| 3 – 0      | TxPOH Clock Speed [3:0] | R/W  | <p><b>TxPOHClk Output Clock Signal Speed:</b></p> <p>These READ/WRITE bit-fields permit the user to specify the frequency of the “TxPOHClk output clock signal. The formula that relates the contents of these register bits to the “TxPOHClk” frequency is presented below.</p> $FREQ = 19.44/[2 * (TxPOH\_CLOCK\_SPEED + 1)]$ <p><b>Note:</b> For STS-3/STM-1 applications, the frequency of the RxPOHClk output signal must be in the range of 0.304MHz to 9.72MHz</p> |

**3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS**
**1.9 RECEIVE SONET POH PROCESSOR BLOCK**

The register map for the Receive SONET POH Processor Block is presented in the Table below. Additionally, a detailed description of each of the “Receive SONET POH Processor” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Receive SONET POH Processor Block” “highlighted” is presented below in Figure 6

**Figure 6: Illustration of the Functional Block Diagram of the XRT94L33, with the Receive SONET POH Processor Block “High-lighted”.**

### 1.10 DS3/E3 FRAMER BLOCK

The register map for the DS3/E3 Framer Block is presented in the Table below. Additionally, a detailed description of each of the “DS3/E3 Framer” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “DS3/E3 Framer Block “highlighted” is presented below in Figure 7.

**Figure 7: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mode), with the DS3/E3 Framer Block “Highlighted”**

| 4          | RxFERF Algo   | R/W  | <p><b>Receive FERF Algorithm Select:</b></p> <p>This READ/WRITE bit-field permits the user to select the “FERF Declaration” and “Clearance” criteria that will be used by the Primary Frame Synchronizer block.</p> <p>0 – The Primary Frame Synchronizer block declares the FERF/RDI defect condition if the “A” bit-field (within the incoming E3 data-stream) is set to “1” for 3 consecutive frames. The Primary Frame Synchronizer block will clear the FERF/RDI defect condition if the “A” bit-field is set to “0” for 3 consecutive frames.</p> <p>1 – The Primary Frame Synchronizer block declares the FERF/RDI defect condition if the “A” bit-field (within the incoming E3 data-stream) is set to “1” for 5 consecutive frames. The Primary Frame Synchronizer block will clear the FERF/RDI defect condition if the “A” bit-field is set to “0” for 5 consecutive frames.</p> <p><b>NOTE:</b> This bit-field is only valid if the DS3/E3 Framer block has been configured to operate in the E3, ITU-T G.751 Framing format.</p> |

| 7          | RxLAPD Any             | R/W  | <p><b>Receive LAPD – Any kind:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Receive LAPD Controller sub-block to receive any kind of LAPD Message (or HDLC Message) with a size of 82 bytes or less. If the user implements this option, then the Receive LAPD Controller sub-block will be capable of receiving any kind of HDLC Message (with any value of header bytes). The only restriction is that the size of the HDLC Message must not exceed 82 bytes.</p> <p>0 – Does not invoke this “Any Kind of HDLC Message” feature. In this case, the Receive LAPD Controller sub-block will only receive HDLC Messages that contains the Bellcore GR-499-CORE values for SAPI and TEI.</p> <p>1 - Invokes this “Any Kind of HDLC Message” feature. In this case, the Receive LAPD Controller sub-block will be able to receive HDLC Messages that contain any header byte values.</p> <p><b>Note:</b> This bit-field is ignored if the Primary Frame Synchronizer block is bypassed.</p> <p>The user can determine the size (or byte count) of the most recently received LAPD/PMDL Message, by reading the contents of the “Receive LAPD Byte Count” Register (Address Location= 0xN384).</p> |
| 6          | Message Check Disable  | R/W  | <p><b>Message Check Disable:</b></p> <p>This READ/WRITE bit-field permits the user to either enable or disable the new message comparison logic. If the user disables the new message comparison logic, then every message received would generate an interrupt.</p> <p>0 – Enables the new message comparison logic</p> <p>1 – Disables the new message comparison logic</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|------------|---------------------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7          | RxLAPD Any                | R/W  | <p><b>Receive LAPD – Any kind:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Receive LAPD Controller sub-block (within the Primary Frame Synchronizer block) to receive any kind of LAPD Message (or HDLC Message) with a size of 82 bytes or less. If the user implements this option, then the Receive LAPD Controller sub-block will be capable of receiving any kind of HDLC Message (with any value of header bytes). The only restriction is that the size of the HDLC Message must not exceed 82 bytes.</p> <p>0 – Does not invoke this “Any Kind of HDLC Message” feature. In this case, the Receive LAPD Controller sub-block will only receive HDLC Messages that contains the Bellcore GR-499-CORE values for SAPI and TEI.</p> <p>1-Invokes this “Any Kind of HDLC Message” feature. In this case, the Receive LAPD Controller sub-block will be able to receive HDLC Messages that contain any header byte values.</p> <p><b>Note:</b> This bit-field is ignored if the Primary Frame Synchronizer block is bypassed.</p> <p>The user can determine the size (or byte count) to the most recently received LAPD/PMDL Message, by reading the contents of the “RxLAPD Byte Count” Register (Address Location= 0xN384).</p> |
| 6          | Message Check Disable     | R/W  | <p><b>Message Check Disable:</b></p> <p>This READ/WRITE bit-field permits the user to either enable or disable the new message comparison logic. If the user disables the new message comparison logic, then every message received would generate an interrupt.</p> <p>0 – Enables the new message comparison logic</p> <p>1 – Disables the new message comparison logic</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|------------|------------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7          | Force TxFERF/RDI | R/W  | <p><b>Force Transmit Yellow Alarm (FERF/RDI) indicator:</b></p> <p>This READ/WRITE bit-field permits the user to force the Frame Generator block to transmit the FERF/RDI indicator to the remote terminal equipment by setting both of the X-bits (within each outbound DS3 frame) to "0".</p> <p>0 – Does not force the DS3/E3 Frame Generator block to transmit the FERF/RDI indicator. In this case, the DS3/E3 Frame Generator block will set the "X" bits (within each outbound DS3 frame) to the appropriate value, depending upon receive conditions (as detected by the Primary Frame Synchronizer block).</p> <p>1 – Forces the DS3/E3 Frame Generator block to transmit the FERF/RDI indicator. In this case, the DS3/E3 Frame Generator block will force the "X" bits (within each outbound DS3 frame) to "0". Thereby transmitting the FERF/RDI indicator to the remote terminal equipment.</p> <p><b>NOTE:</b> For normal operation, (e.g., where the DS3/E3 Frame Generator block will automatically transmit the FERF/RDI indicator whenever the Primary Frame Synchronizer block declares either the LOS, AIS or LOF/OOF defect condition), the user MUST set this bit-field to "0"</p> |
| 6          | Tx X-Bits        | R/W  | <p><b>Force X bits to "1":</b></p> <p>This READ/WRITE bit-field permits the user to force the DS3/E3 Frame Generator block to set the X-bits (within each outbound DS3 frame) to "1".</p> <p>0 – Configures the DS3/E3 Frame Generator block to automatically set the "X" bits to the appropriate value, depending upon the receive conditions (as detected by the corresponding Primary Frame Synchronizer block).</p> <p>1 – Configures the DS3/E3 Frame Generator block to force all of the "X" bits (within the outbound DS3 data-stream) to "1". In this configuration setting, the DS3/E3 Frame Generator block will set all "X" bits to "1" independent of whether the corresponding Primary Frame Synchronizer block is currently declaring any defect conditions.</p> <p><b>NOTE:</b> For normal operation (e.g., where the DS3/E3 Frame Generator block will automatically transmit the FERF/RDI indicator whenever the Primary Frame Synchronizer block declares the LOS, AIS or LOF/OOF defect condition) the user MUST set this bit-field to "0".</p>                                                                                                                                       |
| 5          | TxIdle           | R/W  | <p><b>Transmit DS3 Idle Signal:</b></p> <p>This READ/WRITE bit-field permits the user to force the DS3/E3 Frame Generator block to transmit the DS3 Idle signal pattern to the remote terminal equipment, as described below.</p> <p>0 – Configures the DS3/E3 Frame Generator block to transmit normal traffic to the remote terminal equipment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|   |                     |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 7          | TxLAPD Any      | R/W  | <p><b>Transmit LAPD – Any kind:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Transmit LAPD Controller sub-block (within the DS3/E3 Frame Generator block) to transmit any kind of LAPD Message (or HDLC Message) with a size of 82 byte or less. If the user implements this option, then the Transmit LAPD Controller sub-block will be capable of transmitting any kind of HDLC frame (with any value of header bytes). The only restriction is that the size of the HDLC frame must not exceed 82 bytes.</p> <p>0 – Does not invoke this “Any Kind of HDLC Message” feature. In this case, the LAPD Transmitter will only transmit HDLC Messages that contains the Bellcore GR-499-CORE values for SAPI and TEI.</p> <p>1- Invokes this “Any Kind of HDLC Message” feature. In this case, the LAPD Transmitter will be able to transmit HDLC Messages that contain any header byte values.</p> <p><b>Note:</b> If the user invokes the “Any Kind of HDLC Message” feature, then he/she must indicate the size of the information payload (in terms of bytes) within the “Transmit LAPD Byte Count” Register (Address Location=0xN383).</p>                                                                                                                       |
| 6 - 4      | Unused          | R/O  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3          | Auto Retransmit | R/W  | <p><b>Auto-Retransmit of LAPD Message:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Transmit LAPD Controller sub-block to transmit PMDL messages, repeatedly at one-second intervals. Once the user enables this feature, and then commands the Transmit LAPD Controller sub-block to transmit a given PMDL Message; the Transmit LAPD Controller sub-block will then proceed to transmit this PMDL Message (based upon the contents within the Transmit LAPD Message Buffer) repeatedly at one-second intervals.</p> <p>0 – Disables the Auto-Retransmit Feature.</p> <p>In this case, the PMDL Message will only be transmitted once. Afterwards the Transmit LAPD Controller sub-block will proceed to transmit a continuous stream of Flag Sequence octets (0x7E) via the DL bits, within each output DS3 frame. No more PMDL Messages will be transmitted until the user commands another transmission.</p> <p>1 – Enables the Auto-Retransmit Feature.</p> <p>In this case, the Transmit LAPD Controller sub-block will transmit PMDL messages (based upon the contents within the Transmit LAPD Message Buffer) repeatedly at one-second intervals.</p> <p><b>Note:</b> This bit-field is ignored if the Transmit LAPD Controller sub-block is disabled.</p> |

| 1              | 1              | The Companion Primary Frame Synchronizer block. In this case, the A bit will transmit the FEBE indicator to the remote terminal equipment. The A bit will be set to “1” when the companion Primary Frame Synchronizer block detects a BIP-4 error, and will be set to “0” when the Primary Frame Synchronizer block detects un-erred E3 frames. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                |  |                           |   |   |                                                                                         |   |   |                         |   |   |                                                                                                                                                          |   |   |                                                                                                                                                                                                                                                                                                                                                 |

| 5          | Transmit PDI-P (Down-stream) upon LOS | R/W  | <p><b>Transmit PDI-P indicator (Down-stream) upon declaration of the DS3/E3 LOS defect condition:</b></p> <p>This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block (via the Secondary Frame Synchronizer block) and the Transmit SONET POH Processor block to automatically transmit the PDI-P (Path – Payload Defect Indicator) anytime the LOS defect is declared within the DS3/E3 Ingress Path.</p> <p>More specifically, if this configuration is implemented then the following events will occur.</p> <p>If the Secondary Frame Synchronizer block is operating in the “DS3/E3 Ingress” path (e.g., if the DS3/E3 Framer block has been configured to operate in Frame Generator/Frame Synchronizer Configuration # 0xC0), and if it were to declare the LOS defect condition (within the Ingress Path), then the corresponding Transmit SONET POH Processor block will automatically transmit the PDI-P indicator (via its STS-1 signal, within the outbound composite STS-3 signal) by setting the C2 byte (within each “down-stream” STS-1 SPE) to the value “0xFC”. The Transmit SONET POH Processor block will continue to transmit the PDI-P indicator for the duration that the Secondary Frame Synchronizer block declares the LOS defect condition.</p> <p>Once the Secondary Frame Synchronizer block clears the LOS defect, then the Transmit SONET POH Processor block will automatically terminate its transmission of the PDI-P indicator by setting the C2 byte (within each “down-stream” STS-1 SPE) to the value “0x04”.</p> <p>0 – Disables this “Transmit PDI-P (Down-stream) upon LOS feature.”</p> <p>1 – Enables this “Transmit PDI-P (Down-stream) upon LOS feature.”</p> <p><b>NOTE:</b> The user should only invoke this feature if the Secondary Frame Synchronizer block has been configured to operate in the DS3/E3 Ingress Path.</p> |
| 4          | Transmit AIS (Down-stream) upon LOS   | R/W  | <p><b>Transmit the DS3/E3 AIS Indicator (Down-stream) upon declaration of the LOS defect condition:</b></p> <p>This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block to do the following, if the LOS defect is declared.</p> <p>If the Secondary Frame Synchronizer block declares the LOS defect (within its Receive Path) then it will automatically force the corresponding “DS3/E3 Frame Generator” block to generate and transmit the DS3/E3 AIS indicator. In this case, the DS3/E3 Frame Generator block will transmit the AIS indicator (in the down-stream path) for the duration that the Secondary Frame Synchronizer block declares the LOS defect condition.</p> <p>Once the Secondary Frame Synchronizer block clears the LOS defect condition,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|   |                                       |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|   |                                       |     | <p>then the DS3/E3 Frame Generator block will automatically terminate its transmission of the DS3/E3 AIS indicator, and will permit normal DS3/E3 traffic to pass through the DS3/E3 Framer block (towards the down-stream signal path).</p> <p>0 – Disables the “Transmit AIS (Down-stream) upon LOS feature.</p> <p>1 – Enables the “Transmit AIS (Down-stream) upon LOS feature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 3 | Transmit PDI-P (Down-stream) upon LOF | R/W | <p><b>Transmit PDI-P Indicator (Down-stream) upon declaration of the DS3/E3 LOF defect condition:</b></p> <p>This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block (via the Secondary Frame Synchronizer block) and the corresponding Transmit SONET POH Processor block to automatically transmit the PDI-P (Path – Payload Defect Indicator) anytime the LOF defect is declared within the DS3 Ingress Path.</p> <p>More specifically, if this configuration is implemented then the following events will occur.</p> <p>If the Secondary Frame Synchronizer block is operating in the “DS3/E3 Ingress” path (e.g., if the DS3/E3 Framer block has been configured to operate in Frame Generator/Frame Synchronizer Configuration # 0xC0), and if it were to declare the LOF defect condition (within the Ingress Path), then the corresponding Transmit SONET POH Processor block will automatically transmit the PDI-P indicator (via its STS-1 signal, within the outbound composite STS-3 signal) by setting the C2 byte (within each “down-stream” STS-1 SPE) to the value “0xFC”. The Transmit SONET POH Processor block will continue to transmit the PDI-P indicator for the duration that the Secondary Frame Synchronizer block declares the LOF defect condition.</p> <p>Once the Secondary Frame Synchronizer block clears the LOF defect, then the Transmit SONET POH Processor block will automatically terminate its transmission of the PDI-P indicator by setting the C2 byte (within each “down-stream” STS-1 SPE) to the value “0x04”.</p> <p>0 – Disables this “Transmit PDI-P (Down-stream) upon LOF feature.</p> <p>1 – Enables this “Transmit PDI-P (Down-stream) upon LOF feature.</p> <p><b>NOTE:</b> The user should only invoke this feature if the Secondary Frame Synchronizer block has been configured to operate in the DS3/E3 Ingress Path.</p> |
| 2 | Transmit AIS (Down-stream) upon LOF   | R/W | <p><b>Transmit the DS3/E3 AIS Indicator (Down-stream) upon declaration of the LOF defect condition:</b></p> <p>This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block to do the following, if the LOF defect is declared.</p> <p>If the Secondary Frame Synchronizer block declares the LOF defect (within its Receive Path) then it will automatically force the corresponding “DS3/E3 Frame Generator” block to generate and transmit the DS3/E3 AIS indicator. In this case, the DS3/E3 Frame Generator block will transmit the AIS indicator (in the down-stream path) for the duration that the Secondary Frame Synchronizer block declares the LOF defect condition.</p> <p>Once the Secondary Frame Synchronizer block clears the LOF defect condition, then the DS3/E3 Frame Generator block will automatically terminate its transmission of the DS3/E3 AIS indicator, and will permit normal DS3/E3 traffic to pass through the DS3/E3 Framer block (towards the down-stream signal path).</p> <p>0 – Disables the “Transmit AIS (Down-stream) upon LOF feature.</p> <p>1 – Enables the “Transmit AIS (Down-stream) upon LOF feature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1 | Transmit PDI-P (Down-stream) upon     | R/W | <p><b>Transmit PDI-P Indicator (Down-stream) upon declaration of the DS3/E3 AIS defect condition:</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

Rev 2.0.0

|   |                                     |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---|-------------------------------------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | AIS                                 |     | <p>This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block (via the Secondary Frame Synchronizer block) and the corresponding Transmit SONET POH Processor block to automatically transmit the PDI-P (Path – Payload Defect Indicator) anytime the AIS defect is declared within the DS3 Ingress Path.</p> <p>More specifically, if this configuration is implemented then the following events will occur.</p> <p>If the Secondary Frame Synchronizer block is operating in the “DS3/E3 Ingress” path (e.g., if the DS3/E3 Framer block has been configured to operate in Frame Generator/Frame Synchronizer Configuration # 0xC0), and if it were to declare the AIS defect condition (within the Ingress Path), then the corresponding Transmit SONET POH Processor block will automatically transmit the PDI-P indicator (via its STS-1 signal, within the outbound composite STS-3 signal) by setting the C2 byte (within each “down-stream” STS-1 SPE) to the value “0xFC”. The Transmit SONET POH Processor block will continue to transmit the PDI-P indicator for the duration that the Secondary Frame Synchronizer block declares the AIS defect condition.</p> <p>Once the Secondary Frame Synchronizer block clears the AIS defect, then the Transmit SONET POH Processor block will automatically terminate its transmission of the PDI-P indicator by setting the C2 byte (within each “down-stream” STS-1 SPE) to the value “0x04”.</p> <p>0 – Disables this “Transmit PDI-P (Down-stream) upon AIS feature.</p> <p>1 – Enables this “Transmit PDI-P (Down-stream) upon AIS feature.</p> <p><b>NOTE:</b> The user should only invoke this feature if the Secondary Frame Synchronizer block has been configured to operate in the DS3/E3 Ingress Path.</p> |
| 0 | Transmit AIS (Down-stream) upon AIS | R/W | <p><b>Transmit the DS3/E3 AIS Indicator (Down-stream) upon declaration of the AIS defect condition:</b></p> <p>This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block to do the following, if the AIS defect is declared.</p> <p>If the Secondary Frame Synchronizer block declares the AIS defect (within its Receive Path) then it will automatically force the corresponding “DS3/E3 Frame Generator” block to generate and transmit the DS3/E3 AIS indicator. In this case, the DS3/E3 Frame Generator block will transmit the AIS indicator (in the down-stream path) for the duration that the Secondary Frame Synchronizer block declares the AIS defect condition.</p> <p>Once the Secondary Frame Synchronizer block clears the AIS defect condition, then the DS3/E3 Frame Generator block will automatically terminate its transmission of the DS3/E3 AIS indicator, and will permit normal DS3/E3 traffic to pass through the DS3/E3 Framer block (towards the down-stream signal path).</p> <p>0 – Disables the “Transmit AIS (Down-stream) upon AIS feature.</p> <p>1 – Enables the “Transmit AIS (Down-stream) upon AIS feature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|------------|--------------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 – 0      | PMON Holding Value | R/O  | <p><b>PMON Holding Value:</b><br/>           These READ-ONLY bit-fields were specifically allocated to support READ operations to the PMON (Performance Monitor) Registers, within the DS3/E3 Framer blocks.</p> <p>Since the PMON Register (within the DS3/E3 Framer block) are 16-bit registers. Therefore, given that the bi-directional data bus of the XRT94L33 is only 8-bits wide, it will require two read operations in order to read out the entire 16 bit content of these registers.</p> <p>The other thing to note is that the PMON Registers (within the DS3/E3 Framer blocks) are RESET-upon-READ type registers. As consequence, the entire 16-bit contents of a given PMON Register will be cleared to “0x0000” immediately after the user has executed the first (of two) read operations to this register. In order to avoid losing the contents of the other byte, the contents of the “un-read” byte is automatically loaded into this register.</p> <p>Hence, once the user reads a register, from a given PMON Register, he/she is suppose to obtain the contents of the other byte, by reading the contents of this register.</p> |

The register map for the Transmit SONET POH Processor Block is presented in the Table below. Additionally, a detailed description of each of the “Transmit SONET POH Processor” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Transmit SONET POH Processor Block “highlighted” is presented below in Figure 8.

**Figure 8: Illustration of the Functional Block Diagram of the XRT94L33, with the Transmit SONET POH Processor Block “High-lighted”.**

| 0      | 0     | 0     | 0                      | 0     | 0     | 0     | 0     |

| BIT NUMBER | NAME                   | TYPE | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|------------------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 - 4      | Unused                 | R/O  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3 - 0      | TxPOH_CLOCK_SPEED[7:0] | R/W  | <p><b>TxPOHClk Output Clock Signal Speed:</b></p> <p>These READ/WRITE bit-fields permit the user to specify the frequency of the “TxPOHClk” output clock signal.</p> <p>The formula that relates the contents of these register bits to the “TxPOHClk” frequency is presented below.</p> $\text{FREQ} = 19.44 / [2 * (\text{TxPOH\_CLOCK\_SPEED} + 1)]$ <p><b>Note:</b> For STS-3/STM-1 applications, the frequency of the RxPOHClk output signal must be in the range of 0.304MHz to 9.72MHz</p> |

### 1.12 DS3/E3 MAPPER BLOCK CONTROL BLOCK

The register map for the DS3/E3 Mapper Block is presented in the Table below. Additionally, a detailed description of each of the “DS3/E3 Mapper” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “DS3/E3 Mapper” Block “highlighted” is presented below in Figure 9

**Figure 9: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mode), with the DS3/E3 Mapper Block “High-lighted”.**

| BIT NUMBER | NAME                   | TYPE | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|------------------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7          | STS-1 POH Pass Thru    | R/W  | <p><b>STS-1 POH (Path Overhead) Pass-Thru:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Transmit STS-1 circuitry (within this particular channel) to operate in the “STS-1 POH Pass-Thru” Mode. If the user configures the Channel to operate in the “STS-1 POH Pass-Thru” Mode, then the Transmit (or Egress Direction) STS-1 circuitry will use the “upstream” Receive SONET POH Processor block as the source for the POH bytes within each outbound STS-1 SPE. In the “STS-1 POH Pass Thru” Mode, the Transmit STS-1 POH Processor block will be disabled and will NOT assume the responsibility for computing and inserting the POH byte values into the “POH byte-positions” within the “Transmit (or Egress Direction) STS-1 SPEs. The POH bytes (within these STS-1 SPEs) will pass from the Receive SONET POH Processor block to the Transmit STS-1 TOH Processor block without modification.</p> <p>If the user does NOT configure the Transmit STS-1 circuitry to operate in the “STS-1 POH Pass-Thru” Mode, then the POH bytes (within these STS-1 SPEs) will undergo “modification” as they pass from the Receive SONET POH Processor block to the Transmit STS-1 TOH Processor block (via the Transmit STS-1 POH Processor block).</p> <p>0 – Configures the Transmit STS-1 circuitry to NOT operate in the “STS-1 POH Pass-Thru” Mode.</p> <p>1 – Configures the Transmit STS-1 circuitry to operate in the “STS-1 POH Pass-Thru” Mode.</p> <p><b>NOTES:</b></p> <ol style="list-style-type: none"> <li>1. The “STS-1 POH Pass-Thru” Mode will be disabled, if the channel is configured to operate in the Loop-Timing Mode.</li> <li>2. The “STS-1 POH Pass-Thru” Mode is very useful for those applications in which the XRT94L33 device is handling STS-1 data-stream that is transporting VT-Mapped T1/E1 data-streams (in which it is imperative that the user retain the value of the H4 byte).</li> <li>3. This register bit is only active if a given channel (on the “Slow-Speed” Side of the XRT94L33 device) has been configured to operate in the STS-1 Mode. This register bit is NOT active if a given channel has been configured to operate in the DS3/E3 Mode.</li> </ol> |
| 6          | STS-1 Remote Loop-back | R/W  | <p><b>STS-1 Remote Loop-back Operation:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Channel to operate in the Remote Loop-back Mode.</p> <p>0 – No Loop-back Mode</p> <p>1 – Remote Loop-back Mode</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|   |                       |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

#### 1.13 RECEIVE STS-1 TOH AND POH PROCESSOR BLOCK

The register map for the Receive STS-1 TOH and POH Processor Block is presented in the Table below. Additionally, a detailed description of each of the “Receive STS-1 TOH and POH Processor” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Receive STS-1 TOH and POH Processor Blocks” “highlighted” is presented below in Figure 10

**Figure 10: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mode), with the Receive STS-1 TOH and POH Processor Blocks “High-lighted”.**

## RECEIVE STS-1 TOH AND POH PROCESSOR BLOCK REGISTER

Table 451: Receive STS-1 TOH and POH Processor Block Control Register Address Map

| ADDRESS LOCATION | REGISTER NAME                                              | DEFAULT VALUES |
|------------------|------------------------------------------------------------|----------------|

| 7          | RDI-L Defect Declared                | R/O  | <b>RDI-L Defect Declared Indicator:</b><br>This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is detecting the RDI-L (Line-Remote Defect Indicator) defect condition, within the incoming STS-1 signal. The Receive STS-1 TOH Processor block will declare the RDI-L defect condition whenever bits 6, 7 and 8 (e.g., the three least significant bits) of the K2 byte contains the “1, 1, 0” pattern in 5 consecutive incoming STS-1 frames.<br>0 – Indicates that the RDI-L defect condition is NOT currently being declared.<br>1 – Indicates that the RDI-L defect condition is currently being declared.                                                                                                                                                                                                                                                                                                                                         |
| 6          | S1 Byte Unstable Defect Declared     | R/O  | <b>S1 Byte Unstable Defect Declared:</b><br>This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the “S1 Byte Unstable” defect condition. The Receive STS-1 TOH Processor block will declare the “S1 Byte Unstable” defect condition whenever the “S1 Byte Unstable Counter” reaches the value 32. The “S1 Byte Unstable Counter” is incremented for each time that the Receive STS-1 TOH Processor block receives an STS-1 frame that contains an S1 byte that differs from the previously received S1 byte. The “S1 Byte Unstable Counter” is cleared to “0” when the same S1 byte is received for 8 consecutive STS-1 frames.<br><b>Note:</b> Receiving a given S1 byte, in 8 consecutive STS-1 frames also sets this bit-field to “0”.<br>0 – Indicates that the S1 Byte Unstable Defect Condition is NOT currently being declared.<br>1 – Indicates that the S1 Byte Unstable Defect Condition is currently being declared. |
| 5          | K1, K2 Byte Unstable Defect Declared | R/O  | <b>K1, K2 Byte Unstable Defect Declared:</b><br>This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the “K1, K2 Byte Unstable” defect condition. The Receive STS-1 TOH Processor block will declare the “K1, K2 Byte Unstable” defect condition whenever the Receive STS-1 TOH Processor block fails to receive the same set of K1, K2 bytes, in 12 consecutive incoming STS-1 frames. The “K1, K2 Byte Unstable” defect condition is cleared whenever the Receive STS-1 TOH Processor block has received a given set of K1, K2 byte values within three consecutive incoming STS-1 frames.<br>0 – Indicates that the K1, K2 Byte Unstable Defect Condition is NOT currently being declared.<br>1 – Indicates that the K1, K2 Byte Unstable Defect Condition is currently being declared.                                                                                                                                       |

|   |                     |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 5          | Transmit AIS-P (via Downstream STS-1s) upon LOS | R/W  | <p><b>Transmit AIS-P (via Downstream STS-1s) upon declaration of the LOS (Loss of Signal) defect condition:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block (in the corresponding channel) to automatically transmit the AIS-P (Path AIS) Indicator via the “downstream” STS-1 signal (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the LOS defect condition.</p> <p>0 – Does not configure the corresponding Transmit SONET POH Processor blocks to automatically transmit the AIS-P Indicator via the “downstream” STS-1 signal (within the outbound STS-3 signal), anytime the Receive STS-1 TOH Processor block declares the LOS defect condition.</p> <p>1 – Configures the corresponding Transmit SONET POH Processor blocks to automatically transmit the AIS-P Indicator via the “downstream” STS-1 signals (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the LOS defect condition.</p> <p><b>Note:</b></p> <p>1. In the “long-run” the function of this bit-field is exactly the same as that of Bit 1 (Transmit AIS-P Down-stream – Upon LOS), within the Receive STS-1 Transport – Auto AIS Control Register (Address Location= 0xN163). The only difference is that this register bit will cause the corresponding “downstream” Transmit SONET POH Processor block to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-1 TOH Processor block declares the LOS defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the LOS defect.</p> <p>In the case of Bit 1 (Transmit AIS-P Downstream – Upon LOS), several SONET frame periods are required (after the Receive STS-1 TOH Processor block has declared the LOS defect), before the corresponding Transmit SONET POH Processor block will begin the process of transmitting the AIS-P indicator.</p> <p>2. In addition to setting this bit-field to “1”, the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.</p> |
| 4          | Transmit AIS-P (via Downstream STS-1s) upon LOF | R/W  | <p><b>Transmit AIS-P (via Downstream STS-1s) upon declaration of the LOF (Loss of Frame) defect condition:</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|   |                                                |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---|------------------------------------------------|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                                |     | <p>This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block (in the corresponding channel) to automatically transmit the AIS-P (Path AIS) Indicator via the “downstream” STS-1 signal (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the LOF defect condition.</p> <p>0 – Does not configure the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the “downstream” STS-1 signals (within the outbound STS-3 signal), anytime the Receive STS-1 TOH Processor block declares the LOF defect condition.</p> <p>1 – Configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the “downstream” STS-1 signals (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the LOF defect condition.</p> <p><b>Note:</b></p> <p>1. In the “long-run” the function of this bit-field is exactly the same as that of Bit 2 (Transmit AIS-P Down-stream – Upon LOF), within the Receive STS-1 Transport – Auto AIS Control Register (Address Location= 0xN163). The only difference is that this register bit will cause the corresponding “downstream” Transmit SONET POH Processor blocks to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-1 TOH Processor block declares the LOF defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the LOF defect.</p> <p>In the case of Bit 2 (Transmit AIS-P Downstream – Upon LOF), several SONET frame periods are required (after the Receive STS-3 TOH Processor block has declared the LOS defect), before the corresponding Transmit SONET POH Processor block will begin the process of transmitting the AIS-P indicator.</p> <p>2. In addition to setting this bit-field to “1”, the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.</p> |
| 3 | Transmit AIS-P (via Downstream STS-1s) upon SD | R/W | <p><b>Transmit AIS-P (via Downstream STS-1s) upon declaration of the SD (Signal Degrade) defect condition:</b></p> <p>This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block (in the corresponding channel) to automatically transmit the AIS-P (Path AIS) Indicator via the “downstream” STS-1 signals (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the SD defect condition.</p> <p>0 – Does not configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the “downstream” STS-1 signals (within the outbound STS-3 signal), anytime the Receive STS-1 TOH Processor block declares the SD defect condition.</p> <p>1 – Configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the “downstream” STS-1 signal (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the SD defect condition.</p> <p><b>Note:</b></p> <p>1. |   |                                |     | <p>and 7 (within the G1 byte of the incoming STS-1 frame) are set to [0, 1, 0], [1, 0, 1] or [1, 1, 0] for “RDI-P_THRD” number of consecutive STS-1 frames.</p> <p>0 – Indicates that the Receive STS-1 POH Processor block is NOT currently declaring the RDI-P defect condition.</p> <p>1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the RDI-P defect condition.</p> <p><b>Note:</b> The user can specify the value for “RDI-P_THRD” by writing the appropriate data into Bits 3 through 0 (RDI-P THRD) within the “Receive STS-1 Path – SONET Receive RDI-P Register (Address Location= 0xN193).”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 2 | RDI-P Unstable Defect Declared | R/O | <p><b>RDI-P (Path – Remote Defect Indicator) Unstable Defect Declared:</b></p> <p>This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the “RDI-P Unstable” defect condition. The Receive STS-1 POH Processor block will declare the “RDI-P Unstable” defect condition whenever the “RDI-P Unstable Counter” reaches the value “RDI-P THRD”. The “RDI-P Unstable” counter is incremented for each time that the Receive STS-1 POH Processor block receives an RDI-P value that differs from that of the previous STS-1 frame. The “RDI-P Unstable” counter is cleared to “0” whenever the same RDI-P value is received in “RDI-P_THRD” consecutive STS-1 frames.</p> <p><b>Note:</b> Receiving a given RDI-P value, in “RDI-P_THRD” consecutive STS-1 frames also clears this bit-field to “0”.</p> <p>0 – Indicates that the Receive STS-1 POH Processor block is NOT currently declaring the “RDI-P Unstable” defect condition.</p> <p>1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the “RDI-P Unstable” defect condition.</p> <p><b>Note:</b> The user can specify the value for “RDI-P_THRD” by writing the appropriate data into Bits 3 through 0 (RDI-P THRD) within the “Receive STS-1 Path – SONET Receive RDI-P Register (Address Location= 0xN193).”</p> |
| 1 | LOP-P Defect Declared          | R/O | <p><b>Loss of Pointer Indicator (LOP-P) Defect Declared:</b></p> <p>This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the LOP-P (Loss of Pointer) defect condition.</p> <p>The Receive STS-1 POH Processor block will declare the LOP-P defect condition, if it cannot detect a valid pointer (H1 and H2 bytes, within the TOH) within 8 to 10 consecutive SONET frames. Further, the Receive STS-1 POH Processor block will declare the LOP-P defect condition, if it detects 8 to 10 consecutive NDF events.</p> <p>The Receive STS-1 POH Processor block will clear the LOP-P defect condition, whenever it detects valid pointer bytes (e.g., the H1 and H2 bytes, within the TOH) and normal NDF value for three consecutive incoming STS-1 frames.</p> <p>0 – Indicates that the Receive STS-1 POH Processor block is NOT declaring the LOP-P defect condition.</p> <p>1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the LOP-P defect condition.</p>                                                                                                                                                                                                                                                                                                       |
| 0 | AIS-P Defect Declared          | R/O | <p><b>Path AIS (AIS-P) Defect Declared:</b></p> <p>This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the AIS-P defect condition. The Receive STS-1 POH Processor block will declare the AIS-P defect condition if it detects all of the following conditions within three consecutive incoming STS-1 frames.</p> <ul style="list-style-type: none"> <li>The H1, H2 and H3 bytes are set to an “All Ones” pattern.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

#### 1.14 TRANSMIT STS-1 TOH AND POH PROCESSOR BLOCK

The register map for the Transmit STS-1 TOH and POH Processor Blocks are presented in the Table below. Additionally, a detailed description of each of the “Transmit STS-1 TOH and POH Processor” block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the “Transmit STS-3 TOH Processor Block “highlighted” is presented below in Figure 4

**Figure 11: Illustration of the Functional Block Diagram of the XRT94L33, with the Transmit STS-1 TOH and POH Processor Blocks “High-lighted”.**

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

## TRANSMIT STS-1 TOH AND POH PROCESSOR BLOCK REGISTER

Table 540: Transmit STS-1 TOH and POH Processor Block Registers – Address Map

| ADDRESS LOCATION | REGISTER NAME                                                                  | DEFAULT VALUES |
|------------------|--------------------------------------------------------------------------------|----------------|
| 0xN800 – 0xN901  | Reserved                                                                       | 0x00           |

## 3-CHANNEL DS3/E3/STS-1 TO STS-3/STM-1 MAPPER – SONET REGISTERS

Table 581: Transmit STS-1 Path – Serial Port Control Register (Address Location= 0xN9CF; where N ranges in value from 5 to 7)

| BIT 7  | BIT 6 | BIT 5 | BIT 4 | BIT 3                   | BIT 2 | BIT 1 | BIT 0 |
|--------|-------|-------|-------|-------------------------|-------|-------|-------|
| Unused |       |       |       | TxPOH Clock Speed [3:0] |       |       |       |
| R/O    | R/O   | R/O   | R/O   | R/W                     | R/W   | R/W   | R/W   |
| 0      | 0     | 0     | 0     | 0                       | 0     | 0     | 0     |

| BIT NUMBER | NAME                    | TYPE | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 – 4      | Unused                  | R/O  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3 – 0      | TxPOH Clock Speed [3:0] | R/W  | <p><b>TxPOHClk Output Clock Signal Speed:</b></p> <p>These READ/WRITE bit-fields permit the user to specify the frequency of the “TxPOHClk output clock signal. The formula that relates the contents of these register bits to the “TxPOHClk” frequency is presented below.</p> $\text{FREQ} = 19.44 / [2 * (\text{TxPOH\_CLOCK\_SPEED} + 1)]$ <p><b>Note:</b> For STS-3/STM-1 applications, the frequency of the RxPOHClk output signal must be in the range of 0.304MHz to 9.72MHz</p> |

**NOTES:**

REV. 2.0.0 - Added bit descriptions for bits 7, 6, 5 & 4 in register 0x011B.
