

# EFR32FG13 Flex Gecko Proprietary Protocol SoC Family Data Sheet

The Flex Gecko proprietary protocol family of SoCs is part of the Wireless Gecko portfolio. Flex Gecko SoCs are ideal for enabling energy-friendly proprietary protocol networking for IoT devices.

The single-die solution provides industry-leading energy efficiency, ultra-fast wakeup times, a scalable power amplifier, an integrated balun and no-compromise MCU features.

Flex Gecko applications include:

- Home and Building Automation and Security
- Metering
- Electronic Shelf Labels
- Industrial Automation
- Commercial and Retail Lighting and Sensing

## KEY FEATURES

- 32-bit ARM® Cortex®-M4 core with 40 MHz maximum operating frequency
- 512 kB of flash and 64 kB of RAM
- Pin-compatible across EFR32FG families (exceptions apply for 5V-tolerant pins)
- 12-channel Peripheral Reflex System enabling autonomous interaction of MCU peripherals
- Autonomous Hardware Crypto Accelerator and True Random Number Generator
- Integrated PA with up to 19 dBm (2.4 GHz) or 20 dBm (Sub-GHz) tx power
- Integrated balun for 2.4 GHz
- Robust peripheral set and up to 32 GPIO

## 1. Feature List

The EFR32FG13 highlighted features are listed below.

- **Low Power Wireless System-on-Chip**
  - High Performance 32-bit 40 MHz ARM Cortex®-M4 with DSP instruction and floating-point unit for efficient signal processing
  - Embedded Trace Macrocell (ETM) for advanced debugging
  - 512 kB flash program memory
  - 64 kB RAM data memory
  - 2.4 GHz and Sub-GHz radio operation
  - Transmit power:
    - 2.4 GHz radio: Up to 19 dBm
    - Sub-GHz radio: Up to 20 dBm
- **Low Energy Consumption**
  - 8.4 mA RX current at 38.4 kbps, GFSK, 169 MHz
  - 9.5 mA RX current at 1 Mbps, GFSK, 2.4 GHz
  - 10.2 mA RX current at 250 kbps, DSSS-OQPSK, 2.4 GHz
  - 8.5 mA TX current at 0 dBm output power at 2.4 GHz
  - 35.3 mA TX current at 14 dBm output power at 868 MHz
  - 69 µA/MHz in Active Mode (EM0)
  - 1.3 µA EM2 DeepSleep current (16 kB RAM retention and RTCC running from LFRCO)
  - Wake on Radio with signal strength detection, preamble pattern detection, frame detection and timeout
- **High Receiver Performance**
  - -94.8 dBm sensitivity at 1 Mbit/s GFSK, 2.4 GHz
  - -102.7 dBm sensitivity at 250 kbps DSSS-OQPSK, 2.4 GHz
  - -126.2 dBm sensitivity at 600 bps, GFSK, 915 MHz
  - -120.6 dBm sensitivity at 2.4 kbps, GFSK, 868 MHz
  - -107.4 dBm sensitivity at 4.8 kbps, OOK, 433 MHz
  - -112.2 dBm sensitivity at 38.4 kbps, GFSK, 169 MHz
- **Supported Modulation Formats**
  - 2/4 (G)FSK with fully configurable shaping
  - BPSK / DBPSK TX
  - OOK / ASK
  - Shaped OQPSK / (G)MSK
  - Configurable DSSS and FEC
- **Supported Protocols**
  - Proprietary Protocols
  - Wireless M-Bus
  - Selected IEEE 802.15.4g SUN-FSK PHYs
  - Low Power Wide Area Networks
- **Suitable for Systems Targeting Compliance With:**
  - FCC Part 90.210 Mask D, FCC part 15.247, 15.231, 15.249
  - ETSI Category I Operation, EN 300 220, EN 300 328
  - ARIB T-108, T-96
  - China regulatory
- **Wide selection of MCU peripherals**
  - 12-bit 1 Msps SAR Analog to Digital Converter (ADC)
  - 2 × Analog Comparator (ACMP)
  - 2 × Digital to Analog Converter (VDAC)
  - 3 × Operational Amplifier (Opamp)
  - Digital to Analog Current Converter (IDAC)
  - Low-Energy Sensor Interface (LESENSE)
  - Multi-channel Capacitive Sense Interface (CSEN)
  - Up to 32 pins connected to analog channels (APORT) shared between analog peripherals
  - Up to 32 General Purpose I/O pins with output state retention and asynchronous interrupts
  - 8 Channel DMA Controller
  - 12 Channel Peripheral Reflex System (PRS)
  - 2 × 16-bit Timer/Counter
    - 3 or 4 Compare/Capture/PWM channels
  - 1 × 32-bit Timer/Counter
    - 3 Compare/Capture/PWM channels
  - 32-bit Real Time Counter and Calendar
  - 16-bit Low Energy Timer for waveform generation
  - 32-bit Ultra Low Energy Timer/Counter for periodic wake-up from any Energy Mode
  - 16-bit Pulse Counter with asynchronous operation
  - 2 × Watchdog Timer with dedicated RC oscillator
  - 3 × Universal Synchronous/Asynchronous Receiver/Transmitter (UART/SPI/SmartCard (ISO 7816)/IrDA/I<sup>2</sup>S)
  - Low Energy UART (LEUART™)
  - 2 × I<sup>2</sup>C interface with SMBus support and address recognition in EM3 Stop
- **Wide Operating Range**
  - 1.8 V to 3.8 V single power supply
  - Integrated DC-DC, down to 1.8 V output with up to 200 mA load current for system
  - Standard (-40 °C to 85 °C) and Extended (-40 °C to 125 °C) temperature grades available
- **Support for Internet Security**
  - General Purpose CRC
  - True Random Number Generator
  - 2 × Hardware Cryptographic Acceleration for AES 128/256, SHA-1, SHA-2 (SHA-224 and SHA-256) and ECC
- **QFN48 7x7 mm Package**

## 2. Ordering Information

Table 2.1. Ordering Information

| Ordering Code           | Protocol Stack | Frequency Band @ Max TX Power                                                                | Flash (kB) | RAM (kB) | GPIO | Package | Temp Range    |
|-------------------------|----------------|----------------------------------------------------------------------------------------------|------------|----------|------|---------|---------------|
| EFR32FG13P233F512GM48-C | Proprietary    | <ul style="list-style-type: none"> <li>2.4 GHz @ 19 dBm</li> <li>Sub-GHz @ 20 dBm</li> </ul> | 512        | 64       | 28   | QFN48   | -40 to +85°C  |
| EFR32FG13P233F512GM48-C | Proprietary    | 2.4 GHz @ 19 dBm                                                                             | 512        | 64       | 31   | QFN48   | -40 to +85°C  |
| EFR32FG13P231F512GM48-C | Proprietary    | Sub-GHz @ 20 dBm                                                                             | 512        | 64       | 32   | QFN48   | -40 to +85°C  |
| EFR32FG13P231F512IM48-C | Proprietary    | Sub-GHz @ 20 dBm                                                                             | 512        | 64       | 32   | QFN48   | -40 to +125°C |

## 3. System Overview

### 3.1 Introduction

The EFR32 product family combines an energy-friendly MCU with a highly integrated radio transceiver. The devices are well suited for any battery operated application as well as other systems requiring high performance and low energy consumption. This section gives a short introduction to the full radio and MCU system. The detailed functional description can be found in the EFR32xG13 Reference Manual.

A block diagram of the EFR32FG13 family is shown in [Figure 3.1 Detailed EFR32FG13 Block Diagram on page 7](#). The diagram shows a superset of features available on the family, which vary by OPN. For more information about specific device features, consult [Ordering Information](#).

Figure 3.1. Detailed EFR32FG13 Block Diagram

### 3.2 Radio

The Flex Gecko family features a radio transceiver supporting proprietary wireless protocols.

### 3.2.1 Antenna Interface

The EFR32FG13 family includes devices which support both single-band and dual-band RF communication over separate physical RF interfaces.

The 2.4 GHz antenna interface consists of two pins (2G4RF\_IOP and 2G4RF\_ION) that interface directly to the on-chip BALUN. The 2G4RF\_ION pin should be grounded externally.

The sub-GHz antenna interface consists of a differential transmit interface (pins SUBGRF\_OP and SUBGRF\_ON) and a differential receive interface (pins SUBGRF\_IP and SUBGRF\_IN).

The external components and power supply connections for the antenna interface typical applications are shown in the RF Matching Networks section.

### 3.2.2 Fractional-N Frequency Synthesizer

The EFR32FG13 contains a high performance, low phase noise, fully integrated fractional-N frequency synthesizer. The synthesizer is used in receive mode to generate the LO frequency used by the down-conversion mixer. It is also used in transmit mode to directly generate the modulated RF carrier.

The fractional-N architecture provides excellent phase noise performance combined with frequency resolution better than 100 Hz, with low energy consumption. The synthesizer has fast frequency settling which allows very short receiver and transmitter wake up times to optimize system energy consumption.

### 3.2.3 Receiver Architecture

The EFR32FG13 uses a low-IF receiver architecture, consisting of a Low-Noise Amplifier (LNA) followed by an I/Q down-conversion mixer, employing a crystal reference. The I/Q signals are further filtered and amplified before being sampled by the IF analog-to-digital converter (IFADC).

The IF frequency is configurable from 150 kHz to 1371 kHz. The IF can further be configured for high-side or low-side injection, providing flexibility with respect to known interferers at the image frequency.

The Automatic Gain Control (AGC) module adjusts the receiver gain to optimize performance and avoid saturation for excellent selectivity and blocking performance. The 2.4 GHz radio is calibrated at production to improve image rejection performance. The sub-GHz radio can be calibrated on-demand by the user for the desired frequency band.

Demodulation is performed in the digital domain. The demodulator performs configurable decimation and channel filtering to allow receive bandwidths ranging from 0.1 to 2530 kHz. High carrier frequency and baud rate offsets are tolerated by active estimation and compensation. Advanced features supporting high quality communication under adverse conditions include forward error correction by block and convolutional coding as well as Direct Sequence Spread Spectrum (DSSS) for 2.4 GHz and sub-GHz bands.

A Received Signal Strength Indicator (RSSI) is available for signal quality metrics, for level-based proximity detection, and for RF channel access by Collision Avoidance (CA) or Listen Before Talk (LBT) algorithms. An RSSI capture value is associated with each received frame and the dynamic RSSI measurement can be monitored throughout reception.

The EFR32FG13 features integrated support for antenna diversity to mitigate the problem of frequency-selective fading due to multipath propagation and improve link budget. Support for antenna diversity is available for specific PHY configurations in 2.4 GHz and sub-GHz bands. Internal configurable hardware controls an external switch for automatic switching between antennae during RF receive detection operations.

**Note:** Due to the shorter preamble of 802.15.4 and BLE packets, RX diversity is not supported.

### 3.2.4 Transmitter Architecture

The EFR32FG13 uses a direct-conversion transmitter architecture. For constant envelope modulation formats, the modulator controls phase and frequency modulation in the frequency synthesizer. Transmit symbols or chips are optionally shaped by a digital shaping filter. The shaping filter is fully configurable, including the BT product, and can be used to implement Gaussian or Raised Cosine shaping.

Carrier Sense Multiple Access - Collision Avoidance (CSMA-CA) or Listen Before Talk (LBT) algorithms can be automatically timed by the EFR32FG13. These algorithms are typically defined by regulatory standards to improve inter-operability in a given bandwidth between devices that otherwise lack synchronized RF channel access.

### 3.2.5 Wake on Radio

The Wake on Radio feature allows flexible, autonomous RF sensing, qualification, and demodulation without required MCU activity, using a subsystem of the EFR32FG13 including the Radio Controller (RAC), Peripheral Reflex System (PRS), and Low Energy peripherals.

### 3.2.6 RFSENSE

The RFSENSE module generates a system wakeup interrupt upon detection of wideband RF energy at the antenna interface, providing true RF wakeup capabilities from low energy modes including EM2, EM3 and EM4.

RFSENSE triggers on a relatively strong RF signal and is available in the lowest energy modes, allowing exceptionally low energy consumption. RFSENSE does not demodulate or otherwise qualify the received signal, but software may respond to the wakeup event by enabling normal RF reception.

Various strategies for optimizing power consumption and system response time in presence of false alarms may be employed using available timer peripherals.

### 3.2.7 Flexible Frame Handling

EFR32FG13 has an extensive and flexible frame handling support for easy implementation of even complex communication protocols. The Frame Controller (FRC) supports all low level and timing critical tasks together with the Radio Controller and Modulator/Demodulator:

- Highly adjustable preamble length
- Up to 2 simultaneous synchronization words, each up to 32 bits and providing separate interrupts
- Frame disassembly and address matching (filtering) to accept or reject frames
- Automatic ACK frame assembly and transmission
- Fully flexible CRC generation and verification:
  - Multiple CRC values can be embedded in a single frame
  - 8, 16, 24 or 32-bit CRC value
  - Configurable CRC bit and byte ordering
- Selectable bit-ordering (least significant or most significant bit first)
- Optional data whitening
- Optional Forward Error Correction (FEC), including convolutional encoding / decoding and block encoding / decoding
- Half rate convolutional encoder and decoder with constraint lengths from 2 to 7 and optional puncturing
- Optional symbol interleaving, typically used in combination with FEC
- Symbol coding, such as Manchester or DSSS, or biphase space encoding using FEC hardware
- UART encoding over air, with start and stop bit insertion / removal
- Test mode support, such as modulated or unmodulated carrier output
- Received frame timestamping

### 3.2.8 Packet and State Trace

The EFR32FG13 Frame Controller has a packet and state trace unit that provides valuable information during the development phase. It features:

- Non-intrusive trace of transmit data, receive data and state information
- Data observability on a single-pin UART data output, or on a two-pin SPI data output
- Configurable data output bitrate / baudrate
- Multiplexed transmitted data, received data and state / meta information in a single serial data stream

### 3.2.9 Data Buffering

The EFR32FG13 features an advanced Radio Buffer Controller (BUFC) capable of handling up to 4 buffers of adjustable size from 64 bytes to 4096 bytes. Each buffer can be used for RX, TX or both. The buffer data is located in RAM, enabling zero-copy operations.

### 3.2.10 Radio Controller (RAC)

The Radio Controller controls the top level state of the radio subsystem in the EFR32FG13. It performs the following tasks:

- Precisely-timed control of enabling and disabling of the receiver and transmitter circuitry
- Run-time calibration of receiver, transmitter and frequency synthesizer
- Detailed frame transmission timing, including optional LBT or CSMA-CA

### 3.2.11 Random Number Generator

The Frame Controller (FRC) implements a random number generator that uses entropy gathered from noise in the RF receive chain. The data is suitable for use in cryptographic applications.

Output from the random number generator can be used either directly or as a seed or entropy source for software-based random number generator algorithms such as Fortuna.

### 3.3 Power

The EFR32FG13 has an Energy Management Unit (EMU) and efficient integrated regulators to generate internal supply voltages. Only a single external supply voltage is required, from which all internal voltages are created. An optional integrated DC-DC buck regulator can be utilized to further reduce the current consumption. The DC-DC regulator requires one external inductor and one external capacitor.

The EFR32FG13 device family includes support for internal supply voltage scaling, as well as two different power domains groups for peripherals. These enhancements allow for further supply current reductions and lower overall power consumption.

AVDD and VREGVDD need to be 1.8 V or higher for the MCU to operate across all conditions; however the rest of the system will operate down to 1.62 V, including the digital supply and I/O. This means that the device is fully compatible with 1.8 V components. Running from a sufficiently high supply, the device can use the DC-DC to regulate voltage not only for itself, but also for other PCB components, supplying up to a total of 200 mA.

#### 3.3.1 Energy Management Unit (EMU)

The Energy Management Unit manages transitions of energy modes in the device. Each energy mode defines which peripherals and features are available and the amount of current the device consumes. The EMU can also be used to turn off the power to unused RAM blocks, and it contains control registers for the DC-DC regulator and the Voltage Monitor (VMON). The VMON is used to monitor multiple supply voltages. It has multiple channels which can be programmed individually by the user to determine if a sensed supply has fallen below a chosen threshold.

#### 3.3.2 DC-DC Converter

The DC-DC buck converter covers a wide range of load currents and provides up to 90% efficiency in energy modes EM0, EM1, EM2 and EM3, and can supply up to 200 mA to the device and surrounding PCB components. Patented RF noise mitigation allows operation of the DC-DC converter without degrading sensitivity of radio components. Protection features include programmable current limiting, short-circuit protection, and dead-time protection. The DC-DC converter may also enter bypass mode when the input voltage is too low for efficient operation. In bypass mode, the DC-DC input supply is internally connected directly to its output through a low resistance switch. Bypass mode also supports in-rush current limiting to prevent input supply voltage droops due to excessive output current transients.

#### 3.3.3 Power Domains

The EFR32FG13 has two peripheral power domains for operation in EM2 and lower. If all of the peripherals in a peripheral power domain are configured as unused, the power domain for that group will be powered off in the low-power mode, reducing the overall current consumption of the device.

**Table 3.1. Peripheral Power Subdomains**

| Peripheral Power Domain 1 | Peripheral Power Domain 2 |
|---------------------------|---------------------------|
| ACMP0                     | ACMP1                     |
| PCNT0                     | CSEN                      |
| ADC0                      | VDAC0                     |
| LETIMER0                  | LEUART0                   |
| LESENSE                   | I2C0                      |
| APORT                     | I2C1                      |
| -                         | IDAC                      |

### 3.4 General Purpose Input/Output (GPIO)

EFR32FG13 has up to 32 General Purpose Input/Output pins. Each GPIO pin can be individually configured as either an output or input. More advanced configurations including open-drain, open-source, and glitch-filtering can be configured for each individual GPIO pin. The GPIO pins can be overridden by peripheral connections, like SPI communication. Each peripheral connection can be routed to several GPIO pins on the device. The input value of a GPIO pin can be routed through the Peripheral Reflex System to other peripherals. The GPIO subsystem supports asynchronous external pin interrupts.

## 3.5 Clocking

### 3.5.1 Clock Management Unit (CMU)

The Clock Management Unit controls oscillators and clocks in the EFR32FG13. Individual enabling and disabling of clocks to all peripheral modules is performed by the CMU. The CMU also controls enabling and configuration of the oscillators. A high degree of flexibility allows software to optimize energy consumption in any specific application by minimizing power dissipation in unused peripherals and oscillators.

### 3.5.2 Internal and External Oscillators

The EFR32FG13 supports two crystal oscillators and fully integrates four RC oscillators, listed below.

- A high frequency crystal oscillator (HFXO) with integrated load capacitors, tunable in small steps, provides a precise timing reference for the MCU. Crystal frequencies in the range from 38 to 40 MHz are supported. An external clock source such as a TCXO can also be applied to the HFXO input for improved accuracy over temperature.
- A 32.768 kHz crystal oscillator (LFXO) provides an accurate timing reference for low energy modes.
- An integrated high frequency RC oscillator (HFRCO) is available for the MCU system, when crystal accuracy is not required. The HFRCO employs fast startup at minimal energy consumption combined with a wide frequency range.
- An integrated auxiliary high frequency RC oscillator (AUXHFRCO) is available for timing the general-purpose ADC and the Serial Wire Viewer port with a wide frequency range.
- An integrated low frequency 32.768 kHz RC oscillator (LFRCO) can be used as a timing reference in low energy modes, when crystal accuracy is not required.
- An integrated ultra-low frequency 1 kHz RC oscillator (ULFRCO) is available to provide a timing reference at the lowest energy consumption in low energy modes.

## 3.6 Counters/Timers and PWM

### 3.6.1 Timer/Counter (TIMER)

TIMER peripherals keep track of timing, count events, generate PWM outputs and trigger timed actions in other peripherals through the PRS system. The core of each TIMER is a 16-bit counter with up to 4 compare/capture channels. Each channel is configurable in one of three modes. In capture mode, the counter state is stored in a buffer at a selected input event. In compare mode, the channel output reflects the comparison of the counter to a programmed threshold value. In PWM mode, the TIMER supports generation of pulse-width modulation (PWM) outputs of arbitrary waveforms defined by the sequence of values written to the compare registers, with optional dead-time insertion available in timer unit TIMER\_0 only.

### 3.6.2 Wide Timer/Counter (WTIMER)

WTIMER peripherals function just as TIMER peripherals, but are 32 bits wide. They keep track of timing, count events, generate PWM outputs and trigger timed actions in other peripherals through the PRS system. The core of each WTIMER is a 32-bit counter with up to 4 compare/capture channels. Each channel is configurable in one of three modes. In capture mode, the counter state is stored in a buffer at a selected input event. In compare mode, the channel output reflects the comparison of the counter to a programmed threshold value. In PWM mode, the WTIMER supports generation of pulse-width modulation (PWM) outputs of arbitrary waveforms defined by the sequence of values written to the compare registers, with optional dead-time insertion available in timer unit WTIMER\_0 only.

### 3.6.3 Real Time Counter and Calendar (RTCC)

The Real Time Counter and Calendar (RTCC) is a 32-bit counter providing timekeeping in all energy modes. The RTCC includes a Binary Coded Decimal (BCD) calendar mode for easy time and date keeping. The RTCC can be clocked by any of the on-board oscillators with the exception of the AUXHFRCO, and it is capable of providing system wake-up at user defined instances. When receiving frames, the RTCC value can be used for timestamping. The RTCC includes 128 bytes of general purpose data retention, allowing easy and convenient data storage in all energy modes down to EM4H.

A secondary RTC is used by the RF protocol stack for event scheduling, leaving the primary RTCC block available exclusively for application software.

### 3.6.4 Low Energy Timer (LETIMER)

The unique LETIMER is a 16-bit timer that is available in energy mode EM2 Deep Sleep in addition to EM1 Sleep and EM0 Active. This allows it to be used for timing and output generation when most of the device is powered down, allowing simple tasks to be performed while the power consumption of the system is kept at an absolute minimum. The LETIMER can be used to output a variety of waveforms with minimal software intervention. The LETIMER is connected to the Real Time Counter and Calendar (RTCC), and can be configured to start counting on compare matches from the RTCC.

### 3.6.5 Ultra Low Power Wake-up Timer (CRYOTIMER)

The CRYOTIMER is a 32-bit counter that is capable of running in all energy modes. It can be clocked by either the 32.768 kHz crystal oscillator (LFXO), the 32.768 kHz RC oscillator (LFRCO), or the 1 kHz RC oscillator (ULFRCO). It can provide periodic Wakeup events and PRS signals which can be used to wake up peripherals from any energy mode. The CRYOTIMER provides a wide range of interrupt periods, facilitating flexible ultra-low energy operation.

### 3.6.6 Pulse Counter (PCNT)

The Pulse Counter (PCNT) peripheral can be used for counting pulses on a single input or to decode quadrature encoded inputs. The clock for PCNT is selectable from either an external source on pin PCTNn\_S0IN or from an internal timing reference, selectable from among any of the internal oscillators, except the AUXHFRCO. The module may operate in energy mode EM0 Active, EM1 Sleep, EM2 Deep Sleep, and EM3 Stop.

### 3.6.7 Watchdog Timer (WDOG)

The watchdog timer can act both as an independent watchdog or as a watchdog synchronous with the CPU clock. It has windowed monitoring capabilities, and can generate a reset or different interrupts depending on the failure mode of the system. The watchdog can also monitor autonomous systems driven by PRS.

## 3.7 Communications and Other Digital Peripherals

### 3.7.1 Universal Synchronous/Asynchronous Receiver/Transmitter (USART)

The Universal Synchronous/Asynchronous Receiver/Transmitter is a flexible serial I/O module. It supports full duplex asynchronous UART communication with hardware flow control as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with devices supporting:

- ISO7816 SmartCards
- IrDA
- I<sup>2</sup>S

### 3.7.2 Low Energy Universal Asynchronous Receiver/Transmitter (LEUART)

The unique LEUART™ provides two-way UART communication on a strict power budget. Only a 32.768 kHz clock is needed to allow UART communication up to 9600 baud. The LEUART includes all necessary hardware to make asynchronous serial communication possible with a minimum of software intervention and energy consumption.

### 3.7.3 Inter-Integrated Circuit Interface (I<sup>2</sup>C)

The I<sup>2</sup>C module provides an interface between the MCU and a serial I<sup>2</sup>C bus. It is capable of acting as both a master and a slave and supports multi-master buses. Standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates from 10 kbit/s up to 1 Mbit/s. Slave arbitration and timeouts are also available, allowing implementation of an SMBus-compliant system. The interface provided to software by the I<sup>2</sup>C module allows precise timing control of the transmission process and highly automated transfers. Automatic recognition of slave addresses is provided in active and low energy modes.

### 3.7.4 Peripheral Reflex System (PRS)

The Peripheral Reflex System provides a communication network between different peripheral modules without software involvement. Peripheral modules producing Reflex signals are called producers. The PRS routes Reflex signals from producers to consumer peripherals which in turn perform actions in response. Edge triggers and other functionality such as simple logic operations (AND, OR, NOT) can be applied by the PRS to the signals. The PRS allows peripheral to act autonomously without waking the MCU core, saving power.

### 3.7.5 Low Energy Sensor Interface (LESENSE)

The Low Energy Sensor Interface LESENSE™ is a highly configurable sensor interface with support for up to 16 individually configurable sensors. By controlling the analog comparators, ADC, and DAC, LESENSE is capable of supporting a wide range of sensors and measurement schemes, and can for instance measure LC sensors, resistive sensors and capacitive sensors. LESENSE also includes a programmable finite state machine which enables simple processing of measurement results without CPU intervention. LESENSE is available in energy mode EM2, in addition to EM0 and EM1, making it ideal for sensor monitoring in applications with a strict energy budget.

## 3.8 Security Features

### 3.8.1 GPCRC (General Purpose Cyclic Redundancy Check)

The GPCRC module implements a Cyclic Redundancy Check (CRC) function. It supports both 32-bit and 16-bit polynomials. The supported 32-bit polynomial is 0x04C11DB7 (IEEE 802.3), while the 16-bit polynomial can be programmed to any value, depending on the needs of the application.

### 3.8.2 Crypto Accelerator (CRYPTO)

The Crypto Accelerator is a fast and energy-efficient autonomous hardware encryption and decryption accelerator. EFR32 devices support AES encryption and decryption with 128- or 256-bit keys, ECC over both GF(P) and GF(2<sup>m</sup>), SHA-1 and SHA-2 (SHA-224 and SHA-256).

Supported block cipher modes of operation for AES include: ECB, CTR, CBC, PCBC, CFB, OFB, GCM, CBC-MAC, GMAC and CCM.

Supported ECC NIST recommended curves include P-192, P-224, P-256, K-163, K-233, B-163 and B-233.

The CRYPTO1 block is tightly linked to the Radio Buffer Controller (BUFC) enabling fast and efficient autonomous cipher operations on data buffer content. It allows fast processing of GCM (AES), ECC and SHA with little CPU intervention.

CRYPTO also provides trigger signals for DMA read and write operations.

### 3.8.3 True Random Number Generator (TRNG)

The TRNG module is a non-deterministic random number generator based on a full hardware solution. The TRNG is validated with NIST800-22 and AIS-31 test suites as well as being suitable for FIPS 140-2 certification (for the purposes of cryptographic key generation).

### 3.8.4 Security Management Unit (SMU)

The Security Management Unit (SMU) allows software to set up fine-grained security for peripheral access, which is not possible in the Memory Protection Unit (MPU). Peripherals may be secured by hardware on an individual basis, such that only privileged accesses to the peripheral's register interface will be allowed. When an access fault occurs, the SMU reports the specific peripheral involved and can optionally generate an interrupt.

## 3.9 Analog

### 3.9.1 Analog Port (APORT)

The Analog Port (APORT) is an analog interconnect matrix allowing access to many analog modules on a flexible selection of pins. Each APORT bus consists of analog switches connected to a common wire. Since many clients can operate differentially, buses are grouped by X/Y pairs.

### 3.9.2 Analog Comparator (ACMP)

The Analog Comparator is used to compare the voltage of two analog inputs, with a digital output indicating which input voltage is higher. Inputs are selected from among internal references and external pins. The tradeoff between response time and current consumption is configurable by software. Two 6-bit reference dividers allow for a wide range of internally-programmable reference sources. The ACMP can also be used to monitor the supply voltage. An interrupt can be generated when the supply falls below or rises above the programmable threshold.

### 3.9.3 Analog to Digital Converter (ADC)

The ADC is a Successive Approximation Register (SAR) architecture, with a resolution of up to 12 bits at up to 1 Msps. The output sample resolution is configurable and additional resolution is possible using integrated hardware for averaging over multiple samples. The ADC includes integrated voltage references and an integrated temperature sensor. Inputs are selectable from a wide range of sources, including pins configurable as either single-ended or differential.

### 3.9.4 Capacitive Sense (CSEN)

The CSEN module is a dedicated Capacitive Sensing block for implementing touch-sensitive user interface elements such as switches and sliders. The CSEN module uses a charge ramping measurement technique, which provides robust sensing even in adverse conditions including radiated noise and moisture. The module can be configured to take measurements on a single port pin or scan through multiple pins and store results to memory through DMA. Several channels can also be shorted together to measure the combined capacitance or implement wake-on-touch from very low energy modes. Hardware includes a digital accumulator and an averaging filter, as well as digital threshold comparators to reduce software overhead.

### 3.9.5 Digital to Analog Current Converter (IDAC)

The Digital to Analog Current Converter can source or sink a configurable constant current. This current can be driven on an output pin or routed to the selected ADC input pin for capacitive sensing. The full-scale current is programmable between 0.05  $\mu\text{A}$  and 64  $\mu\text{A}$  with several ranges consisting of various step sizes.

### 3.9.6 Digital to Analog Converter (VDAC)

The Digital to Analog Converter (VDAC) can convert a digital value to an analog output voltage. The VDAC is a fully differential, 500 ksp/s, 12-bit converter. The opamps are used in conjunction with the VDAC, to provide output buffering. One opamp is used per single-ended channel, or two opamps are used to provide differential outputs. The VDAC may be used for a number of different applications such as sensor interfaces or sound output. The VDAC can generate high-resolution analog signals while the MCU is operating at low frequencies and with low total power consumption. Using DMA and a timer, the VDAC can be used to generate waveforms without any CPU intervention. The VDAC is available in all energy modes down to and including EM3.

### 3.9.7 Operational Amplifiers

The opamps are low power amplifiers with a high degree of flexibility targeting a wide variety of standard opamp application areas, and are available down to EM3. With flexible built-in programming for gain and interconnection they can be configured to support multiple common opamp functions. All pins are also available externally for filter configurations. Each opamp has a rail to rail input and a rail to rail output. They can be used in conjunction with the VDAC module or in stand-alone configurations. The opamps save energy, PCB space, and cost as compared with standalone opamps because they are integrated on-chip.

## 3.10 Reset Management Unit (RMU)

The RMU is responsible for handling reset of the EFR32FG13. A wide range of reset sources are available, including several power supply monitors, pin reset, software controlled reset, core lockup reset, and watchdog reset.

## 3.11 Core and Memory

### 3.11.1 Processor Core

The ARM Cortex-M processor includes a 32-bit RISC processor integrating the following features and tasks in the system:

- ARM Cortex-M4 RISC processor achieving 1.25 Dhrystone MIPS/MHz
- Memory Protection Unit (MPU) supporting up to 8 memory segments
- Up to 512 kB flash program memory
- Up to 64 kB RAM data memory
- Configuration and event handling of all modules
- 2-pin Serial-Wire debug interface

### 3.11.2 Memory System Controller (MSC)

The Memory System Controller (MSC) is the program memory unit of the microcontroller. The flash memory is readable and writable from both the Cortex-M and DMA. The flash memory is divided into two blocks; the main block and the information block. Program code is normally written to the main block, whereas the information block is available for special user data and flash lock bits. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in energy modes EM0 Active and EM1 Sleep.

### 3.11.3 Linked Direct Memory Access Controller (LDMA)

The Linked Direct Memory Access (LDMA) controller allows the system to perform memory operations independently of software. This reduces both energy consumption and software workload. The LDMA allows operations to be linked together and staged, enabling sophisticated operations to be implemented.

### 3.12 Memory Map

The EFR32FG13 memory map is shown in the figures below. RAM and flash sizes are for the largest memory configuration.

Figure 3.2. EFR32FG13 Memory Map — Core Peripherals and Code Space

Figure 3.3. EFR32FG13 Memory Map — Peripherals

### 3.13 Configuration Summary

The features of the EFR32FG13 are a subset of the feature set described in the device reference manual. The table below describes device specific implementation of the features. Remaining modules support full configuration.

Table 3.2. Configuration Summary

| Module  | Configuration                   | Pin Connections                 |
|---------|---------------------------------|---------------------------------|
| USART0  | IrDA SmartCard                  | US0_TX, US0_RX, US0_CLK, US0_CS |
| USART1  | IrDA I <sup>2</sup> S SmartCard | US1_TX, US1_RX, US1_CLK, US1_CS |
| USART2  | IrDA SmartCard                  | US2_TX, US2_RX, US2_CLK, US2_CS |
| TIMER0  | with DTI                        | TIM0_CC[2:0], TIM0_CDTI[2:0]    |
| TIMER1  | -                               | TIM1_CC[3:0]                    |
| WTIMER0 | with DTI                        | WTIM0_CC[2:0], WTIM0_CDTI[2:0]  |

## 4. Electrical Specifications

### 4.1 Electrical Characteristics

All electrical parameters in all tables are specified under the following conditions, unless stated otherwise:

- Typical values are based on  $T_{AMB}=25^{\circ}\text{C}$  and  $V_{DD}=3.3\text{ V}$ , by production test and/or technology characterization.
- Radio performance numbers are measured in conducted mode, based on Silicon Laboratories reference designs using output power-specific external RF impedance-matching networks for interfacing to a  $50\ \Omega$  source or load.
- Minimum and maximum values represent the worst conditions across supply voltage, process variation, and operating temperature, unless stated otherwise.

Refer to [4.1.2.1 General Operating Conditions](#) for more details about operational supply and temperature limits.

#### 4.1.1 Absolute Maximum Ratings

Stresses above those listed below may cause permanent damage to the device. This is a stress rating only and functional operation of the devices at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. For more information on the available quality and reliability data, see the Quality and Reliability Monitor Report at <http://www.silabs.com/support/quality/pages/default.aspx>.

**Table 4.1. Absolute Maximum Ratings**

| Parameter                                                    | Symbol                  | Test Condition                         | Min  | Typ | Max                      | Unit        |
|--------------------------------------------------------------|-------------------------|----------------------------------------|------|-----|--------------------------|-------------|

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|----------------|-----|-----|-----|------|
| <b>Note:</b> <ol style="list-style-type: none"> <li>1. When a GPIO pin is routed to the analog module through the APORT, the maximum voltage = IOVDD.</li> <li>2. Valid for IOVDD in valid operating range or when IOVDD is undriven (high-Z). If IOVDD is connected to a low-impedance source below the valid operating range (e.g. IOVDD shorted to VSS), the pin voltage maximum is IOVDD + 0.3 V, to avoid exceeding the maximum IO current specifications.</li> <li>3. To operate above the IOVDD supply rail, over-voltage tolerance must be enabled according to the GPIO_Px_OVTDIS register. Pins with over-voltage tolerance disabled have the same limits as Standard GPIO.</li> </ol> |        |                |     |     |     |      |

#### 4.1.2 Operating Conditions

When assigning supply sources, the following requirements must be observed:

- VREGVDD must be greater than or equal to AVDD, DVDD, RFVDD, PAVDD and all IOVDD supplies.
- VREGVDD = AVDD
- DVDD  $\leq$  AVDD
- IOVDD  $\leq$  AVDD
- RFVDD  $\leq$  AVDD
- PAVDD  $\leq$  AVDD

## 4.1.2.1 General Operating Conditions

Table 4.2. General Operating Conditions

| Parameter                                                    | Symbol         | Test Condition                                      | Min  | Typ | Max           | Unit |
|--------------------------------------------------------------|----------------|-----------------------------------------------------|------|-----|---------------|------|
| Operating ambient temperature range <sup>6</sup>             | $T_A$          | -G temperature grade                                | -40  | 25  | 85            | °C   |
|                                                              |                | -I temperature grade                                | -40  | 25  | 125           | °C   |
| AVDD supply voltage <sup>2</sup>                             | $V_{AVDD}$     |                                                     | 1.8  | 3.3 | 3.8           | V    |

| RFVDD operating supply voltage                               | $V_{RFVDD}$    |                                                     | 1.62 | —   | $V_{VREGVDD}$ | V    |
| DVDD operating supply voltage                                | $V_{DVDD}$     |                                                     | 1.62 | —   | $V_{VREGVDD}$ | V    |
| PAVDD operating supply voltage                               | $V_{PAVDD}$    |                                                     | 1.62 | —   | $V_{VREGVDD}$ | V    |
| IOVDD operating supply voltage                               | $V_{IOVDD}$    | All IOVDD pins <sup>5</sup>                         | 1.62 | —   | $V_{VREGVDD}$ | V    |
| DECOUPLE output capacitor <sup>3 4</sup>                     | $C_{DECOUPLE}$ |                                                     | 0.75 | 1.0 | 2.75          | μF   |
| Difference between AVDD and VREGVDD, $ABS(AVDD - VREGVDD)^2$ | $dV_{DD}$      |                                                     | —    | —   | 0.1           | V    |
| HFCORECLK frequency                                          | $f_{CORE}$     | VSCALE2, MODE = WS1                                 | —    | —   | 40            | MHz  |
|                                                              |                | VSCALE0, MODE = WS0                                 | —    | —   | 20            | MHz  |
| HFCLK frequency                                              | $f_{HFCLK}$    | VSCALE2                                             | —    | —   | 40            | MHz  |
|                                                              |                | VSCALE0                                             | —    | —   | 20            | MHz  |

**Note:**

1. The minimum voltage required in bypass mode is calculated using  $R_{BYP}$  from the DCDC specification table. Requirements for other loads can be calculated as  $V_{DVDD\_min} + I_{LOAD} * R_{BYP\_max}$ .
2. VREGVDD must be tied to AVDD. Both VREGVDD and AVDD minimum voltages must be satisfied for the part to operate.
3. The system designer should consult the characteristic specs of the capacitor used on DECOUPLE to ensure its capacitance value stays within the specified bounds across temperature and DC bias.
4. VSCALE0 to VSCALE2 voltage change transitions occur at a rate of 10 mV / usec for approximately 20 usec. During this transition, peak currents will be dependent on the value of the DECOUPLE output capacitor, from 35 mA (with a 1 μF capacitor) to 70 mA (with a 2.7 μF capacitor).
5. When the CSEN peripheral is used with chopping enabled (CSEN\_CTRL\_CHOPEN = ENABLE), IOVDD must be equal to AVDD.
6. The maximum limit on  $T_A$  may be lower due to device self-heating, which depends on the power dissipation of the specific application.  $T_A (\text{max}) = T_J (\text{max}) - (THETA_{JA} \times \text{PowerDissipation})$ . Refer to the Absolute Maximum Ratings table and the Thermal Characteristics table for  $T_J$  and  $THETA_{JA}$ .

## 4.1.3 Thermal Characteristics

Table 4.3. Thermal Characteristics

| Parameter          | Symbol              | Test Condition                                      | Min | Typ  | Max | Unit |
|--------------------|---------------------|-----------------------------------------------------|-----|------|-----|------|
| Thermal resistance | THETA <sub>JA</sub> | QFN48 Package, 2-Layer PCB,<br>Air velocity = 0 m/s | —   | 75.7 | —   | °C/W |

**Note:**

1. Due to internal dropout, the DC-DC output will never be able to reach its input voltage,  $V_{VREGVDD}$ .
2. Drive levels are defined by configuration of the PFETCNT and NFETCNT registers. Light Drive: PFETCNT=NFETCNT=3; Medium Drive: PFETCNT=NFETCNT=7; Heavy Drive: PFETCNT=NFETCNT=15.
3. LPCMPBIASEMxx refers to either LPCMPBIASEM234H in the EMU\_DCDCMISCCTRL register or LPCMPBIASEM01 in the EMU\_DCDCLOEM01CFG register, depending on the energy mode.
4. LP mode controller is a hysteretic controller that maintains the output voltage within the specified limits.
5. Output voltage under/over-shoot and regulation are specified with  $C_{DCDC}$  4.7  $\mu\text{F}$ . Different settings for DCDCLNCOMPCTRL must be used if  $C_{DCDC}$  is lower than 4.7  $\mu\text{F}$ . See Application Note AN0948 for details.

## 4.1.5 Current Consumption

### 4.1.5.1 Current Consumption 3.3 V without DC-DC Converter

Unless otherwise indicated, typical conditions are: VREGVDD = AVDD = DVDD = RFVDD = PAVDD = 3.3 V. T = 25 °C. DCDC is off. Minimum and maximum values in this table represent the worst conditions across supply voltage and process variation at T = 25 °C.

**Table 4.5. Current Consumption 3.3 V without DC-DC Converter**

| Parameter                                                                                 | Symbol                 | Test Condition                                                        | Min | Typ  | Max | Unit   |

#### 4.1.5.2 Current Consumption 3.3 V using DC-DC Converter

Unless otherwise indicated, typical conditions are: VREGVDD = AVDD = IOVDD = 3.3 V, DVDD = RFVDD = PAVDD = 1.8 V DC-DC output. T = 25 °C. Minimum and maximum values in this table represent the worst conditions across supply voltage and process variation at T = 25 °C.

**Table 4.6. Current Consumption 3.3 V using DC-DC Converter**

**4.1.5.4 Current Consumption Using Radio 3.3 V with DC-DC**

Unless otherwise indicated, typical conditions are: VREGVDD = AVDD = IOVDD = 3.3 V, DVDD = RFVDD = PAVDD = 1.8 V. T = 25 °C. Minimum and maximum values in this table represent the worst conditions across supply voltage and process variation at T = 25 °C.

**Table 4.8. Current Consumption Using Radio 3.3 V with DC-DC**

## 4.1.6 Wake Up Times

Table 4.9. Wake Up Times

| Parameter                                                        | Symbol         | Test Condition                                    | Min | Typ  | Max | Unit       |
|------------------------------------------------------------------|----------------|---------------------------------------------------|-----|------|-----|------------|
| Wakeup time from EM1                                             | $t_{EM1\_WU}$  |                                                   | —   | 3    | —   | AHB Clocks |
| Wake up from EM2                                                 | $t_{EM2\_WU}$  | Code execution from flash                         | —   | 10.9 | —   | $\mu s$    |
|                                                                  |                | Code execution from RAM                           | —   | 3.8  | —   | $\mu s$    |
| Wake up from EM3                                                 | $t_{EM3\_WU}$  | Code execution from flash                         | —   | 10.9 | —   | $\mu s$    |
|                                                                  |                | Code execution from RAM                           | —   | 3.8  | —   | $\mu s$    |
| Wake up from EM4H <sup>1</sup>                                   | $t_{EM4H\_WU}$ | Executing from flash                              | —   | 90   | —   | $\mu s$    |
| Wake up from EM4S <sup>1</sup>                                   | $t_{EM4S\_WU}$ | Executing from flash                              | —   | 300  | —   | $\mu s$    |
| Time from release of reset source to first instruction execution | $t_{RESET}$    | Soft Pin Reset released                           | —   | 51   | —   | $\mu s$    |
|                                                                  |                | Any other reset released                          | —   | 358  | —   | $\mu s$    |
| Power mode scaling time                                          | $t_{SCALE}$    | VSCALE0 to VSCALE2, HFCLK = 19 MHz <sup>4 2</sup> | —   | 31.8 | —   | $\mu s$    |
|                                                                  |                | VSCALE2 to VSCALE0, HFCLK = 19 MHz <sup>3</sup>   | —   | 4.3  | —   | $\mu s$    |

**Note:**

1. Time from wakeup request until first instruction is executed. Wakeup results in device reset.
2. VSCALE0 to VSCALE2 voltage change transitions occur at a rate of 10 mV/ $\mu s$  for approximately 20  $\mu s$ . During this transition, peak currents will be dependent on the value of the DECOUPLE output capacitor, from 35 mA (with a 1  $\mu F$  capacitor) to 70 mA (with a 2.7  $\mu F$  capacitor).
3. Scaling down from VSCALE2 to VSCALE0 requires approximately 2.8  $\mu s$  + 29 HFCLKs.
4. Scaling up from VSCALE0 to VSCALE2 requires approximately 30.3  $\mu s$  + 28 HFCLKs.

## 4.1.7 Brown Out Detector (BOD)

Table 4.10. Brown Out Detector (BOD)

| Parameter              | Symbol                     | Test Condition               | Min  | Typ | Max  | Unit |
|------------------------|----------------------------|------------------------------|------|-----|------|------|
| DVDD BOD threshold     | V <sub>DVddbOD</sub>       | DVDD rising                  | —    | —   | 1.62 | V    |
|                        |                            | DVDD falling (EM0/EM1)       | 1.35 | —   | —    | V    |
|                        |                            | DVDD falling (EM2/EM3)       | 1.3  | —   | —    | V    |
| DVDD BOD hysteresis    | V <sub>DVddbOD_HYST</sub>  |                              | —    | 18  | —    | mV   |
| DVDD BOD response time | t <sub>DVddbOD_DELAY</sub> | Supply drops at 0.1V/μs rate | —    | 2.4 | —    | μs   |
| AVDD BOD threshold     | V <sub>AVddbOD</sub>       | AVDD rising                  | —    | —   | 1.8  | V    |
|                        |                            | AVDD falling (EM0/EM1)       | 1.62 | —   | —    | V    |
|                        |                            | AVDD falling (EM2/EM3)       | 1.53 | —   | —    | V    |
| AVDD BOD hysteresis    | V <sub>AVddbOD_HYST</sub>  |                              | —    | 20  | —    | mV   |
| AVDD BOD response time | t <sub>AVddbOD_DELAY</sub> | Supply drops at 0.1V/μs rate | —    | 2.4 | —    | μs   |
| EM4 BOD threshold      | V <sub>EM4dBOD</sub>       | AVDD rising                  | —    | —   | 1.7  | V    |
|                        |                            | AVDD falling                 | 1.45 | —   | —    | V    |
| EM4 BOD hysteresis     | V <sub>EM4BOD_HYST</sub>   |                              | —    | 25  | —    | mV   |

## 4.1.9 2.4 GHz RF Transceiver Characteristics

## 4.1.9.1 RF Transmitter General Characteristics for 2.4 GHz Band

Unless otherwise indicated, typical conditions are: T = 25 °C, VREGVDD = AVDD = IOVDD = 3.3 V, DVDD = RFVDD = PAVDD. RFVDD and PAVDD path is filtered using ferrites. Crystal frequency=38.4 MHz. RF center frequency 2.45 GHz.

Table 4.12. RF Transmitter General Characteristics for 2.4 GHz Band

| Parameter                                                     | Symbol                | Test Condition                                                                                                | Min  | Typ  | Max    | Unit |
|---------------------------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------|------|------|--------|------|
| Maximum TX power <sup>1</sup>                                 | POUT <sub>MAX</sub>   | 19 dBm-rated part numbers.<br>PAVDD connected directly to external 3.3V supply                                | —    | 19.5 | —      | dBm  |
| Minimum active TX Power                                       | POUT <sub>MIN</sub>   | CW                                                                                                            |      | -30  | —      | dBm  |

**Note:**

1. Reference packet is defined as 20 octet PSDU, modulated according to 802.15.4-2011 DSSS-OQPSK in the 2.4GHz band, with pseudo-random packet data content.
2. Specified at maximum power output level of 10 dBm.
3. For 2415 MHz, 2 dB of power backoff is used to achieve this value.
4. For 2475 MHz, 2 dB of power backoff is used to achieve this value.
5. For 2480 MHz, 13 dB of power backoff is used to achieve this value.

**4.1.9.12 RF Receiver Characteristics for 802.15.4 DSSS-OQPSK in the 2.4 GHz Band**

Unless otherwise indicated, typical conditions are: T = 25 °C, VREGVDD = AVDD = IOVDD = 3.3 V, DVDD = RFVDD = PAVDD. RFVDD and PAVDD path is filtered using ferrites. Crystal frequency=38.4 MHz. RF center frequency 2.45 GHz.

| Lower limit of input power range over which RSSI resolution is maintained | $RSSI_{MIN}$ |                                   | -98 | —    | —   | dBm  |
| RSSI resolution                                                           | $RSSI_{RES}$ | over $RSSI_{MIN}$ to $RSSI_{MAX}$ | —   | 0.25 | —   | dB   |
| RSSI accuracy in the linear region as defined by 802.15.4-2003            | $RSSI_{LIN}$ |                                   | —   | +/-6 | —   | dB   |

**Note:**

1. This is an IEEE 802.11b/g ERP-PBCC 22 MBit/s signal as defined by the IEEE 802.11 specification and IEEE 802.11g addendum.
2. Filter is characterized as a symmetric bandpass centered on the adjacent channel having a 3dB bandwidth of 4.6 MHz and stop-band rejection better than 26 dB beyond 3.15 MHz from the adjacent carrier.
3. Due to low-IF frequency, there is some overlap of adjacent channel and image channel bands. Adjacent channel CW blocker tests place the Interferer center frequency at the Desired frequency  $\pm 5$  MHz on the channel raster, whereas the image rejection test places the CW interferer near the image frequency of the Desired signal carrier, regardless of the channel raster.
4. Reference signal is defined as O-QPSK DSSS per 802.15.4, Frequency range = 2400-2483.5 MHz, Symbol rate = 62.5 ksym-bols/s.
5. Reference sensitivity level is -85 dBm.

#### 4.1.10 Sub-GHz RF Transceiver Characteristics

#### 4.1.10.1 Sub-GHz RF Transmitter characteristics for 915 MHz Band

Unless otherwise indicated, typical conditions are: T = 25 °C, VREGVDD = AVDD = IOVDD = 3.3 V, DVDD = RFVDD = PAVDD. RFVDD and PAVDD path is filtered using ferrites. Crystal frequency=38.4 MHz. RF center frequency 915 MHz.

| Error vector magnitude (offset EVM), per 802.15.4-2011                                                                                                | EVM                         | Signal is DSSS-OQPSK reference packet. Modulated according to 802.15.4-2011 DSSS-OQPSK in the 915MHz band, with pseudo-random packet data content. PAVDD connected to external 3.3V supply.                                                                                        | —   | 1.0   | 2.8   | %rms       |
| Power spectral density limit                                                                                                                          | PSD                         | Relative, at carrier $\pm 1.2$ MHz. Average spectral power shall be measured using a 100kHz resolution bandwidth. The reference level shall be the highest average spectral power measured within $\pm 600$ kHz of the carrier frequency. PAVDD connected to external 3.3V supply. | —   | -37.1 | -24.8 | dBc/100kHz |
|                                                                                                                                                       |                             | Absolute, at carrier $\pm 1.2$ MHz. Average spectral power shall be measured using a 100kHz resolution bandwidth. PAVDD connected to external 3.3V supply.                                                                                                                         | —   | -24.2 | -20   | dBm/100kHz |

**Note:**

- Supported transmit power levels are determined by the ordering part number (OPN). Transmit power ratings for all devices covered in this datasheet can be found in the Max TX Power column of the Ordering Information Table.

#### 4.1.10.2 Sub-GHz RF Receiver Characteristics for 915 MHz Band

Unless otherwise indicated, typical conditions are: T = 25 °C, VREGVDD = AVDD = IOVDD = 3.3 V, DVDD = RFVDD = PAVDD. RFVDD and PAVDD path is filtered using ferrites. Crystal frequency=38.4 MHz. RF center frequency 915 MHz.

**Table 4.25. Sub-GHz RF Receiver Characteristics for 915 MHz Band**

| Parameter                                               | Symbol                   | Test Condition                                                                             | Min | Typ    | Max    | Unit |

**Note:**

- Supported transmit power levels are determined by the ordering part number (OPN). Transmit power ratings for all devices covered in this datasheet can be found in the Max TX Power column of the Ordering Information Table.

**4.1.10.8 Sub-GHz RF Receiver Characteristics for 433 MHz Band**

Unless otherwise indicated, typical conditions are: T = 25 °C, VREGVDD = AVDD = IOVDD = 3.3 V, DVDD = RFVDD = PAVDD. RFVDD and PAVDD path is filtered using ferrites. Crystal frequency=38.4 MHz. RF center frequency 433 MHz.

**Table 4.31. Sub-GHz RF Receiver Characteristics for 433 MHz Band**

**Note:**

1. Definition of reference signal is 2.4 kbps 2GFSK, BT=0.5,  $\Delta f = 1.2$  kHz, RX channel BW = 4.798 kHz, channel spacing = 12.5 kHz.
2. Definition of reference signal is 38.4 kbps 2GFSK, BT=0.5,  $\Delta f = 20$  kHz, RX channel BW = 74.809 kHz, channel spacing = 100 kHz.
3. Definition of reference signal is 500 kbps 2GFSK, BT=0.5,  $\Delta f = 125$  kHz, RX channel BW = 753.320 kHz.
4. RFSense performance is only valid from 0 to 85 °C. RFSense should be disabled outside this temperature range.

#### 4.1.10.11 Sub-GHz RF Transmitter Characteristics for 169 MHz Band

Unless otherwise indicated, typical conditions are: T = 25 °C, VREGVDD = AVDD = IOVDD = 3.3 V, DVDD = RFVDD = PAVDD. RFVDD and PAVDD path is filtered using ferrites. Crystal frequency=38.4 MHz. RF center frequency 169 MHz.

**Table 4.34. Sub-GHz RF Transmitter Characteristics for 169 MHz Band**

| Parameter                                                                                      | Symbol                    | Test Condition                                                                               | Min  | Typ   | Max  | Unit |

**Note:**

- Supported transmit power levels are determined by the ordering part number (OPN). Transmit power ratings for all devices covered in this datasheet can be found in the Max TX Power column of the Ordering Information Table.
- Typical value marginally passes specification. Additional margin can be obtained by increasing the order of the harmonic filter.

| Parameter                                                                                                    | Symbol                 | Test Condition                                        | Min | Typ  | Max | Unit |
|--------------------------------------------------------------------------------------------------------------|------------------------|-------------------------------------------------------|-----|------|-----|------|
| Blocking selectivity, 0.1% BER. Desired is 2.4 kbps GFSK signal <sup>1</sup> at 3 dB above sensitivity level | C/I <sub>BLOCKER</sub> | Interferer CW at Desired $\pm 1$ MHz                  | —   | 73.4 | —   | dB   |
|                                                                                                              |                        | Interferer CW at Desired $\pm 2$ MHz                  | —   | 75   | —   | dB   |
|                                                                                                              |                        | Interferer CW at Desired $\pm 10$ MHz                 | 80  | 90.1 | —   | dB   |
| Upper limit of input power range over which RSSI resolution is maintained                                    | RSSI <sub>MAX</sub>    |                                                       | —   | —    | 5   | dBm  |
| Lower limit of input power range over which RSSI resolution is maintained                                    | RSSI <sub>MIN</sub>    |                                                       | -98 | —    | —   | dBm  |
| RSSI resolution                                                                                              | RSSI <sub>RES</sub>    | Over RSSI <sub>MIN</sub> to RSSI <sub>MAX</sub> range | —   | 0.25 | —   | dBm  |
| Max spurious emissions during active receive mode                                                            | SPUR <sub>RX</sub>     | 30 MHz to 1 GHz                                       | —   | -63  | -57 | dBm  |
|                                                                                                              |                        | 1 GHz to 12 GHz                                       | —   | -53  | -47 | dBm  |

**Note:**

1. Definition of reference signal is 2.4 kbps 2GFSK, BT=0.5,  $\Delta f = 1.2$  kHz, RX channel BW = 4.798 kHz, channel spacing = 12.5 kHz.
2. Definition of reference signal is 38.4 kbps 2GFSK, BT=0.5,  $\Delta f = 20$  kHz, RX channel BW = 74.809 kHz, channel spacing = 100 kHz.
3. Definition of reference signal is 500 kbps 2GFSK, BT=0.5,  $\Delta f = 125$  kHz, RX channel BW = 753.320 kHz.
4. RFSense performance is only valid from 0 to 85 °C. RFSense should be disabled outside this temperature range.

**4.1.11 Modem****Table 4.36. Modem**

| Parameter            | Symbol              | Test Condition                                                      | Min | Typ | Max  | Unit        |
|----------------------|---------------------|---------------------------------------------------------------------|-----|-----|------|-------------|
| Receive bandwidth    | BW <sub>RX</sub>    | Configurable range with 38.4 MHz crystal                            | 0.1 | —   | 2530 | kHz         |
| IF frequency         | f <sub>IF</sub>     | Configurable range with 38.4 MHz crystal. Selected steps available. | 150 | —   | 1371 | kHz         |
| DSSS symbol length   | SL <sub>DSSS</sub>  | Configurable in steps of 1 chip                                     | 2   | —   | 32   | chips       |
| DSSS bits per symbol | BPS <sub>DSSS</sub> | Configurable                                                        | 1   | —   | 4    | bits/symbol |

## 4.1.12 Oscillators

### 4.1.12.1 Low-Frequency Crystal Oscillator (LFXO)

**Table 4.37. Low-Frequency Crystal Oscillator (LFXO)**

| Parameter                                                | Symbol                     | Test Condition                                                                   | Min | Typ    | Max | Unit       |
|----------------------------------------------------------|----------------------------|----------------------------------------------------------------------------------|-----|--------|-----|------------|
| Crystal frequency                                        | $f_{\text{LFXO}}$          |                                                                                  | —   | 32.768 | —   | kHz        |
| Supported crystal equivalent series resistance (ESR)     | $\text{ESR}_{\text{LFXO}}$ |                                                                                  | —   | —      | 70  | k $\Omega$ |
| Supported range of crystal load capacitance <sup>1</sup> | $C_{\text{LFXO\_CL}}$      |                                                                                  | 6   | —      | 18  | pF         |
| On-chip tuning cap range <sup>2</sup>                    | $C_{\text{LFXO\_T}}$       | On each of LFX TAL_N and LFX TAL_P pins                                          | 8   | —      | 40  | pF         |
| On-chip tuning cap step size                             | $\text{SS}_{\text{LFXO}}$  |                                                                                  | —   | 0.25   | —   | pF         |
| Current consumption after startup <sup>3</sup>           | $I_{\text{LFXO}}$          | ESR = 70 k $\Omega$ m, $C_L$ = 7 pF, GAIN <sup>4</sup> = 2, AGC <sup>4</sup> = 1 | —   | 273    | —   | nA         |
| Start- up time                                           | $t_{\text{LFXO}}$          | ESR = 70 k $\Omega$ m, $C_L$ = 7 pF, GAIN <sup>4</sup> = 2                       | —   | 308    | —   | ms         |

**Note:**

1. Total load capacitance as seen by the crystal.
2. The effective load capacitance seen by the crystal will be  $C_{\text{LFXO\_T}}/2$ . This is because each XTAL pin has a tuning cap and the two caps will be seen in series by the crystal.
3. Block is supplied by AVDD if ANASW = 0, or DVDD if ANASW=1 in EMU\_PWRCTRL register.
4. In CMU\_LFXOCTRL register.

## 4.1.12.2 High-Frequency Crystal Oscillator (HFXO)

Table 4.38. High-Frequency Crystal Oscillator (HFXO)

| Parameter                                                | Symbol                                 | Test Condition                                    | Min | Typ  | Max | Unit          |
|----------------------------------------------------------|----------------------------------------|---------------------------------------------------|-----|------|-----|---------------|
| Crystal frequency                                        | $f_{\text{HFXO}}$                      | 38.4 MHz required for radio transceiver operation | 38  | 38.4 | 40  | MHz           |
| Supported crystal equivalent series resistance (ESR)     | $\text{ESR}_{\text{HFXO}_38\text{M4}}$ | Crystal frequency 38.4 MHz                        | —   | —    | 60  | $\Omega$      |
| Supported range of crystal load capacitance <sup>1</sup> | $C_{\text{HFXO\_CL}}$                  |                                                   | 6   | —    | 12  | pF            |
| On-chip tuning cap range <sup>2</sup>                    | $C_{\text{HFXO\_T}}$                   | On each of HFXTAL_N and HFXTAL_P pins             | 9   | 20   | 25  | pF            |
| On-chip tuning capacitance step                          | $\text{SS}_{\text{HFXO}}$              |                                                   | —   | 0.04 | —   | pF            |
| Startup time                                             | $t_{\text{HFXO}}$                      | 38.4 MHz, ESR = 50 Ohm, $C_L$ = 10 pF             | —   | 300  | —   | $\mu\text{s}$ |
| Frequency tolerance for the crystal                      | $\text{FT}_{\text{HFXO}}$              | 38.4 MHz, ESR = 50 Ohm, $C_L$ = 10 pF             | -40 | —    | 40  | ppm           |

**Note:**

1. Total load capacitance as seen by the crystal.
2. The effective load capacitance seen by the crystal will be  $C_{\text{HFXO\_T}}/2$ . This is because each XTAL pin has a tuning cap and the two caps will be seen in series by the crystal.

## 4.1.12.3 Low-Frequency RC Oscillator (LFRCO)

Table 4.39. Low-Frequency RC Oscillator (LFRCO)

| Parameter                        | Symbol             | Test Condition                              | Min  | Typ    | Max  | Unit          |
|----------------------------------|--------------------|---------------------------------------------|------|--------|------|---------------|
| Oscillation frequency            | $f_{\text{LFRCO}}$ | $\text{ENVREF}^2 = 1$                       | 31.3 | 32.768 | 33.6 | kHz           |
|                                  |                    | $\text{ENVREF}^2 = 1, T > 85^\circ\text{C}$ | 31.6 | 32.768 | 36.8 | kHz           |
|                                  |                    | $\text{ENVREF}^2 = 0$                       | 31.3 | 32.768 | 33.4 | kHz           |
|                                  |                    | $\text{ENVREF}^2 = 0, T > 85^\circ\text{C}$ | 30   | 32.768 | 33.4 | kHz           |
| Startup time                     | $t_{\text{LFRCO}}$ |                                             | —    | 500    | —    | $\mu\text{s}$ |
| Current consumption <sup>1</sup> | $I_{\text{LFRCO}}$ | $\text{ENVREF} = 1$ in CMU_LFRCOCTRL        | —    | 342    | —    | nA            |
|                                  |                    | $\text{ENVREF} = 0$ in CMU_LFRCOCTRL        | —    | 494    | —    | nA            |

**Note:**

1. Block is supplied by AVDD if ANASW = 0, or DVDD if ANASW=1 in EMU\_PWRCTRL register.
2. In CMU\_LFRCOCTRL register.

#### 4.1.12.4 High-Frequency RC Oscillator (HFRCO)

Table 4.40. High-Frequency RC Oscillator (HFRCO)

| Parameter                           | Symbol                      | Test Condition                                                              | Min   | Typ | Max   | Unit          |
|-------------------------------------|-----------------------------|-----------------------------------------------------------------------------|-------|-----|-------|---------------|
| Frequency accuracy                  | $f_{\text{HFRCO\_ACC}}$     | At production calibrated frequencies, across supply voltage and temperature | -2.5  | —   | 2.5   | %             |
| Start-up time                       | $t_{\text{HFRCO}}$          | $f_{\text{HFRCO}} \geq 19 \text{ MHz}$                                      | —     | 300 | —     | ns            |

**Table 4.42. Ultra-low Frequency RC Oscillator (ULFRCO)**

| Parameter             | Symbol              | Test Condition | Min  | Typ | Max  | Unit |
|-----------------------|---------------------|----------------|------|-----|------|------|
| Oscillation frequency | $f_{\text{ULFRCO}}$ |                | 0.95 | 1   | 1.07 | kHz  |

4.1.13 Flash Memory Characteristics<sup>5</sup>Table 4.43. Flash Memory Characteristics<sup>5</sup>

| Parameter                                   | Symbol               | Test Condition                                | Min   | Typ  | Max | Unit   |
|---------------------------------------------|----------------------|-----------------------------------------------|-------|------|-----|--------|
| Flash erase cycles before failure           | EC <sub>FLASH</sub>  |                                               | 10000 | —    | —   | cycles |
| Flash data retention                        | RET <sub>FLASH</sub> | T ≤ 85 °C                                     | 10    | —    | —   | years  |
|                                             |                      | T ≤ 125 °C                                    | 10    | —    | —   | years  |
| Word (32-bit) programming time              | t <sub>W_PROG</sub>  | Burst write, 128 words, average time per word | 20    | 26.3 | 30  | μs     |
|                                             |                      | Single word                                   | 62    | 68.9 | 80  | μs     |
| Page erase time <sup>4</sup>                | t <sub>PERASE</sub>  |                                               | 20    | 29.5 | 40  | ms     |
| Mass erase time <sup>1</sup>                | t <sub>MERASE</sub>  |                                               | 20    | 30   | 40  | ms     |
| Device erase time <sup>2 3</sup>            | t <sub>DERASE</sub>  | T ≤ 85 °C                                     | —     | 56.2 | 70  | ms     |
|                                             |                      | T ≤ 125 °C                                    | —     | 56.2 | 75  | ms     |
| Erase current <sup>6</sup>                  | I <sub>ERASE</sub>   | Page Erase                                    | —     | —    | 2.0 | mA     |
| Write current <sup>6</sup>                  | I <sub>WRITE</sub>   |                                               | —     | —    | 3.5 | mA     |
| Supply voltage during flash erase and write | V <sub>FLASH</sub>   |                                               | 1.62  | —    | 3.6 | V      |

**Note:**

1. Mass erase is issued by the CPU and erases all flash.
2. Device erase is issued over the AAP interface and erases all flash, SRAM, the Lock Bit (LB) page, and the User data page Lock Word (ULW).
3. From setting the DEVICEERASE bit in AAP\_CMD to 1 until the ERASEBUSY bit in AAP\_STATUS is cleared to 0. Internal setup and hold times for flash control signals are included.
4. From setting the ERASEPAGE bit in MSC\_WRITECMD to 1 until the BUSY bit in MSC\_STATUS is cleared to 0. Internal setup and hold times for flash control signals are included.
5. Flash data retention information is published in the Quarterly Quality and Reliability Report.
6. Measured at 25 °C.

#### 4.1.14 General-Purpose I/O (GPIO)

**Table 4.44. General-Purpose I/O (GPIO)**

| Parameter                                                      | Symbol          | Test Condition                                                             | Min               | Typ | Max               | Unit       |
|----------------------------------------------------------------|-----------------|----------------------------------------------------------------------------|-------------------|-----|-------------------|------------|
| Input low voltage                                              | $V_{IL}$        | GPIO pins                                                                  | —                 | —   | $IOVDD \cdot 0.3$ | V          |
| Input high voltage                                             | $V_{IH}$        | GPIO pins                                                                  | $IOVDD \cdot 0.7$ | —   | —                 | V          |
| Output high voltage relative to IOVDD                          | $V_{OH}$        | Sourcing 3 mA, $IOVDD \geq 3$ V,<br>DRIVESTRENGTH <sup>1</sup> = WEAK      | $IOVDD \cdot 0.8$ | —   | —                 | V          |
|                                                                |                 | Sourcing 1.2 mA, $IOVDD \geq 1.62$ V,<br>DRIVESTRENGTH <sup>1</sup> = WEAK | $IOVDD \cdot 0.6$ | —   | —                 | V          |
|                                                                |                 | Sourcing 20 mA, $IOVDD \geq 3$ V,<br>DRIVESTRENGTH <sup>1</sup> = STRONG   | $IOVDD \cdot 0.8$ | —   | —                 | V          |
|                                                                |                 | Sourcing 8 mA, $IOVDD \geq 1.62$ V,<br>DRIVESTRENGTH <sup>1</sup> = STRONG | $IOVDD \cdot 0.6$ | —   | —                 | V          |
| Output low voltage relative to IOVDD                           | $V_{OL}$        | Sinking 3 mA, $IOVDD \geq 3$ V,<br>DRIVESTRENGTH <sup>1</sup> = WEAK       | —                 | —   | $IOVDD \cdot 0.2$ | V          |
|                                                                |                 | Sinking 1.2 mA, $IOVDD \geq 1.62$ V,<br>DRIVESTRENGTH <sup>1</sup> = WEAK  | —                 | —   | $IOVDD \cdot 0.4$ | V          |
|                                                                |                 | Sinking 20 mA, $IOVDD \geq 3$ V,<br>DRIVESTRENGTH <sup>1</sup> = STRONG    | —                 | —   | $IOVDD \cdot 0.2$ | V          |
|                                                                |                 | Sinking 8 mA, $IOVDD \geq 1.62$ V,<br>DRIVESTRENGTH <sup>1</sup> = STRONG  | —                 | —   | $IOVDD \cdot 0.4$ | V          |
| Input leakage current                                          | $I_{IOLEAK}$    | All GPIO except LFXO pins, GPIO $\leq IOVDD$ , $T \leq 85$ °C              | —                 | 0.1 | 30                | nA         |
|                                                                |                 | LFXO Pins, GPIO $\leq IOVDD$ , $T \leq 85$ °C                              | —                 | 0.1 | 50                | nA         |

**Note:**

- Derived from ADCCLK.
- PSRR is referenced to AVDD when ANASW=0 and to DVDD when ANASW=1 in EMU\_PWRCTRL.
- In ADCn\_BIASPROG register.
- In ADCn\_CNTL register.
- The absolute voltage allowed at any ADC input is dictated by the power rail supplied to on-chip circuitry, and may be lower than the effective full scale voltage. All ADC inputs are limited to the ADC supply (AVDD or DVDD depending on EMU\_PWRCTRL\_ANASW). Any ADC input routed through the APORT will further be limited by the IOVDD supply to the pin.
- External reference is 1.25 V applied externally to ADCnEXTREFP, with the selection CONF in the SINGLECTRL\_REF or SCANCTRL\_REF register field and VREFP in the SINGLECTRLX\_VREFSEL or SCANCTRLX\_VREFSEL field. The differential input range with this configuration is  $\pm 1.25\text{ V}$ .
- Internal reference option used corresponds to selection 2V5 in the SINGLECTRL\_REF or SCANCTRL\_REF register field. The differential input range with this configuration is  $\pm 1.25\text{ V}$ . Typical value is characterized using full-scale sine wave input. Minimum value is production-tested using sine wave input at 1.5 dB lower than full scale.

#### 4.1.17 Analog Comparator (ACMP)

| Parameter                             | Symbol            | Test Condition | Min | Typ | Max | Unit |
|---------------------------------------|-------------------|----------------|-----|-----|-----|------|
| External load capacitance, OUTSCALE=0 | C <sub>LOAD</sub> |                | —   | —   | 75  | pF   |

**Note:**

1. Supply current specifications are for VDAC circuitry operating with static output only and do not include current required to drive the load.
2. In differential mode, the output is defined as the difference between two single-ended outputs. Absolute voltage on each output is limited to the single-ended range.
3. Entire range is monotonic and has no missing codes.
4. Current from HUPERCLK is dependent on HUPERCLK frequency. This current contributes to the total supply current used when the clock to the DAC module is enabled in the CMU.
5. Gain is calculated by measuring the slope from 10% to 90% of full scale. Offset is calculated by comparing actual VDAC output at 10% of full scale to ideal VDAC output at 10% of full scale with the measured gain.
6. PSRR calculated as  $20 * \log_{10}(\Delta V_{DD} / \Delta V_{OUT})$ , VDAC output at 90% of full scale

#### 4.1.19 Current Digital to Analog Converter (IDAC)

**Note:**

1. In IDAC\_CURPROG register.
2. The IDAC is supplied by either AVDD, DVDD, or IOVDD based on the setting of ANASW in the EMU\_PWRCTRL register and PWRSEL in the IDAC\_CTRL register. Setting PWRSEL to 1 selects IOVDD. With PWRSEL cleared to 0, ANASW selects between AVDD (0) and DVDD (1).

| Supply current, continuous conversions, WARMUP-MODE=KEEPCSENWARM | I <sub>CSEN_ACTIVE</sub>   | SAR or Delta Modulation conversions of 33 pF capacitor, CS0CG=0 (Gain = 10x), always on | —   | 90.5 | —   | μA     |
| HFPERCLK supply current                                          | I <sub>CSEN_HFPERCLK</sub> | Current contribution from HFPERCLK when clock to CSEN block is enabled.                 | —   | 2.25 | —   | μA/MHz |

**Note:**

- Current is specified with a total external capacitance of 33 pF per channel. Average current is dependent on how long the module is actively sampling channels within the scan period, and scales with the number of samples acquired. Supply current for a specific application can be estimated by multiplying the current per sample by the total number of samples per period (total\_current = single\_sample\_current \* (number\_of\_channels \* accumulation)).

#### 4.1.21 Operational Amplifier (OPAMP)

Unless otherwise indicated, specified conditions are: Non-inverting input configuration, VDD = 3.3 V, DRIVESTRENGTH = 2, MAIN-OUTEN = 1, C<sub>LOAD</sub> = 75 pF with OUTSCALE = 0, or C<sub>LOAD</sub> = 37.5 pF with OUTSCALE = 1. Unit gain buffer and 3X-gain connection as specified in table footnotes<sup>8</sup> 1.

**Table 4.51. Operational Amplifier (OPAMP)**

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|----------------|-----|-----|-----|------|
| <b>Note:</b> <ol style="list-style-type: none"> <li>Specified configuration for 3X-Gain configuration is: INCBW = 1, HCMDIS = 1, RESINSEL = VSS, <math>V_{\text{INPUT}} = 0.5 \text{ V}</math>, <math>V_{\text{OUTPUT}} = 1.5 \text{ V}</math>. Nominal voltage gain is 3.</li> <li>If the maximum <math>C_{\text{LOAD}}</math> is exceeded, an isolation resistor is required for stability. See AN0038 for more information.</li> <li>When INCBW is set to 1 the OPAMP bandwidth is increased. This is allowed only when the non-inverting close-loop gain is <math>\geq 3</math>, or the OPAMP may not be stable.</li> <li>Current into the load resistor is excluded. When the OPAMP is connected with closed-loop gain <math>&gt; 1</math>, there will be extra current to drive the resistor feedback network. The internal resistor feedback network has total resistance of 143.5 kOhm, which will cause another <math>\sim 10 \mu\text{A}</math> current when the OPAMP drives 1.5 V between output and ground.</li> <li>Step between 0.2V and <math>V_{\text{OPA}} - 0.2\text{V}</math>, 10%-90% rising/falling range.</li> <li>From enable to output settled. In sample-and-off mode, RC network after OPAMP will contribute extra delay. Settling error <math>&lt; 1\text{mV}</math>.</li> <li>In unit gain connection, UGF is the gain-bandwidth product of the OPAMP. In 3x Gain connection, UGF is the gain-bandwidth product of the OPAMP and 1/3 attenuation of the feedback network.</li> <li>Specified configuration for Unit gain buffer configuration is: INCBW = 0, HCMDIS = 0, RESINSEL = DISABLE. <math>V_{\text{INPUT}} = 0.5 \text{ V}</math>, <math>V_{\text{OUTPUT}} = 0.5 \text{ V}</math>.</li> <li>When HCMDIS=1 and input common mode transitions the region from <math>V_{\text{OPA}} - 1.4\text{V}</math> to <math>V_{\text{OPA}} - 1\text{V}</math>, input offset will change. PSRR and CMRR specifications do not apply to this transition region.</li> </ol> |        |                |     |     |     |      |

#### 4.1.22 Pulse Counter (PCNT)

Table 4.52. Pulse Counter (PCNT)

| Parameter       | Symbol          | Test Condition                               | Min | Typ | Max | Unit |
|-----------------|-----------------|----------------------------------------------|-----|-----|-----|------|
| Input frequency | $F_{\text{IN}}$ | Asynchronous Single and Quadrature Modes     | —   | —   | 10  | MHz  |
|                 |                 | Sampled Modes with Debounce filter set to 0. | —   | —   | 8   | kHz  |

#### 4.1.23 Analog Port (APORT)

Table 4.53. Analog Port (APORT)

| Parameter                     | Symbol             | Test Condition       | Min | Typ | Max | Unit          |
|-------------------------------|--------------------|----------------------|-----|-----|-----|---------------|
| Supply current <sup>2 1</sup> | $I_{\text{APORT}}$ | Operation in EM0/EM1 | —   | 7   | —   | $\mu\text{A}$ |
|                               |                    | Operation in EM2/EM3 | —   | 63  | —   | nA            |

- Note:**
- Specified current is for continuous APORT operation. In applications where the APORT is not requested continuously (e.g. periodic ACMP requests from LESENSE in EM2), the average current requirements can be estimated by multiplying the duty cycle of the requests by the specified continuous current number.
  - Supply current increase that occurs when an analog peripheral requests access to APORT. This current is not included in reported module currents. Additional peripherals requesting access to APORT do not incur further current.

## 4.1.24 I2C

4.1.24.1 I2C Standard-mode (Sm)<sup>1</sup>Table 4.54. I2C Standard-mode (Sm)<sup>1</sup>

| Parameter                                        | Symbol              | Test Condition | Min | Typ | Max  | Unit |
|--------------------------------------------------|---------------------|----------------|-----|-----|------|------|
| SCL clock frequency <sup>2</sup>                 | f <sub>SCL</sub>    |                | 0   | —   | 100  | kHz  |
| SCL clock low time                               | t <sub>LOW</sub>    |                | 4.7 | —   | —    | μs   |
| SCL clock high time                              | t <sub>HIGH</sub>   |                | 4   | —   | —    | μs   |
| SDA set-up time                                  | t <sub>SU_DAT</sub> |                | 250 | —   | —    | ns   |
| SDA hold time <sup>3</sup>                       | t <sub>HD_DAT</sub> |                | 100 | —   | 3450 | ns   |
| Repeated START condition set-up time             | t <sub>SU_STA</sub> |                | 4.7 | —   | —    | μs   |
| (Repeated) START condition hold time             | t <sub>HD_STA</sub> |                | 4   | —   | —    | μs   |
| STOP condition set-up time                       | t <sub>SU_STO</sub> |                | 4   | —   | —    | μs   |
| Bus free time between a STOP and START condition | t <sub>BUF</sub>    |                | 4.7 | —   | —    | μs   |

**Note:**

1. For CLHR set to 0 in the I2Cn\_CTRL register.
2. For the minimum HPPERCLK frequency required in Standard-mode, refer to the I2C chapter in the reference manual.
3. The maximum SDA hold time (t<sub>HD\_DAT</sub>) needs to be met only when the device does not stretch the low time of SCL (t<sub>LOW</sub>).

#### 4.1.24.2 I2C Fast-mode (Fm)<sup>1</sup>

| SDA hold time <sup>3</sup>                       | t <sub>HD_DAT</sub> |                | 100 | —   | 900 | ns   |
| Repeated START condition set-up time             | t <sub>SU_STA</sub> |                | 0.6 | —   | —   | μs   |
| (Repeated) START condition hold time             | t <sub>HD_STA</sub> |                | 0.6 | —   | —   | μs   |
| STOP condition set-up time                       | t <sub>SU_STO</sub> |                | 0.6 | —   | —   | μs   |
| Bus free time between a STOP and START condition | t <sub>BUF</sub>    |                | 1.3 | —   | —   | μs   |

**Note:**

1. For CLHR set to 1 in the I2Cn\_CTRL register.
2. For the minimum HPPERCLK frequency required in Fast-mode, refer to the I2C chapter in the reference manual.
3. The maximum SDA hold time (t<sub>HD,DAT</sub>) needs to be met only when the device does not stretch the low time of SCL (t<sub>LOW</sub>).

## 4.1.24.3 I2C Fast-mode Plus (Fm+)¹

Table 4.56. I2C Fast-mode Plus (Fm+)¹

| Parameter                                        | Symbol              | Test Condition | Min  | Typ | Max  | Unit |
|--------------------------------------------------|---------------------|----------------|------|-----|------|------|
| SCL clock frequency²                             | f <sub>SCL</sub>    |                | 0    | —   | 1000 | kHz  |
| SCL clock low time                               | t <sub>LOW</sub>    |                | 0.5  | —   | —    | µs   |
| SCL clock high time                              | t <sub>HIGH</sub>   |                | 0.26 | —   | —    | µs   |
| SDA set-up time                                  | t <sub>SU_DAT</sub> |                | 50   | —   | —    | ns   |
| SDA hold time                                    | t <sub>HD_DAT</sub> |                | 100  | —   | —    | ns   |
| Repeated START condition set-up time             | t <sub>SU_STA</sub> |                | 0.26 | —   | —    | µs   |
| (Repeated) START condition hold time             | t <sub>HD_STA</sub> |                | 0.26 | —   | —    | µs   |
| STOP condition set-up time                       | t <sub>SU_STO</sub> |                | 0.26 | —   | —    | µs   |
| Bus free time between a STOP and START condition | t <sub>BUF</sub>    |                | 0.5  | —   | —    | µs   |

**Note:**

1. For CLHR set to 0 or 1 in the I2Cn\_CTRL register.
2. For the minimum HPERCLK frequency required in Fast-mode Plus, refer to the I2C chapter in the reference manual.

## 4.1.25 USART SPI

### SPI Master Timing

Table 4.57. SPI Master Timing

| Parameter                      | Symbol                | Test Condition | Min                      | Typ | Max  | Unit |
|--------------------------------|-----------------------|----------------|--------------------------|-----|------|------|
| SCLK period <sup>1 3 2</sup>   | $t_{\text{SCLK}}$     |                | $2 * t_{\text{HFERCLK}}$ | —   | —    | ns   |
| CS to MOSI <sup>1 3</sup>      | $t_{\text{CS\_MO}}$   |                | -12.5                    | —   | 14   | ns   |
| SCLK to MOSI <sup>1 3</sup>    | $t_{\text{SCLK\_MO}}$ |                | -8.5                     | —   | 10.5 | ns   |
| MISO setup time <sup>1 3</sup> | $t_{\text{SU\_MI}}$   | IOVDD = 1.62 V | 90                       | —   | —    | ns   |
|                                |                       | IOVDD = 3.0 V  | 42                       | —   | —    | ns   |
| MISO hold time <sup>1 3</sup>  | $t_{\text{H\_MI}}$    |                | -9                       | —   | —    | ns   |

**Note:**

1. Applies for both CLKPHA = 0 and CLKPHA = 1 (figure only shows CLKPHA = 0).
2.  $t_{\text{HFERCLK}}$  is one period of the selected HFERCLK.
3. Measurement done with 8 pF output loading at 10% and 90% of  $V_{\text{DD}}$  (figure shows 50% of  $V_{\text{DD}}$ ).

## SPI Slave Timing

**Table 4.58. SPI Slave Timing**

| Parameter                         | Symbol                   | Test Condition | Min                                | Typ | Max                                 | Unit |
|-----------------------------------|--------------------------|----------------|------------------------------------|-----|-------------------------------------|------|
| SCLK period <sup>1 3 2</sup>      | $t_{\text{SCLK}}$        |                | 6 *<br>$t_{\text{HFPERCLK}}$       | —   | —                                   | ns   |
| SCLK high time <sup>1 3 2</sup>   | $t_{\text{SCLK\_HI}}$    |                | 2.5 *<br>$t_{\text{HFPERCLK}}$     | —   | —                                   | ns   |
| SCLK low time <sup>1 3 2</sup>    | $t_{\text{SCLK\_LO}}$    |                | 2.5 *<br>$t_{\text{HFPERCLK}}$     | —   | —                                   | ns   |
| CS active to MISO <sup>1 3</sup>  | $t_{\text{CS\_ACT\_MI}}$ |                | 4                                  | —   | 70                                  | ns   |
| CS disable to MISO <sup>1 3</sup> | $t_{\text{CS\_DIS\_MI}}$ |                | 4                                  | —   | 50                                  | ns   |
| MOSI setup time <sup>1 3</sup>    | $t_{\text{SU\_MO}}$      |                | 12.5                               | —   | —                                   | ns   |
| MOSI hold time <sup>1 3 2</sup>   | $t_{\text{H\_MO}}$       |                | 13                                 | —   | —                                   | ns   |
| SCLK to MISO <sup>1 3 2</sup>     | $t_{\text{SCLK\_MI}}$    |                | 6 + 1.5 *<br>$t_{\text{HFPERCLK}}$ | —   | 45 + 2.5 *<br>$t_{\text{HFPERCLK}}$ | ns   |

**Note:**

1. Applies for both CLKPHA = 0 and CLKPHA = 1 (figure only shows CLKPHA = 0).
2.  $t_{\text{HFPERCLK}}$  is one period of the selected HFPERCLK.
3. Measurement done with 8 pF output loading at 10% and 90% of  $V_{\text{DD}}$  (figure shows 50% of  $V_{\text{DD}}$ ).

**Figure 4.2. SPI Slave Timing Diagram**

## 4.2 Typical Performance Curves

Typical performance curves indicate typical characterized performance under the stated conditions.

## 4.2.1 Supply Current

Figure 4.3. EM0 Active Mode Typical Supply Current vs. Temperature

**Figure 4.4. EM1 Sleep Mode Typical Supply Current vs. Temperature**

Typical supply current for EM2, EM3 and EM4H using standard software libraries from Silicon Laboratories.

Figure 4.5. EM2, EM3, EM4H and EM4S Typical Supply Current vs. Temperature

**Figure 4.6. EM0 and EM1 Mode Typical Supply Current vs. Supply**

Typical supply current for EM2, EM3 and EM4H using standard software libraries from Silicon Laboratories.

Figure 4.7. EM2, EM3, EM4H and EM4S Typical Supply Current vs. Supply

#### 4.2.2 DC-DC Converter

Default test conditions: CCM mode, LDCDC = 4.7  $\mu$ H, CDCDC = 4.7  $\mu$ F, VDCDC\_I = 3.3 V, VDCDC\_O = 1.8 V, FDCDC\_LN = 7 MHz

Figure 4.11. 2.4 GHz RF Receiver Sensitivity

## 5. Typical Connection Diagrams

### 5.1 Power

Typical power supply connections for direct supply, without using the internal DC-DC converter, are shown in the following figure.

Figure 5.1. EFR32FG13 Typical Application Circuit: Direct Supply Configuration without DC-DC converter

Typical power supply circuits using the internal DC-DC converter are shown below. The MCU operates from the DC-DC converter supply. For low RF transmit power applications less than 13dBm, the RF PA may be supplied by the DC-DC converter. For OPNs supporting high power RF transmission, the RF PA must be directly supplied by VDD for RF transmit power greater than 13 dBm.

Figure 5.2. EFR32FG13 Typical Application Circuit: Configuration with DC-DC converter (PAVDD from VDCDC)

**Figure 5.3. EFR32FG13 Typical Application Circuit: Configuration with DC-DC converter (PAVDD from VDD)**

## 5.2 RF Matching Networks

Typical RF matching network circuit diagrams are shown in [Figure 5.4 Typical 2.4 GHz RF impedance-matching network circuits on page 119](#) for applications in the 2.4GHz band, and in [Figure 5.5 Typical Sub-GHz RF impedance-matching network circuits on page 119](#) for applications in the sub-GHz band. Application-specific component values can be found in the EFR32xG13 Reference Manual. For low RF transmit power applications less than 13dBm, the two-element match is recommended. For OPNs supporting high power RF transmission, the four-element match is recommended for high RF transmit power (> 13dBm).

Figure 5.4. Typical 2.4 GHz RF impedance-matching network circuits

Sub-GHz Match Topology I (169-500 MHz)

Sub-GHz Match Topology 2 (500-915 MHz)

Figure 5.5. Typical Sub-GHz RF impedance-matching network circuits

### 5.3 Other Connections

Other components or connections may be required to meet the system-level requirements. Application Note AN0002: "Hardware Design Considerations" contains detailed information on these connections. Application Notes can be accessed on the Silicon Labs website ([www.silabs.com/32bit-appnotes](http://www.silabs.com/32bit-appnotes)).

## 6. Pin Definitions

### 6.1 QFN48 2.4 GHz and Sub-GHz Device Pinout

**Figure 6.1. QFN48 2.4 GHz and Sub-GHz Device Pinout**

The following table provides package pin connections and general descriptions of pin functionality. For detailed information on the supported features for each GPIO pin, see [6.4 GPIO Functionality Table](#) or [6.5 Alternate Functionality Overview](#).

**Table 6.1. QFN48 2.4 GHz and Sub-GHz Device Pinout**

| Pin Name | Pin(s) | Description                       | Pin Name | Pin(s) | Description                        |
|----------|--------|-----------------------------------|----------|--------|------------------------------------|
| VSS      | 0      | Ground                            | PF0      | 1      | GPIO (5V)                          |
| PF1      | 2      | GPIO (5V)                         | PF2      | 3      | GPIO (5V)                          |
| PF3      | 4      | GPIO (5V)                         | PF4      | 5      | GPIO (5V)                          |
| PF5      | 6      | GPIO (5V)                         | PF6      | 7      | GPIO (5V)                          |
| PF7      | 8      | GPIO (5V)                         | RFVDD    | 9      | Radio power supply                 |
| HFXTAL_N | 10     | High Frequency Crystal input pin. | HFXTAL_P | 11     | High Frequency Crystal output pin. |

| Pin Name  | Pin(s) | Description                                                                                                                                                                                 | Pin Name  | Pin(s) | Description                                                                                              |
|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------|----------------------------------------------------------------------------------------------------------|
| RESETn    | 12     | Reset input, active low. To apply an external reset source to this pin, it is required to only drive this pin low during reset, and let the internal pull-up ensure that reset is released. | SUBGRF_OP | 13     | Sub GHz Differential RF output, positive path.                                                           |
| SUBGRF_ON | 14     | Sub GHz Differential RF output, negative path.                                                                                                                                              | SUBGRF_IP | 15     | Sub GHz Differential RF input, positive path.                                                            |
| SUBGRF_IN | 16     | Sub GHz Differential RF input, negative path.                                                                                                                                               | RFVSS     | 17     | Radio Ground                                                                                             |
| PAVSS     | 18     | Power Amplifier (PA) voltage regulator VSS                                                                                                                                                  | 2G4RF_IOP | 19     | 2.4 GHz Differential RF input/output, negative path. This pin should be externally grounded.             |
| 2G4RF_IOP | 20     | 2.4 GHz Differential RF input/output, positive path.                                                                                                                                        | PAVDD     | 21     | Power Amplifier (PA) voltage regulator VDD input                                                         |
| PD13      | 22     | GPIO                                                                                                                                                                                        | PD14      | 23     | GPIO                                                                                                     |
| PD15      | 24     | GPIO                                                                                                                                                                                        | PA0       | 25     | GPIO                                                                                                     |
| PA1       | 26     | GPIO                                                                                                                                                                                        | PA2       | 27     | GPIO                                                                                                     |
| PA3       | 28     | GPIO                                                                                                                                                                                        | PA4       | 29     | GPIO                                                                                                     |

| PC11      | 48     | GPIO (5V)                                                                                                                                                                                   |           |        |                                                                                                          |

**Note:**

1. GPIO with 5V tolerance are indicated by (5V).

## 6.2 QFN48 2.4 GHz Device Pinout

**Figure 6.2. QFN48 2.4 GHz Device Pinout**

The following table provides package pin connections and general descriptions of pin functionality. For detailed information on the supported features for each GPIO pin, see [6.4 GPIO Functionality Table](#) or [6.5 Alternate Functionality Overview](#).

**Table 6.2. QFN48 2.4 GHz Device Pinout**

| Pin Name | Pin(s) | Description                       | Pin Name | Pin(s) | Description                        |
|----------|--------|-----------------------------------|----------|--------|------------------------------------|
| VSS      | 0      | Ground                            | PF0      | 1      | GPIO (5V)                          |
| PF1      | 2      | GPIO (5V)                         | PF2      | 3      | GPIO (5V)                          |
| PF3      | 4      | GPIO (5V)                         | PF4      | 5      | GPIO (5V)                          |
| PF5      | 6      | GPIO (5V)                         | PF6      | 7      | GPIO (5V)                          |
| PF7      | 8      | GPIO (5V)                         | RFVDD    | 9      | Radio power supply                 |
| HFXTAL_N | 10     | High Frequency Crystal input pin. | HFXTAL_P | 11     | High Frequency Crystal output pin. |

| Pin Name  | Pin(s) | Description                                                                                                                                                                                 | Pin Name  | Pin(s) | Description                                                                                              |
|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------|----------------------------------------------------------------------------------------------------------|
| RESETn    | 12     | Reset input, active low. To apply an external reset source to this pin, it is required to only drive this pin low during reset, and let the internal pull-up ensure that reset is released. | NC        | 13     | No Connect.                                                                                              |
| RFVSS     | 14     | Radio Ground                                                                                                                                                                                | PAVSS     | 15     | Power Amplifier (PA) voltage regulator VSS                                                               |
| 2G4RF_ION | 16     | 2.4 GHz Differential RF input/output, negative path. This pin should be externally grounded.                                                                                                | 2G4RF_IOP | 17     | 2.4 GHz Differential RF input/output, positive path.                                                     |
| PAVDD     | 18     | Power Amplifier (PA) voltage regulator VDD input                                                                                                                                            | PD10      | 19     | GPIO (5V)                                                                                                |

GPIO with 5V tolerance are indicated by (5V). |        |                                                                                                                                                                                             |           |        |                                                                                                          |

## 6.4 GPIO Functionality Table

A wide selection of alternate functionality is available for multiplexing to various pins. The following table shows the name of each GPIO pin, followed by the functionality available on that pin. Refer to [6.5 Alternate Functionality Overview](#) for a list of GPIO locations available for each function.

**Table 6.4. GPIO Functionality Table**

| GPIO Name | Pin Alternate Functionality / Description |                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                         |                                                                                                               |

## 6.5 Alternate Functionality Overview

A wide selection of alternate functionality is available for multiplexing to various pins. The following table shows the name of the alternate functionality in the first column, followed by columns showing the possible LOCATION bitfield settings and the associated GPIO pin. Refer to [6.4 GPIO Functionality Table](#) for a list of functions available on each GPIO pin.

**Note:** Some functionality, such as analog interfaces, do not have alternate settings or a LOCATION bitfield. In these cases, the pinout is shown in the column corresponding to LOCATION 0.

**Table 6.5. Alternate Functionality Overview**

| Alternate     | LOCATION                               |                                        |                                           |                                           |                                             |                                              |                                          |                                          | Description                                                             |

Certain alternate function locations may have non-interference priority. These locations will take precedence over any other functions selected on that pin (i.e. another alternate function enabled to the same pin inadvertently).

Some alternate functions may also have high speed priority on certain locations. These locations ensure the fastest possible paths to the pins for timing-critical signals.

The following table lists the alternate functions and locations with special priority.

**Table 6.6. Alternate Functionality Priority**

| Alternate Functionality | Location | Priority   |
|-------------------------|----------|------------|
| CMU_CLKI0               | 1: PF7   | High Speed |

6.6 Analog Port (APORT) Client Maps

The Analog Port (APORT) is an infrastructure used to connect chip pins with on-chip analog clients such as analog comparators, ADCs, DACs, etc. The APORT consists of a set of shared buses, switches, and control logic needed to configurably implement the signal routing. [Figure 6.4 APORT Connection Diagram on page 150](#) shows the APORT routing for this device family (note that available features may vary by part number). A complete description of APORT functionality can be found in the Reference Manual.

Figure 6.4. APORT Connection Diagram

Client maps for each analog circuit using the APORT are shown in the following tables. The maps are organized by bus, and show the peripheral's port connection, the shared bus, and the connection from specific bus channel numbers to GPIO pins.

In general, enumerations for the pin selection field in an analog peripheral's register can be determined by finding the desired pin connection in the table and then combining the value in the Port column (APORT\_\_), and the channel identifier (CH\_\_). For example, if pin PF7 is available on port APORT2X as CH23, the register field enumeration to connect to PF7 would be APORT2XCH23. The shared bus used by this connection is indicated in the Bus column.

**Table 6.7. ACMP0 Bus and Pin Mapping**

## 7. QFN48 Package Specifications

### 7.1 QFN48 Package Dimensions

Figure 7.1. QFN48 Package Drawing

**Table 7.1. QFN48 Package Dimensions**

| Dimension | Min      | Typ  | Max  |
|-----------|----------|------|------|
| A         | 0.80     | 0.85 | 0.90 |
| A1        | 0.00     | 0.02 | 0.05 |
| A3        | 0.20 REF |      |      |
| b         | 0.18     | 0.25 | 0.30 |
| D         | 6.90     | 7.00 | 7.10 |
| E         | 6.90     | 7.00 | 7.10 |
| D2        | 5.15     | 5.30 | 5.45 |
| E2        | 5.15     | 5.30 | 5.45 |
| e         | 0.50 BSC |      |      |
| L         | 0.30     | 0.40 | 0.50 |
| K         | 0.20     | —    | —    |
| R         | 0.09     | —    | —    |
| aaa       | 0.15     |      |      |
| bbb       | 0.10     |      |      |
| ccc       | 0.10     |      |      |
| ddd       | 0.05     |      |      |
| eee       | 0.08     |      |      |
| fff       | 0.10     |      |      |

**Note:**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to the JEDEC Solid State Outline MO-220, Variation VKKD-4.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

## 7.2 QFN48 PCB Land Pattern

Figure 7.2. QFN48 PCB Land Pattern Drawing

**Table 7.2. QFN48 PCB Land Pattern Dimensions**

| Dimension | Typ  |
|-----------|------|
| S1        | 6.01 |
| S         | 6.01 |
| L1        | 4.70 |
| W1        | 4.70 |
| e         | 0.50 |
| W         | 0.26 |
| L         | 0.86 |

**Note:**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.
3. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60  $\mu\text{m}$  minimum, all the way around the pad.
4. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
5. The stencil thickness should be 0.125 mm (5 mils).
6. The ratio of stencil aperture to land pad size can be 1:1 for all perimeter pads.
7. A 4x4 array of 0.75 mm square openings on a 1.00 mm pitch can be used for the center ground pad.
8. A No-Clean, Type-3 solder paste is recommended.
9. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

### 7.3 QFN48 Package Marking

**Figure 7.3. QFN48 Package Marking**

The package marking consists of:

- P P P P P P P P P P – The part number designation.
  1. Family Code (B | M | F)
  2. G (Gecko)
  3. Series (1, 2,...)
  4. Device Configuration (1, 2,...)
  5. Performance Grade (P | B | V)
  6. Feature Code (1 to 7)
  7. TRX Code (3 = TXRX | 2 = RX | 1 = TX)
  8. Band (1 = Sub-GHz | 2 = 2.4 GHz | 3 = Dual-band)
  9. Flash (J = 1024K | H = 512K | G = 256K | F = 128K | E = 64K | D = 32K)
  10. Temperature Grade (G = -40 to 85 | I = -40 to 125)
- YY – The last 2 digits of the assembly year.
- WW – The 2-digit workweek when the device was assembled.
- T T T T T T – A trace or manufacturing code. The first letter is the device revision.

## 8. Revision History

### Revision 1.1

January 2017

- Updated [3.12 Memory Map](#) with latest formatting and low-energy peripherals.
- [4.1.1 Absolute Maximum Ratings](#):
  - Changed "Non-5V tolerant GPIO pins" to "Standard GPIO pins".
  - Added footnotes to clarify  $V_{DIGPIN}$  specification for 5V tolerant GPIO.
- [Table 4.2 General Operating Conditions on page 23](#): Added footnote for additional information on peak current during voltage scaling operations.
- [4.1.9.4 RF Receiver Characteristics for 2GFSK in the 2.4GHz Band, 1 Mbps Data Rate](#):  $BLOCK_{OOB}$  specifications changed to show Min values instead of Typ, and footnote added.
- [4.1.9.6 RF Receiver Characteristics for 2GFSK in the 2.4GHz Band, 2 Mbps Data Rate](#):  $BLOCK_{OOB}$  specifications removed (not part of BLE 2 Mbps specification).
- [4.1.9.7 RF Transmitter Characteristics for 2GFSK in the 2.4GHz Band, 500 kbps Data Rate](#) and [4.1.9.9 RF Transmitter Characteristics for 2GFSK in the 2.4GHz Band, 125 kbps Data Rate](#):  $PSD_{LIMIT}$  changed to specify maximum instead of typ, with footnote added for FCC output power limit.
- [4.1.9.12 RF Receiver Characteristics for 802.15.4 DSSS-OQPSK in the 2.4 GHz Band](#): Footnote added to  $BLOCK_{80211G}$  specification to clarify blocker signal definition.
- [4.1.10.2 Sub-GHz RF Receiver Characteristics for 915 MHz Band](#): Added O-QPSK DSSS phy specifications.
- [4.1.18 Digital to Analog Converter \(VDAC\)](#): Widened  $V_{GAIN}$  Gain error limits.
- [4.1.25 USART SPI](#):
  - SPI Slave Timing: Corrected  $t_{SU\_MO}$ ,  $t_{H\_MO}$  and  $t_{SCLK\_MIN}$  limits.
  - Updated remainder of specifications to match formatting and common specs in all EFR32xG1x product families.
- [4.2.3 2.4 GHz Radio](#):
  - Extended temperature plots to 125 degrees C.
  - Updated RX sensitivity plots with latest phy characterization data.
- Added [Figure 6.4 APORT Connection Diagram on page 150](#).

### Revision 1.0

2017-Aug-02

- Updated specification tables with latest characterization values and production test min/max limits.
- Added high-temperature OPNs and associated specifications.
- Added performance specifications and supported radio modulations/protocols to Feature List.
- Clarified / corrected energy mode mentions in RTCC and Opamp sections of the System Overview.
- **Sub-GHz RF Transmitter characteristics for 868 MHz Band** Electrical Specifications Table:
  - $POUT_{VAR\_V\_NODCDC}$  specification symbol corrected to  $POUT_{VAR\_V}$
  - $POUT_{VAR\_F\_NODCDC}$  specification symbol corrected to  $POUT_{VAR\_F}$
- **Sub-GHz RF Transmitter characteristic for 433 MHz Band** Electrical Specifications Table:  $POT_{MIN}$  specification symbol corrected to  $POUT_{MIN}$
- **Analog to Digital Converter (ADC)** Electrical Specifications Table: Added footnote for clarification of input voltage limits.
- **Typical Sub-GHz Impedance-matching network circuits** Figure: Corrected split between two examples from 450 MHz to 500 MHz.
- **RF Transmitter General Characteristics for 2.4 GHz Band** Electrical Specifications Table:
  - Test Conditions changed from "19.5 dBm" to "19 dBm" and from "10.5 dBm" to "10 dBm"
- **RF Receiver Characteristics for Bluetooth Low Energy in the 2.4GHz Band, 1 Mbps Data Rate** Electrical Specifications Table:
  - Sensitivity (SENS) for Reference Signal changed from "-95.8 dBm" to "-94.8 dBm"

**Revision 0.5**

2017-Apr-25

- Added RFSENSE section to System Overview.
- Updated specification tables with latest characterization results.
- Split 2.4 GHz 2GFSK tables into separate tables for 1 Mbps, 2 Mbps, 500kbps, and 125kbps data rates.
- Added typical performance graphs.
- Condensed pin function tables with new formatting.
- Added APORT Connection Diagram.
- Corrected package marking flash size designator.
- Removed OPNs for QFN32 package options.

**Revision 0.1**

2016-Nov-15

Initial release.

Silicon Labs

# Simplicity Studio™4

## Simplicity Studio

One-click access to MCU and wireless tools, documentation, software, source code libraries & more. Available for Windows, Mac and Linux!
