

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCAS247D – AUGUST 1993 – REVISED APRIL 1998

- Free-Running CLKA and CLKB Can Be Asynchronous or Coincident
- Two Independent Clocked FIFOs Buffering Data in Opposite Directions
- Mailbox-Bypass Register for Each FIFO
- Programmable Almost-Full and Almost-Empty Flags
- Microprocessor Interface Control Logic
- IRA, ORA, $\overline{\text{AEA}}$, and $\overline{\text{AFB}}$ Flags Synchronized by CLKA
- IRB, ORB, $\overline{\text{AEB}}$, and $\overline{\text{AFB}}$ Flags Synchronized by CLKB
- Low-Power 0.8 μm Advanced CMOS Technology
- Supports Clock Frequencies up to 67 MHz
- Fast Access Times of 11 ns
- Pin-to-Pin Compatible With the SN74ACT3632 and SN74ACT3642
- Package Options Include 120-Pin Thin Quad Flat (PCB) and 132-Pin Plastic Quad Flat (PQ) Packages

† Uses Yamaichi socket IC51-1324-828

description

The SN74ACT3622 is a high-speed, low-power CMOS clocked bidirectional FIFO memory. It supports clock frequencies up to 67 MHz with read access times of 11 ns. Two independent 256 × 36 dual-port SRAM FIFOs on the chip buffer data in opposite directions. Each FIFO has flags to indicate empty and full conditions and two programmable flags almost full ($\overline{AF}$) and almost empty ($\overline{AE}$) to indicate when a selected number of words is stored in memory. Communication between each port can bypass the FIFOs via two 36-bit mailbox registers. Each mailbox register has a flag to signal when new mail has been stored. Two or more devices can be used in parallel to create wider datapaths.

The SN74ACT3622 is a clocked FIFO, which means each port employs a synchronous interface. All data transfers through a port are gated to the low-to-high transition of a port clock by enable signals. The clocks for each port are independent of one another and can be asynchronous or coincident. The enables for each port are arranged to provide a simple bidirectional interface between microprocessors and/or buses with synchronous control.

The input-ready (IRA, IRB) flag and almost-full ($\overline{AFA}$, $\overline{AFB}$) flag of a FIFO are two-stage synchronized to the port clock that writes data to its array. The output-ready (ORA, ORB) flag and almost-empty ($\overline{AEA}$, $\overline{AEB}$) flag of a FIFO are two-stage synchronized to the port clock that reads data from its array. Offset values for the $\overline{AF}$ and $\overline{AE}$ flags of the FIFO can be programmed from port A.

The SN74ACT3622 is characterized for operation from 0°C to 70°C.

For more information on this device family, see the application report *FIFO Mailbox-Bypass Registers: Using Bypass Registers to Initialize DMA Control* (literature number SCAA007) and *Metastability Performance of Clocked FIFOs* (literature number SCZA004).

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCAS247D – AUGUST 1993 – REVISED APRIL 1998

Terminal Functions

TERMINAL NAME	I/O	DESCRIPTION
A0–A35	I/O	Port-A data. The 36-bit bidirectional data port for side A.
$\overline{AEA}$	O (port A)	Port-A almost-empty flag. Programmable flag synchronized to CLKA. $\overline{AEA}$ is low when the number of words in FIFO2 is less than or equal to the value in the almost-empty A offset register, X2.
$\overline{AEB}$	O (port B)	Port-B almost-empty flag. Programmable flag synchronized to CLKB. $\overline{AEB}$ is low when the number of words in FIFO1 is less than or equal to the value in the almost-empty B offset register, X1.
$\overline{AFA}$	O (port A)	Port-A almost-full flag. Programmable flag synchronized to CLKA. $\overline{AFA}$ is low when the number of empty locations in FIFO1 is less than or equal to the value in the almost-full A offset register, Y1.
$\overline{AFB}$	O (port B)	Port-B almost-full flag. Programmable flag synchronized to CLKB. $\overline{AFB}$ is low when the number of empty locations in FIFO2 is less than or equal to the value in the almost-full B offset register, Y2.
B0–B35	I/O	Port-B data. The 36-bit bidirectional data port for side B.
CLKA	I	Port-A clock. CLKA is a continuous clock that synchronizes all data transfers through port A and can be asynchronous or coincident to CLKB. IRA, ORA, $\overline{AFA}$, and $\overline{AEA}$ are all synchronized to the low-to-high transition of CLKA.
CLKB	I	Port-B clock. CLKB is a continuous clock that synchronizes all data transfers through port B and can be asynchronous or coincident to CLKA. IRB, ORB, $\overline{AFB}$, and $\overline{AEB}$ are synchronized to the low-to-high transition of CLKB.
$\overline{CSA}$	I	Port-A chip select. $\overline{CSA}$ must be low to enable a low-to-high transition of CLKA to read or write data on port A. The A0–A35 outputs are in the high-impedance state when $\overline{CSA}$ is high.
$\overline{CSB}$	I	Port-B chip select. $\overline{CSB}$ must be low to enable a low-to-high transition of CLKB to read or write data on port B. The B0–B35 outputs are in the high-impedance state when $\overline{CSB}$ is high.
ENA	I	Port-A enable. ENA must be high to enable a low-to-high transition of CLKA to read or write data on port A.
ENB	I	Port-B enable. ENB must be high to enable a low-to-high transition of CLKB to read or write data on port B.
FS1, FS0	I	Flag offset selects. The low-to-high transition of a FIFO's reset input latches the values of FS0 and FS1. If either FS0 or FS1 is high when a reset input goes high, one of three preset values is selected as the offset for the FIFO AF and AE flags. If both FIFOs are reset simultaneously and both FS0 and FS1 are low when RST1 and RST2 go high, the first four writes to FIFO1 program the almost-full and almost-empty offsets for both FIFOs.
IRA	O (port A)	Input-ready flag. IRA is synchronized to the low-to-high transition of CLKA. When IRA is low, FIFO1 is full and writes to its array are disabled. IRA is set low when FIFO1 is reset and is set high on the second low-to-high transition of CLKA after reset.
IRB	O (port B)	Input-ready flag. IRB is synchronized to the low-to-high transition of CLKB. When IRB is low, FIFO2 is full and writes to its array are disabled. IRB is set low when FIFO2 is reset and is set high on the second low-to-high transition of CLKB after reset.
MBA	I	Port-A mailbox select. A high level on MBA chooses a mailbox register for a port-A read or write operation. When the A0–A35 outputs are active, a high level on MBA selects data from the mail2 register for output and a low level selects FIFO2 output-register data for output.
MBB	I	Port-B mailbox select. A high level on MBB chooses a mailbox register for a port-B read or write operation. When the B0–B35 outputs are active, a high level on MBB selects data from the mail1 register for output and a low level selects FIFO1 output-register data for output.
$\overline{MBF1}$	O	Mail1 register flag. $\overline{MBF1}$ is set low by a low-to-high transition of CLKA that writes data to the mail1 register. Writes to the mail1 register are inhibited while $\overline{MBF1}$ is low. $\overline{MBF1}$ is set high by a low-to-high transition of CLKB when a port-B read is selected and MBB is high. $\overline{MBF1}$ is set high when FIFO1 is reset.
$\overline{MBF2}$	O	Mail2 register flag. $\overline{MBF2}$ is set low by a low-to-high transition of CLKB that writes data to the mail2 register. Writes to the mail2 register are inhibited while $\overline{MBF2}$ is low. $\overline{MBF2}$ is set high by a low-to-high transition of CLKA when a port-A read is selected and MBA is high. $\overline{MBF2}$ is also set high when FIFO2 is reset.
ORA	O (port A)	Output-ready flag. ORA is synchronized to the low-to-high transition of CLKA. When ORA is low, FIFO2 is empty and reads from its memory are disabled. Ready data is present on the output register of FIFO2 when ORA is high. ORA is forced low when FIFO2 is reset and goes high on the third low-to-high transition of CLKA after a word is loaded to empty memory.

Terminal Functions (continued)

TERMINAL NAME	I/O	DESCRIPTION
ORB	O (port B)	Output-ready flag. ORB is synchronized to the low-to-high transition of CLKB. When ORB is low, FIFO1 is empty and reads from its memory are disabled. Ready data is present on the output register of FIFO1 when ORB is high. ORB is forced low when FIFO1 is reset and goes high on the third low-to-high transition of CLKB after a word is loaded to empty memory.
$\overline{\text{RST1}}$	I	FIFO1 reset. To reset FIFO1, four low-to-high transitions of CLKA and four low-to-high transitions of CLKB must occur while $\overline{\text{RST1}}$ is low. The low-to-high transition of $\overline{\text{RST1}}$ latches the status of FS0 and FS1 for $\overline{\text{AFA}}$ and $\overline{\text{AEB}}$ offset selection. FIFO1 must be reset upon power up before data is written to its RAM.
$\overline{\text{RST2}}$	I	FIFO2 reset. To reset FIFO2, four low-to-high transitions of CLKA and four low-to-high transitions of CLKB must occur while $\overline{\text{RST2}}$ is low. The low-to-high transition of $\overline{\text{RST2}}$ latches the status of FS0 and FS1 for $\overline{\text{AFB}}$ and $\overline{\text{AEA}}$ offset selection. FIFO2 must be reset upon power up before data is written to its RAM.
$\text{W}/\overline{\text{RA}}$	I	Port-A write/read select. A high on $\text{W}/\overline{\text{RA}}$ selects a write operation and a low selects a read operation on port A for a low-to-high transition of CLKA. The A0–A35 outputs are in the high-impedance state when $\text{W}/\overline{\text{RA}}$ is high.
$\overline{\text{W}}/\text{RB}$	I	Port-B write/read select. A low on $\overline{\text{W}}/\text{RB}$ selects a write operation and a high selects a read operation on port B for a low-to-high transition of CLKB. The B0–B35 outputs are in the high-impedance state when $\overline{\text{W}}/\text{RB}$ is low.

detailed description

reset

The FIFO memories of the SN74ACT3622 are reset separately by taking their reset ($\overline{\text{RST1}}$, $\overline{\text{RST2}}$) inputs low for at least four port-A clock (CLKA) and four port-B clock (CLKB) low-to-high transitions. The reset inputs can switch asynchronously to the clocks. A FIFO reset initializes the internal read and write pointers and forces the input-ready (IRA, IRB) flag low, the output-ready (ORA, ORB) flag low, the almost-empty ($\overline{\text{AEA}}$, $\overline{\text{AEB}}$) flag low, and the almost-full ($\overline{\text{AFA}}$, $\overline{\text{AFB}}$) flag high. Resetting a FIFO also forces the mailbox ($\overline{\text{MBF1}}$, $\overline{\text{MBF2}}$) flag of the parallel mailbox register high. After a FIFO is reset, its IR flag is set high after two clock cycles to begin normal operation. A FIFO must be reset after power up before data is written to its memory.

A low-to-high transition on a FIFO reset ($\overline{\text{RST1}}$, $\overline{\text{RST2}}$) input latches the value of the flag-select (FS0, FS1) inputs for choosing the almost-full and almost-empty offset programming method (see *almost-empty flag and almost-full flag offset programming*).

almost-empty flag and almost-full flag offset programming

Four registers in the SN74ACT3622 are used to hold the offset values for the $\overline{\text{AE}}$ and $\overline{\text{AF}}$ flags. The port-B almost-empty ($\overline{\text{AEB}}$) flag offset register is labeled X1 and the port-A almost-empty ($\overline{\text{AEA}}$) flag offset register is labeled X2. The port-A almost-full ($\overline{\text{AFA}}$) flag offset register is labeled Y1 and the port-B almost-full ($\overline{\text{AFB}}$) flag offset register is labeled Y2. The index of each register name corresponds to its FIFO number. The offset registers can be loaded with preset values during the reset of a FIFO or they can be programmed from port A (see Table 1).

almost-empty flag and almost-full flag offset programming (continued)

Table 1. Flag Programming

FS1	FS0	$\overline{\text{RST1}}$	$\overline{\text{RST2}}$	X1 AND Y1 REGISTERS [†]	X2 AND Y2 REGISTERS [‡]
H	H	↑	X	64	X
H	H	X	↑	X	64
H	L	↑	X	16	X
H	L	X	↑	X	16
L	H	↑	X	8	X
L	H	X	↑	X	8
L	L	↑	↑	Programmed from port A	Programmed from port A

[†] X1 register holds the offset for $\overline{\text{AEB}}$; Y1 register holds the offset for $\overline{\text{AFA}}$.

[‡] X2 register holds the offset for $\overline{\text{AEA}}$; Y2 register holds the offset for $\overline{\text{AFB}}$.

To load the FIFO $\overline{\text{AE}}$ flag and $\overline{\text{AF}}$ flag offset registers with one of the three preset values listed in Table 1, at least one of the flag-select inputs must be high during the low-to-high transition of its reset input. For example, to load the preset value of 64 into X1 and Y1, FS0 and FS1 must be high when FIFO1 reset ($\overline{\text{RST1}}$) returns high. Flag-offset registers associated with FIFO2 are loaded with one of the preset values in the same way with FIFO2 reset ($\overline{\text{RST2}}$). When using one of the preset values for the flag offsets, the FIFOs can be reset simultaneously or at different times.

To program the X1, X2, Y1, and Y2 registers from port A, both FIFOs should be reset simultaneously with FS0 and FS1 low during the low-to-high transition of the reset inputs. After this reset is complete, the first four writes to FIFO1 do not store data in RAM but load the offset registers in the order Y1, X1, Y2, X2. Each offset register uses port-A inputs (A7–A0). The highest numbered input is used as the most-significant bit of the binary number in each case. Valid programming values for the registers range from 1 to 252. After all the offset registers are programmed from port A, the port-B input-ready (IRB) flag is set high and both FIFOs begin normal operation.

FIFO write/read operation

The state of the port-A data (A0–A35) outputs is controlled by the port-A chip select ($\overline{\text{CSA}}$) and the port-A write/read select ($\text{W}/\overline{\text{RA}}$). The A0–A35 outputs are in the high-impedance state when either $\overline{\text{CSA}}$ or $\text{W}/\overline{\text{RA}}$ is high. The A0–A35 outputs are active when both $\overline{\text{CSA}}$ and $\text{W}/\overline{\text{RA}}$ are low.

Data is loaded into FIFO1 from the A0–A35 inputs on a low-to-high transition of CLKA when $\overline{\text{CSA}}$ is low, $\text{W}/\overline{\text{RA}}$ is high, ENA is high, MBA is low, and IRA is high. Data is read from FIFO2 to the A0–A35 outputs by a low-to-high transition of CLKA when $\overline{\text{CSA}}$ is low, $\text{W}/\overline{\text{RA}}$ is low, ENA is high, MBA is low, and ORA is high (see Table 2). FIFO reads and writes on port A are independent of any concurrent port-B operation.

Table 2. Port-A Enable Function Table

$\overline{\text{CSA}}$	$\text{W}/\overline{\text{RA}}$	ENA	MBA	CLKA	A0–A35 OUTPUTS	PORT FUNCTION
H	X	X	X	X	In high-impedance state	None
L	H	L	X	X	In high-impedance state	None
L	H	H	L	↑	In high-impedance state	FIFO1 write
L	H	H	H	↑	In high-impedance state	Mail1 write
L	L	L	L	X	Active, FIFO2 output register	None
L	L	H	L	↑	Active, FIFO2 output register	FIFO2 read
L	L	L	H	X	Active, mail2 register	None
L	L	H	H	↑	Active, mail2 register	Mail2 read (set $\overline{\text{MBF2}}$ high)

FIFO write/read operation (continued)

The port-B control signals are identical to those of port A, with the exception that the port-B write/read select ($\overline{W/RB}$) is the inverse of the port-A write/read select ($\overline{W/RA}$). The state of the port-B data (B0–B35) outputs is controlled by the port-B chip select ($\overline{CSB}$) and the port-B write/read select ($\overline{W/RB}$). The B0–B35 outputs are in the high-impedance state when either $\overline{CSB}$ is high or $\overline{W/RB}$ is low. The B0–B35 outputs are active when $\overline{CSB}$ is low and $\overline{W/RB}$ is high.

Data is loaded into FIFO2 from the B0–B35 inputs on a low-to-high transition of CLKB when $\overline{CSB}$ is low, $\overline{W/RB}$ is low, ENB is high, MBB is low, and IRB is high. Data is read from FIFO1 to the B0–B35 outputs by a low-to-high transition of CLKB when $\overline{CSB}$ is low, $\overline{W/RB}$ is high, ENB is high, MBB is low, and ORB is high (see Table 3). FIFO reads and writes on port B are independent of any concurrent port-A operation.

Table 3. Port-B Enable Function Table

$\overline{CSB}$	$\overline{W/RB}$	ENB	MBB	CLKB	B0 – B35 OUTPUTS	PORT FUNCTION
H	X	X	X	X	In high-impedance state	None
L	L	L	X	X	In high-impedance state	None
L	L	H	L	↑	In high-impedance state	FIFO2 write
L	L	H	H	↑	In high-impedance state	Mail2 write
L	H	L	L	X	Active, FIFO1 output register	None
L	H	H	L	↑	Active, FIFO1 output register	FIFO1 read
L	H	L	H	X	Active, mail1 register	None
L	H	H	H	↑	Active, mail1 register	Mail1 read (set MBF1 high)

The setup- and hold-time constraints to the port clocks for the port-chip selects and write/read selects are only for enabling write and read operations and are not related to high-impedance control of the data outputs. If a port enable is low during a clock cycle, the port-chip select and write/read select may change states during the setup- and hold-time window of the cycle.

When a FIFO OR flag is low, the next data word is sent to the FIFO output register automatically by the low-to-high transition of the port clock that sets the OR flag high. When the OR flag is high, an available data word is clocked to the FIFO output register only when a FIFO read is selected by the port's chip select, write/read select, enable, and mailbox select.

synchronized FIFO flags

Each FIFO is synchronized to its port clock through at least two flip-flop stages. This is done to improve flag-signal reliability by reducing the probability of metastable events when CLKA and CLKB operate asynchronously to one another. ORA, AEA, IRA, and AFA are synchronized to CLKA. ORB, AEB, IRB, and AFB are synchronized to CLKB. Tables 4 and 5 show the relationship of each port flag to FIFO1 and FIFO2.

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCAS247D – AUGUST 1993 – REVISED APRIL 1998

synchronized FIFO flags (continued)

Table 4. FIFO1 Flag Operation

NUMBER OF WORDS IN FIFO1 ^{†‡}	SYNCHRONIZED TO CLKB		SYNCHRONIZED TO CLKA	
	ORB	$\overline{\text{AEB}}$	$\overline{\text{AFA}}$	IRA
0	L	L	H	H
1 to X1	H	L	H	H
(X1 + 1) to [256 – (Y1 + 1)]	H	H	H	H
(256 – Y1) to 255	H	H	L	H
256	H	H	L	L

[†] X1 is the almost-empty offset for FIFO1 used by $\overline{\text{AEB}}$. Y1 is the almost-full offset for FIFO1 used by $\overline{\text{AFA}}$. Both X1 and Y1 are selected during a reset of FIFO1 or programmed from port A.

[‡] When a word loaded to an empty FIFO is shifted to the output register, its previous FIFO memory location is free.

Table 5. FIFO2 Flag Operation

NUMBER OF WORDS IN FIFO2 ^{†‡}	SYNCHRONIZED TO CLKA		SYNCHRONIZED TO CLKB	
	ORA	$\overline{\text{AEA}}$	$\overline{\text{AFB}}$	IRB
0	L	L	H	H
1 to X2	H	L	H	H
(X2 + 1) to [256 – (Y2 + 1)]	H	H	H	H
(256 – Y2) to 255	H	H	L	H
256	H	H	L	L

[†] X2 is the almost-empty offset for FIFO2 used by $\overline{\text{AEA}}$. Y2 is the almost-full offset for FIFO2 used by $\overline{\text{AFB}}$. Both X2 and Y2 are selected during a reset of FIFO2 or programmed from port A.

[‡] When a word loaded to an empty FIFO is shifted to the output register, its previous FIFO memory location is free.

output-ready flags (ORA, ORB)

The OR flag of a FIFO is synchronized to the port clock that reads data from its array. When the OR flag is high, new data is present in the FIFO output register. When the OR flag is low, the previous data word is present in the FIFO output register and attempted FIFO reads are ignored.

A FIFO read pointer is incremented each time a new word is clocked to its output register. From the time a word is written to a FIFO, it can be shifted to the FIFO output register in a minimum of three cycles of the OR flag synchronizing clock; therefore, an OR flag is low if a word in memory is the next data to be sent to the FIFO output register and three cycles of the port clock that reads data from the FIFO have not elapsed since the time the word was written. The OR flag of the FIFO remains low until the third low-to-high transition of the synchronizing clock occurs, simultaneously forcing the OR flag high and shifting the word to the FIFO output register.

A low-to-high transition on an OR flag synchronizing clock begins the first synchronization cycle of a write if the clock transition occurs at time t_{sk1} , or greater, after the write. Otherwise, the subsequent clock cycle can be the first synchronization cycle (see Figures 7 and 8).

input-ready flags (IRA, IRB)

The IR flag of a FIFO is synchronized to the port clock that writes data to its array. When the IR flag is high, a memory location is free in the SRAM to receive new data. No memory locations are free when the IR flag is low and attempted writes to the FIFO are ignored.

Each time a word is written to a FIFO, its write pointer is incremented. From the time a word is read from a FIFO, its previous memory location is ready to be written in a minimum of two cycles of the IR flag synchronizing clock; therefore, an IR flag is low if less than two cycles of the IR flag synchronizing clock have elapsed since the next memory write location has been read. The second low-to-high transition on the IR flag synchronizing clock after the read sets the IR flag high.

A low-to-high transition on an IR flag synchronizing clock begins the first synchronization cycle of a read if the clock transition occurs at time t_{sk1} , or greater, after the read. Otherwise, the subsequent clock cycle can be the first synchronization cycle (see Figures 9 and 10).

almost-empty flags ($\overline{AEA}$, $\overline{AEB}$)

The $\overline{AE}$ flag of a FIFO is synchronized to the port clock that reads data from its array. The $\overline{AE}$ state is defined by the contents of register X1 for AEB and register X2 for AEA. These registers are loaded with preset values during a FIFO reset or programmed from port A (see *almost-empty flag and almost-full flag offset programming*). An $\overline{AE}$ flag is low when its FIFO contains X or fewer words and is high when its FIFO contains (X + 1) or more words. A data word present in the FIFO output register has been read from memory.

Two low-to-high transitions of the $\overline{AE}$ flag synchronizing clock are required after a FIFO write for its $\overline{AE}$ flag to reflect the new level of fill; therefore, the $\overline{AE}$ flag of a FIFO containing (X + 1) or more words remains low if two cycles of its synchronizing clock have not elapsed since the write that filled the memory to the (X + 1) level. An $\overline{AE}$ flag is set high by the second low-to-high transition of its synchronizing clock after the FIFO write that fills memory to the (X + 1) level. A low-to-high transition of an $\overline{AE}$ flag synchronizing clock begins the first synchronization cycle if it occurs at time t_{sk2} , or greater, after the write that fills the FIFO to (X + 1) words. Otherwise, the subsequent synchronizing clock cycle can be the first synchronization cycle (see Figures 11 and 12).

almost-full flags ($\overline{AFA}$, $\overline{AFB}$)

The $\overline{AF}$ flag of a FIFO is synchronized to the port clock that writes data to its array. The $\overline{AF}$ state is defined by the contents of register Y1 for AFA and register Y2 for AFB. These registers are loaded with preset values during a FIFO reset or programmed from port A (see *almost-empty flag and almost-full flag offset programming*). An $\overline{AF}$ flag is low when the number of words in its FIFO is greater than or equal to (256 – Y). An $\overline{AF}$ flag is high when the number of words in its FIFO is less than or equal to [256 – (Y + 1)]. A data word present in the FIFO output register has been read from memory.

Two low-to-high transitions of the $\overline{AF}$ flag synchronizing clock are required after a FIFO read for its $\overline{AF}$ flag to reflect the new level of fill; therefore, the $\overline{AF}$ flag of a FIFO containing [256 – (Y + 1)] or fewer words remains low if two cycles of its synchronizing clock have not elapsed since the read that reduced the number of words in memory to [256 – (Y + 1)]. An $\overline{AF}$ flag is set high by the second low-to-high transition of its synchronizing clock after the FIFO read that reduces the number of words in memory to [256 – (Y + 1)]. A low-to-high transition of an $\overline{AF}$ flag synchronizing clock begins the first synchronization cycle if it occurs at time t_{sk2} , or greater, after the read that reduces the number of words in memory to [256 – (Y + 1)]. Otherwise, the subsequent synchronizing clock cycle can be the first synchronization cycle (see Figures 13 and 14).

mailbox registers

Each FIFO has a 36-bit bypass register to pass command and control information between port A and port B without putting it in queue. The mailbox-select (MBA, MBB) inputs choose between a mail register and a FIFO for a port data transfer operation. A low-to-high transition on CLKA writes A0–A35 data to the mail1 register when a port-A write is selected by $\overline{\text{CSA}}$, $\overline{\text{W/RA}}$, and ENA and with MBA high. A low-to-high transition on CLKB writes B0–B35 data to the mail2 register when a port-B write is selected by $\overline{\text{CSB}}$, $\overline{\text{W/RB}}$, and ENB and with MBB high. Writing data to a mail register sets its corresponding flag ($\overline{\text{MBF1}}$ or $\overline{\text{MBF2}}$) low. Attempted writes to a mail register are ignored while the mail flag is low.

When data outputs of a port are active, the data on the bus comes from the FIFO output register when the port-mailbox-select input is low and from the mail register when the port-mailbox-select input is high. The mail1 register flag ($\overline{\text{MBF1}}$) is set high by a low-to-high transition on CLKB when a port-B read is selected by $\overline{\text{CSB}}$, $\overline{\text{W/RB}}$, and ENB and with MBB high. The mail2 register flag ($\overline{\text{MBF2}}$) is set high by a low-to-high transition on CLKA when a port-A read is selected by $\overline{\text{CSA}}$, $\overline{\text{W/RA}}$, and ENA and with MBA high. The data in a mail register remains intact after it is read and changes only when new data is written to the register.

Figure 1. FIFO1 Reset Loading X1 and Y1 With a Preset Value of Eight[†]

[†] FIFO2 is reset in the same manner to load X2 and Y2 with a preset value.

t_{sk1} is the minimum time between the rising CLKA edge and a rising CLKB edge for IRB to transition high in the next cycle. If the time between the rising edge of CLKA and rising edge of CLKB is less than t_{sk1} , IRB may transition high one cycle later than shown.

NOTE A: CSA = L, W/RA = H, MBA = L. It is not necessary to program offset register on consecutive clock cycles.

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCAS247D – AUGUST 1993 – REVISED APRIL 1998

[†] t_{sk1} is the minimum time between a rising CLKA edge and a rising CLKB edge for ORB to transition high and to clock the next word to the FIFO1 output register in three CLKB cycles. If the time between the rising CLKA edge and rising CLKB edge is less than t_{sk1} , the transition of ORB high and load of the first word to the output register may occur one CLKB cycle later than shown.

Figure 7. ORB-Flag Timing and First Data-Word Fall Through When FIFO1 Is Empty

[†] t_{sk1} is the minimum time between a rising CLKB edge and a rising CLKA edge for ORA to transition high and to clock the next word to the FIFO2 output register in three CLKA cycles. If the time between the rising CLKB edge and rising CLKA edge is less than t_{sk1} , the transition of ORA high and load of the first word to the output register may occur one CLKA cycle later than shown.

Figure 8. ORA-Flag Timing and First Data-Word Fall Through When FIFO2 Is Empty

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCAS247D – AUGUST 1993 – REVISED APRIL 1998

[†] t_{sk1} is the minimum time between a rising CLKB edge and a rising CLKA edge for IRA to transition high in the next CLKA cycle. If the time between the rising CLKB edge and rising CLKA edge is less than t_{sk1} , IRA may transition high one CLKA cycle later than shown.

Figure 9. IRA-Flag Timing and First Available Write When FIFO1 Is Full

[†] t_{sk1} is the minimum time between a rising CLKA edge and a rising CLKB edge for IRB to transition high in the next CLKB cycle. If the time between the rising CLKA edge and rising CLKB edge is less than t_{sk1} , IRB may transition high one CLKB cycle later than shown.

Figure 10. IRB-Flag Timing and First Available Write When FIFO2 Is Full

CLOCKED BIDIRECTIONAL FIRST-IN, FIRST-OUT MEMORY

SCAS247D – AUGUST 1993 – REVISED APRIL 1998

$^\dagger t_{sk2}$ is the minimum time between a rising $\overline{CLKA}$ edge and a rising $\overline{CLKB}$ edge for $\overline{AEB}$ to transition high in the next $\overline{CLKB}$ cycle. If the time between the rising $\overline{CLKA}$ edge and rising $\overline{CLKB}$ edge is less than t_{sk2} , $\overline{AEB}$ may transition high one $\overline{CLKB}$ cycle later than shown.

NOTE A: FIFO1 write ($\overline{CSA} = L$, $\overline{W/RA} = H$, $\overline{MBA} = L$), FIFO1 read ($\overline{CSB} = L$, $\overline{W/RB} = H$, $\overline{MBB} = L$). Data in the FIFO1 output register has been read from the FIFO.

Figure 11. Timing for $\overline{AEB}$ When FIFO1 Is Almost Empty

$^\dagger t_{sk2}$ is the minimum time between a rising $\overline{CLKB}$ edge and a rising $\overline{CLKA}$ edge for $\overline{AEA}$ to transition high in the next $\overline{CLKA}$ cycle. If the time between the rising $\overline{CLKB}$ edge and rising $\overline{CLKA}$ edge is less than t_{sk2} , $\overline{AEA}$ may transition high one $\overline{CLKA}$ cycle later than shown.

NOTE A: FIFO2 write ($\overline{CSB} = L$, $\overline{W/RB} = L$, $\overline{MBB} = L$), FIFO2 read ($\overline{CSA} = L$, $\overline{W/RA} = L$, $\overline{MBA} = L$). Data in the FIFO2 output register has been read from the FIFO.

Figure 12. Timing for $\overline{AEA}$ When FIFO2 Is Almost Empty

† t_{sk2} is the minimum time between a rising CLKA edge and a rising CLKB edge for $\overline{AFA}$ to transition high in the next CLKA cycle. If the time between the rising CLKA edge and rising CLKB edge is less than t_{sk2} , $\overline{AFA}$ may transition high one CLKB cycle later than shown.

NOTE A: FIFO1 write ($\overline{CSA} = L$, $\overline{W/RA} = H$, $\overline{MBA} = L$), FIFO1 read ($\overline{CSB} = L$, $\overline{W/RB} = H$, $\overline{MBB} = L$). Data in the FIFO1 output register has been read from the FIFO.

Figure 13. Timing for $\overline{AFA}$ When FIFO1 Is Almost Full

‡ t_{sk2} is the minimum time between a rising CLKB edge and a rising CLKA edge for $\overline{AFB}$ to transition high in the next CLKB cycle. If the time between the rising CLKB edge and rising CLKA edge is less than t_{sk2} , $\overline{AFB}$ may transition high one CLKA cycle later than shown.

NOTE A: FIFO2 write ($\overline{CSB} = L$, $\overline{W/RB} = L$, $\overline{MBB} = L$), FIFO2 read ($\overline{CSA} = L$, $\overline{W/RA} = L$, $\overline{MBA} = L$). Data in the FIFO2 output register has been read from the FIFO.

SCAS247D – AUGUST 1993 – REVISED APRIL 1998

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)[†]

Supply voltage range, V_{CC}	–0.5 V to 7 V
Input voltage range, V_I (see Note 1)	–0.5 V to $V_{CC} + 0.5$ V
Output voltage range, V_O (see Note 1)	–0.5 V to $V_{CC} + 0.5$ V
Input clamp current, I_{IK} ($V_I < 0$ or $V_I > V_{CC}$)	±20 mA
Output clamp current, I_{OK} ($V_O < 0$ or $V_O > V_{CC}$)	±50 mA
Continuous output current, I_O ($V_O = 0$ to V_{CC})	±50 mA
Continuous current through V_{CC} or GND	±400 mA
Package thermal impedance, θ_{JA} (see Note 2): PCB package	28°C/W
PQ package	46°C/W
Storage temperature range, T_{stg}	–65°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and output voltage ratings may be exceeded provided the input and output current ratings are observed.
2. The package thermal impedance is calculated in accordance with JESD 51.

recommended operating conditions

		MIN	MAX	UNIT
V_{CC}	Supply voltage	4.5	5.5	V
V_{IH}	High-level input voltage	2		V
V_{IL}	Low-level input voltage		0.8	V
I_{OH}	High-level output current		–4	mA
I_{OL}	Low-level output current		8	mA
T_A	Operating free-air temperature	0	70	°C

electrical characteristics over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS		MIN	TYP [†]	MAX	UNIT
V _{OH}	V _{CC} = 4.5 V,	I _{OH} = –4 mA	2.4			V
V _{OL}	V _{CC} = 4.5 V,	I _{OL} = 8 mA			0.5	V
I _I	V _{CC} = 5.5 V,	V _I = V _{CC} or 0			±5	μA
I _{OZ}	V _{CC} = 5.5 V,	V _O = V _{CC} or 0			±5	μA
I _{CC}	V _{CC} = 5.5 V,	V _I = V _{CC} – 0.2 V or 0			400	μA
ΔI _{CC} [‡]	V _{CC} = 5.5 V, One input at 3.4 V, Other inputs at V _{CC} or GND	CSA = V _{IH}	A0–A35	0		mA
		CSB = V _{IH}	B0–B35	0		
		CSA = V _{IL}	A0–A35		1	
		CSB = V _{IL}	B0–B35		1	
		All other inputs			1	
C _i	V _I = 0,	f = 1 MHz		4		pF
C _o	V _O = 0,	f = 1 MHz		8		pF

[†] All typical values are at V_{CC} = 5 V, T_A = 25°C.[‡] This is the supply current when each input is at one of the specified TTL voltage levels rather than 0 V or V_{CC}.**timing requirements over recommended ranges of supply voltage and operating free-air temperature (see Figures 1 through 17)**

		'ACT3622-15		'ACT3622-20		'ACT3622-30		UNIT

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
