# Intelligent Power Module (IPM)

600 V, 30 A

# STK581U3C2D-E

#### Overview

This "Inverter IPM" is highly integrated device containing all High Voltage (HV) control from HV–DC to 3–phase outputs in a single SIP module (Single–In line Package). Output stage uses IGBT/FRD technology and implements Under Voltage Protection (UVP) and Over Current Protection (OCP) with a Fault Detection output flag. Internal Boost diodes are provided for high side gate boost drive.

#### **Features**

- Single Control Power Supply due to Internal Bootstrap Circuit for High Side Pre–driver Circuit
- All Control Input and Status Output are at Low Voltage Levels directly compatible with Microcontrollers
- Built-in Cross Conduction Prevention
- Externally accessible Embedded Thermistor for Substrate Temperature Measurement
- The Level of the Over-current Protection Current is adjustable with the External Resistor, "RSD"
- These Devices are Pb-Free and are RoHS Compliant

# Certification

#### **ORDERING INFORMATION**

See detailed ordering and shipping information in the package dimensions section on page 13 of this data sheet.

## **Specifications**

# **ABSOLUTE MAXIMUM RATINGS** (at Tc = 25°C)

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	V <sub>CC</sub>	P to N, surge < 500 V (Note 1)	450	V
Collector-emitter voltage	V <sub>CE</sub>	P to U,V,W or U,V,W to N	600	V
Output current	lo	P, N, U,V,W terminal current	±30	Α
		P, N, U,V,W terminal current at Tc = 100°C	±15	Α
Output peak current	lop	P, N, U,V,W terminal current for a Pulse width of 1 ms	±45	Α
Pre-driver voltage	VD1,2,3,4	VB1 to U, VB2 to V, VB3 to W, V <sub>DD</sub> to V <sub>SS</sub> (Note 2)	20	V
Input signal voltage	V <sub>IN</sub>	HIN1, 2, 3, LIN1, 2, 3	–0.3 to V <sub>DD</sub>	V
FAULT terminal voltage	VFAULT	FAULT terminal	–0.3 to V <sub>DD</sub>	V
Maximum power dissipation	Pd	IGBT per channel	49	W
Junction temperature	Tj	IGBT, FRD	150	°C
Storage temperature	Tstg		-40 to +125	°C
Operating case temperature	Tc	IPM case temperature	-40 to +100	°C
Tightening torque		Case mounting screws (Note 3)	1.17	Nm
Withstand voltage	Vis	50 Hz sine wave AC 1 minute (Note 4)	2000	VRMS

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

NOTE: Reference voltage is " $V_{SS}$ " terminal voltage unless otherwise specified.

- Surge voltage developed by the switching operation due to the wiring inductance between "P" and "N" terminal.
   Terminal voltage: VD1 = VB1 to U, VD2 = VB2 to V, VD3 = VB3 to W, VD4 = V<sub>DD</sub> to V<sub>SS</sub>
- 3. Flatness of the heat-sink should be 0.15 mm and below.
- 4. Test conditions: AC 2500 V, 1 s.

# ELECTRICAL CHARACTERISTICS (at Tc = 25°C, VD1, VD2, VD3, VD4 = 15 V, V<sub>CC</sub> = 300 V, L = 3.5 mH)

Short circuit safe operating area	SCSOA	V <sub>CE</sub> = 400 V, Tc = 100°C		4	_	-	μS
Allowable offset voltage slew rate	dv/dt	Between U, V, W to N		-50	_	50	V/ns

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

NOTE: Reference voltage is "V<sub>SS</sub>" terminal voltage unless otherwise specified.

5. The lower side's  $V_{CE}(SAT)$  and VF include a loss by the shunt resistance

#### Notes:

1. When the internal protection circuit operates, a Fault signal is turned ON (When the Fault terminal is low level, Fault signal is ON state: output form is open DRAIN) but the Fault signal does not latch. After protection operation ends, it returns automatically within about 18 ms to 80 ms and resumes operation beginning condition. So, after Fault signal detection, set all input signals to OFF (Low) at once. However, the operation of pre—drive power supply low voltage protection

(UVLO : with hysteresis about 0.2 V) is as follows.

*Upper side*:

The gate is turned off and will return to regular operation when recovering to the normal voltage, but the latch will continue till the input signal will turn 'low'.

Lower side:

The gate is turned off and will automatically reset when recovering to normal voltage. It does not depend on input signal voltage.

- 2. When assembling the IPM on the heat sink with M3 type screw, tightening torque range is 0.79 Nm to 1.17 Nm.
- 3. The pre-drive low voltage protection is the feature to protect devices when the pre-driver supply voltage falls due to an operating malfunction.

# **RECOMMENDED OPERATING CONDITIONS** (at Tc = 25°C)

Item	Symbol	Conditions	Min	Тур	Max	Unit
Supply voltage	V <sub>CC</sub>	P to N	0	280	450	V
Pre-driver supply voltage	VD1, 2, 3	VB1 to U, VB2 to V, VB3 to W	12.5	15	17.5	V
	VD4	V <sub>DD</sub> to V <sub>SS</sub> (Note 6)	13.5	15	16.5	
ON-state input voltage	V <sub>IN</sub> (ON)	HIN1, HIN2, HIN3, LIN1, LIN2, LIN3	3.0	_	5.0	V
OFF-state input voltage	V <sub>IN</sub> (OFF)		0	_	0.0	
PWM frequency	f <sub>PWM</sub>		1	-	20	kHz
Dead time	DT	Turn-off to turn-on	2	_	-	μS
Allowable input pulse width	PWIN	ON and OFF	1	-	-	μs
Package mounting torque		'M4' type screw	0.79	_	1.17	Nm

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

6. Pre–drive power supply (VD4 =  $15 \pm 1.5$  V) must have the capacity of 10 = 20 mA (DC), 0.5 A (Peak).

# **MODULE PIN-OUT DESCRIPTION**

Pin	Name	Description

## **Logic Timing Chart**

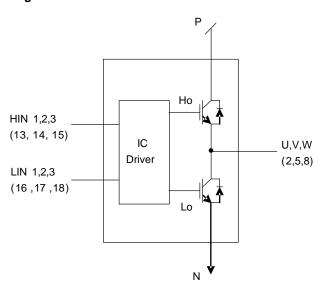

#### Notes:

- \*1: Diagram shows the prevention of shoot-through via control logic. More dead time to account for switching delay needs to be added externally.
- \*2: When V<sub>DD</sub> decreases all gate output signals will go low and cut off all of 6 IGBT outputs. When V<sub>DD</sub> rises the operation will resume immediately.
- \*3: When the upper side gate voltage at VB1, VB2 and VB3 drops only, the corresponding upper side output is turned off. The outputs return to normal operation immediately after the upper side gate voltage rises.
- \*4: In case of over current detection, all IGBT's are turned off and the FAULT output is asserted. Normal operation resumes in 18 to 80 ms after the over current condition is removed.

# **Sample Application Circuit**

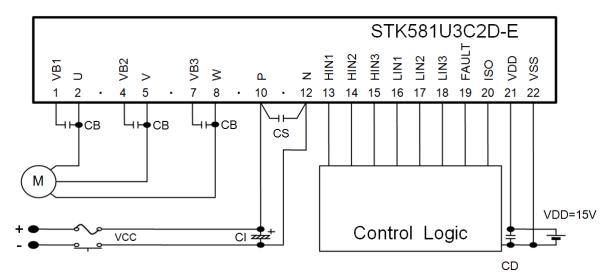

Figure 10. Sample Application Circuit

## **Usage Precautions**

- 1. This IPM includes bootstrap diode and resistors. Therefore, by adding a capacitor "CB", a high side drive voltage is generated; each phase requires an individual bootstrap capacitor. The recommended value of CB is in the range of 1 to 47  $\mu$ F, however this value needs to be verified prior to production. If selecting the capacitance more than 47  $\mu$ F ( $\pm 20\%$ ), connect a resistor (about 20  $\Omega$ ) in series between each 3–phase upper side power supply terminals (VB1, 2, 3) and each bootstrap capacitor.
  - When not using the bootstrap circuit, each upper side pre—drive power supply requires an external independent power supply.
- It is essential that wirning length between terminals in the snubber circuit be kept as short as possible to reduce the effect of surge voltages. Recommended value of "CS" is in the range of 0.1 to 10 μF.
- 3. "ISO" (pin20) is terminal for current monitor. When the pull–down resistor is used, please select it more than 5.6 k $\Omega$

- 4. "FAULT" (pin19) is open DRAIN output terminal (Active Low). Pull up resistor is recommended more than 5.6 k $\Omega$ .
- 5. Inside the IPM, a thermistor used as the temperature monitor for internal substrate is connected between V<sub>SS</sub> terminal and TH terminal, therefore, an external pull up resistor connected between the TH terminal and an external power supply should be used. The temperature monitor example application is as follows, please refer the Fig.11, and Fig.12 below.
- 6. Pull down resistor of 33 k $\Omega$  is provided internally at the signal input terminals. An external resistor of 2.2 k to 3.3 k $\Omega$  should be added to reduce the influence of external wiring noise.
- 7. The over–current protection feature is not intended to protect in exceptional fault condition. An external fuse is recommended for safety.
- 8. When input pulse width is less than  $1.0 \mu s$ , an output may not react to the pulse. (Both ON signal and OFF signal)

This data shows the example of the application circuit, does not guarantee a design as the mass production set.

## THERMISTOR CHARACTERISTICS

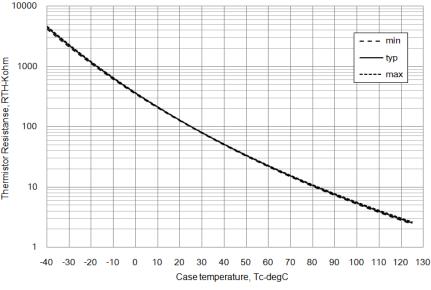

Parameter	Symbol	Condition	Min	Тур	Max	Unit

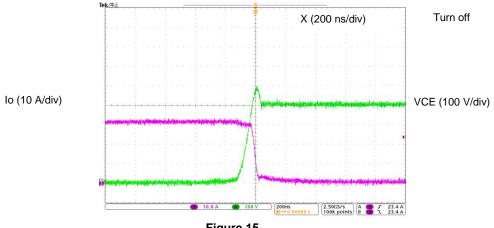

Figure 15.

## **CB Capacitor Value Calculation for Bootstrap Circuit**

# **CALCULATE CONDITIONS TABLE**

Item	Symbol	Value	Unit
Upper side power supply.	VBS	15	V
Total gate charge of output power IGBT at 15 V.	Qg	266	nC
Upper side power supply low voltage protection.	UVLO	12	V
Upper side power dissipation.	IDmax	400	μΑ
ON time required for CB voltage to fall from 15 V to UVLO	Tonmax	_	s

# Capacitance Calculation Formula

CB must not be discharged below to the upper limit of the UVLO – the maximum allowable on–time (Tonmax) of the upper side is calculated as follows:

$$VBS * CB - Qg - IDmax * Tonmax = UVLO * CB$$

$$CB = (Qg + IDmax * Tonmax) / (VBS - UVLO)$$

The relationship between Tonmax and CB becomes as follows. CB is recommended to be approximately 3 times the value calculated above. The recommended value of CB is in the range of 1 to 47  $\mu$ F, however, the value needs to be verified prior to production.

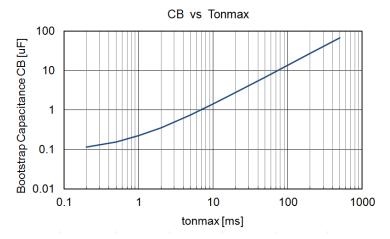

Figure 16. Tonmax-CB Characteristics
