

Isolated Fixed-Ratio DC-DC Converter

Features & Benefits

- Up to 40A continuous low-voltage-side current
- Fixed transformation ratio (K) of 1/16
- Up to 776W/in³ power density
- 97.5% peak efficiency
- Integrated filtering
- Parallel operation for multi-kW arrays
- OV, OC, UV, short circuit and thermal protection
- 4414 package
- High MTBF
- Thermally enhanced VIA package
- PMBus[®] management interface

Typical Applications

- High-Voltage DC Power Distribution
- 3-Phase AC-DC Converters
- Information and Communication Technology (ICT) Equipment
- High-End Computing Systems
- Automated Test Equipment
- Industrial Systems
- High-Density Energy Systems
- Transportation
- Green Buildings and Microgrids

Product Ratings	
$V_{HI} = 544V$ (400 – 700V)	$I_{LO} = \text{up to } 40A$
$V_{LO} = 34V$ (25 – 43.8V) (NO LOAD)	$K = 1/16$

Product Description

The BCM4414xG0F4440yzz in a VIA package is a high-efficiency Bus Converter, operating from a 400 to 700V_{DC} high-voltage bus to deliver an isolated 25 to 43.8V_{DC} unregulated, low voltage.

This unique ultra-low-profile module incorporates DC-DC conversion, integrated filtering and PMBus commands and controls in a chassis or PCB mount form factor.

The BCM offers low noise, fast transient response and industry-leading efficiency and power density. A low-voltage-side referenced PMBus-compatible telemetry and control interface provides access to the BCM's configuration, fault monitoring and other telemetry functions.

Leveraging the thermal and density benefits of Vicor VIA packaging technology, the BCM module offers flexible thermal management options with very low top- and bottom-side thermal impedances.

When combined with downstream Vicor DC-DC conversion components and regulators, the BCM allows the Power Design Engineer to employ a simple, low-profile design, which will differentiate the end system without compromising on cost or performance metrics.

Size:
4.35 x 1.40 x 0.37in
[110.55 x 35.54 x 9.40mm]

Note: Product images may not highlight current product markings.

Typical Applications

3-phase AC to point-of-load (3-phase AIM + BCM4414xG0F4440yzz)

Paralleling BCM in a VIA package – connection to common Host PMBus®

Typical Applications (Cont.)

BCM4414xG0F4440yzz + PRM™ + VTM™, Adaptive-Loop Configuration – connection to common Host PMBus®

BCM4414xG0F4440yzz + PRM + VTM, Remote-Sense Configuration – connection to common Host PMBus

Pin Configuration

Note: The dot on the VIA housing indicates the location of the signal pin 9.

Pin Descriptions

Pin Number	Signal Name	Type	Function
1	+HI	HIGH SIDE POWER	High-voltage-side positive power terminal
2	-HI	HIGH SIDE POWER RETURN	High-voltage-side negative power terminal
3	+LO	LOW SIDE POWER	Low-voltage-side positive power terminal
4	-LO	LOW SIDE POWER RETURN	Low-voltage-side negative power terminal
5	EXT BIAS	INPUT	5V supply input
6	SCL	INPUT	I ² C™ Clock, PMBus® Compatible
7	SDA	INPUT/OUTPUT	I ² C Data, PMBus Compatible
8	SGND	LOW SIDE SIGNAL RETURN	Signal Ground
9	ADDR	INPUT	Address assignment – Resistor based

Notes: All signal pins (5, 6, 7, 8, 9) are referenced to the low-voltage side and isolated from the high-voltage side. Keep SGND signal separated from the low-voltage side power return terminal (-LO) in electrical design.

Part Ordering Information

Part Number	Package Type	Product Grade	Option Field
BCM4414BG0F4440C06	B = Board VIA	C = -20 to 100°C [a]	06 = Short Pin/PMBus®
BCM4414BG0F4440CR6			R6 = Reversible Short Pin/PMBus
BCM4414BG0F4440C10			10 = Long Pin/PMBus
BCM4414BG0F4440CR0			R0 = Reversible Long Pin/PMBus
BCM4414BG0F4440T06		T = -40 to 100°C [a]	06 = Short Pin/PMBus
BCM4414BG0F4440TR6			R6 = Reversible Short Pin/PMBus
BCM4414BG0F4440T10			10 = Long Pin/PMBus
BCM4414BG0F4440TR0			R0 = Reversible Long Pin/PMBus
BCM4414BG0F4440M06		M = -55 to 100°C [a]	06 = Short Pin/PMBus

BCM4414VG0F4440MR2			R2 = Reversible Chassis/PMBus

[a] High-temperature current de-rating may apply; see Figure 1, specified thermal operating area.

Absolute Maximum Ratings

The absolute maximum ratings below are stress ratings only. Operation at or beyond these maximum ratings can cause permanent damage to the device.

Parameter	Comments	Min	Max	Unit
+HI to -HI		-1	800	V
HI_DC or LO_DC Slew Rate			1	V/μs
+LO to -LO		-1	60	V
EXT BIAS to SGND		-0.3	10	V
			0.15	A
SCL to SGND		-0.3	5.5	V
SDA to SGND		-0.3	5.5	V
ADDR to SGND		-0.3	3.6	V
Isolation Voltage / Dielectric Withstand	High-voltage side to case	3100		V _{DC}
	High-voltage side to low-voltage side	4300		V _{DC}
	Low-voltage side to case	1200		V _{DC}

Electrical Specifications

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of $-40^{\circ}\text{C} \leq T_{\text{CASE}} \leq 100^{\circ}\text{C}$ (T-Grade); all other specifications are at $T_{\text{CASE}} = 25^{\circ}\text{C}$ unless otherwise noted.

Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
General Powertrain Specification – Forward Direction Operation (High-Voltage Side to Low-Voltage Side)						
HI-Side Voltage Range, (Continuous)	$V_{\text{HI_DC}}$		400		700	V
HI-Side Voltage Range, (Transient)	$V_{\text{HI_TRANS}}$		400		700	V
HI-Side Voltage Initialization Threshold	$V_{\mu\text{C_ACTIVE}}$	HI-side voltage where internal controller is initialized, (powertrain inactive)	130		350	V
HI-Side Quiescent Current	$I_{\text{HI_Q}}$	Disabled, $V_{\text{HI_DC}} = 544\text{V}$		6.3		mA
		$T_{\text{CASE}} \leq 100^{\circ}\text{C}$			10.2	
No-Load Power Dissipation	$P_{\text{HI_NL}}$	$V_{\text{HI_DC}} = 544\text{V}$, $T_{\text{CASE}} = 25^{\circ}\text{C}$		12	20	W
		$V_{\text{HI_DC}} = 544\text{V}$			30	
		$V_{\text{HI_DC}} = 400 - 700\text{V}$, $T_{\text{CASE}} = 25^{\circ}\text{C}$			22	
		$V_{\text{HI_DC}} = 400 - 700\text{V}$			32	
HI-Side Inrush Current Peak	$I_{\text{HI_INR_PK}}$	$V_{\text{HI_DC}} = 700\text{V}$, $C_{\text{LO_EXT}} = 470\mu\text{F}$, $R_{\text{LOAD_LO}} = 20\%$ of full-load current		4		A
		$T_{\text{CASE}} \leq 100^{\circ}\text{C}$			8	
DC HI-Side Current	$I_{\text{HI_IN_DC}}$	At $I_{\text{LO_OUT_DC}} = 40\text{A}$, $T_{\text{CASE}} \leq 70^{\circ}\text{C}$			2.6	A
Transformation Ratio	K	High voltage to low voltage $K = V_{\text{LO_DC}} / V_{\text{HI_DC}}$ at no load		1/16		V/V
LO-Side Current (Continuous)	$I_{\text{LO_OUT_DC}}$	$T_{\text{CASE}} \leq 70^{\circ}\text{C}$			40	A
LO-Side Current (Pulsed)	$I_{\text{LO_OUT_PULSE}}$	2ms pulse, 25% duty cycle, $I_{\text{LO_OUT_AVG}} \leq 50\%$ rated $I_{\text{LO_OUT_DC}}$			44	A
Efficiency (Ambient)	η_{AMB}	$V_{\text{HI_DC}} = 544\text{V}$, $I_{\text{LO_OUT_DC}} = 40\text{A}$	95	96.9		%
		$V_{\text{HI_DC}} = 400 - 700\text{V}$, $I_{\text{LO_OUT_DC}} = 40\text{A}$	94			
		$V_{\text{HI_DC}} = 544\text{V}$, $I_{\text{LO_OUT_DC}} = 20\text{A}$	96	97.5		
Efficiency (Hot)	η_{HOT}	$V_{\text{HI_DC}} = 544\text{V}$, $I_{\text{LO_OUT_DC}} = 40\text{A}$, $T_{\text{CASE}} = 70^{\circ}\text{C}$	95	96.1		%
Efficiency (Over Load Range)	$\eta_{20\%}$	$8\text{A} < I_{\text{LO_OUT_DC}} < 40\text{A}$	92			%
LO-Side Output Resistance	$R_{\text{LO_COLD}}$	$V_{\text{HI_DC}} = 544\text{V}$, $I_{\text{LO_OUT_DC}} = 40\text{A}$, $T_{\text{CASE}} = -40^{\circ}\text{C}$	5.5	10.8	20	m Ω
	$R_{\text{LO_AMB}}$	$V_{\text{HI_DC}} = 544\text{V}$, $I_{\text{LO_OUT_DC}} = 40\text{A}$	8	14.4	22	
	$R_{\text{LO_HOT}}$	$V_{\text{HI_DC}} = 544\text{V}$, $I_{\text{LO_OUT_DC}} = 40\text{A}$, $T_{\text{CASE}} = 70^{\circ}\text{C}$	9	21.9	30	
Switching Frequency	F_{SW}	LO-side voltage ripple frequency = $2 \times F_{\text{SW}}$	0.7	0.75	0.8	MHz
LO-Side Voltage Ripple	$V_{\text{LO_OUT_PP}}$	$C_{\text{LO_EXT}} = 0\mu\text{F}$, $I_{\text{LO_OUT_DC}} = 40\text{A}$, $V_{\text{HI_DC}} = 544\text{V}$, 20MHz BW		300		mV
		$T_{\text{CASE}} \leq 100^{\circ}\text{C}$			800	

Electrical Specifications (Cont.)

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of $-40^{\circ}\text{C} \leq T_{\text{CASE}} \leq 100^{\circ}\text{C}$ (T-Grade); all other specifications are at $T_{\text{CASE}} = 25^{\circ}\text{C}$ unless otherwise noted.

Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
General Powertrain Specification – Forward Direction Operation (High-Voltage Side to Low-Voltage Side) Cont.						
Effective HI-Side Capacitance (Internal)	$C_{\text{HI_INT}}$	Effective value at $544V_{\text{HI_DC}}$		0.18		μF
Effective LO-Side Capacitance (Internal)	$C_{\text{LO_INT}}$	Effective value at $34V_{\text{LO_DC}}$		50.6		μF
Rated LO-Side Capacitance (External)	$C_{\text{LO_OUT_EXT}}$	Excessive capacitance may drive module into short circuit protection			470	μF
Rated LO-Side Capacitance (External), Parallel Array Operation	$C_{\text{LO_OUT_AEXT}}$	$C_{\text{LO_OUT_AEXT Max}} = N \cdot 0.5 \cdot C_{\text{LO_OUT_EXT Max}}$, where N = the number of units in parallel			235	μF
Powertrain Hardware Protection Specification – Forward Direction Operation (High-Voltage Side to Low-Voltage Side)						
- These built-in powertrain protections are fixed in hardware and cannot be configured through PMBus®. - When duplicated in supervisory limits, hardware protections serve a secondary role and become active when supervisory limits are disabled through PMBus.						
Auto Restart Time	$t_{\text{AUTO_RESTART}}$	Start up into a persistent fault condition. Non-latching fault detection given $V_{\text{HI_DC}} > V_{\text{HI_UVLO+}}$	900	1000	1100	ms
HI-Side Overvoltage Lockout Threshold	$V_{\text{HI_OVLO+}}$		730	750	780	V
HI-Side Overvoltage Recovery Threshold	$V_{\text{HI_OVLO-}}$		700	730	740	V
HI-Side Overvoltage Lockout Hysteresis	$V_{\text{HI_OVLO_HYST}}$			20		V
HI-Side Overvoltage Lockout Response Time	$t_{\text{HI_OVLO}}$			10		μs
HI-Side Soft Start Time	$t_{\text{HI_SOFT_START}}$	From powertrain active. Fast current limit protection disabled during soft start		1	2	ms
LO-Side Overcurrent Trip Threshold	$I_{\text{LO_OUT_OCP}}$		42	50	70	A
LO-Side Overcurrent Response Time Constant	$t_{\text{LO_OUT_OCP}}$	Effective internal RC filter		3.6		ms
LO-Side Short Circuit Protection Trip Threshold	$I_{\text{LO_OUT_SCP}}$		55			A
LO-Side Short Circuit Protection Response Time	$t_{\text{LO_OUT_SCP}}$	Short circuit protection (fast current limit) is disabled at start up ^[b]		1		μs
Overtemperature Shutdown Threshold	$t_{\text{OTP+}}$	Internal	125			$^{\circ}\text{C}$

^[b] At start up, short circuit protection is disabled. Soft-start current limit provides protection against pre-existing output shorts. Soft-start mode ends when the output voltage reaches at least 90% of the final output voltage, and short-circuit protection is enabled when $t_{\text{HI_SOFT_START}}$ expires. Shorts that occur after soft start ends but before $t_{\text{HI_SOFT_START}}$ expires may cause damage to the product and will require external protection.

Electrical Specifications (Cont.)

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of $-40^{\circ}\text{C} \leq T_{\text{CASE}} \leq 100^{\circ}\text{C}$ (T-Grade); all other specifications are at $T_{\text{CASE}} = 25^{\circ}\text{C}$ unless otherwise noted.

Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
Powertrain Supervisory Limits Specification – Forward Direction Operation (High-Voltage Side to Low-Voltage Side)						
- These supervisory limits are set in the internal controller and can be reconfigured or disabled through PMBus®. - When disabled, the powertrain protections presented in the previous table will intervene during fault events.						
HI-Side Overvoltage Lockout Threshold	$V_{\text{HI_OVLO+}}$		730	750	780	V
HI-Side Overvoltage Recovery Threshold	$V_{\text{HI_OVLO-}}$		700	730	740	V
HI-Side Overvoltage Lockout Hysteresis	$V_{\text{HI_OVLO_HYST}}$			20		V
HI-Side Overvoltage Lockout Response Time	$t_{\text{HI_OVLO}}$			100		μs
HI-Side Undervoltage Lockout Threshold	$V_{\text{HI_UVLO-}}$		350	360	370	V
HI-Side Undervoltage Recovery Threshold	$V_{\text{HI_UVLO+}}$		370	380	399	V
HI-Side Undervoltage Lockout Hysteresis	$V_{\text{HI_UVLO_HYST}}$			20		V
HI-Side Undervoltage Lockout Response Time	$t_{\text{HI_UVLO}}$			100		μs
HI-Side Undervoltage Start Up Delay	$t_{\text{HI_UVLO+_DELAY}}$	From $V_{\text{HI_DC}} = V_{\text{HI_UVLO+}}$ to powertrain active (i.e., one-time start up delay from application of $V_{\text{HI_DC}}$ to $V_{\text{LO_DC}}$)		50		ms
LO-Side Overcurrent Trip Threshold	$I_{\text{LO_OUT_OCP}}$		42	50	70	A
LO-Side Overcurrent Response Time Constant	$t_{\text{LO_OUT_OCP}}$	Effective internal RC filter		2		ms
Overtemperature Shutdown Threshold	$t_{\text{OTP+}}$	Internal	125			$^{\circ}\text{C}$
Overtemperature Recovery Threshold	$t_{\text{OTP-}}$	Internal	105	110	115	$^{\circ}\text{C}$
Undertemperature Shutdown Threshold (Internal)	t_{UTP}	C-Grade			-25	$^{\circ}\text{C}$
		T-Grade			-45	
		M-Grade			-55	
Undertemperature Restart Time	$t_{\text{UTP_RESTART}}$	Start up into a persistent fault condition. Non-latching fault detection given $V_{\text{HI_DC}} > V_{\text{HI_UVLO+}}$		3		s

Electrical Specifications (Cont.)

Operating Area

Figure 1 — Specified thermal operating area

- 1. The BCM in a VIA package is cooled through the non-pin-side case.
- 2. The thermal rating is based on typical measured device efficiency.
- 3. The case temperature in the graph is the measured temperature of the non-pin-side housing, such that the internal operating temperature does not exceed 125°C.

Figure 2 — Specified electrical operating area using rated R_{LO_HOT}

Figure 3 — Specified HI-side start up into load current and external capacitance

PMBus® Reported Characteristics

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of $-40^{\circ}\text{C} \leq T_{\text{CASE}} \leq 100^{\circ}\text{C}$ (T-Grade); all other specifications are at $T_{\text{CASE}} = 25^{\circ}\text{C}$ unless otherwise noted.

Monitored Telemetry					
The current telemetry is only available in forward operation. The input and output current reported value is not supported in reverse operation.					
Attribute	PMBus Read Command	Accuracy (Rated Range)	Functional Reporting Range	Update Rate	Reported Units
HI-Side Voltage	(88h) READ_VIN	$\pm 5\%$ (LL – HL)	130 to 780V	100 μs	$V_{\text{ACTUAL}} = V_{\text{REPORTED}} \times 10^{-1}$
HI-Side Current	(89h) READ_IIN	$\pm 20\%$ (10 – 20% of FL) $\pm 5\%$ (20 – 133% of FL)	–0.85 to 4.4A	100 μs	$I_{\text{ACTUAL}} = I_{\text{REPORTED}} \times 10^{-3}$
LO-Side Voltage ^[c]	(8Bh) READ_VOUT	$\pm 5\%$ (LL – HL)	8.125 to 48.75V	100 μs	$V_{\text{ACTUAL}} = V_{\text{REPORTED}} \times 10^{-1}$
LO-Side Current	(8Ch) READ_IOUT	$\pm 20\%$ (10 – 20% of FL) $\pm 5\%$ (20 – 133% of FL)	–13.6 to 70A	100 μs	$I_{\text{ACTUAL}} = I_{\text{REPORTED}} \times 10^{-2}$
LO-Side Resistance	(D4h) READ_ROUT	$\pm 5\%$ (50 – 100% of FL) at NL $\pm 10\%$ (50 – 100% of FL)(LL – HL)	5 to 40m Ω	100ms	$R_{\text{ACTUAL}} = R_{\text{REPORTED}} \times 10^{-5}$
Temperature ^[d]	(8Dh) READ_TEMPERATURE_1	$\pm 7^{\circ}\text{C}$ (Full Range)	–55 to 130 $^{\circ}\text{C}$	100ms	$T_{\text{ACTUAL}} = T_{\text{REPORTED}}$

^[c] Default READ LO Side Voltage returned when unit is disabled = –300V.

^[d] Default READ Temperature returned when unit is disabled = –273 $^{\circ}\text{C}$.

Variable Parameters					
- Factory setting of all Thresholds and Warning limits listed below are 100% of specified protection values. - Variables can be written only when module is disabled with $V_{\text{HI}} < V_{\text{HI_UVLO}}$ and external bias (VDDb) applied. - Module must remain in a disabled mode for 3ms after any changes to the variables below to allow sufficient time to commit changes to EEPROM.					
Attribute	PMBus Command	Conditions / Notes	Accuracy (Rated Range)	Functional Reporting Range	Default Value
HI-Side Overvoltage Protection Limit	(55h) VIN_OV_FAULT_LIMIT	$V_{\text{HI_OVLO}}$ is automatically 3% lower than this set point	$\pm 5\%$ (LL – HL)	130 – 750V	100%
HI-Side Overvoltage Warning Limit	(57h) VIN_OV_WARN_LIMIT		$\pm 5\%$ (LL – HL)	130 – 750V	100%
HI-Side Undervoltage Protection Limit	(D7h) DISABLE_FAULTS	Can only be disabled to a preset default value	$\pm 5\%$ (LL – HL)	130 – 400V	100%
HI-Side Overcurrent Protection Limit	(58h) IIN_OC_FAULT_LIMIT		$\pm 20\%$ (10 – 20% of FL) $\pm 5\%$ (20 – 133% of FL)	0 – 4.4A	100%
HI-Side Overcurrent Warning Limit	(5Dh) IIN_OC_WARN_LIMIT		$\pm 20\%$ (10 – 20% of FL) $\pm 5\%$ (20 – 133% of FL)	0 – 4.4A	100%
Overtemperature Protection Limit	(4Fh) OT_FAULT_LIMIT	Internal temperature	$\pm 7^{\circ}\text{C}$ (Full Range)	0 – 125 $^{\circ}\text{C}$	100%
Overtemperature Warning Limit	(51h) OT_WARN_LIMIT	Internal temperature	$\pm 7^{\circ}\text{C}$ (Full Range)	0 – 125 $^{\circ}\text{C}$	100%
Turn On Delay	(60h) TON_DELAY	Additional time delay to the undervoltage start up delay	$\pm 50\mu\text{s}$	0 – 100ms	0ms

Signal Characteristics

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of $-40^{\circ}\text{C} \leq T_{\text{CASE}} \leq 100^{\circ}\text{C}$ (T-Grade); all other specifications are at $T_{\text{CASE}} = 25^{\circ}\text{C}$ unless otherwise noted. **Please note:** For chassis mount model, Vicor part number 42550 will be needed for applications requiring the use of the signal pins. Signal cable 42550 is rated up to five insertions and extractions. To avoid unnecessary stress on the connector, the cable should be appropriately strain relieved.

EXT. BIAS (VDDB) Pin

- VDDB powers the internal controller.
- VDDB needs to be applied to enable and disable the BCM through PMBus® control (using OPERATION COMMAND), and to adjust warning and protection thresholds.
- VDDB voltage not required for telemetry; however, if VDDB is not applied, telemetry information will be lost when V_{IN} is removed.

Signal Type	State	Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
INPUT	Regular Operation	VDDB Voltage	V_{VDDB}		4.5	5	9	V
		VDDB Current Consumption	I_{VDDB}				50	mA
	Start Up	Inrush Current Peak	$I_{\text{VDDB_INR}}$	V_{VDDB} slew rate = $1\text{V}/\mu\text{s}$		3.5		A
		Turn-On Time	$t_{\text{VDDB_ON}}$	From $V_{\text{VDDB_MIN}}$ to PMBus active		1.5		ms

SGND Pin

- All PMBus interface signals (SCL, SDA, ADDR) are referenced to SGND pin.
- SGND pin also serves as return pin (ground pin) for VDDB.
- Keep SGND signal separated from the low-voltage side power return terminal (–LO) in electrical design.

Address (ADDR) Pin

- This pin programs the address using a resistor between ADDR pin and signal ground.
- The address is sampled during start up and is stored until power is reset. This pin programs only a Fixed and Persistent address.
- This pin has an internal $10\text{k}\Omega$ pullup resistor to 3.3V.
- 16 addresses are available. The range of each address is 206.25mV (total range for all 16 addresses is 0 – 3.3V).

Signal Type	State	Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
MULTI-LEVEL INPUT	Regular Operation	ADDR Input Voltage	V_{SADDR}	See address section	0		3.3	V
		ADDR Leakage Current	I_{SADDR}	Leakage current			1	μA
	Start Up	ADDR Registration Time	t_{SADDR}	From $V_{\text{VDDB_MIN}}$		1		ms

Signal Characteristics

Specifications apply over all line and load conditions, unless otherwise noted; **boldface** specifications apply over the temperature range of $-40^{\circ}\text{C} \leq T_{\text{CASE}} \leq 100^{\circ}\text{C}$ (T-Grade); all other specifications are at $T_{\text{CASE}} = 25^{\circ}\text{C}$ unless otherwise noted. **Please note:** For chassis mount model, Vicor part number 42550 will be needed for applications requiring the use of the signal pins. Signal cable 42550 is rated up to five insertions and extractions. To avoid unnecessary stress on the connector, the cable should be appropriately strain relieved.

Serial Clock input (SCL) AND Serial Data (SDA) Pins

- High-power SMBus specification and SMBus physical layer compatible. Note that optional SMBALERT# is not supported.
- PMBus® command compatible.

BCM in a VIA Package

Figure 19 — BCM DC model (Forward Direction)

The BCM uses a high-frequency resonant tank to move energy from the high-voltage side to the low-voltage side and vice versa. The resonant LC tank, operated at high frequency, is amplitude modulated as a function of the HI-side voltage and the LO-side current. A small amount of capacitance embedded in the high-voltage-side and low-voltage-side stages of the module is sufficient for full functionality and is key to achieving high power density.

The BCM4414xG0F4440yzz can be simplified into the model shown in Figure 19.

At no load:

$$V_{LO} = V_{HI} \cdot K \quad (1)$$

K represents the “turns ratio” of the BCM. Rearranging Equation 1:

$$K = \frac{V_{LO}}{V_{HI}} \quad (2)$$

In the presence of a load, V_{LO} is represented by:

$$V_{LO} = V_{HI} \cdot K - I_{LO} \cdot R_{LO} \quad (3)$$

and I_{LO} is represented by:

$$I_{LO} = \frac{I_{HI} - I_{HI-Q}}{K} \quad (4)$$

R_{LO} represents the impedance of the BCM and is a function of the R_{DS_ON} of the HI-side and LO-side MOSFETs, PC board resistance of HI-side and LO-side boards and the winding resistance of the power transformer. I_{HI-Q} represents the HI-side quiescent current of the BCM controller, gate drive circuitry and core losses.

The effective DC voltage transformer action provides additional interesting attributes. Assuming that $R_{LO} = 0\Omega$ and $I_{HI-Q} = 0A$, Equation 3 now becomes Equation 1 and is essentially load independent, resistor R is now placed in series with V_{HI} .

Figure 20 — $K = 1/16$ BCM with series HI-side resistor

The relationship between V_{HI} and V_{LO} becomes:

$$V_{LO} = (V_{HI} - I_{HI} \cdot R) \cdot K \quad (5)$$

Substituting the simplified version of Equation 4 (I_{HI-Q} is assumed = 0A) into Equation 5 yields:

$$V_{LO} = V_{HI} \cdot K - I_{LO} \cdot R \cdot K^2 \quad (6)$$

This is similar in form to Equation 3, where R_{LO} is used to represent the characteristic impedance of the BCM. However, in this case a real resistor, R, on the high-voltage side of the BCM is effectively scaled by K^2 with respect to the low-voltage side.

Assuming that $R = 1\Omega$, the effective R as seen from the low-voltage side is 3.9m Ω , with $K = 1/16$.

A similar exercise can be performed with the addition of a capacitor or shunt impedance at the high-voltage side of the BCM. A switch in series with V_{HI} is added to the circuit. This is depicted in Figure 21.

Figure 21 — BCM with HI-side capacitor

A change in V_{HI} with the switch closed would result in a change in capacitor current according to the following equation:

$$I_C(t) = C \frac{dV_{HI}}{dt} \quad (7)$$

Assume that with the capacitor charged to V_{HI} , the switch is opened and the capacitor is discharged through the idealized BCM. In this case,

$$I_C = I_{LO} \cdot K \quad (8)$$

substituting Equation 1 and 8 into Equation 7 reveals:

$$I_{LO}(t) = \frac{C}{K^2} \cdot \frac{dV_{LO}}{dt} \quad (9)$$

The equation in terms of the LO-side has yielded a K^2 scaling factor for C , specified in the denominator of the equation.

A K factor less than unity results in an effectively larger capacitance on the low-voltage side when expressed in terms of the high-voltage side. With $K = 1/16$ as shown in Figure 21, $C = 1\mu F$ would appear as $C = 256\mu F$ when viewed from the low-voltage side.

Low impedance is a key requirement for powering a high-current, low-voltage load efficiently. A switching regulation stage should have minimal impedance while simultaneously providing appropriate filtering for any switched current. The use of a BCM between the regulation stage and the point-of-load provides a dual benefit of scaling down series impedance leading back to the source and scaling up shunt capacitance or energy storage as a function of its K factor squared. However, these benefits are not achieved if the series impedance of the BCM is too high. The impedance of the BCM must be low, i.e., well beyond the crossover frequency of the system.

A solution for keeping the impedance of the BCM low involves switching at a high frequency. This enables the use of small magnetic components because magnetizing currents remain low. Small magnetics mean small path lengths for turns. Use of low-loss core material at high frequencies also reduces core losses.

The two main terms of power loss in the BCM module are:

- No-load power dissipation (P_{HI_NL}): defined as the power used to power up the module with an enabled powertrain at no load.
- Resistive loss ($P_{R_{LO}}$): refers to the power loss across the BCM module modeled as pure resistive impedance.

$$P_{DISSIPATED} = P_{HI_NL} + P_{R_{LO}} \quad (10)$$

Therefore,

$$P_{LO_OUT} = P_{HI_IN} - P_{DISSIPATED} = P_{HI_IN} - P_{HI_NL} - P_{R_{LO}} \quad (11)$$

The above relations can be combined to calculate the overall module efficiency:

$$\eta = \frac{P_{LO_OUT}}{P_{HI_IN}} = \frac{P_{HI_IN} - P_{HI_NL} - P_{R_{LO}}}{P_{HI_IN}} \quad (12)$$

$$= \frac{V_{HI} \cdot I_{HI} - P_{HI_NL} - (I_{LO})^2 \cdot R_{LO}}{V_{HI} \cdot I_{HI}}$$

$$= 1 - \left(\frac{P_{HI_NL} + (I_{LO})^2 \cdot R_{LO}}{V_{HI} \cdot I_{HI}} \right)$$

Thermal Considerations

The VIA package provides effective conduction cooling from either of the two module surfaces. Heat may be removed from the pin-side surface, the non-pin-side surface or both. The extent to which these two surfaces are cooled is a key component for determining the maximum power that can be processed by a BCM, as can be seen from the specified thermal operating area in Figure 1. Since the BCM has a maximum internal temperature rating, it is necessary to estimate this temperature based on a system-level thermal solution. For this purpose, it is helpful to simplify the thermal solution into a roughly equivalent circuit where power dissipation is modeled as a current source, isothermal surface temperatures are represented as voltage sources and the thermal resistances are represented as resistors. Figure 22 shows the “thermal circuit” for the BCM in a VIA package.

Figure 22 — Double-sided cooling thermal model

In this case, the internal power dissipation is P_{DISS} , $\theta_{INT_PIN_SIDE}$ and $\theta_{INT_NON_PIN_SIDE}$ are the thermal resistance characteristics of the BCM and the pin-side and non-pin-side surface temperatures are represented as $T_{C_PIN_SIDE}$ and $T_{C_NON_PIN_SIDE}$. It is interesting to note that the package itself provides a high degree of thermal coupling between the pin-side and non-pin-side case surfaces (represented in the model by the resistor θ_{HOU}). This feature enables two main options regarding thermal designs:

- Single-side cooling: the model of Figure 22 can be simplified by calculating the parallel resistor network and using one simple thermal resistance number and the internal power dissipation curves; an example for non-pin-side cooling only is shown in Figure 23.

In this case, θ_{INT} can be derived as follows:

$$\theta_{INT} = \frac{(\theta_{INT_PIN_SIDE} + \theta_{HOU}) \cdot \theta_{INT_NON_PIN_SIDE}}{\theta_{INT_PIN_SIDE} + \theta_{HOU} + \theta_{INT_NON_PIN_SIDE}} \quad (13)$$

Figure 23 — Single-sided cooling thermal model

- Double-side cooling: while this option might bring limited advantage to the module internal components (given the surface-to-surface coupling provided), it might be appealing in cases where the external thermal system requires allocating power to two different elements, such as heat sinks with independent airflows or a combination of chassis/air cooling.

Current Sharing

The performance of the BCM is based on efficient transfer of energy through a transformer without the need of closed loop control. For this reason, the transfer characteristic can be approximated by an ideal transformer with a positive temperature coefficient series resistance.

This type of characteristic is close to the impedance characteristic of a DC power distribution system both in dynamic (AC) behavior and for steady state (DC) operation.

When multiple BCM modules of a given part number are connected in an array, they will inherently share the load current according to the equivalent impedance divider that the system implements from the power source to the point-of-load. Ensuring equal current sharing among modules requires that BCM array impedances be matched.

Some general recommendations to achieve matched array impedances include:

- Dedicate common copper planes/wires within the PCB/Chassis to deliver and return the current to the modules.
- Provide as symmetric a PCB/Wiring layout as possible among modules

For further details see [AN:016 Using BCM Bus Converters in High Power Arrays](#).

Figure 24 — BCM module array

Fuse Selection

In order to provide flexibility in configuring power systems, BCM in a VIA package modules are not internally fused. Input line fusing of BCM products is recommended at the system level to provide thermal protection in case of catastrophic failure.

The fuse shall be selected by closely matching system requirements with the following characteristics:

- Current rating
(usually greater than maximum current of BCM module)
- Maximum voltage rating
(usually greater than the maximum possible input voltage)
- Ambient temperature
- Nominal melting I^2t
- Recommend fuse: see safety agency approvals (HI side)

Reverse Operation

BCM modules are capable of reverse power operation. Once the unit is started, energy will be transferred from the low-voltage side back to the high-voltage side whenever the low-side voltage exceeds $V_{HI} \cdot K$. The module will continue operation in this fashion as long as no faults occur.

To use the module in reverse, it must first be started from the high-voltage side. If a high-voltage source is not available for start up, see:

[AN:038 HV ChiP™ BCM® Reverse Start Up Circuit](#)

Fault protection that protects the module in forward operation also protects the module in reverse operation. The protection level scales with the K factor when changing the reference side of the module. Operation of the the module protection for UVLO changes from auto recovery to latching. The bootstrap circuit used to start from the low side must be re-engaged to restart.

Transient operation in reverse is expected in cases where there is significant energy storage on the low-voltage side and transient voltages appear on the high-voltage side. Application qualification should check transient and fault conditions to ensure no unexpected conditions.

Dielectric Withstand

The chassis of the BCM in a VIA package is required to be connected to Protective Earth when installed in the end application and must satisfy the requirements of IEC 60950-1 for Class I products.

Summary

The case is required to be connected to protective earth in the final installation.

The construction of the BCM in a VIA package can be summarized by describing it as a "Class II" component installed in a "Class I" subassembly.

Figure 25 — BCM in a ChiP™ package before final assembly in the VIA package

Figure 26 — BCM in a VIA package after final assembly

Filtering

The BCM in a VIA package has built-in single stage EMI filtering located on the high-voltage side. The integrated EMI filtering consists of a common mode choke and differential mode capacitors. However, it does not include Y2 capacitors for common mode filtering. Y2 common mode capacitors can be added externally on the high-voltage side between +HI and PE (Case), and –HI and PE (Case) to meet certain EMI requirements. A typical test set-up block diagram for conducted emissions is shown in Figure 27.

The integrated filtering reduces the voltage ripple on the high-voltage side. External LO-side filtering can be added as needed, with ceramic capacitance used as a LO-side bypass for this purpose. BCM HI-side and LO-side voltage ranges shall not be exceeded. An internal overvoltage function prevents operation outside of the normal operating HI-side range. However, the BCM is exposed to the applied voltage even when disabled, and must withstand it. External transient protection circuitry may be required to protect the BCM from overvoltage transients imposed by a system that would exceed maximum ratings.

The source response is generally the limiting factor in the overall system response, given the wide bandwidth of the BCM. Anomalies in the response of the source will appear at the LO side of the module multiplied by its K factor.

Total load capacitance at the LO side of the BCM shall not exceed the specified maximum to ensure correct operation in start up. Due to the wide bandwidth and small LO-side impedance of the BCM, low-frequency bypass capacitance and significant energy storage may be more densely and efficiently provided by adding capacitance at the HI-side of the BCM.

At frequencies less than 500kHz, the BCM appears as an impedance of R_{LO} between the source and load. Within this frequency range, capacitance connected at the HI side appears as an effective scaled capacitance on the LO side per the relationship defined in Equation 14.

$$C_{LO} = \frac{C_{HI}}{K^2} \quad (14)$$

This enables a reduction in the size and number of capacitors used in a typical system.

The high bandwidth of the BCM can cause load changes seen on the output up to this bandwidth to appear at the input. They must be considered in any input filter design if required. This effect is seen during power transfer in either direction, however the benefit of capacitor size reduction will consistently be on the high-voltage side.

Figure 27 — Typical test set up block diagram for Conducted Emissions

System Diagram for PMBus® Interface

The controller of the BCM in a VIA package is referenced to the low-voltage-side signal ground (SGND).

The BCM in a VIA package provides the Host PMBus system with accurate telemetry monitoring and reporting, threshold and warning limits adjustment, in addition to corresponding status flags. The standalone BCM is periodically polled for status by the host PMBus. Direct communication to the BCM is enabled by a page command. For example, the page (0x00) prior to a telemetry inquiry points to the controller data and page (0x01) prior to a telemetry inquiry points to the BCM parameters.

The BCM enables the PMBus compatible host interface with an operating bus speed of up to 400kHz. The BCM follows the PMBus command structure and specification.

PMBus® Interface

Refer to “PMBus Power System Management Protocol Specification Revision 1.2, Part I and II” for complete PMBus specifications details at <http://pmbus.org>.

Device Address

The PMBus address (ADDR Pin) should be set to one of the predetermined 16 possible addresses shown in the table below using a resistor between the ADDR pin and SGND pin.

The BCM accepts only a fixed and persistent address and does not support SMBus address resolution protocol. At initial power-up, the BCM controller will sample the address pin voltage and will keep this address until device power is removed.

ID	Child Address	HEX	Recommended Resistor R _{ADDR} (Ω)
1	1010 000b	50h	487
2	1010 001b	51h	1050
3	1010 010b	52h	1870
4	1010 011b	53h	2800
5	1010 100b	54h	3920

14	1011 101b	5Dh	53600
15	1011 110b	5Eh	97600
16	1011 111b	5Fh	316000

Reported DATA Formats

The BCM controller employs a direct data format where all reported measurements are in Volts, Amperes, Degrees Celsius, or Seconds. The host uses the following PMBus specification to interpret received values metric prefixes. Note that the COEFFICIENTS command is not supported:

$$X = \left(\frac{1}{m} \right) \cdot (Y \cdot 10^{-R} - b)$$

Where:

X, is a “real world” value in units (A, V, °C, s)

Y, is a two’s complement integer received from the BCM controller

m, b and R are two’s complement integers defined as follows:

Command	Code	m	R	b
TON_DELAY	60h	1	3	0
READ_VIN	88h	1	1	0
READ_IIN	89h	1	3	0
READ_VOUT ^[e]	8Bh	1	1	0
READ_IOUT	8Ch	1	2	0
READ_TEMPERATURE_1 ^[f]	8Dh	1	0	0
READ_POUT	96h	1	0	0

READ_BCM_ROUT	D4h	1	5	0

^[e] Default READ LO-side voltage returned when BCM unit is disabled = –300V.

^[f] Default READ Temperature returned when BCM unit is disabled = –273°C.

No special formatting is required when lowering the supervisory limits and warnings.

Supported Command List

Command	Code	Function	Default Data Content	Data Bytes
PAGE	00h	Access BCM stored information	00h	1
OPERATION	01h	Turn BCM on or off	80h	1
CLEAR_FAULTS	03h	Clear all faults	N/A	None
CAPABILITY	19h	PMBus® key capabilities set by factory	20h	1
OT_FAULT_LIMIT	4Fh ^[9]	Overtemperature protection	64h	2
OT_WARN_LIMIT	51h ^[9]	Overtemperature warning	64h	2
VIN_OV_FAULT_LIMIT	55h ^[9]	High-voltage-side overvoltage protection	64h	2
VIN_OV_WARN_LIMIT	57h ^[9]	High-voltage-side overvoltage warning	64h	2
IIN_OC_FAULT_LIMIT	5Bh ^[9]	High-voltage-side overcurrent protection	64h	2
IIN_OC_WARN_LIMIT	5Dh ^[9]	High-voltage-side overcurrent warning	64h	2
TON_DELAY	60h ^[9]	Start up delay in addition to fixed delay	00h	2
STATUS_BYTE	78h	Summary of faults	00h	1
STATUS_WORD	79h	Summary of fault conditions	00h	2
STATUS_IOUT	7Bh	Overcurrent fault status	00h	1
STATUS_INPUT	7Ch	Overvoltage and undervoltage fault status	00h	1
STATUS_TEMPERATURE	7Dh	Overtemperature and undertemperature fault status	00h	1
STATUS_CML	7Eh	PMBus communication fault	00h	1
STATUS_MFR_SPECIFIC	80h	Other BCM status indicator	00h	1
READ_VIN	88h	Reads HI-side voltage	FFFFh	2
READ_IIN	89h	Reads HI-side current	FFFFh	2
READ_VOUT	8Bh	Reads LO-side voltage	FFFFh	2
READ_IOUT	8Ch	Reads LO-side current	FFFFh	2
READ_TEMPERATURE_1	8Dh	Reads internal temperature	FFFFh	2
READ_POUT	96h	Reads LO-side power	FFFFh	2
PMBUS_REVISION	98h	PMBus compatible revision	22h	1
MFR_ID	99h	BCM controller ID	"VI"	2
MFR_MODEL	9Ah	Internal controller or BCM model	Part Number	18
MFR_REVISION	9Bh	Internal controller or BCM revision	FW and HW revision	18
MFR_LOCATION	9Ch	Internal controller or BCM factory location	"AP"	2
MFR_DATE	9Dh	Internal controller or BCM manufacturing date	"YYWW"	4
MFR_SERIAL	9Eh	Internal controller or BCM serial number	Serial Number	16
MFR_VIN_MIN	A0h	Minimum rated high-side voltage	Varies per BCM	2
MFR_VIN_MAX	A1h	Maximum rated high-side voltage	Varies per BCM	2
MFR_VOUT_MIN	A4h	Minimum rated low-side voltage	Varies per BCM	2
MFR_VOUT_MAX	A5h	Maximum rated low-side voltage	Varies per BCM	2
MFR_IOUT_MAX	A6h	Maximum rated low-side current	Varies per BCM	2
MFR_POUT_MAX	A7h	Maximum rated low-side power	Varies per BCM	2
READ_K_FACTOR	D1h	Reads K factor	Varies per BCM	2
READ_BCM_ROUT	D4h	Reads low-voltage side output resistance	Varies per BCM	2
SET_ALL_THRESHOLDS	D5h ^[9]	Set supervisory warning and protection thresholds	6464646464h	6
DISABLE_FAULT	D7h ^[9]	Disable overvoltage, overcurrent or undervoltage supervisory faults	00h	2

^[9] The BCM must be in a disabled state with $V_{HI} < V_{HI_UVLO-}$ and VDDb applied during a write message.

Command Structure Overview

Write Byte protocol:

The Host always initiates PMBus® communication with a START bit. All messages are terminated by the Host with a STOP bit. In a write message, the parent sends the child device address followed by a write bit. Once the child acknowledges, the parent proceeds with the command code and then similarly the data byte.

- S Start Condition
- Sr Repeated start Condition
- Rd Read
- Wr Write
- X Indicated that field is required to have the value of x
- A Acknowledge (bit may be 0 for an ACK or 1 for a NACK)
- P Stop Condition
- From Parent to Child
- From Child to Parent
- ... Continued next line

Figure 1 — PAGE COMMAND (00h), WRITE BYTE PROTOCOL

Read Byte protocol:

A Read message begins by first sending a Write Command, followed by a REPEATED START Bit and a child Address. After receiving the READ bit, the BCM controller begins transmission of the Data responding to the Command. Once the Host receives the requested Data, it terminates the message with a NACK preceding a stop condition signifying the end of a read transfer.

Figure 2 — ON_OFF_CONFIG COMMAND (02h), READ BYTE PROTOCOL

Write Word protocol:

When transmitting a word, the lowest order byte leads the highest order byte. Furthermore, when transmitting a Byte, the least significant bit (LSB) is sent last. Refer to System Management Bus (SMBus) specification version 2.0 for more details.

Note: Extended command and Packet Error Checking Protocols are not supported.

Figure 3 — TON_DELAY COMMAND (D6h)_WRITE WORD PROTOCOL

Read Word protocol:

Figure 4 — MFR_VIN_MIN COMMAND (88h)_READ WORD PROTOCOL

Write Block protocol:

Figure 5 — SET_ALL_THRESHOLDS COMMAND (D5h)_WRITE BLOCK PROTOCOL

Read Block protocol:

Figure 6 — SET_ALL_THRESHOLDS COMMAND (D5h)_READ BLOCK PROTOCOL

Write Group Command protocol:

Note that only one command per device is allowed in a group command.

Figure 7 — DISABLE_FAULT COMMAND (D7h)_WRITE

Supported Commands Transaction Type

A direct communication to the BCM controller and a simulated communication to non-PMBus® devices is enabled by a page command. Supported command access privileges with a pre-selected PAGE are defined in the following table. Deviation from this table generates a communication error in STATUS_CML register.

Command	Code	PAGE Data Byte Access Type	
		00h	01h
PAGE	00h	R/W	R/W
OPERATION	01h	R	R/W
CLEAR_FAULTS	03h	W	W
CAPABILITY	19h	R	
OT_FAULT_LIMIT	4Fh		R/W
OT_WARN_LIMIT	51h		R/W
VIN_OV_FAULT_LIMIT	55h		R/W
VIN_OV_WARN_LIMIT	57h		R/W
IIN_OC_FAULT_LIMIT	5Bh		R/W
IIN_OC_WARN_LIMIT	5Dh		R/W
TON_DELAY	60h		R/W
STATUS_BYTE	78h	R/W	R
STATUS_WORD	79h	R	R
STATUS_IOUT	7Bh	R	R/W
STATUS_INPUT	7Ch	R	R/W
STATUS_TEMPERATURE	7Dh	R	R/W
STATUS_CML	7Eh	R/W	
STATUS_MFR_SPECIFIC	80h	R	R/W
READ_VIN	88h		R
READ_IIN	89h	R	R
READ_VOUT	8Bh		R
READ_IOUT	8Ch	R	R
READ_TEMPERATURE_1	8Dh	R	R
READ_POUT	96h	R	R
PMBUS_REVISION	98h	R	
MFR_ID	99h	R	
MFR_MODEL	9Ah	R	R
MFR_REVISION	9Bh	R	R

MFR_POUT_MAX	A7h	R	R
READ_K_FACTOR	D1h		R
READ_BCM_ROUT	D4h		R
SET_ALL_THRESHOLDS	D5h		R/W
DISABLE_FAULT	D7h		R/W

Page Command (00h)

The page command data byte of 00h prior to a command call will address the BCM controller specific data and a page data byte of 01h would broadcast to the BCM. The value of the Data Byte corresponds to the pin name trailing number with the exception of 00h and FFh.

Data Byte	Description
00h	BCM controller
01h	BCM

OPERATION Command (01h)

The OPERATION command can be used to turn on and off the connected BCM.

If synchronous start up is required in the system, it is recommended to use the command from host PMBus in order to achieve simultaneous array start up.

This command accepts only two data values: 00h and 80h. If any other value is sent the command will be rejected and a CML Data error will result.

CLEAR_FAULTS Command (03h)

This command clears all status bits that have been previously set. Persistent or active faults are re-asserted again once cleared. All faults are latched once asserted in the BCM controller. Registered faults will not be cleared when shutting down the BCM powertrain by recycling the BCM high-side voltage or sending the OPERATION command.

CAPABILITY Command (19h)

The BCM controller returns a default value of 20h. This value indicates that the PMBus® frequency supported is up to 400kHz and that both Packet Error Checking (PEC) and SMBALERT# are not supported.

OT_FAULT_LIMIT Command (4Fh), OT_WARN_LIMIT Command (51h), VIN_OV_FAULT_LIMIT Command (55h), VIN_OV_WARN_LIMIT Command (57h), IIN_OC_FAULT_LIMIT Command (5Bh), IIN_OC_WARN_LIMIT Command (5Dh)

The values of these registers are set in non-volatile memory and can only be written when the BCM is disabled.

The values of the above mentioned faults and warnings are set by default to 100% of the respective BCM model supervisory limits. However, these limits can be set to a lower value. For example: In order for a limit percentage to be set to 80%, one would send a write command with a (50h) Data Word.

Any values outside the range of (00h – 64h) sent by a host will be rejected, will not override the currently stored value and will set the Unsupported Data bit in STATUS_CML.

The SET_ALL_THRESHOLDS COMMAND (D5h) combines in one block overtemperature fault and warning limits, V_{HI} overvoltage fault and warning limits as well as I_{LO} overcurrent fault and warning limits. A delay prior to a read command of up to 200ms following a write of new value is required.

The VIN_UV_WARN_LIMIT (58h) and VIN_UV_FAULT_LIMIT (59h) are set by the factory and cannot be changed by the host. However, a host can disable the undervoltage setting using the DISABLE_FAULT COMMAND (D7h).

All FAULT_RESPONSE commands are unsupported. The BCM powertrain supervisory limits and powertrain protection will behave as described in the Electrical Specifications. In general, once a fault is detected, the BCM powertrain will shut down and attempt to auto-restart after a predetermined delay.

TON_DELAY Command (60h)

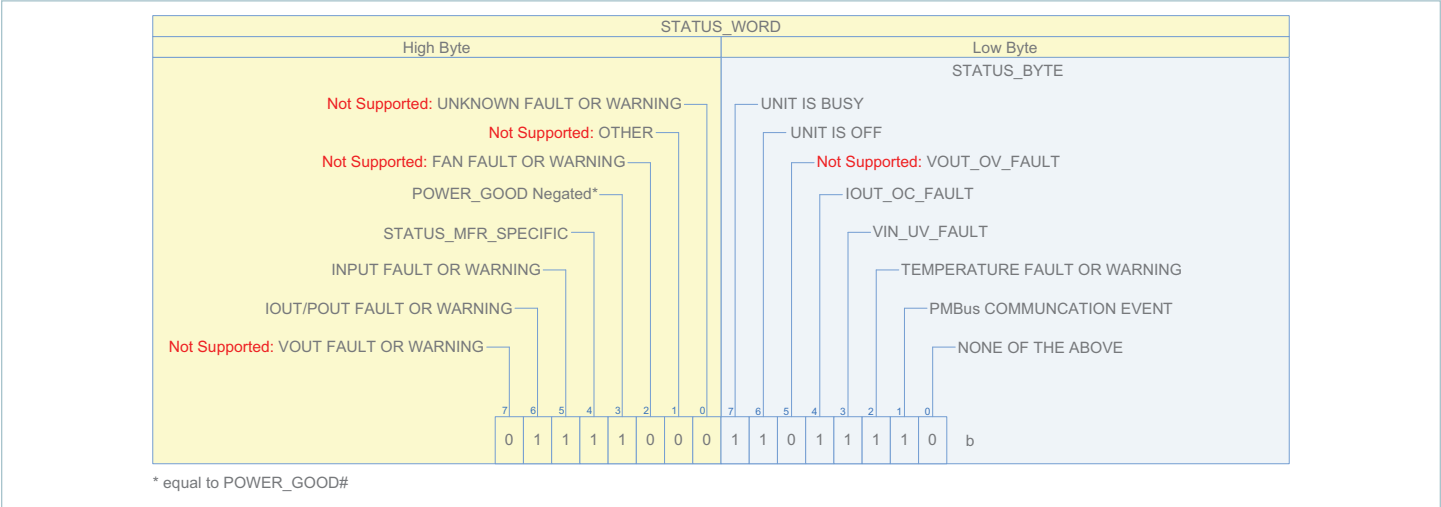

The value of this register word is set in non-volatile memory and can only be written when the BCM is disabled.

The maximum possible delay is 100ms. Default value is set to (00h). The reported value can be interpreted using the following equation.

$$TON_DELAY_{ACTUAL} = t_{REPORTED} \cdot 10^{-3}(s)$$

Staggering start up in an array is possible with the TON_DELAY Command. This delay will be in addition to any start up delay inherent in the BCM module. For example: start up delay from application of V_{HI} is typically 20ms. When TON_DELAY is greater than zero, the set delay will be added to it.

STATUS_BYTE (78h) and STATUS_WORD (79h)

All fault or warning flags, if set, will remain asserted until cleared by the host or once the BCM and VDDb power is removed. This includes undervoltage fault, overvoltage fault, overvoltage warning, overcurrent warning, overtemperature fault, overtemperature warning, undertemperature fault, reverse operation, communication faults and analog controller shutdown fault.

Asserted status bits in all status registers, with the exception of STATUS_WORD and STATUS_BYTE, can be individually cleared. This is done by sending a data byte with one in the bit position corresponding to the intended warning or fault to be cleared. Refer to the PMBus® Power System Management Protocol Specification – Part II – Revision 1.2 for details.

The POWER_GOOD# bit reflects the state of the device and does not reflect the state of the POWER_GOOD# signal limits. The POWER_GOOD_ON COMMAND (5Eh) and POWER_GOOD_OFF COMMAND (5Fh) are not supported. The POWER_GOOD# bit is set, when the BCM is not in the active state, to indicate that the powertrain is inactive and not switching. The POWER_GOOD# bit is cleared, when the BCM is in the active state, 5ms after the powertrain is activated allowing for soft start to elapse. POWER_GOOD# and OFF bits cannot be cleared as they always reflect the current state of the device.

The Busy bit can be cleared using CLEAR_ALL Command (03h) or by writing either data value (40h, 80h) to PAGE (00h) using the STATUS_BYTE (78h).

Fault reporting, such as SMBALERT# signal output, and host notification by temporarily acquiring bus parent status is not supported.

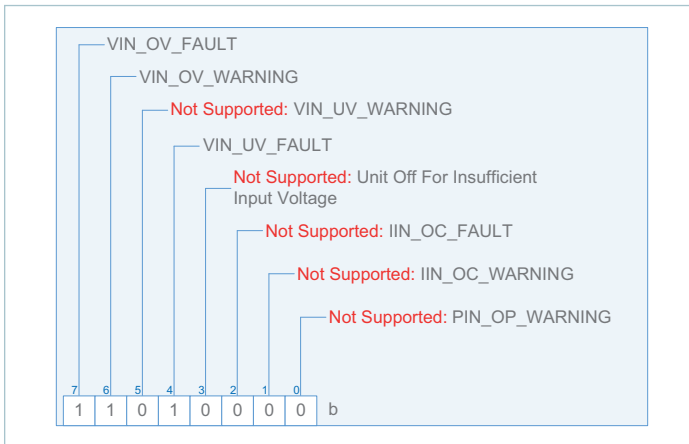

If the BCM controller is powered through VDDb, it will retain the last telemetry data and this information will be available to the user via a PMBus Status request. This is in agreement with the PMBus standard, which requires that status bits remain set until specifically cleared. Note that in the case where the BCM V_{HI} is lost, the status will always indicate an undervoltage fault, in addition to any other fault that occurred.

NONE OF THE ABOVE bit will be asserted if either the STATUS_MFR_SPECIFIC (80h) or the High Byte of the STATUS WORD is set.

STATUS_IOUT (7Bh)

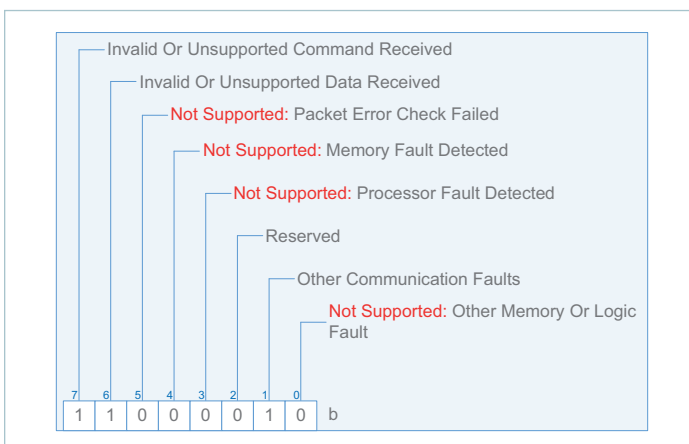

Unsupported bits are indicated above. A one indicates a fault.

STATUS_INPUT (7Ch)

Unsupported bits are indicated above. A one indicates a fault.

STATUS_TEMPERATURE (7Dh)

Unsupported bits are indicated above. A one indicates a fault.

STATUS_CML (7Eh)

Unsupported bits are indicated above. A one indicates a fault. The STATUS_CML data byte will be asserted when an unsupported PMBus® command or data or other communication fault occurs.

STATUS_MFR_SPECIFIC (80h)

The reverse operation bit, if asserted, indicates that the BCM is processing current in reverse. Reverse current reported value is not supported.

The BCM has hardware protections and supervisory limits. The hardware protections provide an additional layer of protection and have the fastest response time. The Hardware Protections Shutdown Fault, when asserted, indicates that at least one of the powertrain protection faults is triggered. This fault will also be asserted if a disabled fault event occurs after asserting any bit using the DISABLE_FAULTS COMMAND.

The BCM communicates with its internal secondary microcontroller via UART communication. If the BCM UART CML is asserted, it may indicate a hardware or connection issue between the BCM and the secondary microcontroller.

When the PAGE COMMAND (00h) data byte is equal to (00h), the BCM Reverse operation, Analog Controller Shutdown Fault, and BCM UART CML bit will return the result of the active BCM. The BCM UART CML will also be asserted if the active BCM stops responding. The BCM must communicate at least once to the internal controller in order to trigger this FAULT. The BCM UART CML can be cleared using the PAGE (00h) CLEAR_FAULTS (03h) Command.

READ_VIN Command (88h)

If PAGE data byte is equal to (01h), command will return the BCM's HI-side voltage in the following format:

$$V_{HI_ACTUAL} = V_{HI_REPORTED} \cdot 10^{-1}(V)$$

READ_IIN Command (89h)

If PAGE data byte is equal to (01h), command will return the BCM's

$$I_{HI_ACTUAL} = I_{HI_REPORTED} \cdot 10^{-3}(A)$$

HI-side current in the following format:

If PAGE data byte is equal (00h), command will also return the BCM's HI-side current.

READ_VOUT Command (8Bh)

$$V_{LO_ACTUAL} = V_{LO_REPORTED} \cdot 10^{-1}(V)$$

If PAGE data byte is equal to (01h), command will return the BCM's LO-side voltage in the following format:

READ_IOUT Command (8Ch)

$$I_{LO_ACTUAL} = I_{LO_REPORTED} \cdot 10^{-2}(A)$$

If PAGE data byte is equal to (01h), command will return the BCM's LO-side current in the following format:

If PAGE data byte is equal (00h), command will also return the BCM's LO-side current.

READ_TEMPERATURE_1 Command (8Dh)

$$T_{ACTUAL} = \pm T_{REPORTED} (^{\circ}C)$$

If PAGE data byte is equal to (01h), command will return the BCM's temperature in the following format:

If PAGE data byte is equal (00h), command will also return the BCM's temperature

READ_POUT Command (96h)

If PAGE data byte is equal to (01h), command will return the BCM's LO-side power in the following format:

$$P_{LO_ACTUAL} = P_{LO_REPORTED} (W)$$

If PAGE data byte is equal to (00h), command will also return the BCM's LO-side power.

**MFR_VIN_MIN Command (A0h),
MFR_VIN_MAX Command (A1h),
MFR_VOUT_MIN Command (A4h),
MFR_VOUT_MAX Command (A5h),
MFR_IOUT_MAX Command (A6h),
MFR_POUT_MAX Command (A7h)**

These values are set by the factory and indicate the device HI-side/LO-side voltage and LO-side current range and LO-side power capacity.

If the PAGE data byte is equal to (00h – 01h), commands report the rated BCM HI-side voltage minimum and maximum in Volts, LO-side voltage minimum and maximum in Volts, LO-side current maximum in Amperes and LO-side power maximum in Watts.

The BCM Controller Implementation vs. PMBus® Specification Rev 1.2

The BCM controller is an I²C™ compliant, SMBus compatible device and PMBus command compliant device. This section denotes some deviation, perceived as differences from the PMBus Part I and Part II specification Rev 1.2.

1. The PMBus interface meets all Part I and II PMBus specification requirements with the following differences to the transport requirement.

Unmet DC parameter Implementation vs SMBus spec						
Symbol	Parameter	PMBus Interface		SMBus Rev 2.0		Units
		Min	Max	Min	Max	
V _{IL} [a]	Input Low Voltage	–	0.99	–	0.8	V
V _{IH} [a]	Input High Voltage	2.31	–	2.1	V _{VDD_IN}	V
I _{LEAK_PIN} [c]	Input Leakage per Pin	10	22	–	±5	µA

[a] V_{VDD_IN} = 3.3V

[c] V_{BUS} = 5V

2. The BCM accepts 38 PMBus command codes. Implemented commands execute functions as described in the PMBus specification.

- Deviations from the PMBus specification:

- a. Section 15, fault related commands

- The limits and Warnings unit is implemented as a percentage (%) a range from decimal (0 – 100) of the factory set limits.

3. The unsupported PMBus command code response as described in the Fault Management and Reporting:

- Deviations from the PMBus specification:

- a. PMBus section 10.2.5.3, exceptions

- The busy bit of the STATUS_BYTE as implemented can be cleared (80h). In order to maintain compatibility with the specification, (40h) can also be used.

- Manufacturer Implementation of the PMBus Spec:

- a. PMBus section 10.5, setting the response to a detected fault condition

- All powertrain responses are pre-set and cannot be changed.

- b. PMBus section 10.6, reporting faults and warnings to the Host

- SMBALERT# signal and Direct PMBus Device to Host Communication are not supported. However, the PMBus interface will set the corresponding fault status bits and will wait for the host to poll.

- c. PMBus section 10.7, clearing a shutdown due to a fault

- There is no RESET pin or EN pin in the BCM. Cycling power to the BCM will not clear a BCM Shutdown. The BCM will clear itself once the fault condition is removed.

- d. PMBus Section 10.8.1, corrupted data transmission faults:

- Packet error checking is not supported.

Data Transmission Faults Implementation

This section describes data transmission faults as implemented in the BCM controller.

Section	Description	Response to Host		STATUS_BYTE	STATUS_CML		Notes
		NAK	FFh	CML	Other Fault	Unsupported Data	
10.8.1	Corrupted data						No response; PEC not supported
10.8.2	Sending too few bits			X	X		
10.8.3	Reading too few bits			X	X		
10.8.4	Host sends or reads too few bytes			X	X		
10.8.5	Host sends too many bytes	X		X		X	
10.8.6	Reading too many bytes		X	X	X		
10.8.7	Device busy	X	X				Device will ACK own address BUSY bit in STATUS_BYTE even if STATUS_WORD is set

Data Content Faults Implementation

This section describes data content fault as implemented in the BCM controller.

Section	Description	Response to Host	STATUS_BYTE	STATUS_CML			Notes
		NAK	CML	Other Fault	Unsupported Command	Unsupported Data	
10.9.1	Improperly set read bit in the address byte	X	X	X			
10.9.2	Unsupported command code	X	X		X		
10.9.3	Invalid or unsupported data		X			X	
10.9.4	Data out of range		X			X	
10.9.5	Reserved bits						No response; not a fault

BCM in VIA Package PCB (Board) Mount Package Recommended Hole Pattern

4414 UHV VIA BCM TIM PAD Mechanical Drawing

In chassis-mount applications or in board-mount applications with heat sink, an insulation layer of Gap Pad TIM (for example, Henkel Bergquist Gap Pad 5000S35 thickness 20 thousands, or similar) is necessary to meet the creepage requirements from the high-voltage terminals to the case. Vicor part number 45766 is the TIM Pad recommended for use with Vicor UHV BCM4414 VIA.

Revision History

Revision	Date	Description	Page Number(s)
1.0	07/05/17	Initial release	n/a
1.1	10/06/17	Updated agency approvals Updated TIM pad mechanical drawing	1, 18 41
1.2	01/16/18	Updated monitored telemetry technical information Updated mechanical drawings	10 38 – 40
1.3	08/17/18	Updated mechanical drawings Updated TIM pad note	38 – 40 41
1.4	11/25/18	Updated to include M-Grade option	1, 8, 9, 17
1.5	05/22/19	Updated features & benefits Updated electrical specifications Updated figure 12 description Updated 80h command description	1 6, 7 15 33
1.6	08/06/20	Updated terminology	25, 27, 28, 29, 32
1.7	10/26/20	Updated to include reverse-direction operation options and specifications	5, 9, 23, 24

Note: page added in Rev 1.7.

Vicor's comprehensive line of power solutions includes high density AC-DC and DC-DC modules and accessory components, fully configurable AC-DC and DC-DC power supplies, and complete custom power systems.

Information furnished by Vicor is believed to be accurate and reliable. However, no responsibility is assumed by Vicor for its use. Vicor makes no representations or warranties with respect to the accuracy or completeness of the contents of this publication. Vicor's Standard Terms and Conditions and Product Warranty

All sales are subject to Vicor's Standard Terms and Conditions of Sale, and Product Warranty which are available on Vicor's webpage (<http://www.vicorpower.com/termsconditionswarranty>) or upon request.

Life Support Policy

VICOR'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF VICOR CORPORATION. As used herein, life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness. Per Vicor Terms and Conditions of Sale, the user of Vicor products and components in life support applications assumes all risks of such use and indemnifies Vicor against all liability and damages.

Intellectual Property Notice

Vicor and its subsidiaries own Intellectual Property (including issued U.S. and Foreign Patents and pending patent applications) relating to the products described in this data sheet. No license, whether express, implied, or arising by estoppel or otherwise, to any intellectual property rights is granted by this document. Interested parties should contact Vicor's Intellectual Property Department.

The products described on this data sheet are protected by the following U.S. Patents Numbers: 7,145,786; 6,930,893; 10,398,040 and other patents pending.
