DESCRIPTION

Highly integrated modules like **Q7-974** and **Q7-A36** offer very high performance within small dimensions. On the other hand, the miniaturization of ICs and the high operating frequencies of the processors lead to high heat generation that must be dissipated in order to maintain the CPU within its allowed temperature range.

The operating temperature specified in the Technical Features of **Q7-974** and **Q7-A36** indicates the temperature range in which any and all parts of the heat spreader / heat sink must remain, in order for SECO to guarantee
