note:</b> This bit must be enabled in SDH mode for Subrate Telecom Bus 0 operation. This bit is ignored and does not apply in SONET mode of operation.</p>                                                           |
| 5          | V1_PULSE_EN  |      | <p><b>V1 Pulse Enable</b></p> <p>This bit provides the option of using an additional pulse on the Telecom Drop Bus RxD_C1J1 output pin and Telecom Add Bus TxA_C1J1 pin to denote the location or onset of V1 Byte within the Synchronous Payload Envelope/Virtual Container of the SONET/SDH frame whenever the Telecom Bus is processing the Virtual Tributary Group/Virtual Container multi-frame boundary</p> <p>0 - Telecom Bus 0 in STS-3/STM-1 mode will not indicate a V1 pulse on RxD_C1J1V1 output pin and TxA_C1J1V1 pin to indicate VT/VC multi-frame boundary.</p> <p>1 - Telecom Bus 0 in STS-3/STM-1 mode has V1 pulse added on RxD_C1J1V1 output pin and TxA_C1J1V1 pin to indicate VT/VC multi-frame boundary</p> |
| 4          | TBUS0_MASTER |      | <p><b>Select Phase Timing Reference</b></p> <p>This bit selects TxA_C1J1V1 and TxA_PL phase timing reference when operating the Subrate Add Telecom Bus 0 in Rephase OFF mode.</p> <p>0 - Add Telecom Bus 0 timing in Slave Mode. TxA_C1J1V1 and TxA_PL</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

Rev 2.0.0

|       |             |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

Rev 2.0.0

|       |                                  |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|----------------------------------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       |                                  |     | <p>“STS1RXD_C1J1_2” output coincident to whenever the C1 and J1 bytes are being output via the “STS1RXD_2_D[7:0]” output pins.</p> <p>b. The Transmit STS-1 Telecom Bus Interface will expect the “STS1TXA_C1J1_2” input to be pulsed “high” coincident to whenever the C1 and J1 bytes are being sampled via the “STS1TXA_2_D[7:0]” input pins.</p> <p><b>1 – J1 Bytes Only</b></p> <p>This selection configures the following.</p> <p>a. The Receive STS-1 Telecom Bus Interface to only pulse the “STS1RXD_C1J1_2” output pin coincident to whenever the J1 byte is being output via the “STS1RXD_2_D[7:0]” output pins.</p> <p><b>Note:</b> In this setting, the “STS1RXD_C1J1_2” output pin will NOT be pulsed “high” whenever the C1 byte is being output via the “STS1RXD_2_D[7:0]” output pins</p> <p>b. The Transmit STS-1 Telecom Bus Interface will expect the “STS1TXA_C1J1_2” input to only be pulsed “high” coincident to whenever the J1 byte is being sampled via the “STS1TXA_2_D[7:0]” input pins.</p> <p><b>Note:</b> In this setting, the “STS1TXA_C1J1_2” input pin will NOT be pulsed “high” whenever the C1 byte is being input via the “STS1TXA_2_D[7:0]” input pins</p>                                                                                 |
| Bit 2 | STS-1 Telecom Bus Parity Odd     | R/W | <p><b>STS-1 Telecom Bus Interface Parity – ODD Parity Select – Channel 2:</b></p> <p>This READ/WRITE bit-field permits the user to configure the STS-1 Telecom Bus Interface, associated with Channel 2 to do the following.</p> <p><b>In the Receive (Drop) Direction</b></p> <p>Receive STS-1 Telecom Bus Interface will compute either the EVEN or ODD parity over the contents of the (1) STS1RXD_2_D[7:0] output pins, or (2) STS1RXD_2_D[7:0] output pins, the states of the STS1RXD_PL_2 and STS1RXD_C1J1_2 output pins (depending upon user setting for Bit 3).</p> <p><b>In the Transmit (Add) Direction</b></p> <p>Transmit STS-1 Telecom Bus Interface will compute and verify the EVEN or ODD parity over the contents of the (1) STS1TXA_2_D[7:0] input pins, or (2) STS1TXA_2_D[7:0] input pins, the states of the STS1TXA_PL_2 and STS1TXA_C1J1_2 input pins (depending upon user setting for Bit 3).</p> <p>0 – Configures Receive STS-1 (Drop) Telecom Bus Interface to compute EVEN parity and configures the Transmit STS-1 (Add) Telecom Bus Interface to verify EVEN parity.</p> <p>1 – Configures Receive STS-1 (Drop) Telecom Bus Interface to compute ODD parity and configures the Transmit STS-1 (Add) Telecom Bus Interface to verify ODD parity.</p> |
| Bit 1 | STS-1 Telecom Bus Parity Disable | R/W | <p><b>STS-1 Telecom Bus Interface - Parity Disable – Channel 2:</b></p> <p>This READ/WRITE bit-field permits the user to either enable or disable parity calculation and placement via the “STS1RXD_DP_2” output pin. Further, this bit-field also permits the user to enable or disable parity verification via the “STS1TXA_DP_2” input pin by the Transmit Telecom Bus.</p> <p>1 – Disables Parity Calculation (on the Receive Telecom Bus) and Disables Parity Verification (on the Transmit Telecom Bus).</p> <p>0 – Enables Parity Calculation and Verification</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Bit 0 | STS-1 REPHASE OFF                | R/W | <p><b>STS-1 Telecom Bus Interface – Rephase Disable – Channel 2:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Receive STS-1</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS**

|  |     |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--|-----|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | OFF |  | <p>Telecom Bus to internally compute the Pointer Bytes, based upon the data that it receives via the "RxD_D[7:0]" input pins.</p> <p><b>Note:</b> <i>If the Receive STS-1 Telecom Bus is being provided with pulses denoting the C1 and J1 bytes (via the "RxD_C1J1" input pin), then this feature is unnecessary.</i></p> <p>1 – Disable Rephase</p> <p>If the user implements this selection, then the Transmit STS-1 Telecom Bus Interface (associated with Channel 2) will rely on the signaling that is provided via the "STS1TXA_C1J1_2" and "STS1TXA_PL_2" input pins, in order to determine the location of the STS-1 SPE (within the Ingress Direction STS-1 signal) with respect to the STS-1 frame boundaries.</p> <p>0 – Enable Rephase</p> <p>If the user implements this selection, then the Transmti STS-1 Telecom Bus Interface (associated with Channel 2) will NOT rely on the signaling that is provided via the "STS1TXA_C1J1_2" and the "STS1TXA_PL_2" input pins in order to determine the location of the STS-1 SPE (within the Ingress Direction STS-1 signal) with respectg to the STS-1 frame boundaries. In this case the Transmit STS-1 TOH and POH Processor blocks (will be enabled) and will take on the role of locating the STS-1 SPE within the Ingress Direction STS-1 signal.</p> |

### 1.3 LINE INTERFACE CONTROL BLOCK

The register map for the Line Interface Control block is presented in the Table below. Additionally, a detailed description of each of the “Line Interface Control” Block registers is presented below.

The Line Interface Control Block registers provide the user with “Command and Control” over the following functional blocks.

- The Transmit STS-3/STM-1 PECL Interface block
- The Receive STS-3/STM-1 PECL Interface block
- The Clock Synthesizer Block

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33 device, with each of these “above-mentioned” functional blocks “highlighted” is presented below in Figure 1.

**Figure 1: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mapper Mode, with the Line-Interface-related blocks “High-lighted”).**

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

## 1.3.1 LINE INTERFACE CONTROL REGISTER

Table 55: Line Interface Control Register – Address Map

| ADDRESS LOCATION | REGISTER NAME                                    | DEFAULT VALUES |
|------------------|--------------------------------------------------|----------------|
| 0x0302           | Receive Line Interface Control Register – Byte 1 | 0x00           |

| 3 | Remote Serial Loop Back        |     | <b>Remote Serial Loop-back Enable:</b><br><p>This READ/WRITE bit-field permits the user to configure the 94L33 to operate in the “Remote Serial Loop-back” Mode. In this mode, the incoming (Received Data) will enter the device via the Receive STS-3/STM-1 PECL Interface Input. This signal will then be processed via the CDR (Clock and Data Recovery) Block. At this point, this input signal will proceed via two paths in parallel. In one path, the signal will proceed onto the “Receive Serial-to-Parallel” Converter and then the Receive STS-3 TOH Processor block (and so on). The other path will not proceed through the “Receive Serial-to Parallel” Converter block. Instead this signal will proceed on towards the “Transmit STS-3/STM-1 PECL Interface Output, thereby completing the loop-back path.</p> <p>0 – Configures the 94L33 to NOT operate in the Remote Serial Loop-back Mode.</p> <p>1 – Configures the 94L33 to operate in the Remote Serial Loop-back Mode.</p> |

| 1-0 | Clock Synthesizer Block Frequency Select[1:0] | R/W | <b>Clock Synthesizer Block Frequency Select[1:0]:</b><br>This READ/WRITE bit field permits the user to select the desired reference clock speed as follows:<br>00 = 19.44 MHz<br>01 = 38.88 MHz<br>10 = 51.85 MHz<br>11 = 77.76 MHz |

#### 1.4 RECEIVE STS-3 TOH PROCESSOR BLOCK

The register map for the Receive STS-3 TOH Processor Block is presented in the Table below. Additionally, a detailed description of each of the “Receive STS-3 TOH Processor” Block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Receive STS-3 TOH Processor Block “highlighted” is presented below in Figure 2

**Figure 2: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mapper Mode), with the Receive STS-3 TOH Processor Block “High-lighted”.**

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

## RECEIVE STS-3 TOH PROCESSOR BLOCK REGISTERS

Table 62: Receive STS-3 TOH Processor Block Control Register – Address Map

| ADDRESS LOCATION | REGISTER NAME                                                   | DEFAULT VALUES |
|------------------|-----------------------------------------------------------------|----------------|
| 0x1000 – 0x1102  | Reserved                                                        |                |
| 0x1103           | Receive STS-3 Transport Control Register – Byte 0               | 0x00           |
| 0x1104 – 0x1105  | Reserved                                                        | 0x00           |
| 0x1106           | Receive STS-3 Transport Status Register – Byte 1                | 0x00           |
| 0x1107           | Receive STS-3 Transport Status Register – Byte 0                | 0x02           |

The Receive STS-3 TOH Processor block will declare the RDI-L defect condition whenever it determines that bits 6, 7 and 8 (e.g., the three least significant bits) of the K2 byte contains the “1, 1, 0” pattern in 5 consecutive incoming STS-3 frames.<br>0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the RDI-L defect condition.<br>1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the RDI-L defect condition.                                                                                                                                                                                                                                                                      |
| 6          | S1 Byte Unstable Defect Declared     | R/O  | <b>S1 Byte Unstable Defect Declared:</b><br>This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the “S1 Byte Unstable” defect condition. The Receive STS-3 TOH Processor block will declare the “S1 Byte Unstable” defect condition whenever the “S1 Byte Unstable Counter” reaches the value 32. The Receive STS-3 TOH Processor block will increment the “S1 Byte Unstable Counter” each time that it receives an STS-3 frame that contains an S1 byte that differs from the previously received S1 byte. The Receive STS-3 TOH Processor block will clear the contents of the “S1 Byte Unstable Counter” to “0” whenever it receives the same S1 byte for 8 consecutive STS-3 frames.<br>0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the “S1 Byte Unstable Defect Condition.”<br>1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring “S1 Byte Unstable Defect Condition.” |
| 5          | K1, K2 Byte Unstable Defect Declared | R/O  | <b>K1, K2 Byte Unstable Defect Declared:</b><br>This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the “K1, K2 Byte Unstable” defect condition. The Receive STS-3 TOH Processor block will declare the “K1, K2 Byte Unstable” defect condition whenever it fails to receive the same set of K1, K2 bytes, in 12 consecutive STS-3 frames. The Receive STS-3 TOH Processor block will clear the “K1, K2 Byte Unstable” defect condition whenever it receives a given set of K1, K2 byte values within three consecutive STS-3 frames.<br>0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the K1, K2 Byte Unstable Defect Condition.<br>1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the K1, K2 Byte Unstable Defect Condition.                                                                                                                                            |

| 5          | Transmit AIS-P/AIS (via Downstream STS-1s/DS3s) upon LOS | R/W  | <p><b>Transmit AIS-P (via Downstream STS-1s) upon declaration of the LOS (Loss of Signal) defect condition/Transmit DS3 AIS (via Downstream DS3s) upon declaration of the LOS Defect condition:</b></p> <p>The exact function of this bit-field depends upon whether the XRT94L33 device has been configured to handle STS-1 or DS3 signals, on the “low-speed” side of the chip, as described below.</p> <p><b>For those channels that are configured to operate in the STS-1 Mode:</b></p> <p>This READ/WRITE bit-field permits the user to configure all of the active Transmit STS-1 POH Processor blocks (within the XRT94L33 device) to automatically transmit the AIS-P (Path AIS) Indicator via the “downstream” STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS defect condition.</p> <p>0 – Does not configure all “activated” Transmit STS-1 POH Processor blocks to automatically transmit the AIS-P Indicator via the “downstream” STS-1 signals, anytime the Receive STS-3 TOH Processor block declares the LOS defect condition.</p> <p>1 – Configures all “activated” Transmit STS-1POH Processor blocks to automatically transmit the AIS-P Indicator via the “downstream” STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS defect condition.</p> <p><b>Note:</b></p> <p>1. In the “long-run” the function of this bit-field is exactly the same as that of Bit 1 (Transmit AIS-P Down-stream – Upon LOS), within the Receive STS-3 Transport – Auto AIS Control Register (Address Location= 0x1163). The only difference is that this register bit will cause each of the “downstream” Transmit STS-1 POH Processor blocks to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-3 TOH Processor block declares the LOS defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the LOS defect.</p> <p>2. In the case of Bit 1 (Transmit AIS-P Downstream – Upon LOS), several SONET frame periods are required (after the Receive STS-3</p> |

|---|---------------------------------------------------------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                                         |     | <p>of Bit 5 (Transmit AIS-P Down-stream – Upon SF), within the Receive STS-3 Transport – Auto AIS Control Register (Address Location= 0x1163). The only difference is that this register bit will cause each of the “downstream” Transmit STS-1 POH Processor blocks to IMMEDIATELY begin transmit the AIS-P condition whenever the Receive STS-3 TOH Processor block declares the SF defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the SF defect.</p> <p>2. In the case of Bit 5 (Transmit AIS-P Downstream – Upon SF), several SONET frame periods are required (after the Receive STS-3 TOH Processor block has declared the SF defect), before the Transmit STS-1 POH Processor blocks will begin the process of transmitting the AIS-P indicators.</p> <p>3. In addition to setting this bit-field to “1”, the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.</p> <p><b>For those channels that are configured to operate in the DS3 Mode:</b></p> <p>This READ/WRITE bit-field permits the user to configure all of the active DS3/E3 Framer blocks (within the XRT94L33 device) to automatically transmit the DS3 AIS indicator via the “downstream” (or Egress Direction) DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SF defect condition.</p> <p>0 – Does not configure all “active” DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator via the “downstream” DS3 signals, anytime the Receive STS-3 TOH Processor block declares the SF defect condition.</p> <p>1 – Configures all “active” DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator via the “downstream” DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SF defect condition.</p> <p><b>NOTE:</b> In addition to setting this bit-field to “1”, the user must also set Bit 0 (Transmit AIS-P/AIS via Downstream STS-1s/DS3s Enable) within this register, in order to enable this feature.</p> |
| 1 | AIS-L Output Enable                                     | R/W | <p><b>AIS-L Output Enable:</b></p> <p>This READ/WRITE bit-field, along with Bits 7 (8kHz or STUFF Out Enable) within the “Operation Output Control Register – Byte 1” (Address Location= 0x0150) permit the user to configure the “AIS-L” indicator to be output via the “LOF” output pin (pin AD11).</p> <p>If Bit 7 (within the “Operation Output Control Register – Byte 1”) is set to “0”, then setting this bit-field to “1” configures pin AD11 to function as the AIS-L output indicator.</p> <p>If Bit 7 (within the “Operation Output Control Register – Byte 1”) is set to “0”, then setting this bit-field to “0” configures pin AD11 to function as the LOF output indicator.</p> <p>If Bit 7 (within the “Operation Output Control Register – Byte 1”) is set to “1”, then this register bit is ignored.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### 1.5 RECEIVE STS-3C POH PROCESSOR BLOCK

The register map for the Receive STS-3c POH Processor Block is presented in the Table below. Additionally, a detailed description of each of the “Receive STS-3c POH Processor” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Receive STS-3c POH Processor Block “highlighted” is presented below in Figure 2.

It should be noted that for Mapper Aggregation Applications, the Receive STS-3c POH Processor block is only active if the user has configured the XRT94L33 device to handle STS-3c data via STS-1 Telecom Bus Interface # 1. The Receive STS-3c POH Processor block is also active if the user configures the XRT94L33 device to operate in the “ATM UNI” or “PPP Packet over STS-3c” Mode. For details on XRT94L33 device operate in the ATM or PPP Mode, the user should consult the “XRT94L33 Register Map/Description for ATM/PPP Applications” document.

**Figure 2: Illustration of the Functional Block Diagram of the XRT94L33, with the Receive STS-3c POH Processor Block “High-lighted”.**

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

## 1.5.1 RECEIVE STS-3c POH PROCESSOR BLOCK REGISTER

Table 119: Receive STS-3c POH Processor Block Register - Address Map

| ADDRESS LOCATION | REGISTER NAME                                                | DEFAULT VALUES |
|------------------|--------------------------------------------------------------|----------------|
| 0x1000 – 0x1181  | Reserved                                                     | 0x00           |
| 0x1182           | Receive STS-3c Path – Control Register – Byte 1              | 0x00           |
| 0x1183           | Receive STS-3c Path – Control Register – Byte 0              | 0x00           |
| 0x1184, 0x1185   | Reserved                                                     | 0x00           |
| 0x1186           | Receive STS-3c Path – Status Register – Byte 1               | 0x00           |
| 0x1187           | Receive STS-3c Path – Status Register – Byte 0               | 0x00           |
| 0x1188           | Reserved                                                     | 0x00           |
| 0x1189           | Receive STS-3c Path – Interrupt Status Register – Byte 2     | 0x00           |
| 0x118A           | Receive STS-3c Path – Interrupt Status Register – Byte 1     | 0x00           |
| 0x118B           | Receive STS-3c Path – Interrupt Status Register – Byte 0     | 0x00           |
| 0x118C           | Reserved                                                     | 0x00           |
| 0x118D           | Receive STS-3c Path – Interrupt Enable Register – Byte 2     | 0x00           |
| 0x118E           | Receive STS-3c Path – Interrupt Enable Register – Byte 1     | 0x00           |
| 0x118F           | Receive STS-3c Path – Interrupt Enable Register – Byte 0     | 0x00           |
| 0x1190 – 0x1192  | Reserved                                                     | 0x00           |
| 0x1193           | Receive STS-3c Path – SONET Receive RDI-P Register           | 0x00           |
| 0x1194, 0x1195   | Reserved                                                     | 0x00           |
| 0x1196           | Receive STS-3c Path – Received Path Label Byte (C2) Register | 0x00           |
| 0x1197           | Receive STS-3c Path – Expected Path Label Byte (C2) Register | 0x00           |
| 0x1198           | Receive STS-3c Path – B3 Error Count Register – Byte 3       | 0x00           |
| 0x1199           | Receive STS-3c Path – B3 Error Count Register – Byte 2       | 0x00           |
| 0x119A           | Receive STS-3c Path – B3 Error Count Register – Byte 1       | 0x00           |
| 0x119B           | Receive STS-3c Path – B3 Error Count Register – Byte 0       | 0x00           |
| 0x119C           | Receive STS-3c Path – REI-P Error Count Register – Byte 3    | 0x00           |
| 0x119D           | Receive STS-3c Path – REI-P Error Count Register – Byte 2    | 0x00           |

During the next SONET frame period, this value will be overridden with a new Z5 byte value.</p> |

**3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS**
**1.6 REDUNDANT RECEIVE STS-3 TOH PROCESSOR BLOCK**

The register map for the Redundant Receive STS-3 TOH Processor Block is presented in the Table below. Additionally, a detailed description of each of the “Redundant Receive STS-3 TOH Processor” Block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Redundant Receive STS-3 TOH Processor Block “highlighted” is presented below in Figure 3.

**NOTE:** The Redundant Receive STS-3 TOH Processor block is only active if the user has configured the XRT94L33 device to support Line APS Applications.

**Figure 3: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mapper Mode), with the Redundant Receive STS-3 TOH Processor Block “High-lighted”.**

# REDUNDANT RECEIVE STS-3 TOH PROCESSOR BLOCK REGISTER

**Table 157: Redundant Receive STS-3 TOH Processor Block Control Register – Address Map**

| ADDRESS LOCATION | REGISTER NAME                                                        | DEFAULT VALUES |
|------------------|----------------------------------------------------------------------|----------------|
| 0x1600 – 0x1702  | Reserved                                                             |                |

If the Redundant Receive STS-3 TOH Processor block is configured to count REI-L events on a “per-bit” basis, then it will increment this 32 bit counter by the value within the REI-L fields of the M1 byte within each incoming STS-3 frame.</li> <li>2. If the Redundant Receive STS-3 TOH Processor block is configured to count REI-L events on a “per-frame” basis, then it will increment this 32 bit counter each time that it receives an STS-3 frame that contains a non-zero M1 byte value.</li> </ol> |

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

| 3 - 0      | RxTOH_CLOCK_SPEED[7:0] | R/W  | <p><b>RxTOHClk Output Clock Signal Speed:</b></p> <p>These READ/WRITE bit-fields permit the user to specify the frequency of the “RxTOHClk” output clock signal.</p> <p>The formula that relates the contents of these register bits to the “RxTOHClk” frequency is presented below.</p> $\text{FREQ} = 19.44 / [2 * (\text{RxTOH\_CLOCK\_SPEED} + 1)]$ <p><b>Note:</b> For STS-3/STM-1 applications, the frequency of the RxTOHClk output signal must be in the range of 0.6075MHz to 9.72MHz</p> |

### 1.7 TRANSMIT STS-3 TOH PROCESSOR BLOCK

The register map for the Transmit STS-3 TOH Processor Block is presented in the Table below. Additionally, a detailed description of each of the “Transmit STS-3 TOH Processor” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Transmit STS-3 TOH Processor Block” highlighted is presented below in Figure 4

**Figure 4: Illustration of the Functional Block Diagram of the XRT94L33, with the Transmit STS-3 TOH Processor Block “High-lighted”.**

| 3 - 0      | TxTOH_CLOCK_SPEED[7:0] | R/W  | <p><b>TxTOHClk Output Clock Signal Speed:</b></p> <p>These READ/WRITE bit-fields permits the user to specify the frequency of the “TxTOHClk output clock signal.</p> <p>The formula that relates the contents of these register bits to the “TxTOHClk” frequency is presented below.</p> $\text{FREQ} = 19.44 / [2 * (\text{TxTOH\_CLOCK\_SPEED} + 1)]$ <p><b>Note:</b> For STS-3/STM-1 applications, the frequency of the TxTOHClk output signal must be in the range of 0.6075MHz to 9.72MHz</p> |

### 1.8 TRANSMIT STS-3C POH PROCESSOR BLOCK REGISTERS

The register map for the Transmit STS-3c POH Processor Block is presented in the Table below. Additionally, a detailed description of each of the “Transmit STS-3c POH Processor” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Transmit STS-3c POH Processor Block” highlighted is presented below in Figure 5.

**Figure 5: Illustration of the Functional Block Diagram of the XRT94L33, with the Transmit STS-3c POH Processor Block “High-lighted”.**

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

## 1.8.1 TRANSMIT STS-3c POH PROCESSOR BLOCK REGISTERS

Table 232: Transmit STS-3c POH Processor Block - Register Address Map

| ADDRESS LOCATION | REGISTER NAME                                                      | DEFAULT VALUES |
|------------------|--------------------------------------------------------------------|----------------|
| 0x1900 – 0x1981  | Reserved                                                           | 0x00           |
| 0x1982           | Transmit STS-3c Path – SONET Control Register – Byte 1             | 0x00           |
| 0x1983           | Transmit STS-3c Path – SONET Control Register – Byte 0             | 0x00           |
| 0x1984 – 0x1992  | Reserved                                                           | 0x00           |
| 0x1993           | Transmit STS-3c Path – Transmit J1 Byte Value Register             | 0x00           |
