Le87100

PLC Differential Line Driver

Introduction

The Le87100 device is a single-channel differential amplifier designed to drive PLC high-power signals. The Le87100 device contains a pair of wide-band amplifiers designed with Microsemi's HV15 bipolar SOI process for high-power output with low-power consumption.

Line driver gain is set externally to the device. The device can be powered from a single high-voltage supply or from dual supplies.

The device can be programmed to one of three preset bias levels to optimize power and performance. In addition, the line driver features a power down state, which forces low-power and high-impedance mode for receive transmissions or for idle operations.

The control pins respond to input levels that can be generated with a standard GPIO, but are tolerant of higher voltage logic levels.

The Le87100 device is available in a 16-pin (4 mm x 4 mm) QFN package with an exposed pad for enhanced thermal conductivity.

Features

- High-Power differential output
    - Delivers signal strengths up to 15.5 dBm
    - Operates up to 13.2 V from a single supply or up to ±6.6 V from dual power supplies
    - Drive capability up to 400 mA from a single 12 V supply
    - High output impedance when disabled for a TDM operation
- User settable gain and bandwidth
    - Bandwidth up to 100 MHz
- Class AB operation
- Four operational states, low power operation
- Thermal shutdown circuitry
- Miniature 4 x 4 mm thermally enhanced package
- RoHS compliant
- Pin-Compatible with industry standard line drivers

Applications

- Power Line Communications (PLC)
- G.HN, EOC HomePlug AV2

Block Diagram

The following figure shows the Le87100 block diagram.

Figure 1. Line Driver Block Diagram

Table of Contents

1. Functional Descriptions

1.1 Applications

The Le87100 device contains a pair of wide-band high-power current-feedback amplifiers. The external RFA and RFB resistors close the feedback loop for each amplifier. The Le87100 device is designed with the specification of RF = 1 KΩ and AV = 16. An RFA or RFB value of 1000 Ω provides a 3 dB bandwidth of ~180 MHz. In general, a lower RFA or RFB value provides a greater bandwidth and a higher RFA or RFB value provides a narrower bandwidth. If the line driver is in high-impedance when disabled, it provides a better PLC half-duplex operation.

Note: Amplifiers configured in a current-feedback arrangement exhibit some amount of gain peaking before roll-off. The higher the bandwidth, the more peaking.
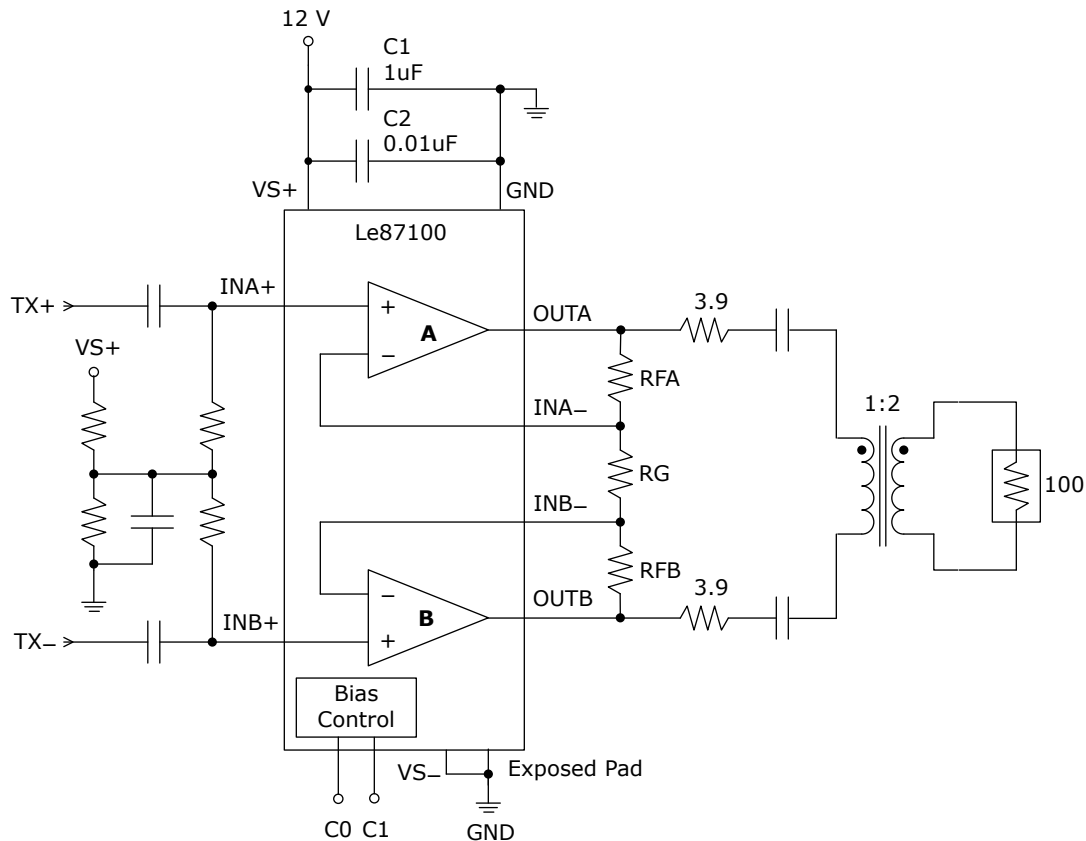

The RG resistor sets the gain of both amplifiers, using the following formula: `AV = [(RFA + RFB)/RG] + 1`

The resistor network on the INA+ and INB+ inputs sets a common-mode bias for the inputs. For Typical Application Circuit - Single Supply, this bias should be set at the midpoint of VS+.

1.1.1 Block Diagram

The following figure shows a typical PLC application circuit for transmission of 15.5 dBm to the line. This circuit uses a single VS supply.

Figure 1-1. Typical Application Circuit - Single Supply

The following figure shows the typical application circuit using dual VS supplies. The resistor network on the INA+ and INB+ inputs sets a common-mode bias for the inputs.

Figure 1-2. Typical Application Circuit - Dual Supplies
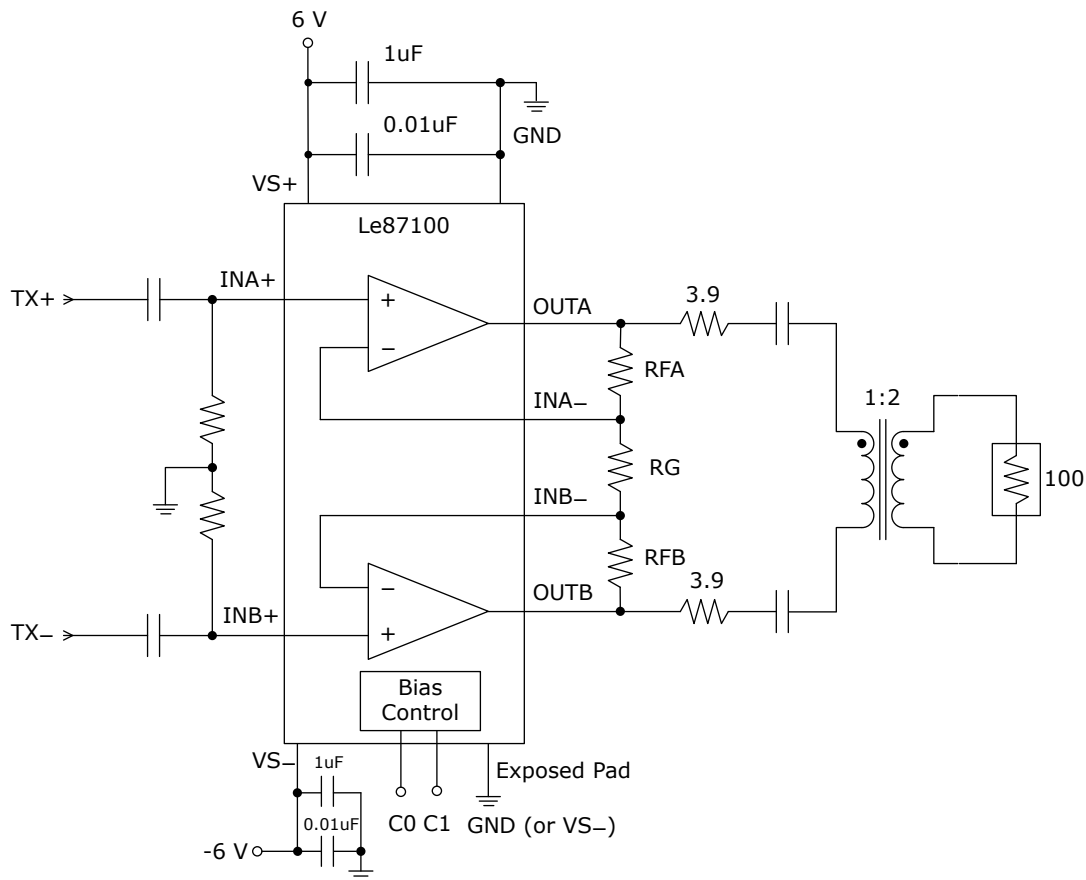

1.1.1.1 Input Considerations

The driving source impedance should be less than 100 nH to avoid any ringing or oscillation.

1.1.1.2 Output Driving Considerations

The internal metalization is designed to drive 200 mArms sinusoidal current and there is no current limit mechanism. It is recommended that series resistors are used to drive lines.

If a DC current path exists between the two outputs, DC current can flow through the outputs. To avoid the DC current flow, the most effective solution is to place DC blocking capacitors in series with the outputs.

1.1.1.3 Protection

The line driver has thermal shutdown protection. Amplifiers turn off and outputs appear as high-impedance if the silicon temperature rises above the TSD temperature.

1.1.1.4 Power Supplies and Component Placement

The power supply should be well bypassed with decoupling placed close to the Le87100 device.

2.   Electrical Specifications

This section provides the DC characteristics, AC characteristics (full bias unless otherwise specified), and recommended operating conditions of the Le87100 device.

Typical Conditions: VS+ = 12 V and TA = 25 °C

VS– = GND, RF = 1000 Ω, and RG = 133 Ω. For more information, see Basic Test Circuit .

Table 2-1. Electrical Specifications

Symbol	Parameter Description	Condition	Min	Typical	Max	Unit	Notes
I_{VS+}	Quiescent Supply Current	Full Bias	27	32	37	mA	
I_{VS+}	Quiescent Supply Current	Medium Bias	19	23	27	mA

THD	Total Harmonic Distortion	f = 4 MHz V_O = 12 Vp-p R_{Load} = 29 Ω		–51	–48	dBc	2
TSD	Thermal Shutdown			170		°C	2

Note:

1. Positive current flows out of pin.
2. Not tested in production, guaranteed by design and device characterization.

Note: The line driver can survive a permanent short circuit on the line.

The following figure shows the basic test circuit.

Figure 2-1. Basic Test Circuit
2.1   Operational States

Logic input control pins have internal pull-down resistors. By default, the line driver powers-up in the full bias state.

The following table lists the operational state control.

Table 2-2. Operational State Control

C1	C0	Device State
0	0	Full Bias
0	1	Medium Bias
1	0	Low Bias
1	1	Power Down

The line driver is active for transmission in full, medium, and low bias states. These states are different only in the level of bias current applied to amplifiers, allowing the user to select the lowest amount of power required to achieve the desired linearity.

The amplifier outputs are set for high-impedance in the power-down state.

3. Pin Descriptions

The Le87100 device has 16 pins, which are described in this section.

3.1 Connection Diagram

The following illustration represents the pin diagram for the Le87100 device, as seen from top of the package.

Figure 3-1. Connection Diagram

Note: The device incorporates an exposed die pad on the underside of its package. The pad acts as a heat sink and must be connected to a copper plane through the thermal plane for proper heat dissipation. It is electrically isolated and may be connected to GND or VS−.

3.1.1 Pin Description

The following table shows the functional pin descriptions for the Le87100 device.

Table 3-1. Pin Description

Pin	Pin Name	Type	Description
1, 5, 6, 12, 15	NC		No connects, no internal connection
2	INA–	Input	Amplifier A negative input
3	INA+	Input	Amplifier A positive input
4	GND	Ground	Low noise analog ground
7	VS–	Power	Negative power supply. Connect to GND if single supply.
8, 9	C0, C1	Inputs	Control inputs
10	INB+	Input	Amplifier B positive input
11	INB–	Input	Amplifier B negative input
13	OUTB	Output	Amplifier B output
14	VS+	Power	Positive power supply
16	OUTA	Output	Amplifier A output
Exposed Pad			The exposed pad must be connected to a thermal plane, it is electrically isolated and can be connected to GND or VS–.

4. Package Information

4.1 Absolute Maximum Ratings

The following table shows the absolute maximum ratings.

Table 4-1. Absolute Maximum Ratings

Names	Range
Storage temperature	–65 °C ≤ TA ≤ 150 °C
Operating junction temperature	–40 °C ≤ TJ ≤ 150 °C[1]
VS+ to GND	–0.3 V to 16 V
VS- to GND	–7.0 V to 0.3 V
VS+ to VS–	0 V to 16 V
Continuous driver output current	100 mA
Control inputs C0/1	–0.3 V to VS+
Maximum device power dissipation, continuous[2] - TA = 85 °C, PD	1.0 W
Junction to ambient thermal resistance [2, 3] , θ_{JA}	52 °C/W
Junction to board thermal resistance [2], θ_{JB}	26 °C/W
Junction to case bottom (exposed pad) thermal resistance, θ_{JC} (BOTTOM)	14.6 °C/W
Junction-to-top characterization parameter [2], Ψ_{JT}	3.1 °C/W
ESD immunity (Human Body Model)	JESD22 class 2 compliant
ESD immunity (Charge Device Model)	JESD22 class IV compliant

1. Continuous operation above 145 °C junction temperature may degrade device reliability.
2. For more information, see "Thermal Resistance".
3. No air flow.

4.1.1 Thermal Resistance

The thermal performance of a thermally enhanced package is assured through optimized printed circuit board layout. Specified performance requires that the exposed thermal pad should be soldered to an equally sized exposed copper surface, which, in turn, conducts heat through multiple vias to larger internal copper planes.

4.1.2 Package Assembly

The green package devices are assembled with enhanced, environment-friendly materials that have no lead, halogens, or antimony. The leads possess a matte tin plating that is compatible with conventional board assembly processes or newer lead-free board assembly processes.

Refer to IPC/JEDEC J-Std-020 for recommended peak soldering temperature and solder re-flow temperature profile.

4.1.3 Operating Ranges

Microsemi guarantees the performance of this device over the –40 °C to 85 °C temperature range by conducting electrical characterization and a single insertion production test coupled with periodic sampling. These procedures comply with the Telcordia GR-357-CORE generic requirements for assuring the reliability of components used in telecommunications equipment.

The following table shows the operating ranges.

Table 4-2. Operating Ranges

| Name	Unit	Range
Ambient temperature	T_A	–40 °C to 85 °C
Single power supply operation	VS+ with respect to GND, VS– tied to GND: Typical usage	8 V to 12 V, 12 V to ±10%
Dual power supply operation	VS+/VS– with respect to GND: Typical usage	±4 V to ±6 V, ±6 V to ±10%

4.2 Physical Dimension - 16-Pin Diagram

16-Lead Very Thin Plastic Quad Flat, No Lead Package (LUC) - 4x4x1.0 mm Body [VQFN] With 2.16 mm Exposed Pad; Microsemi Legacy Package

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging.

Figure 4-1. Top- and Bottom-View of Package Drawing
Units		Millimeters		
Dimension Limits		MIN	NOM	MAX
Number of Terminals	N	16

Terminal Length	L	0.45	0.55	0.65

Note:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package is saw strangulated.
3. Dimensioning and tolerancing per ASME Y14.5M.
    –   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
    –   REF: Reference Dimension, usually without tolerance, for information purposes only.

Figure 4-2. Recommended Land Pattern
Units		Millimeters		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E		0.65 BSC	
Optional Center Pad Width	X2			2.25
Optional Center Pad Length	Y2			2.25
Contact Pad Spacing	C1		3.70	
Contact Pad Spacing	C2		3.70	
Contact Pad Width (X16)	X1			0.35
Contact Pad Length (X16)	Y1			1.00
Contact Pad to Center Pad (X16)	G1	0.23		
Contact Pad to Contact Pad (X12)	G2	0.30		
Thermal Via Diameter	V		0.33	
Thermal Via Pitch	EV		1.20	

Note:

1. Dimensioning and tolerancing per ASME Y14.5M.
    – BSC: Basic Dimension. Theoretically exact value shown without tolerances.
2. For best soldering results, thermal vias, if used, should be filled or tented to avoid solder loss during reflow process.

5. Ordering Information

The following table lists the ordering information for the Le87100 device.

Table 5-1. Ordering Information

Part Order Number	Description	Packing System
Le87100NQC	16-pin, 4 mm x 4 mm QFN green package with an exposed pad	Tray
Le87100NQCT	16-pin, 4 mm x 4 mm QFN green package with an exposed pad	Tape and reel

Note: The green package is halogen free and meets RoHS2 directive 2011/65/EU of the European council to minimize the environmental impact of electrical equipment.

6. Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

Table 6-1. Revision History

Revision	Date	Section	Description
A	05/2020	Revision 3.0	The following topics are updated in this revision: • Updated values and added table footnote, see Electrical Specifications • Updated values in the Absolute Maximum Ratingssection. • Migrated this document to Microchip template. • Have changed this document number PD-155221 to DS-60001626A per Microchip standards.
2.0		Revision 2.0	In revision 2.0, electrical specifications are updated in Table 1.
1.0		Revision 1.0	Revision 1.0 was the first publication of this document.

The Microchip Website

Microchip provides online support via our website at http://www.microchip.com/. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to http://www.microchip.com/pcn and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: http://www.microchip.com/support

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
