

## Applications

- Transient voltage protection
- High-voltage switches
- Crowbar
- Lasers
- Pulse generators

Application Note H - 6

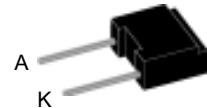

**Remark:** For special selection of more than 2 pieces IXBOD 1-... for every break down voltage of  $V_{BO} > 2000$  V please contact us.

## Single Breakover Diode

**V<sub>BO</sub>** = 600-1000V  
**I<sub>AVM</sub>** = 0.9 A

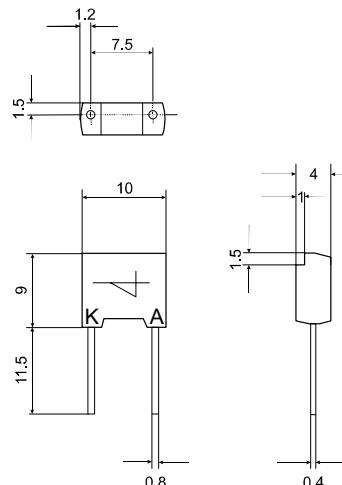

V <sub>BO</sub> V	Standard Types

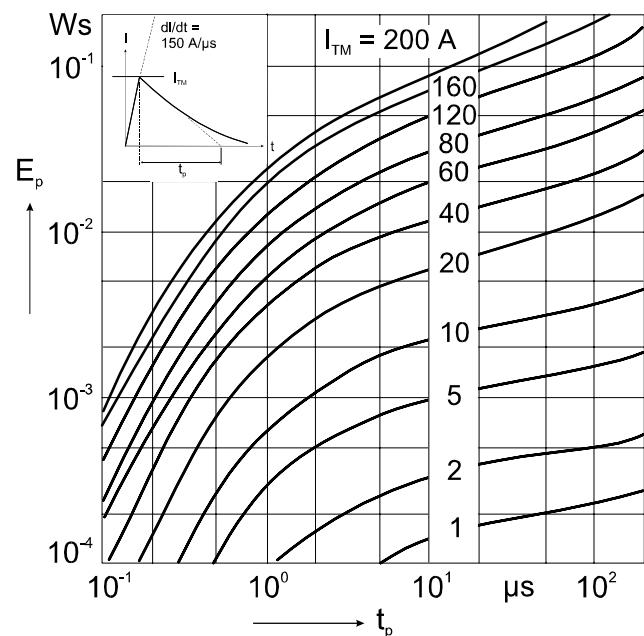

Fig. 6 Energy per pulse for single BOD element for exponentially decaying current pulse.  $E_p$  must be multiplied by number of elements for total energy.

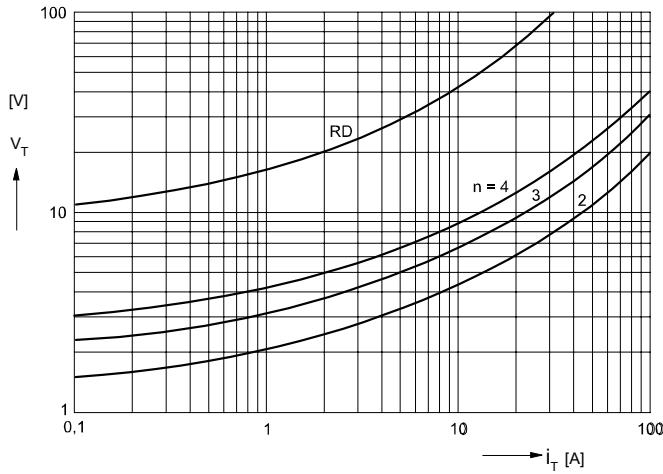

Fig. 7 On-state voltage at  $T_{VJ} = 125^\circ\text{C}$ .

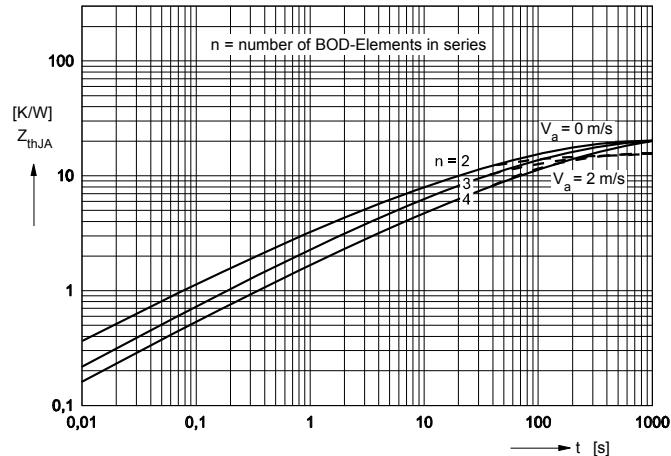

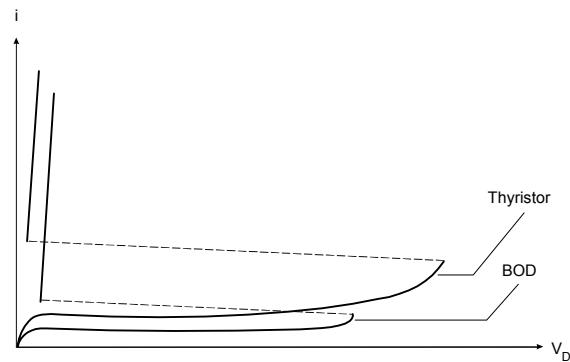

Fig. 8 Transient thermal resistance.

## Application

Protection of thyristors against overvoltages in forward direction.

$$V_{BO}(T_{VJ}) = V_{BO, 25^\circ C} [1 + KT(T_{VJ} - 25^\circ C)]$$

### Calculation example

- a. The maximum junction temperature shall be calculated for a module IXBOD 1-30R at an ambient temperature  $T_a = 60^\circ C$ , an exponentially decaying current  $I_{TM} = 40A$ , a pulselength  $t_p = 2 \mu s$ , an operating frequency  $f = 50 Hz$  and natural convection. From the diagram Fig. 6 the energy per pulse is obtained:

$$E_{p1} = 6 \times 10^{-3} Ws$$

For a module IXBOD1-30R the number of single IXBOD elements is:

$$n = 3$$

At natural air cooling the thermal resistance junction to ambient amounts to (Fig.8):

$$R_{thJA} = 20 K/W$$

and the unknown temperature can be calculated as:

$$T_{VJmax1} = T_a + n \cdot f \cdot E_p \cdot R_{thJA} + K_p \cdot E_p$$

$$T_{VJmax1} = 60 + 18 + 4.2 = 82.2^\circ C$$

- b. If following these steady-state conditions an overload for 1 minute occurs with  $I_{TM} = 60 A$  and a pulse-width  $t_p = 4 \mu s$  at the same operating frequency  $f = 50 Hz$ , then the resulting maximum junction temperature is calculating as follows:

$$T_{VJmax2} = T_{VJmax1} + (E_{p2} - E_{p1}) \cdot n \cdot f \cdot Z_{thJA}(t) + K_p \cdot (E_{p2} - E_{p1})$$

The diagrams Fig. 11 and Fig. 8 show

$$E_{p2} = 14 \times 10^{-3} Ws$$

$$Z_{thJA}(t = 1min) = 12 K/W$$

From what follows:

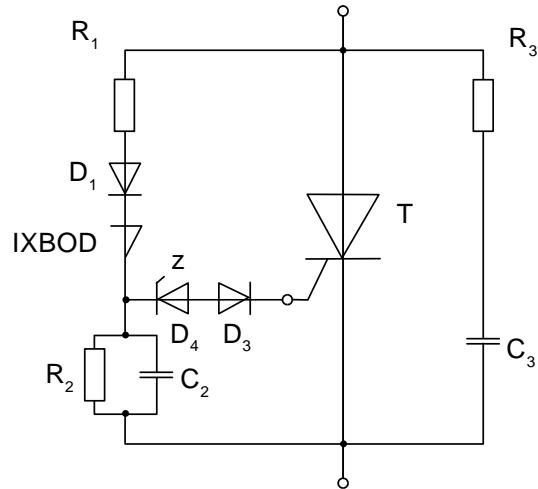

$$T_{VJmax2} = 82.2 + 14.4 + 5.6 = 102.2^\circ C$$

which is allowed because the maximum admissible junction temperature  $T_{VJ} = 125^\circ C$ .

## Example of a circuit

A simple emergency triggering circuit.

- T : Thyristor
- R<sub>1</sub> : Current limiting resistance (0 - 200 Ω)
- D<sub>1</sub> : Series-diode (fast recovery diode)
- D<sub>3</sub> : Protection diode
- D<sub>4</sub> : Zener diode, typical V<sub>z</sub>: 3-6 V
- R<sub>2</sub>, C<sub>2</sub> : Protection against parasitic triggering; recommended values:  
R<sub>2</sub> : 100 - 1000 Ω  
C<sub>2</sub> : 22 - 47 nF
- R<sub>3</sub>, C<sub>3</sub> : Snubber network of the thyristor

### Notice

1. A IXBOD element has a maximum reverse blocking voltage of 10V.
2. For higher reverse voltages a fast, soft recovery diode must be connected in series (Fig. 9). This diode must fulfill the conditions of Fig. 10.

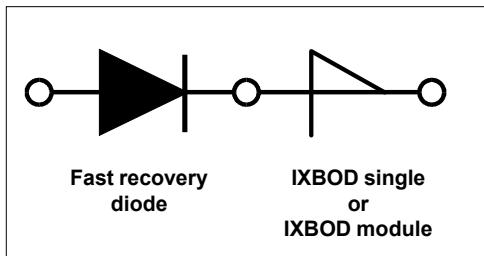

Fig. 9 IXBOD protection by a fast recovery diode.

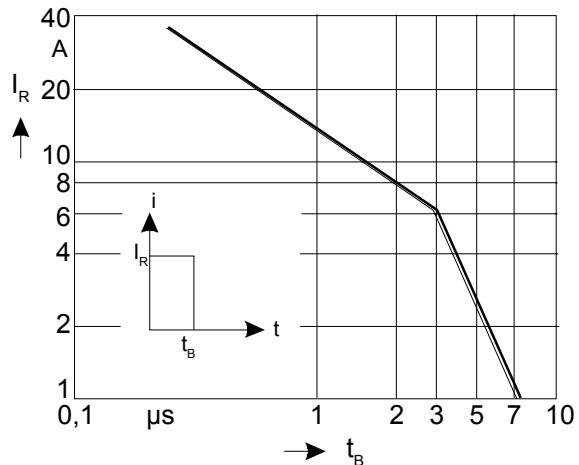

Fig. 10 Maximum peak value of the reverse current admissible for a given pulse-width t<sub>B</sub>, which is required for the suitable fast recovery series-diode.
