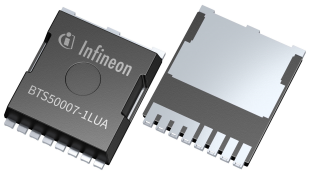
Power PROFET™ + 12V smart high-side power switch

Features



AEC Qualified

RoHS

ISO 26262 ready

Halogen-free

- PRO-SIL™ ISO 26262-ready for supporting the integrator in evaluation of hardware element according to ISO 26262:2018 Clause 8-13
- One channel device
- Low stand-by current
- Reverse ON protection for low power dissipation in reverse battery condition
- Ground loss protection
- Electrostatic discharge protection (ESD)
- Optimized electromagnetic compatibility (EMC)
- Compatible to cranking pulses
- Integrated diagnostic functions
- Integrated protection functions
- Green product (RoHS compliant)

Potential applications

- Suitable for resistive, inductive and capacitive loads
- Replaces electromechanical relays, fuses and discrete circuits
- Most suitable for application with high current loads, such as heating system, fan and pump
- PWM applications with low frequency

Product validation

Qualified for automotive applications. Product validation according to AEC-Q100 grade 1.

Description

The device is a 0.7 mΩ single channel smart high-side power switch, available in a PG-HSOF-8 package, providing protective functions and diagnosis. It contains Reverse ON functionality. It is especially designed to drive high current loads, for applications like heaters, glow plugs, fans and pumps.

Table of contents

Table of contents

1 Product description

1.1 Product summary

Table 1 Product summary

Parameter	Symbol	Values
Operating voltage	$V_{S(NOM)}$	5.8 V … 18 V
Extended supply voltage range	$V_{S(EXT)}$	3.1 V...28 V
Maximum on-state resistance (T_J = 150°C)	$R_{DS(ON)}$	1.4 mΩ
Minimum nominal load current (T_A = 85°C, 4-layer 2s2p PCB)	$I_{L(NOM)}$	51 A
Typical current sense ratio	dk_{ILIS}	50 000
Minimum short circuit current threshold	$I_{CL(0)}$	130 A
Maximum reverse battery voltage	$-V_{S(REV)}$	-18 V
Maximum stand-by current at T_J = 25°C	$I_{VS(OFF)}$	3 µA

1.2 Integrated diagnosis and protection functions

Integrated diagnosis functions

- Proportional load current sense
- Open load detection in on and off state
- Diagnosis enable pin
- Latched status signal after short circuit or overtemperature detection

Integrated protection functions

- Reverse ON: Reverse battery protection by self turn on of power MOSFET
- Short circuit protection with latch
- Overtemperature protection with latch
- Enhanced short circuit operation
- Smart clamping for inductive loads demagnetization

1) Not subject to production test, specified by design.
2) The device is mounted on a FR4 2s2p board according to Jedec JESD51-2,-5,-7 at natural convection.

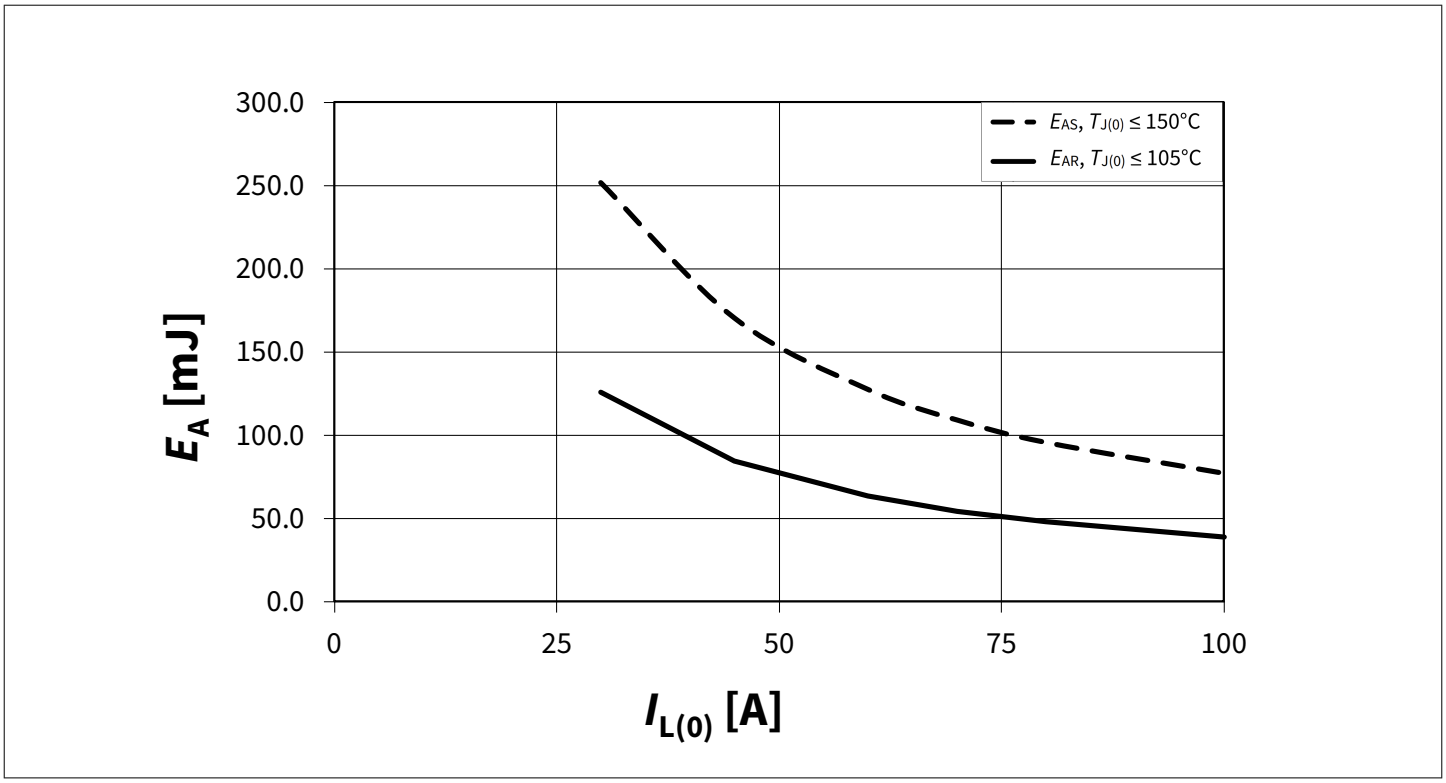

Figure 6 **Maximum energy dissipation for inductive switch off, $E_{AS/AR}$ vs. I_L at V_S = 13.5 V**

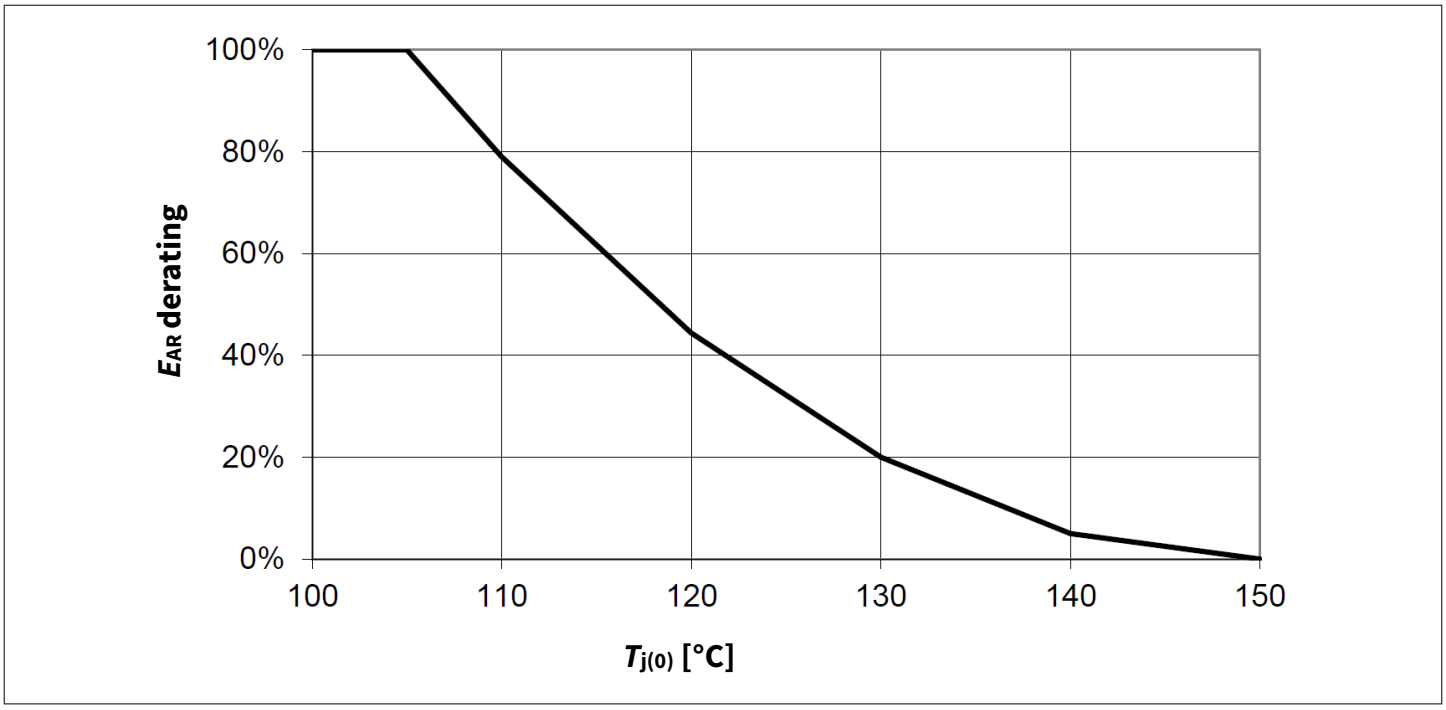

Figure 7 **Maximum energy dissipation repetitive pulse temperature derating**

Note: *1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

4.2 Functional description

Table 4 Functional range

Parameter	Symbol	Values			Unit	Note or condition	P-Number
		Min.	Typ.	Max.			
Supply voltage range for nominal operation	$V_{S(NOM)}$	5.8	–	18	V	1)	PRQ-68
Supply voltage range for extended operation	$V_{S(EXT)}$	3.1	–	28	V	2) 1) Parameter deviation possible	PRQ-69

1) Not subject to production test, specified by design.
2) Protection function still operative

Note: Within the nominal operating range, the IC behaves as described in the circuit description. The electrical characteristics are inside the limits specified in the Electrical Characteristics table.

4.3 Thermal resistance

Note: This thermal data was generated in accordance to JEDEC JESD51 standards. For more information, go to www.jedec.org.

Table 5 Thermal resistance

Parameter	Symbol	Values			Unit	Note or condition	P-Number
		Min.	Typ.	Max.			
Junction to case	R_{thJC}	–	–	0.5	K/W	1)	PRQ-206
Junction to ambient	$R_{thJA(2s2p)}$	–	18	–	K/W	1) 2)	PRQ-71
Junction to ambient	$R_{thJA(1s0p)}$ /600mm²	–	32	–	K/W	1) 3)	PRQ-72

1) Not subject to production test, specified by design.
2) Specified RthJA value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; the product (chip + package) was simulated on a 76.2 × 114.3 × 1.5 mm board with 2 inner copper layers (2 × 70 µm Cu, 2 × 35 µm Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer. The device is dissipating 2 W power.
3) Specified RthJA value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 1s0p board; the product (chip+package) was simulated on a 76.2 × 114.3 × 1.5 mm board with only one top copper layer 1 × 70 µm. The device is dissipating 2 W power.

Figure 8 is showing the typical thermal impedance of BTS50007-1LUA mounted according to JEDEC JESD51-2,-5,-7 at natural convection on FR4 1s0p and 2s2p boards.

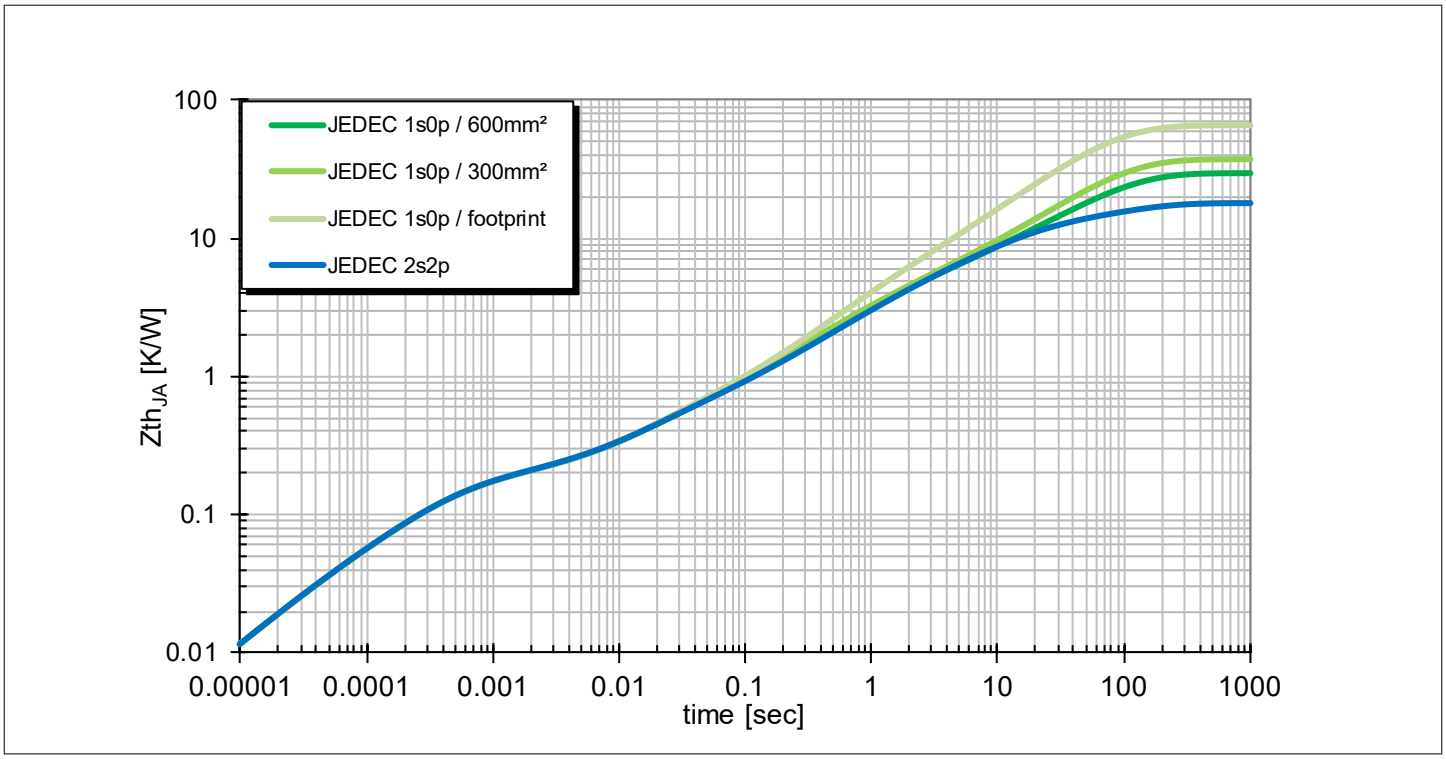

Figure 8 Typical transient thermal impedance $Z_{th(JA)}$ = f(time) for different PCB conditions

5 Functional description

5.1 Power stage

The power stage is built by a N-channel power MOSFET with a charge pump.

5.1.1 Output on-state resistance

The on-state resistance $R_{DS(ON)}$ depends on the supply voltage and on the junction temperature T_J. Chapter 6 shows the dependencies in terms of temperature and supply voltage, for the typical on-state resistance. The behavior in reverse polarity is described in Chapter 5.3.3.

5.1.2 Switching resistive loads

Figure 9 shows the typical timing when switching a resistive load. The power stage has a defined switching behavior. Defined slew rates results in lowest EMC emission at minimum switching losses.

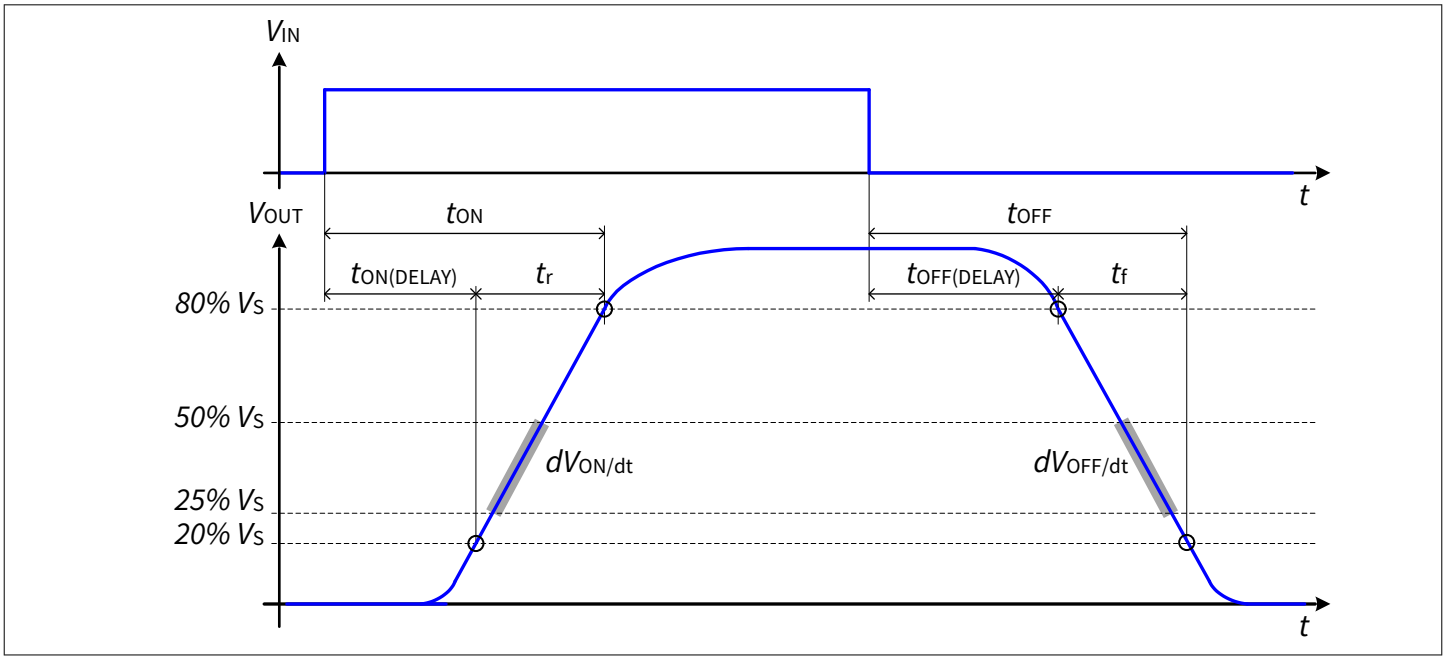

Figure 9 Timings when switching a resistive load

5.1.3 PWM switching

Consider the switching losses properly during this operation (see following equation):

$$P_{TOTAL} = \frac{switch\_on\_energy + switch\_off\_energy + \left(I_L{}^2 \times R_{DS(ON)} \times t_{DC}\right)}{Period} \quad (1)$$

If a fault condition occurs, ensure that the PWM frequency does not exceed a maximum retry frequency of f_{FAULT}.

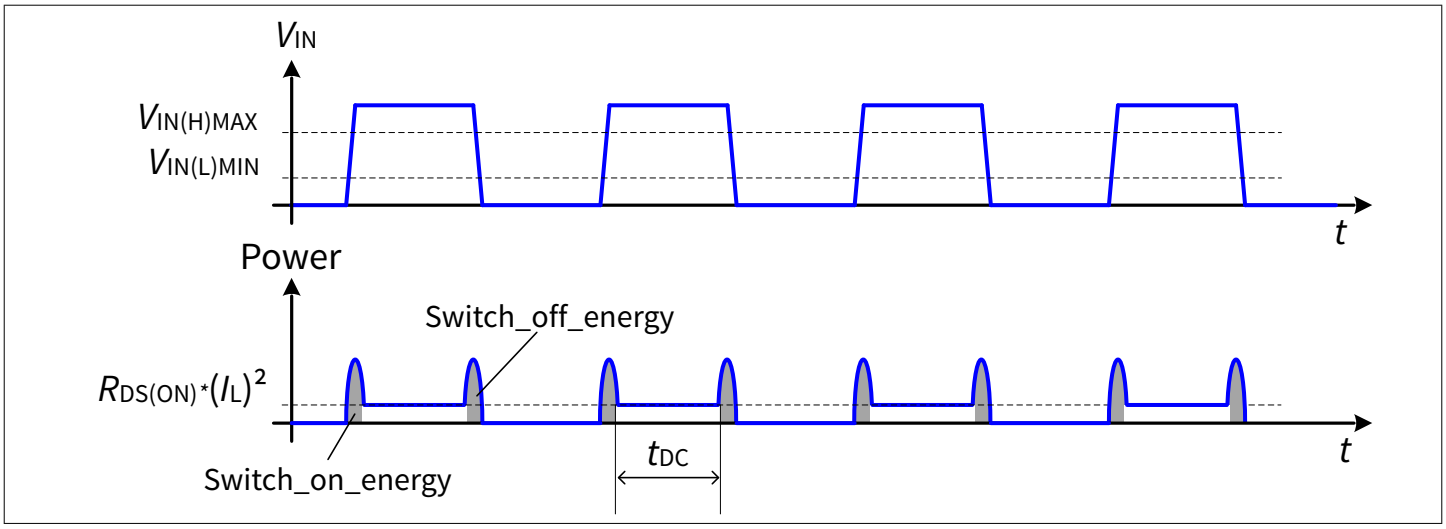

Figure 10 Switching in PWM

5.1.4 Switching inductive loads

5.1.4.1 Output clamping

When switching off inductive loads with high-side switches, the voltage V_{OUT} drops below ground potential, since the voltage polarity across the inductor has to be reversed to get a decrease of the inductive load current.

To prevent the destruction of the device due to high voltages, there is a smart clamping mechanism implemented that keeps negative output voltage to a certain level (V_S - $V_{DS(CL)}$). Please refer to Figure 11 and Figure 12 for details. Nevertheless, the maximum allowed load inductance remains limited.

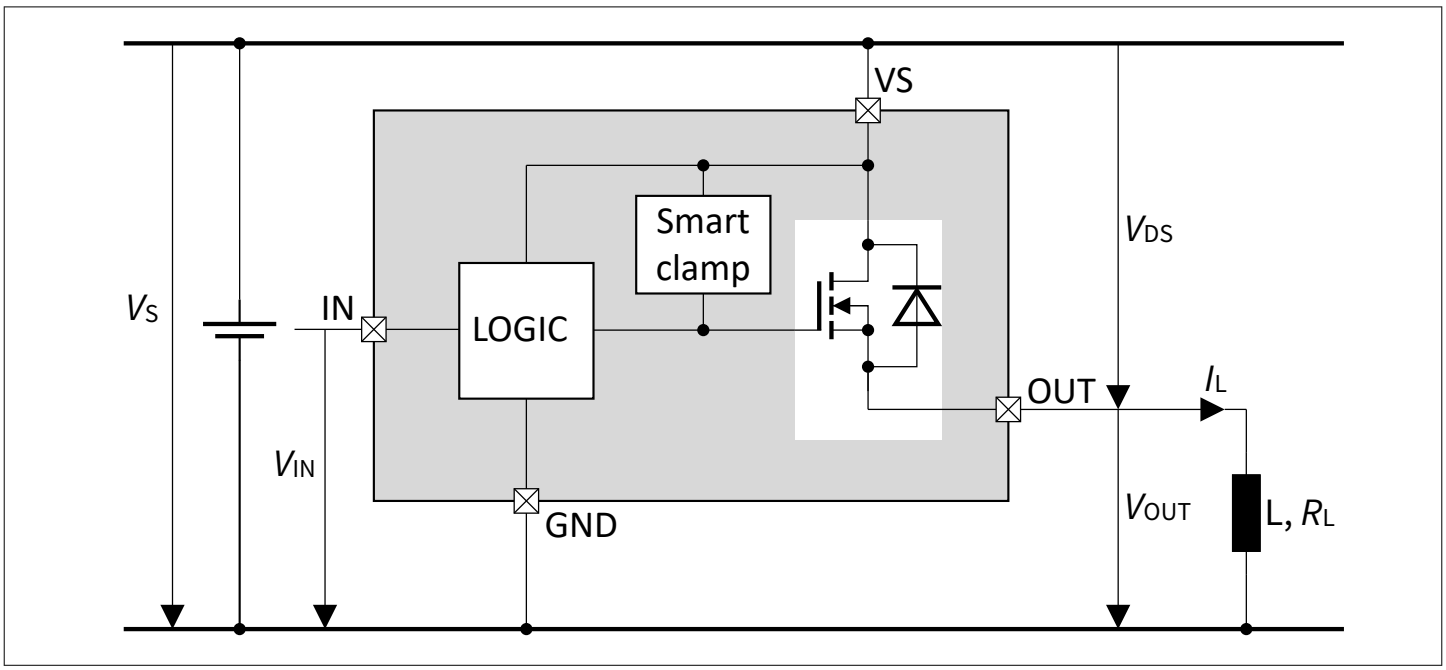

Figure 11 Output clamp

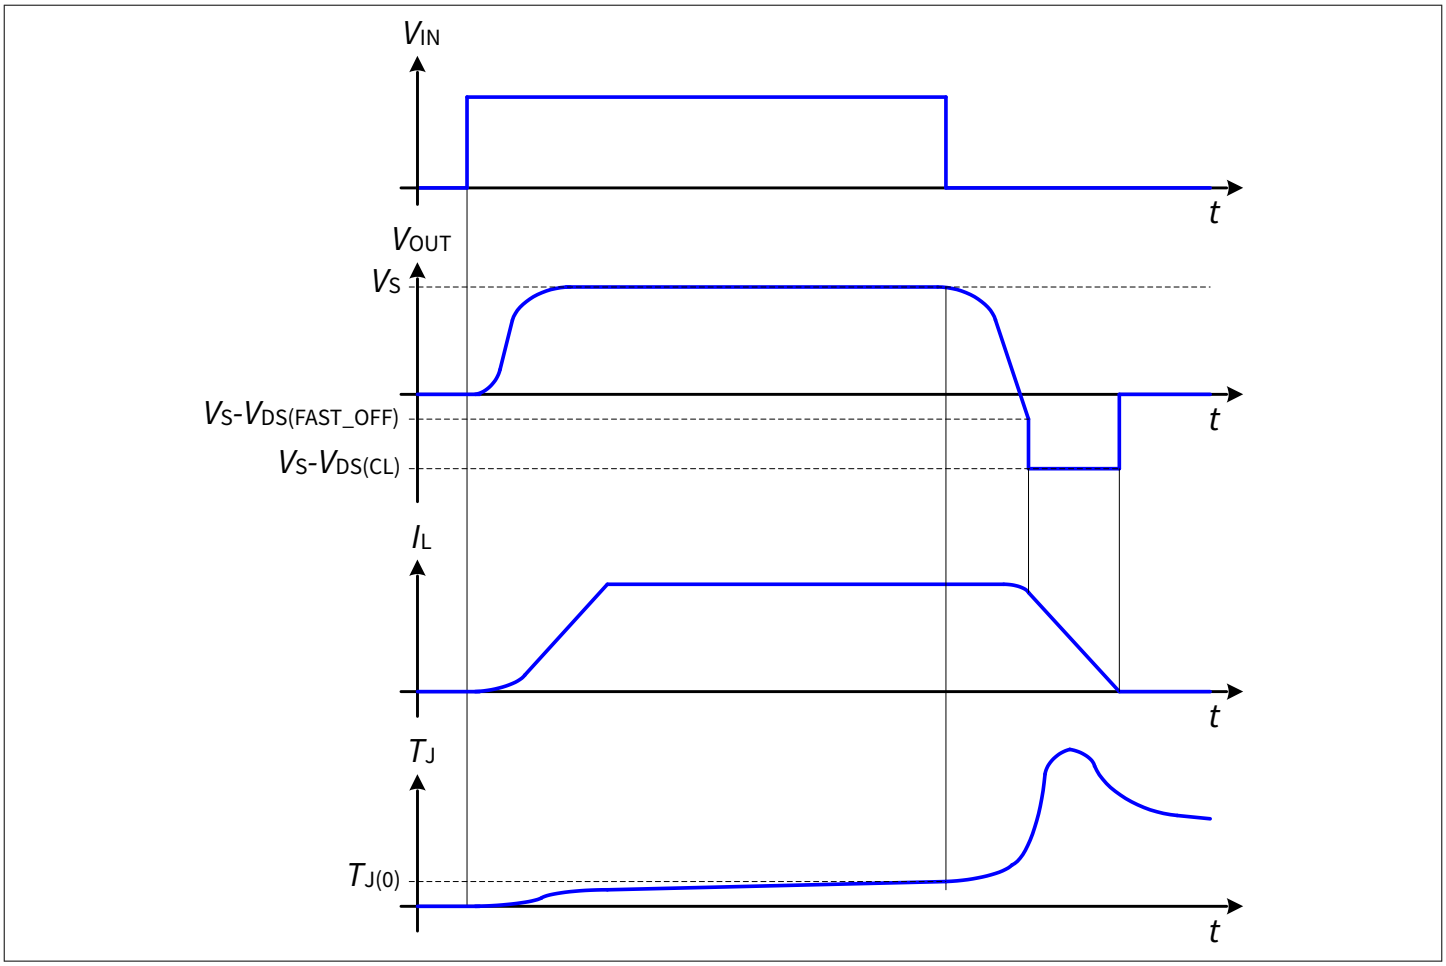

Figure 12 Switching an inductance

The device features a fast switch off when driving an inductive load in order to increase the energy capability. The fast turn off is triggered when V_{DS} is higher than $V_{DS(FAST\_OFF)}$. Please refer to Figure 12 for details.

The device must not be reactivated (V_{IN} goes from low to high) before $t_{IN(RESETDELAY)}$. Otherwise the device may not turn on and can be latched.

5.1.4.2 Maximum load inductance

During the demagnetization of inductive loads, the energy stored in the inductance must be dissipated in the device. This energy can be calculated with the following (2), where R_L is the parasitic resistance of the inductance:

$$E = V_{DS(CL)} \times \frac{L}{R_L} \times \left[\frac{V_S - V_{DS(CL)}}{R_L} \times \ln\left(1 - \frac{R_L \times I_L}{V_S - V_{DS(CL)}}\right) + I_L \right] \quad (2)$$

(2) can be simplified under the assumption that $R_L = 0\ \Omega$. It then becomes:

$$E = \frac{1}{2} \times L \times I_L^2 \times \left(1 - \frac{V_S}{V_S - V_{DS(CL)}}\right) \quad (3)$$

The energy, which is converted into heat, is limited by the thermal design of the component. See Figure 6 for the maximum allowed energy dissipation as a function of the load current.

5.1.5 Advanced switch-off behavior

In order to reduce the device stress when switching off inductive and critical loads, the device provides a functionality which results in a faster switch off behavior.

The fast switch off functionality is triggered by each of the following conditions:

- The device is turned off by applying $V_{IN(L)}$ at the IN pin. During the switch off operation the OUT pins' voltage in respect to VS pin drops below $V_{DS(FAST\_OFF)}$. See Figure 12.
- The device is turned on or is already in on state. The device then detects a short circuit condition ($I_L \geq I_{CL(0)}$) and initiates a protective switch off. Please refer to Chapter 5.3.1.1 and Chapter 5.3.1.2 for details.
- The device is turned on or is already in on state. The device then detects an overtemperature condition.
- The device is turned on or is already in on state. The device then detects an overpower condition.

5.1.6 Inverse current behavior

When $V_{OUT} > V_S$, a current $-I_L$ flows into the power output transistor (see Figure 13). This condition is known as inverse current. If the channel is in off state, the current flows through the intrinsic body diode generating high power losses and therefore, an increase of the overall device temperature. If the channel is in on state, $R_{DS(INV)}$ can be expected and power dissipation in the output stage is comparable to normal operation in $R_{DS(ON)}$.

During inverse current condition, the channel remains in on or off state and it is possible to switch on as long as $|-I_L| < |-I_{CL(0)}|$.

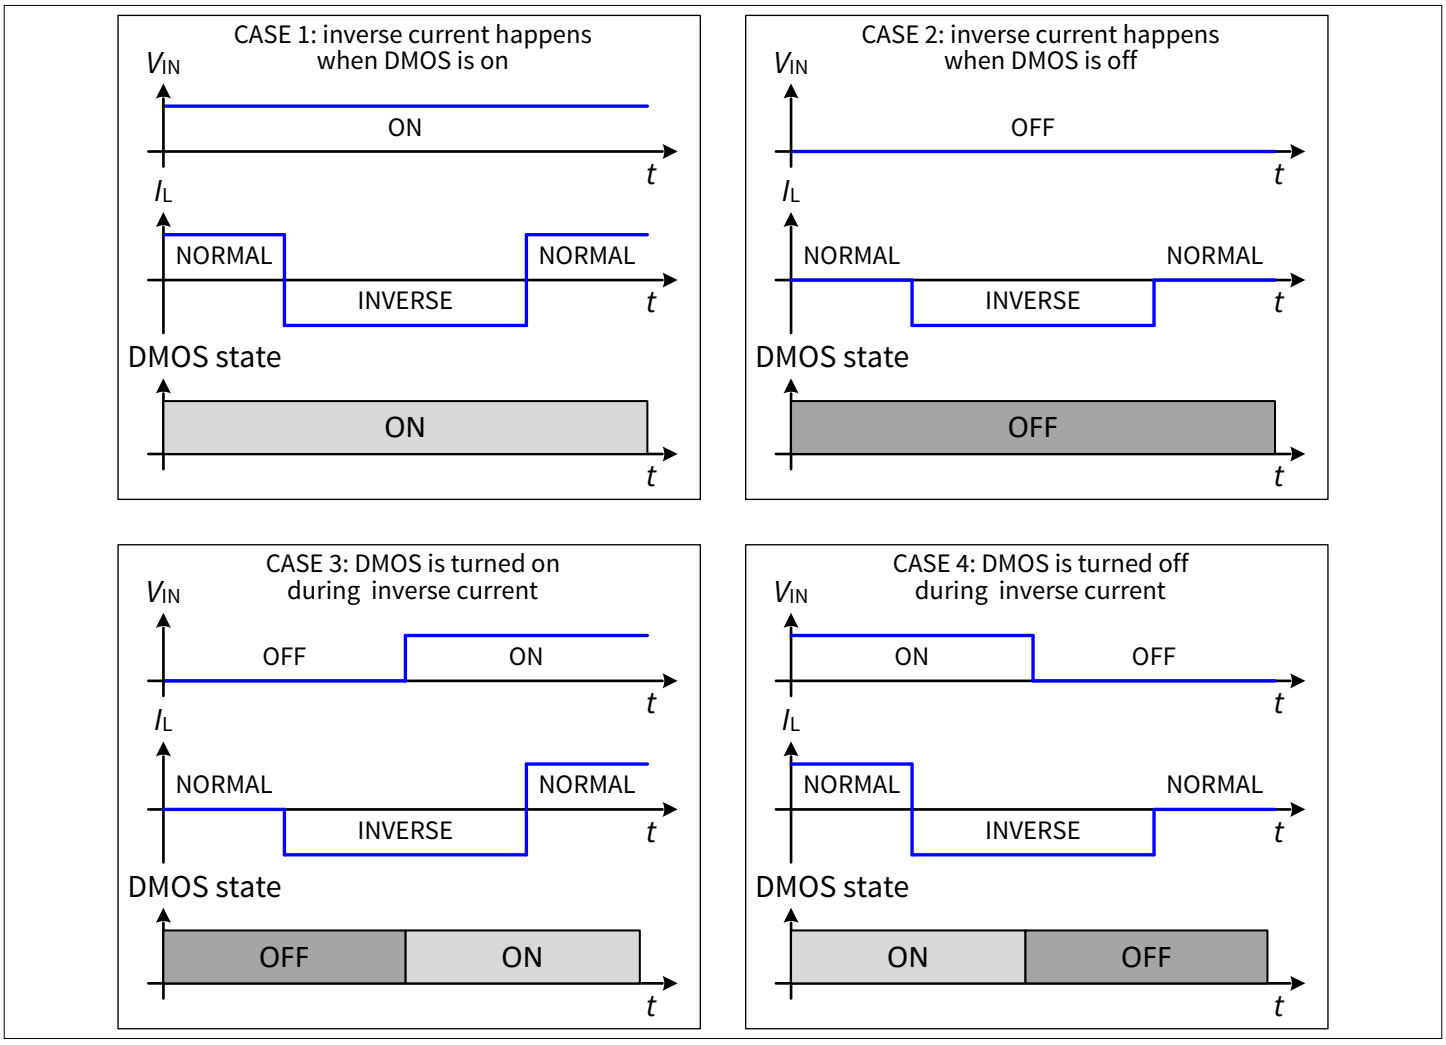

Figure 13 Channel behavior in case of applied inverse current

5.2 Input pin

The input circuitry is compatible with 3.3 V and 5 V logic levels. These two pins can also be directly tied to V_S. The input circuitry tolerates negative voltages down to V_S-75 V: see the limits for parameters V_{IN} and V_{DEN} in Table 3. The Figure 14 below shows the electrical equivalent input circuitry.

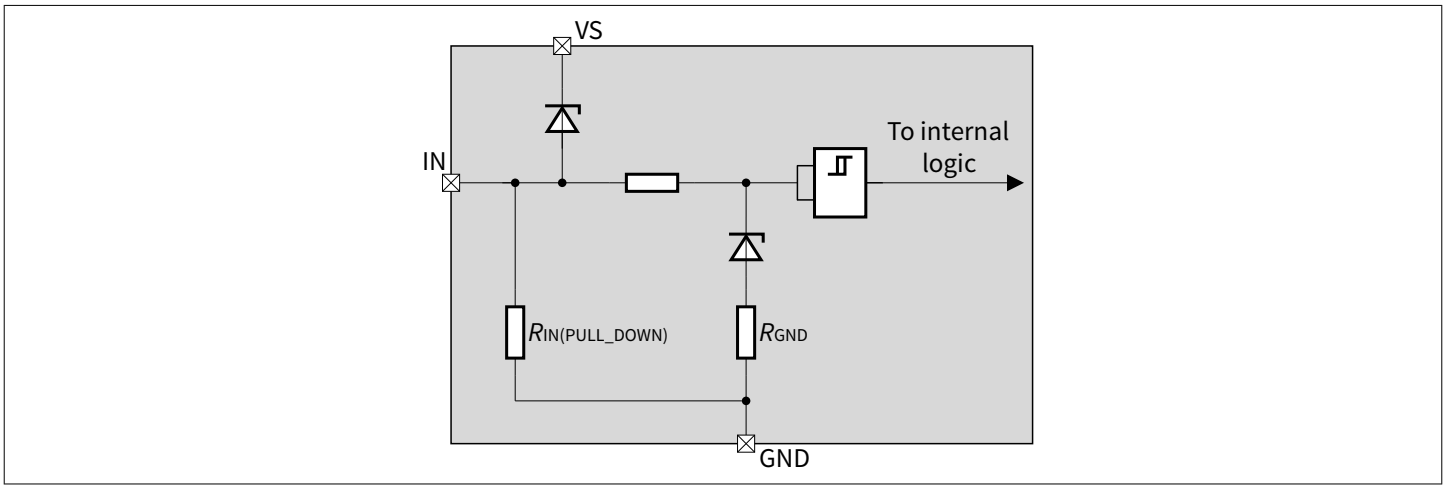

Figure 14 Simplified schematics of the IN pin circuitry

5.3 Protection functions

The device provides integrated protective functions. They are designed to prevent the destruction of the IC when it is exposed to fault conditions described in the present datasheet. These fault conditions are considered as outside the normal operating range. Protection functions are designed neither for continuous nor for repetitive operation.

The Figure 15 below describes the typical functionality of the diagnosis and protection blocks.

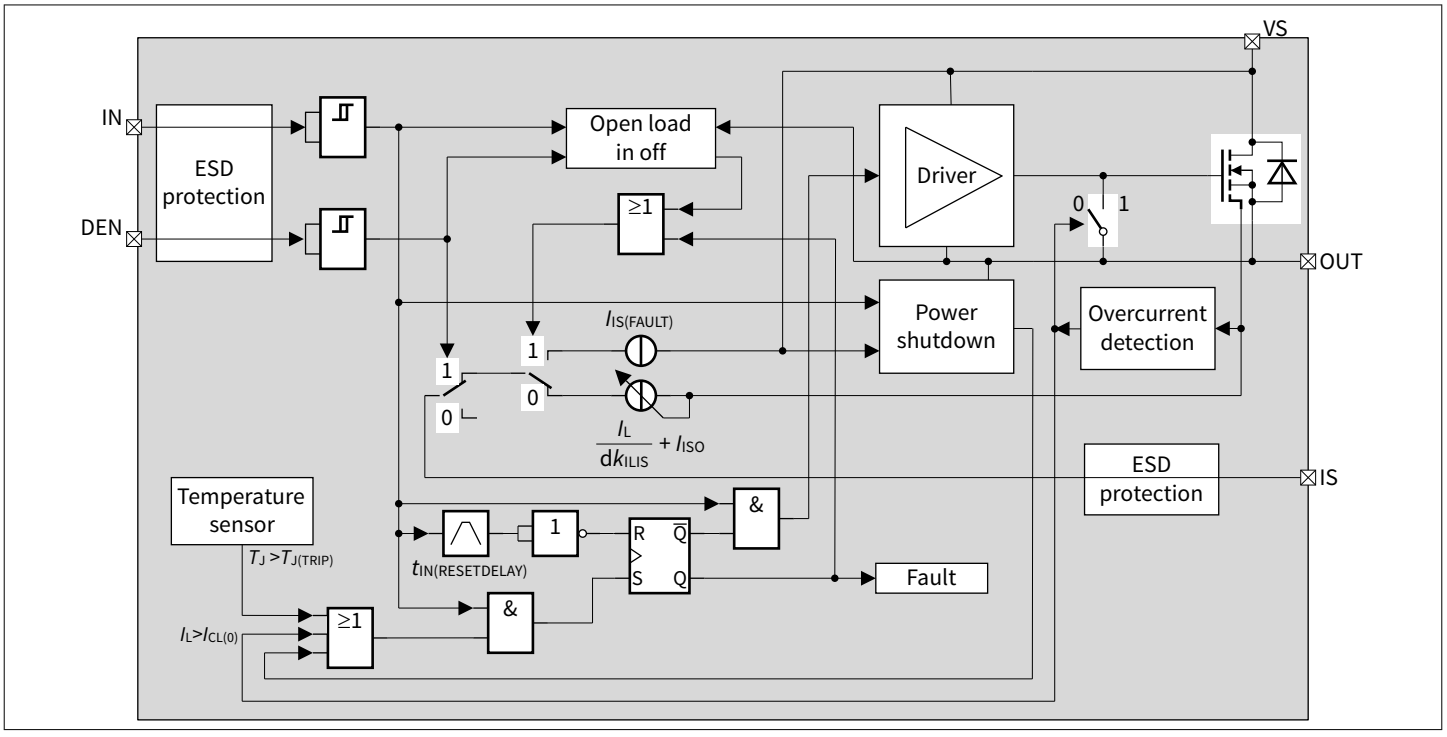

Figure 15 Diagram of diagnosis and protection blocks

5.3.1 Overload protection

In case of overload, high inrush current or short circuit to ground, the device offers several protection mechanisms.

An overcurrent, an overtemperature or an overpower shutdown switches off the output and latches the device.

There are 2 ways to reset the internal latch:

- Set $V_{IN} < V_{IN(L)}$ for $t > t_{IN(RESETDELAY)}$
- *Set* $V_S < V_{S(UVL)}$ for $t > t_{IN(RESETDELAY)}$

For overload (short circuit or overtemperature), the maximum retry cycle (f_{FAULT}) under fault condition must be considered.

5.3.1.1 Activation of the switch into short circuit (short circuit type 1)

When the switch is activated into short circuit, the current rises rapidly. When the output current reaches $I_{CL(0)}$ value, the device is latched and turns off after $t_{OFF(TRIP)}$ which leads to an overshoot on the output current above $I_{CL(0)}$.

5.3.1.2 Short circuit appearance when the device is already on (short circuit type 2)

When the device is in on state and a short circuit to ground appears at the output with an overcurrent higher than $I_{CL(0)}$, the device automatically turns off and latches.

5.3.1.3 Overpower shutdown (PSD)

The device integrates an overpower shutdown protection in order to limit the power dissipation. The target is to limit the maximum junction temperature in case of:

- A soft short circuit, where the short circuit resistance is too high to trigger the overcurrent protection ($I_L < I_{CL(0)}$)
- Repetitive short circuits
- A short circuit in applications with a high resistor and/or inductor in the battery line, where V_S drops below $V_{S(PSD)}$ and the load current does not reach the $I_{CL(0)}$

In such conditions, the overpower shutdown protection is activated and latches the device after $t_{PSD(UV)}$.

Note: It also limits the maximum PWM frequency below the maximum value of f_{IN}. See Figure 16 below:

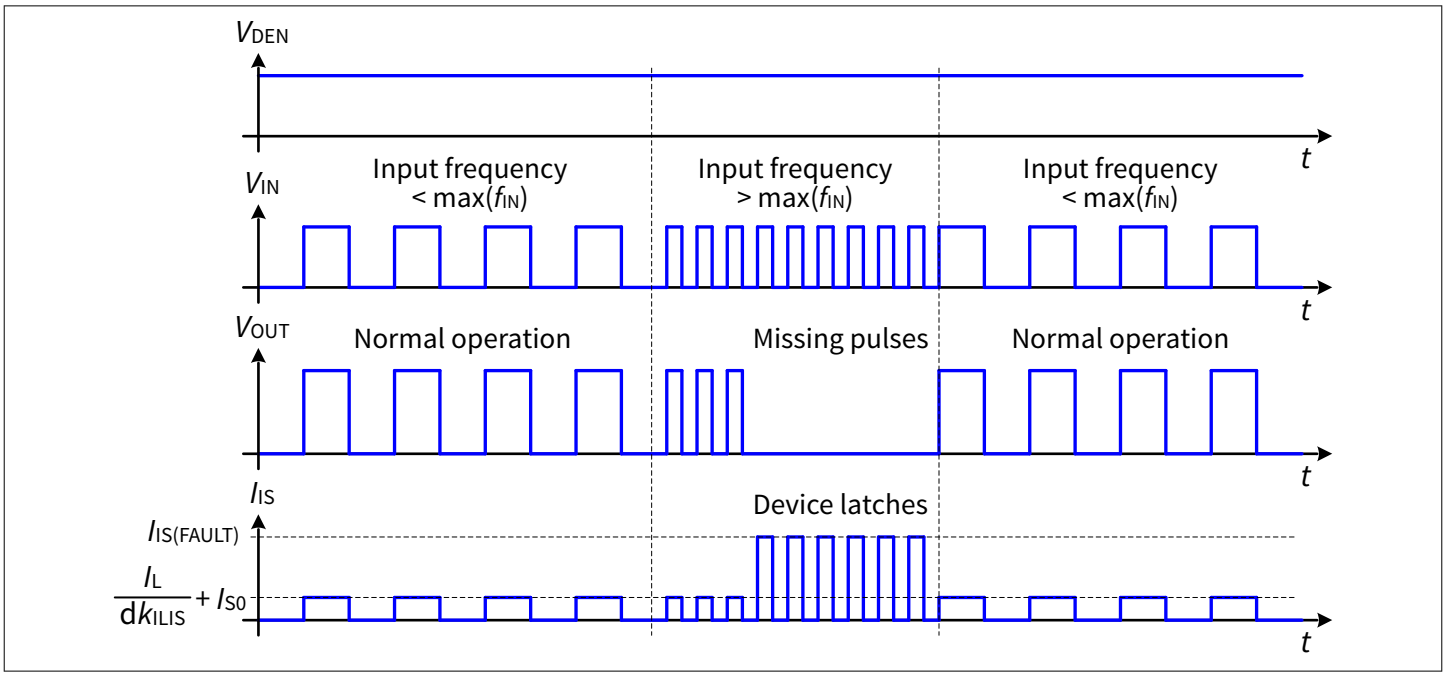

Figure 16 Behavior during PWM operation above the maximum value of f_{IN}

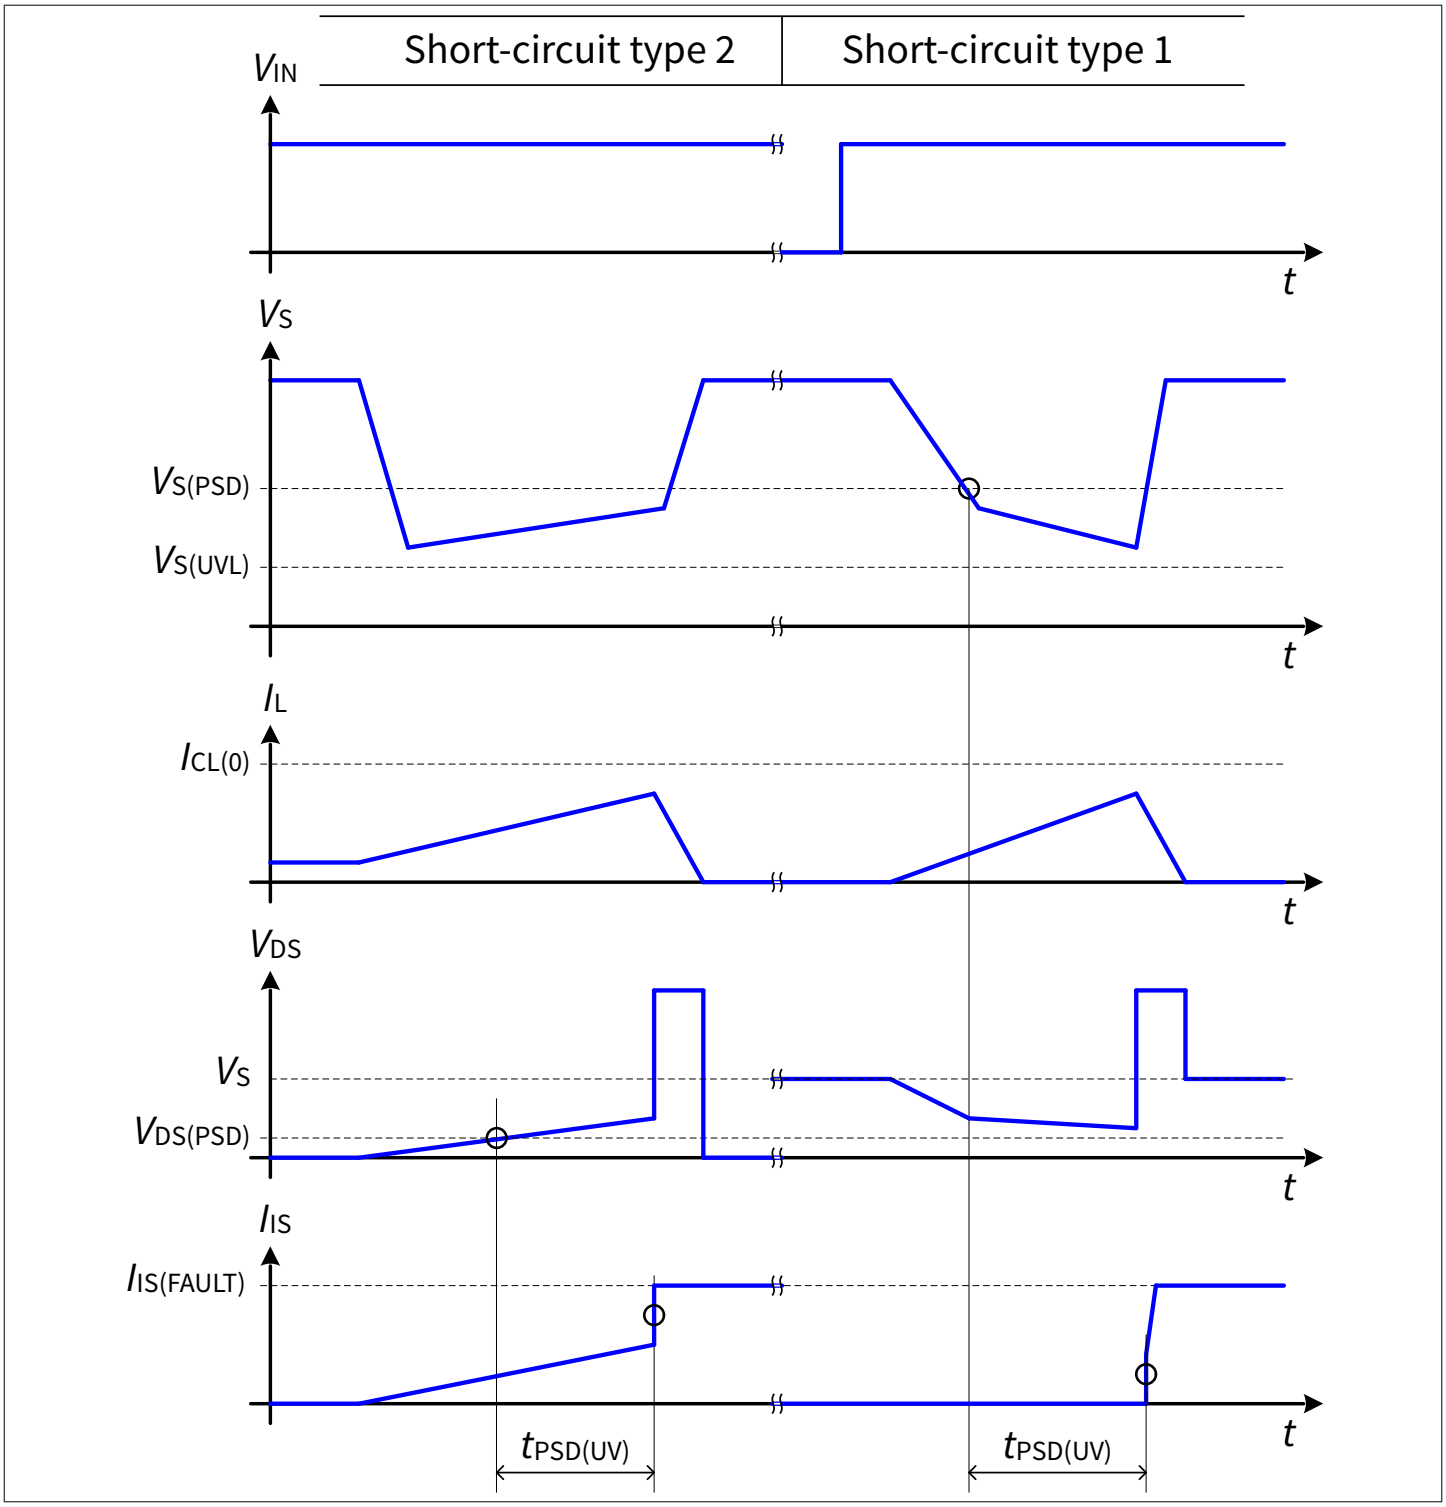

Figure 17 Overpower shutdown behavior during supply voltage drops

5.3.1.4 Temperature limitation in the power MOSFET

The device incorporates a temperature sensor. Triggering the overtemperature ($T_J > T_{J(TRIP)}$) switches off the power MOSFET to prevent destruction and latches the device.

5.3.2 Ground loss protection

In case of loss of device ground, while the load remains connected to ground, the device protects itself by automatically turning off (when it was previously on) or remains off, regardless of the voltage applied at IN pin.

5.3.3 Reverse battery protection

In case of reverse polarity, the intrinsic body diode of the power MOSFET causes power dissipation. To limit the risk of overtemperature, the device provides Reverse ON functionality. The power in this intrinsic body diode is limited by turning the power MOSFET on. The power MOSFET resistance is then equal to $R_{DS(REV)}$. Additionally, the current into the logic has to be limited with R_{IN} and R_{DEN} because there is a current path in the microcontroller.

The device includes a R_{GND} resistor which limits the current without any external resistor. R_{IS} is used to limit the current into IS pin.

See Chapter 7.

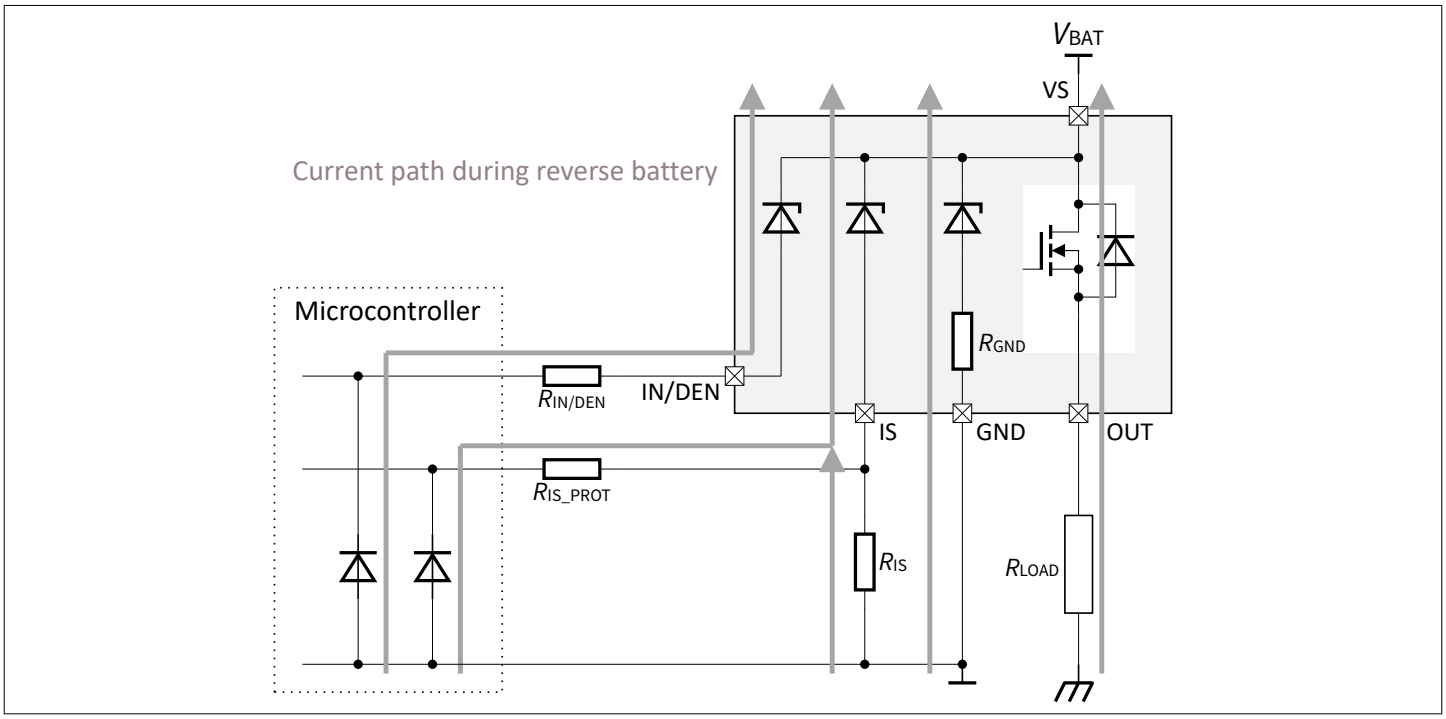

Figure 18 Reverse battery current path

5.4 Diagnosis functions

For diagnosis purposes, the device provides on the IS pin, either an image of the output load current, or a constant fault current.

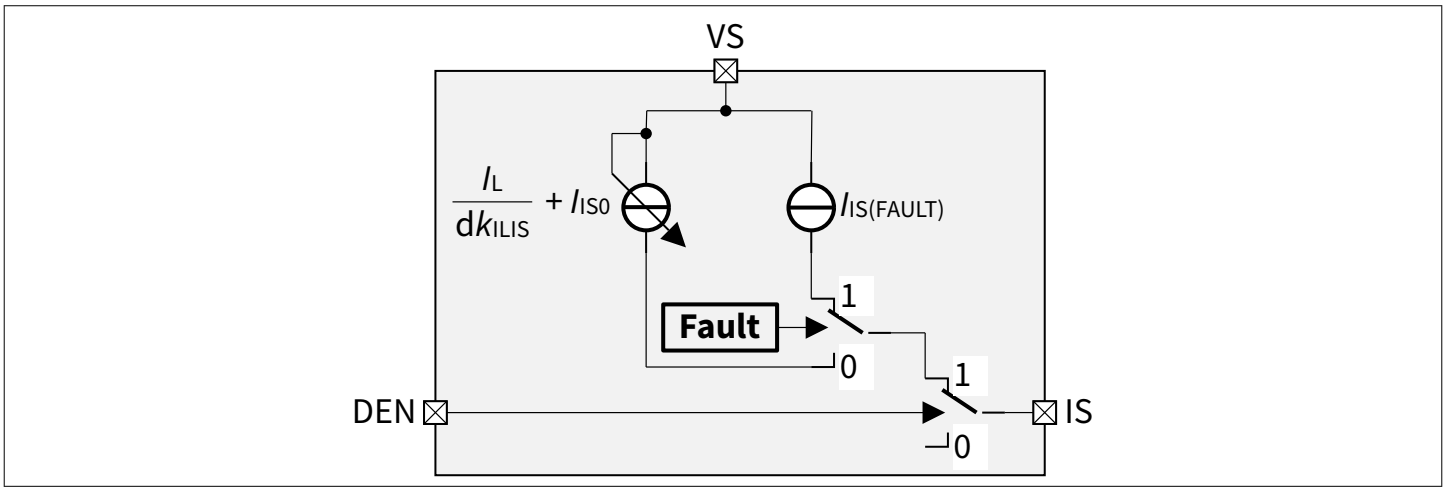

Figure 19 Diagnosis block diagram

5.4.1 DEN pin

The DEN input circuitry is compatible with 3.3 V and 5 V microcontroller or can be directly connected to V_S. The maximum voltage on the DEN pin is referenced to V_S and can go below the ground. See DEN pin in Table 3.

The figure below shows the electrical equivalent DEN input circuitry.

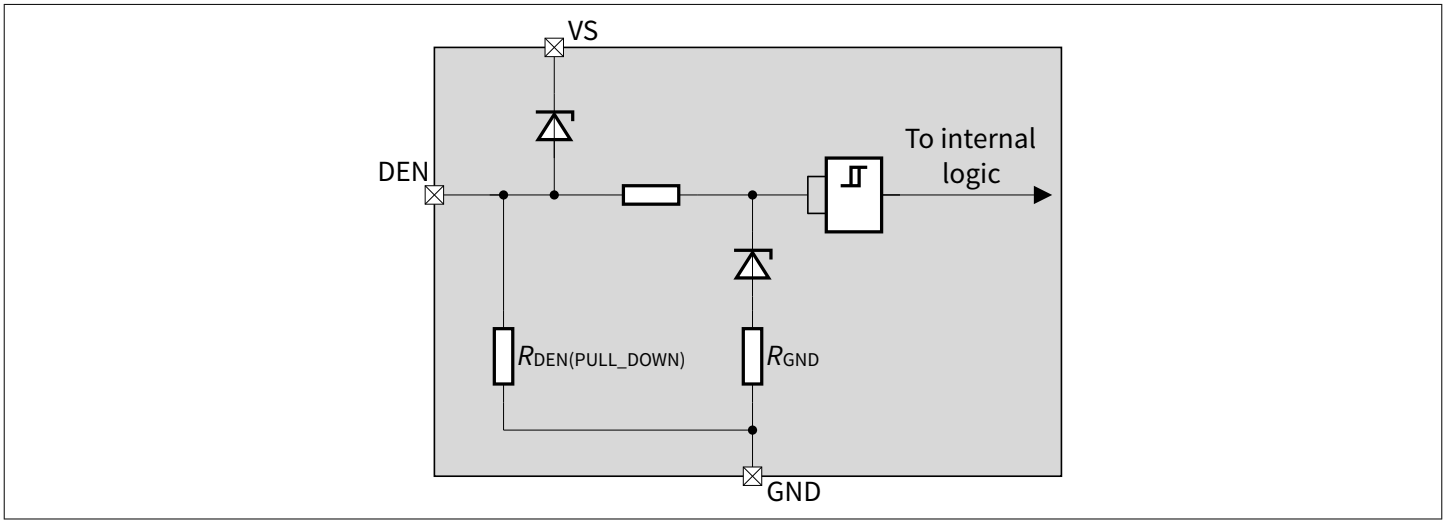

Figure 20 Simplified schematics of the DEN pin circuitry

5.4.2 Overview

Operation mode	V_{IN}	V_{DEN}	V_{OUT}	Diagnosis output
Normal condition	Low (OFF)	High	GND	$I_{IS(OFF)}$
Short circuit to GND			GND	$I_{IS(OFF)}$
Overtemperature			GND	$I_{IS(OFF)}$
Short circuit to VS			V_S	$I_{IS(FAULT)}$
Open load			$V_{OUT} > V_{OUT(OL\_OFF)}$ 1)	$I_{IS(FAULT)}$
			$V_{OUT} < V_{OUT(OL\_OFF)}$	$I_{IS(OFF)}$
Normal condition	High (ON)		~ V_S	$I_{IS} = I_L / dk_{ILIS} + I_{IS0}$
Short circuit to GND			GND	$I_{IS(FAULT)}$
Overtemperature			GND	$I_{IS(FAULT)}$
Short circuit to VS			V_S	$I_{IS} \leq I_L / dk_{ILIS} + I_{IS0}$
Open load			V_S	I_{IS0} if I_{IS0} positive, $I_{IS(OFF)}$ if I_{IS0} negative
All conditions	N.a.	Low	N.a.	$I_{IS(OFF)}$

1) With additional pull-up resistor

5.4.3 Diagnosis in on state

A current proportional to the load current is provided at pin IS when the following conditions are fulfilled:

- The power output stage is switched on with V_S - V_{IS} > 3.5V
- The diagnosis is enabled

- No fault is present or was present
- The R_{IS} recommended value is 1kΩ

A current $I_{IS(FAULT)}$ is provided at IS pin when:

- The device is latched due to a previous overcurrent, overtemperature or overpower
- The diagnosis is enabled

Figure 21 and Figure 22 show the current sense as a function of the load current in the power MOSFET.
Usually, a pull-down resistor R_{IS} is connected to the current sense pin IS.
The dotted curve represents the typical sense current, assuming a typical dk_{ILIS} factor value.
The area between the two solid curves shows the current sense accuracy the device is able to provide.

$$I_{IS} = \frac{I_L}{dk_{ILIS}} + I_{IS0} \text{ with } (I_{IS} \geq 0) \tag{4}$$

Where the definition of dk_{ILIS} is:

$$dk_{ILIS} = \frac{I_{L2} - I_{L1}}{I_{IS2} - I_{IS1}} \tag{5}$$

the definition I_{IS0} is:

$$I_{IS0} = I_{IS1} - \frac{I_{L1}}{dk_{ILIS}} \tag{6}$$

and the definition of I_{L0} is:

$$I_{L0} = I_{L1} - I_{IS1} \times dk_{ILIS} \tag{7}$$

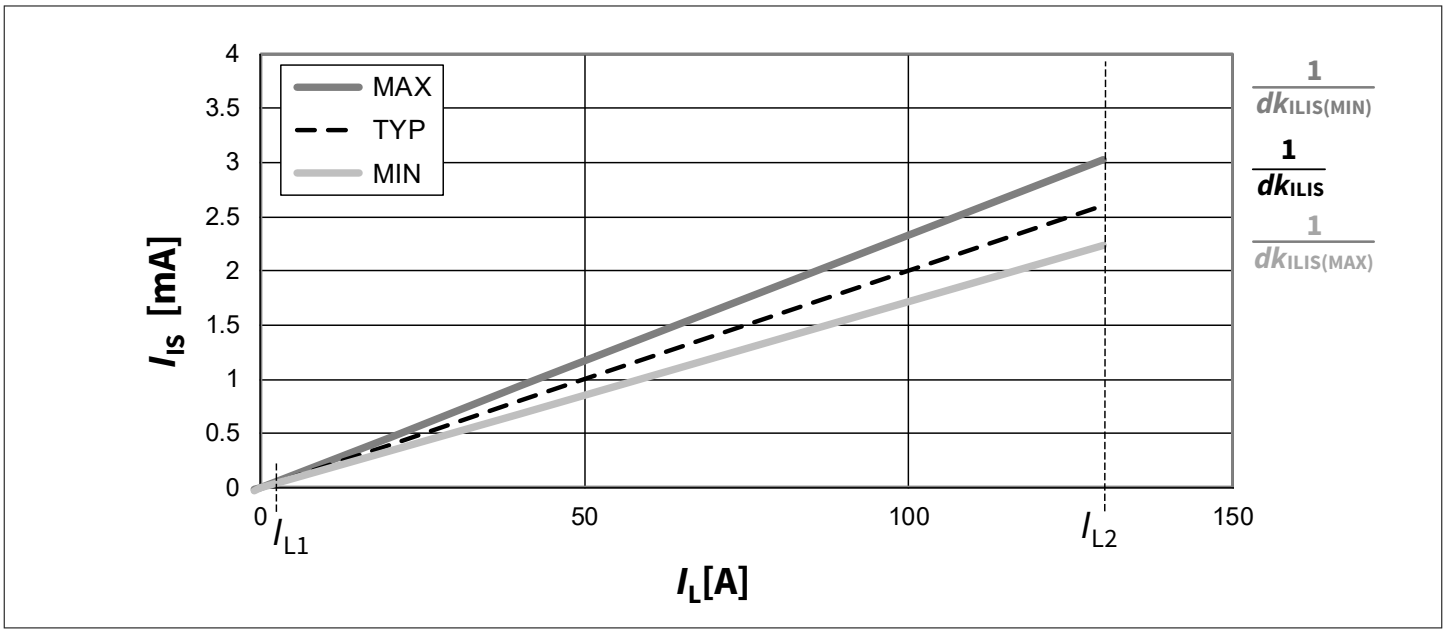

Figure 21 Current sense at IS pin as a function of load current

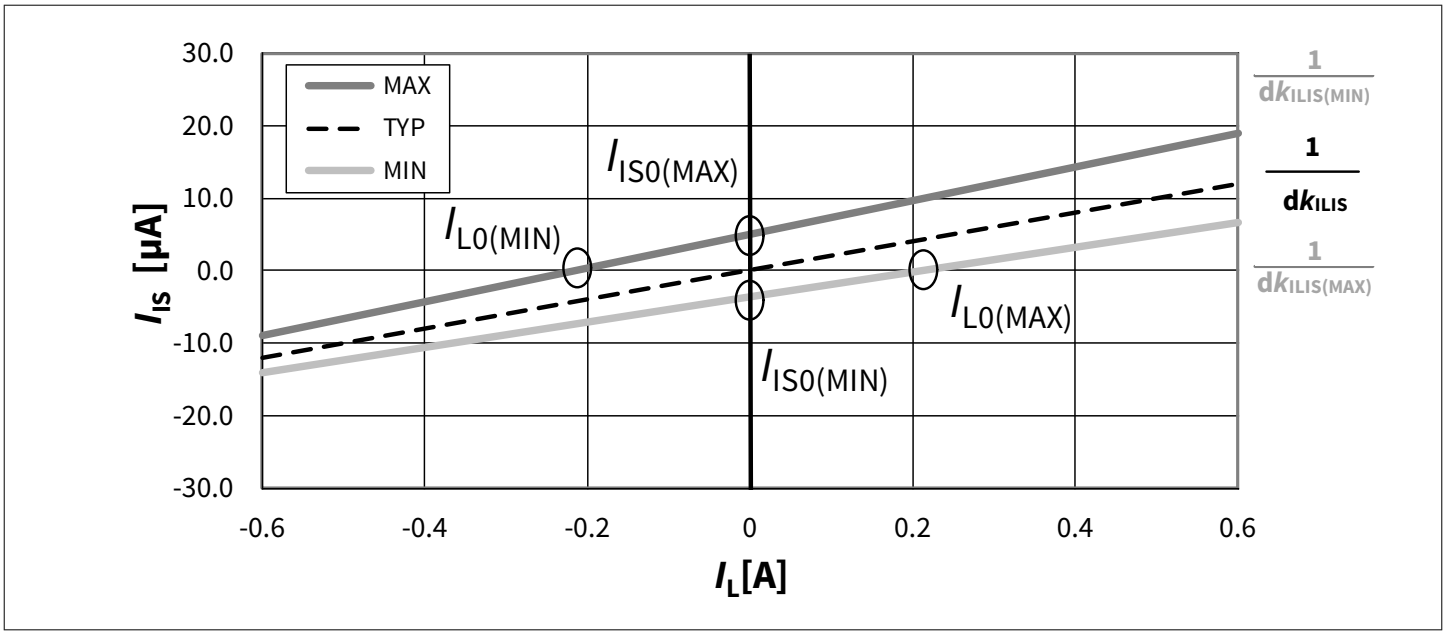

Figure 22 I_{IS0} and I_{L0} definition

5.4.3.1 Sense signal variation and calibration

In some applications, an enhanced accuracy is required around the device nominal current range $I_{L(NOM)}$. To improve the accuracy, a calibration in the application can be implemented; the best results are achieved using a two-point calibration.

Once calibrated, the IIS variation over temperature and aging can be described with the parameters $\Delta(dk_{ILIS(CAL)})$ and the $\Delta I_{IS0(CAL)}$.

The grey solid line in Figure 23 is the current sense ratio calculated from the two-point calibration at a given temperature.

The slope of this line is calculated as:

$$\frac{1}{dk_{ILIS(CAL)}} = \frac{I_{IS(CAL)2} - I_{IS(CAL)1}}{I_{L(CAL)2} - I_{L(CAL)1}} \quad (8)$$

The offset is calculated as:

$$I_{IS0(CAL)} = I_{IS(CAL)1} - \frac{I_{L(CAL)1}}{dk_{ILIS(CAL)}} = I_{IS(CAL)2} - \frac{I_{L(CAL)2}}{dk_{ILIS(CAL)}} \quad (9)$$

These two parameters, slope and offset, are accurate when the device is operated at the same ambient temperature as the one used during the calibration.

However, both parameters are temperature and lifetime dependant by a few percent, which results in an additional inaccuracy when the ambient temperature changes or when the device has been operated for a long time.

The grey area in Figure 23 shows the range of values for these two parameters across temperature and load current.

It is visible that the accuracy of the load current sensing is improved, when compared to the darkest lines showing the spread without calibration.

In the application, when a sense current value IIS is measured, the corresponding load current can be calculated as follows:

$$I_{\mathrm{L}} = \mathrm{d}k_{\mathrm{ILIS(CAL)}} \times \left(1 + \Delta\left(\mathrm{d}k_{\mathrm{ILIS(CAL)}}\right)\right) \times \left(I_{\mathrm{IS}} - I_{\mathrm{IS0(CAL)}} - \Delta I_{\mathrm{IS0(CAL)}}\right) \quad (10)$$

where:

- $\mathrm{d}k_{\mathrm{ILIS(CAL)}}$ is the current sense ratio calculated after two-points calibration, as defined in (8)
- $\Delta(\mathrm{d}k_{\mathrm{ILIS(CAL)}})$ is the additional variation of the current sense ratio over life time and temperature (in absolute value, not in percentage)
- $I_{\mathrm{IS0(CAL)}}$ is the current sense offset calculated after two points calibration, as defined in (9), and
- $\Delta I_{\mathrm{IS0(CAL)}}$ is the additional variation of the offset over life time and temperature (in absolute value, not in percentage)

For a calibration at 25°C, $\Delta I_{\mathrm{IS0(CAL)}}$ varies over temperature and life time according to the following equations. For positive $I_{\mathrm{IS0(CAL)}}$ values ($I_{\mathrm{IS0(CAL)}} > 0$):

$$MaxI_{\mathrm{IS0}}(@T_{\mathrm{J}} = 150°C) - MaxI_{\mathrm{IS0}}(@T_{\mathrm{J}} = 25°C) \leq \Delta I_{\mathrm{IS0(CAL)}} \leq MaxI_{\mathrm{IS0}}(@T_{\mathrm{J}} = -40°C) - MaxI_{\mathrm{IS0}}(@T_{\mathrm{J}} = 25°C) \quad (11)$$

For negative $I_{\mathrm{IS0(CAL)}}$ values ($I_{\mathrm{IS0(CAL)}} < 0$):

$$MinI_{\mathrm{IS0}}(@T_{\mathrm{J}} = 150°C) - MinI_{\mathrm{IS0}}(@T_{\mathrm{J}} = 25°C) \geq \Delta I_{\mathrm{IS0(CAL)}} \geq MinI_{\mathrm{IS0}}(@T_{\mathrm{J}} = -40°C) - MinI_{IS0}(@T_{\mathrm{J}} = 25°C) \quad (12)$$

(10) actually provides four solutions for load current, considering that $\Delta(\mathrm{d}k_{\mathrm{ILIS(CAL)}})$ and $\Delta I_{\mathrm{IS0(CAL)}}$ can both be positive or negative. The load current I_{L} corresponding to a known sense current I_{IS} spreads between:

- A minimum I_{L} value resulting from the combination of lowest $\Delta(\mathrm{d}k_{\mathrm{ILIS(CAL)}})$ value and highest $\Delta I_{\mathrm{IS0(CAL)}}$ and
- A maximum I_{L} value resulting from the combination of highest $\Delta(\mathrm{d}k_{\mathrm{ILIS(CAL)}})$ value and lowest $\Delta I_{\mathrm{IS0(CAL)}}$

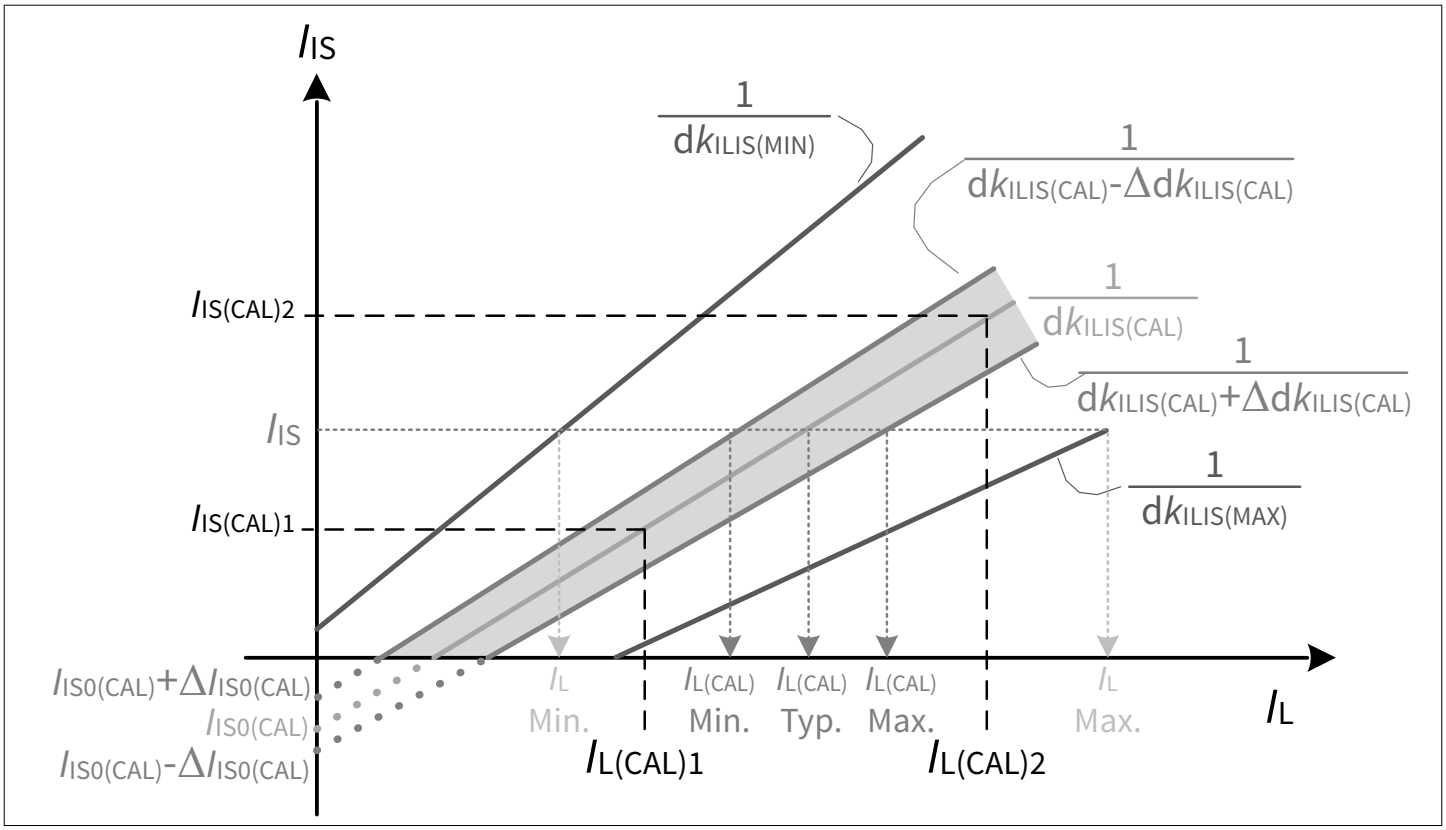

Figure 23 Improved current sense accuracy after 2 points calibration

5.4.3.2 Sense signal timing

The Figure 24 below shows the timings at turn on and when enabling/disabling the current sense feature through the DEN pin:

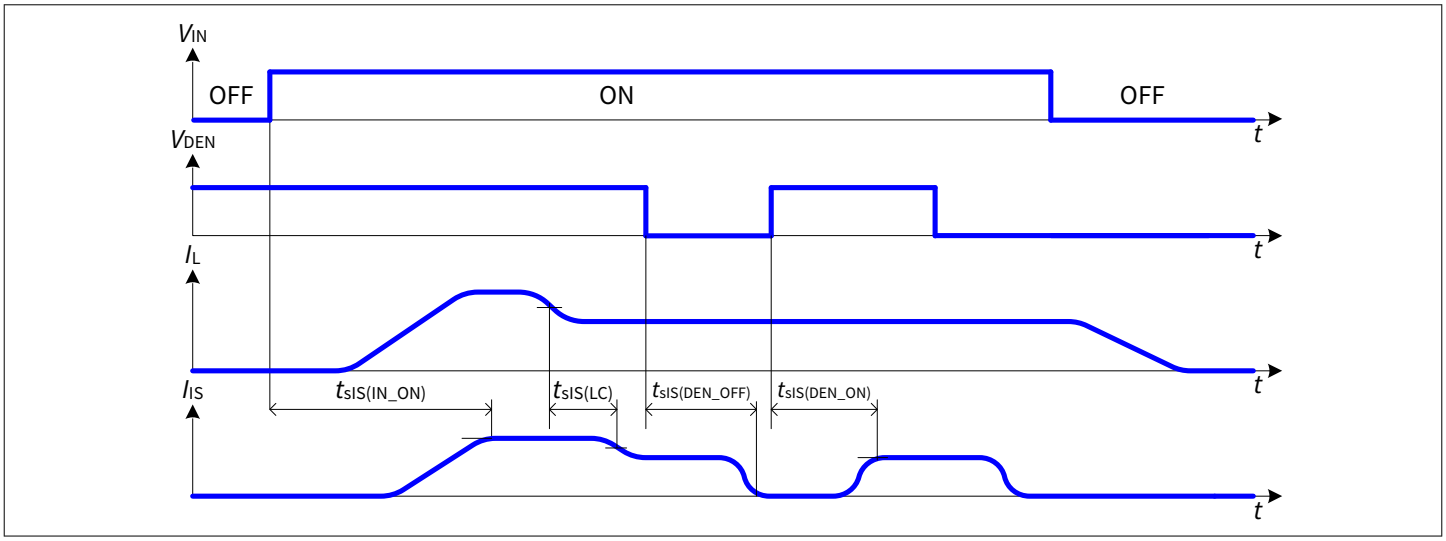

Figure 24 Current sense timing in normal operation

The Figure 25 below describes the IS pin behavior under protection conditions:

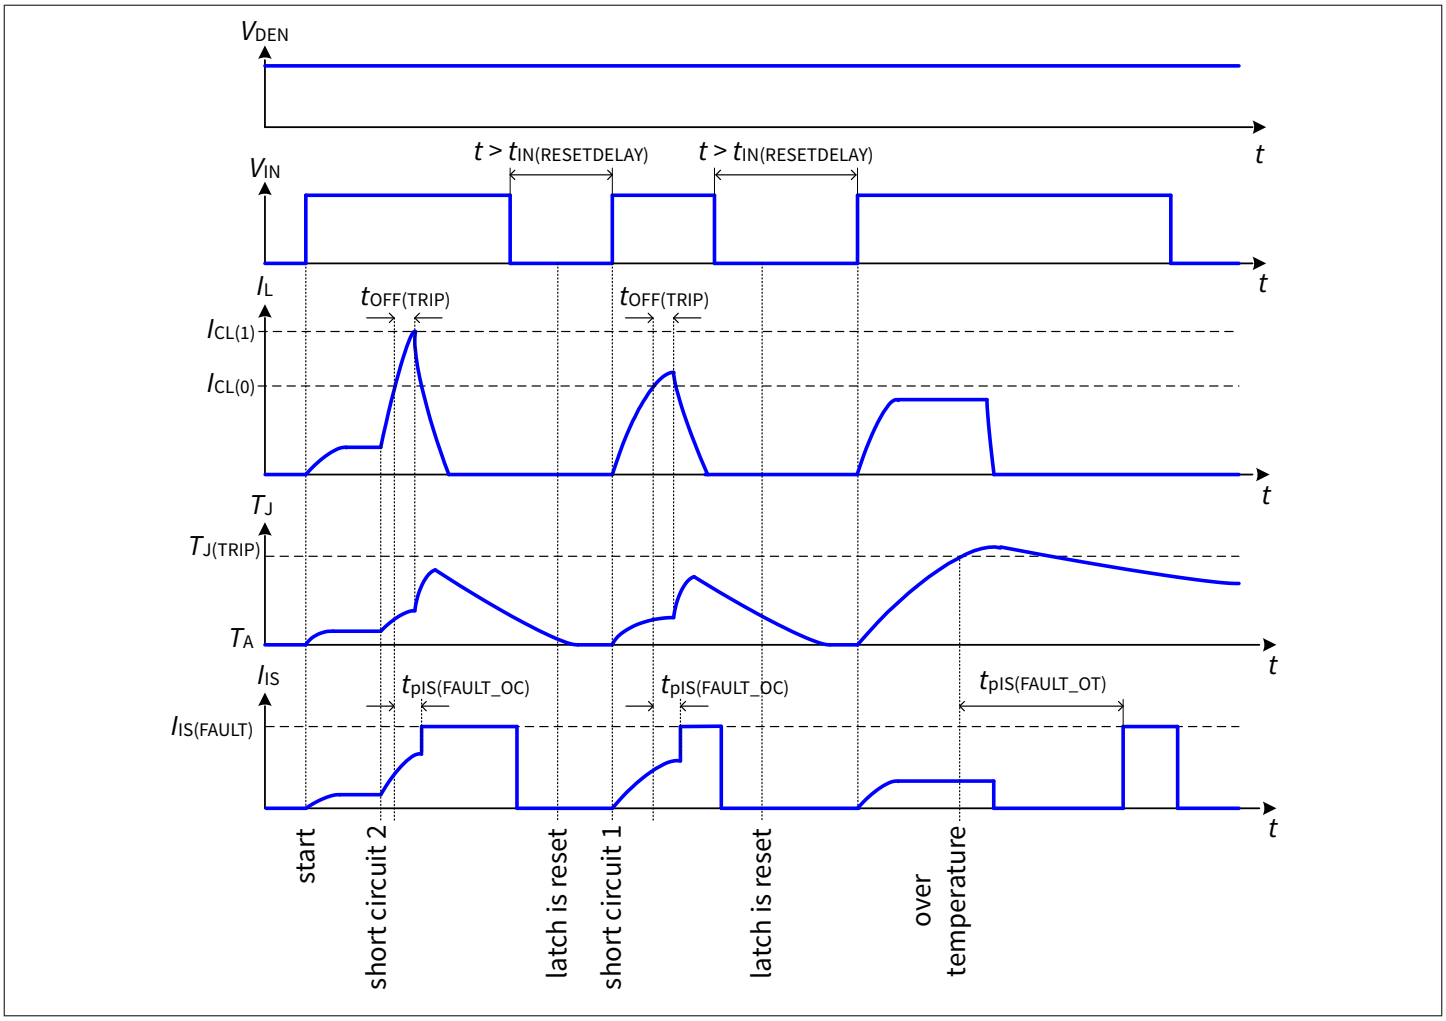

Figure 25 IS pin behavior under protection

5.4.4 Diagnosis in off state

The device features a detection of open load when it is in off state. An internal comparator is monitoring V_{OUT}.
If $V_{OUT} > V_{OUT(OL\_OFF)}$ and $V_{DEN} > V_{I(H)MAX}$, the current at IS pin is $I_{IS(FAULT)}$.
In order to pull-up OUT in case of open load condition, an external pull-up resistor must be connected between VS and OUT pins. This external resistor must be switchable to keep the quiescent current as low as possible on VS pin.

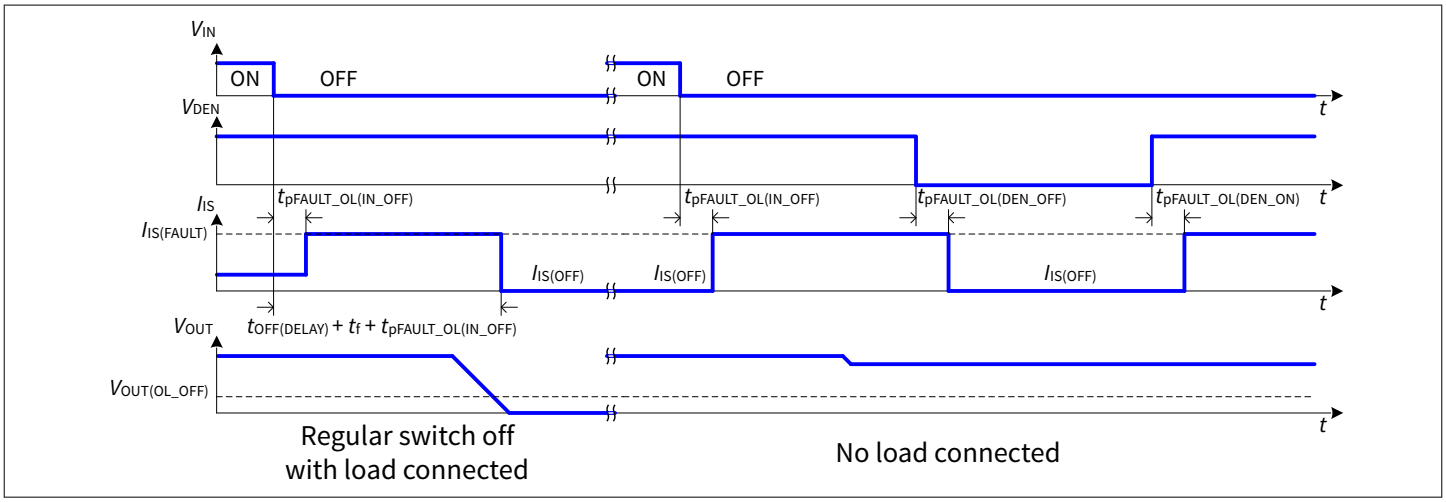

Figure 26 Behavior of the open load detection in off feature with and without load connected

5.5 Electrical characteristics

Table 6 Electrical characteristics table

V_S =5.8 V to 18 V, T_J = -40°C to +150°C unless otherwise specified. For a given temperature or voltage range, typical values are specified at V_S = 13.5 V, T_J = 25°C.

Parameter	Symbol	Values			Unit	Note or condition	P-Number
		Min.	Typ.	Max.			
Operating and standby currents							
Standby current for whole device with load	$I_{VS(OFF)}$	–	1	3	µA	V_{OUT} = 0 V V_{IN} = 0V V_{DEN} = 0V $T_J \leq$ 85°C After 10ms	PRQ-73

Table 6 (continued) Electrical characteristics table

V_S =5.8 V to 18 V, T_J = -40°C to +150°C unless otherwise specified. For a given temperature or voltage range, typical values are specified at V_S = 13.5 V, T_J = 25°C.

Parameter	Symbol	Values			Unit	Note or condition	P-Number
		Min.	Typ.	Max.			
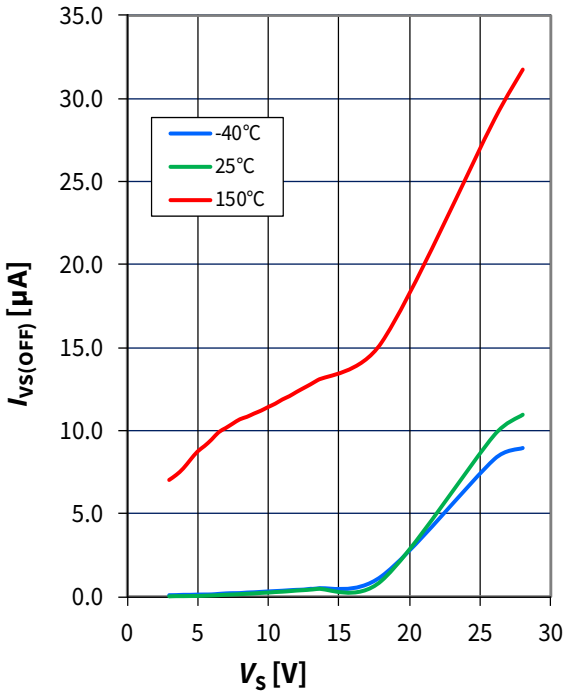
Fault propagation time for open load detection off during turn off	$t_{pFAULT\_OL(IN\_OFF)}$	–	10	30	µs	From falling edge on V_{IN} to $I_{S(FAULT)}$ on IS pin $V_{DEN} > V_{DEN(H)}$ $V_{OUT} > V_{OUT(OL\_OFF)}$	PRQ-179
Fault propagation time for open load detection off after activation of DEN	$t_{pFAULT\_OL(DEN\_ON)}$	–	5	30	µs	From rising edge on V_{DEN} to $I_{IS(FAULT)}$ on IS pin $V_{IN} < V_{IN(L)}$ $V_{OUT} > V_{OUT(OL\_OFF)}$	PRQ-180
Disable time of IIS(FAULT) in off condition after desactivation of DEN	$t_{pFAULT\_OL(DEN\_OFF)}$	–	5	40	µs	From falling edge on V_{DEN} to $I_{IS(OFF)}$ on IS pin $V_{IN} < V_{IN(L)}$	PRQ-181

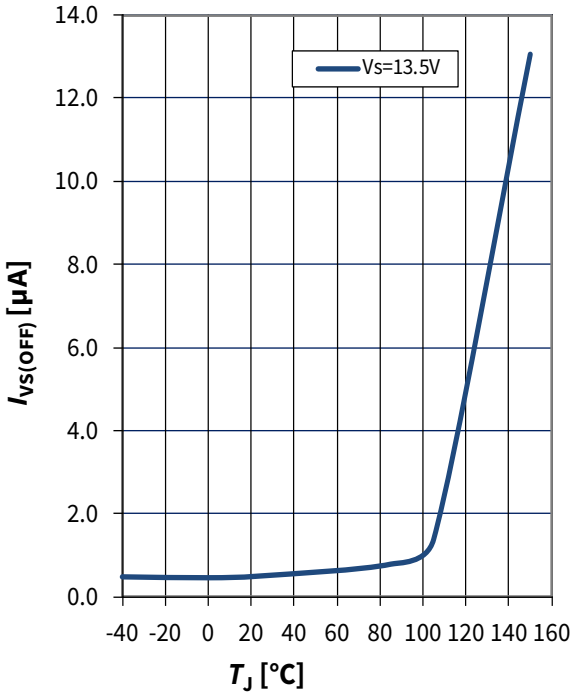
1) Not subject to production test, specified by design.

6 Typical performance characteristics

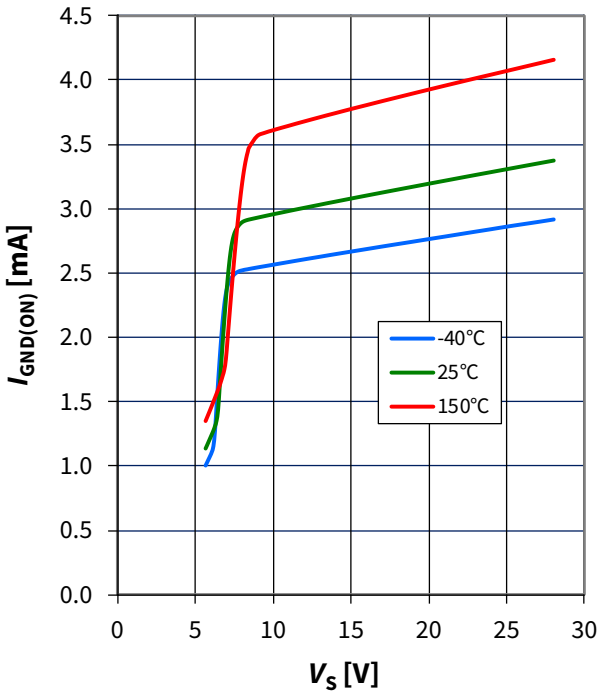
Standby current for whole device with load, $I_{VS(OFF)} = f(V_S, T_J)$



Standby current for whole device with load, $I_{VS(OFF)} = f(T_J)$, at V_S = 13.5 V



GND current when IN and DEN are biased to VS, $I_{GND(ON)} = f(V_S, T_J)$



GND current when IN and DEN are biased to 5.5 V, $I_{GND(ON)} = f(V_S, T_J)$

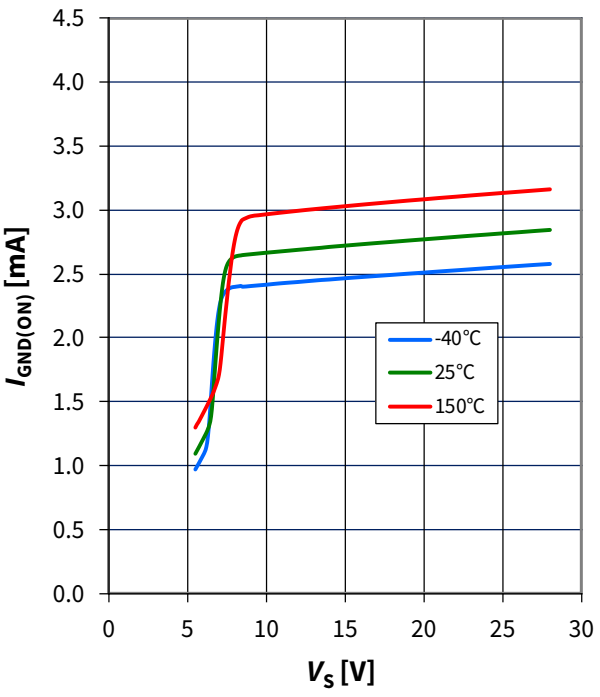


Figure 27 Typical performance characteristics

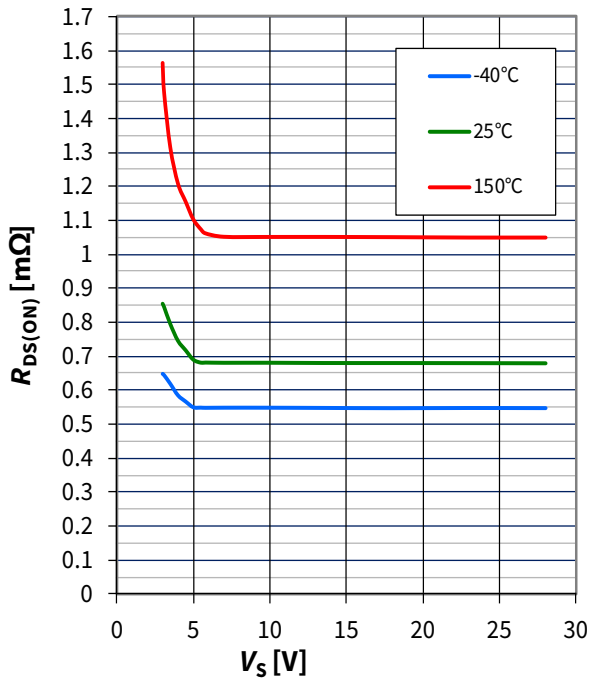
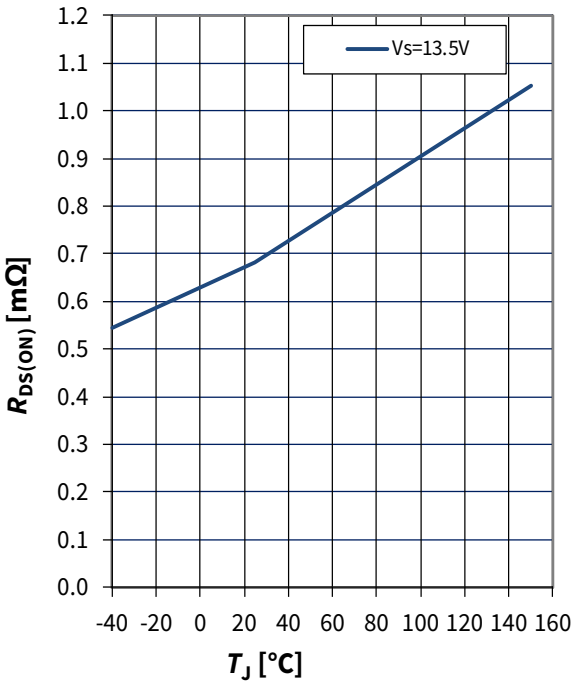
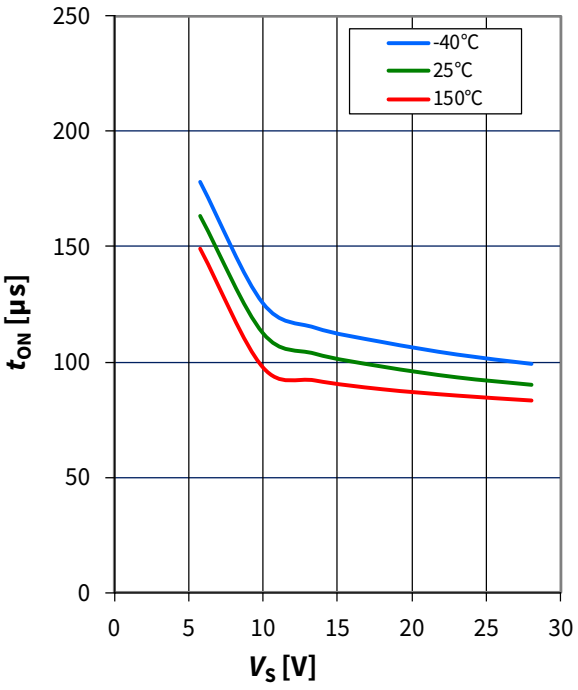
On state resistance at I_L = 55 A
$R_{DS(ON)}$ = f(V_S, T_J)



On state resistance at I_L = 55 A and V_S = 13.5 V
$R_{DS(ON)}$ = f(T_J)



Turn on time
t_{ON} = f(V_S, T_J), R_L = 0.4 Ω



Turn off time
t_{OFF} = f(V_S, T_J), R_L = 0.4 Ω

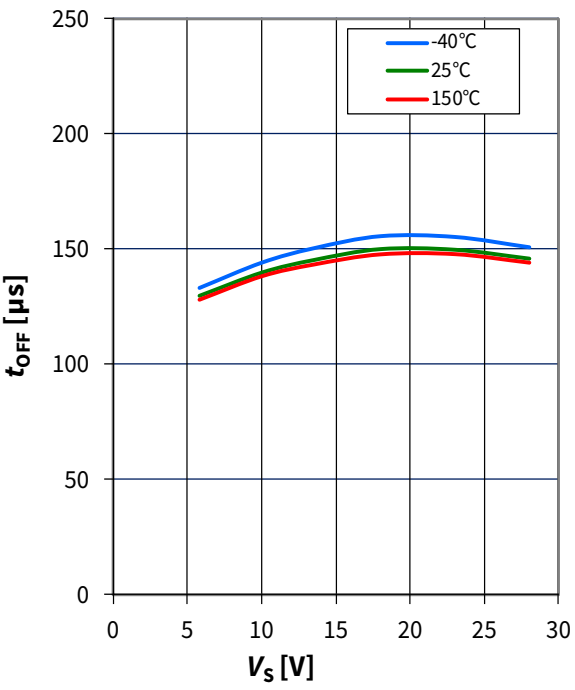


Figure 28 Typical performance characteristics (continued)

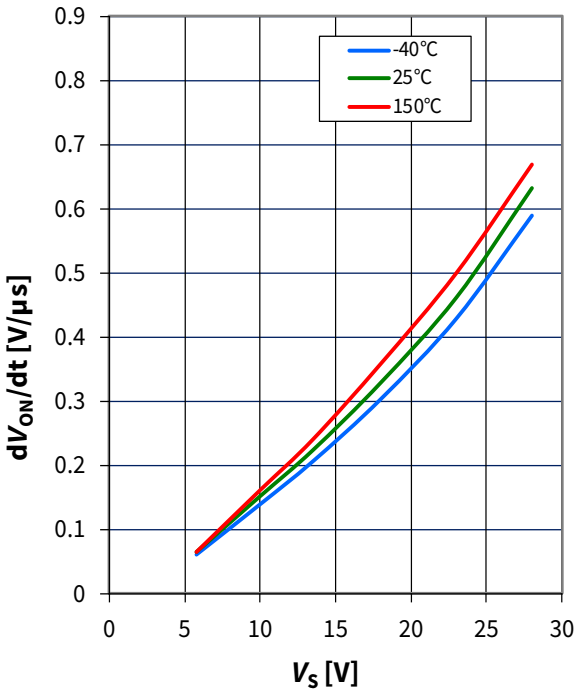
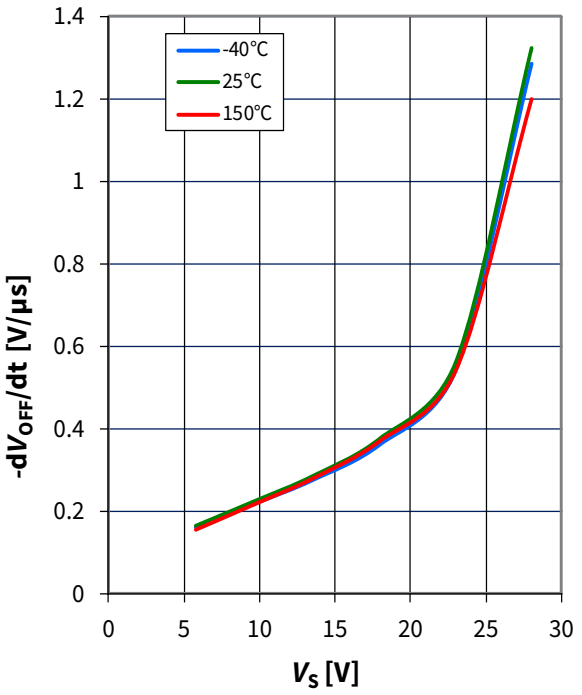
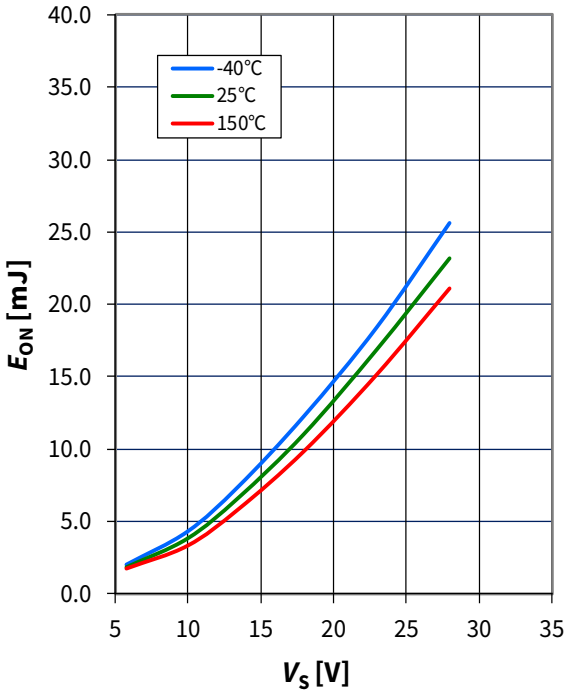
Slew rate at turn on
$dV_{ON/dt} = f(V_S, T_J), R_L = 0.4\ \Omega$



Slew rate at turn off
$-dV_{OFF/dt} = f(V_S, T_J), R_L = 0.4\ \Omega$



Energy at turn on
$E_{ON} = f(V_S, T_J), R_L = 0.4\ \Omega$



Energy at turn off
$E_{OFF} = f(V_S, T_J), R_L = 0.4\ \Omega$

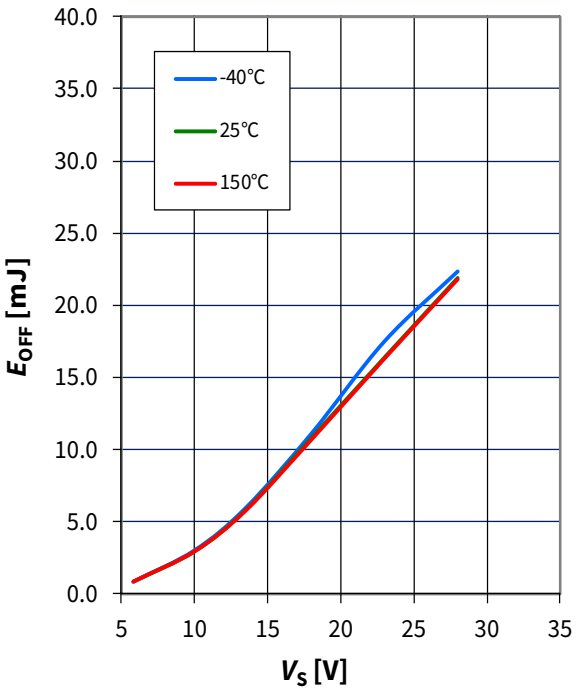


Figure 29 Typical performance characteristics (continued)

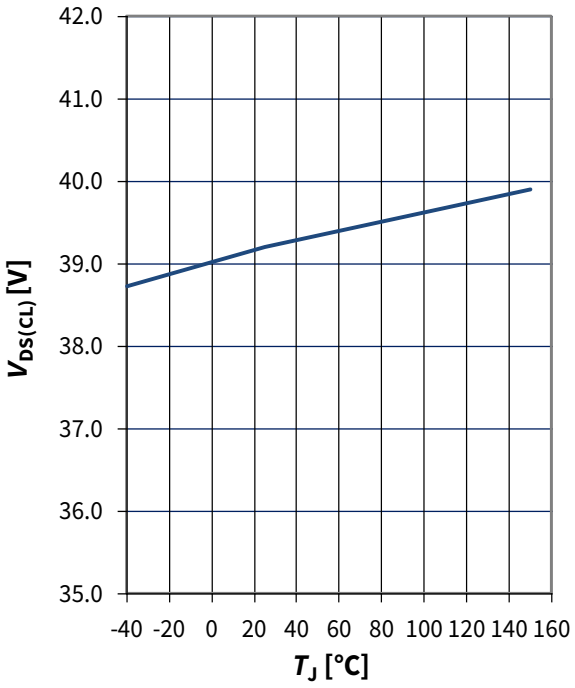
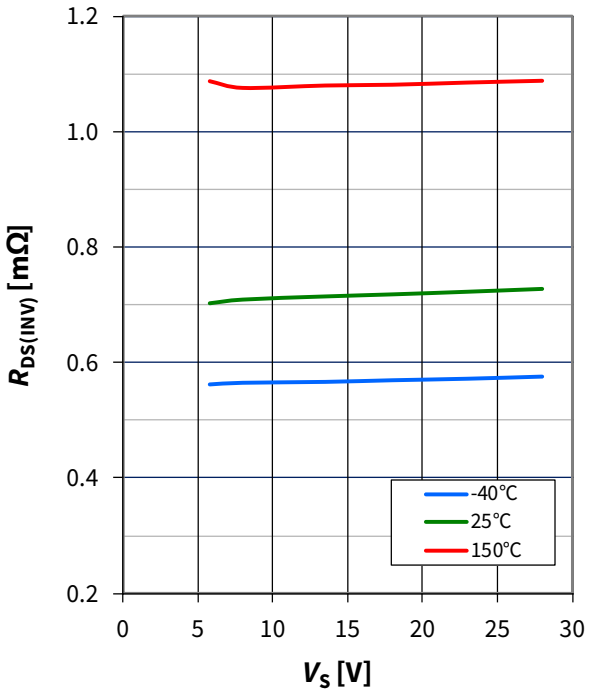
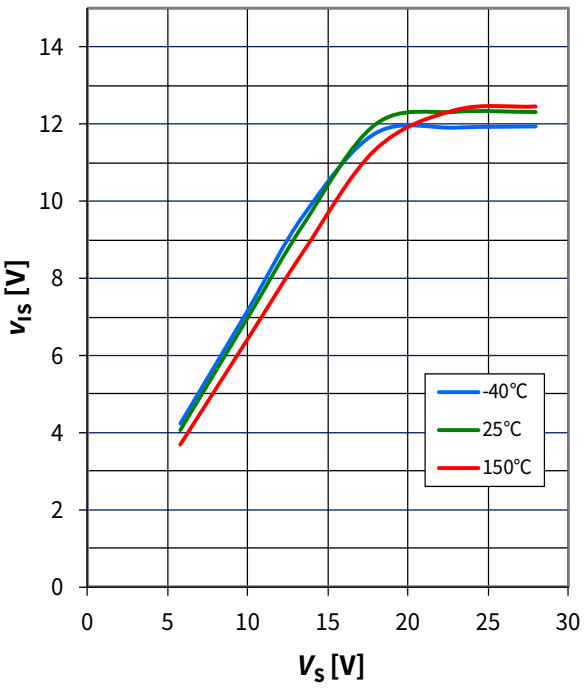
Drain to source smart clamp voltage
$V_{DS(CL)} = f(T_J)$



On resistance in inverse at I_L = -50 A
$R_{DS(INV)} = f(V_S, T_J)$



Voltage on IS in fault
$V_{IS} = f(V_S, T_J)$, R_{IS} = 1.0 kΩ



Current sense differential ratio
$dk_{ILIS} = f(T_J)$

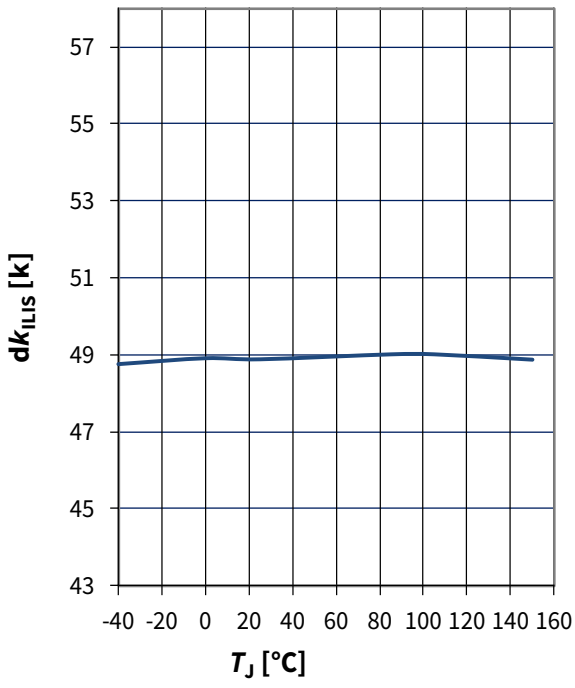


Figure 30 Typical performance characteristics (continued)

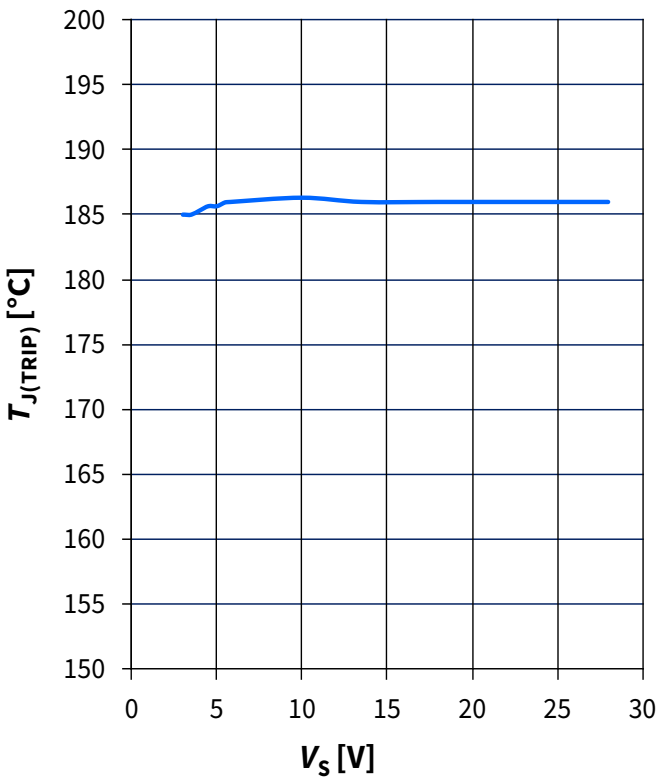
Thermal shutdown temperature
$T_{J(TRIP)} = f(V_S)$



Current trip detection level
$I_{CL(0)} = f(V_S, T_J)$

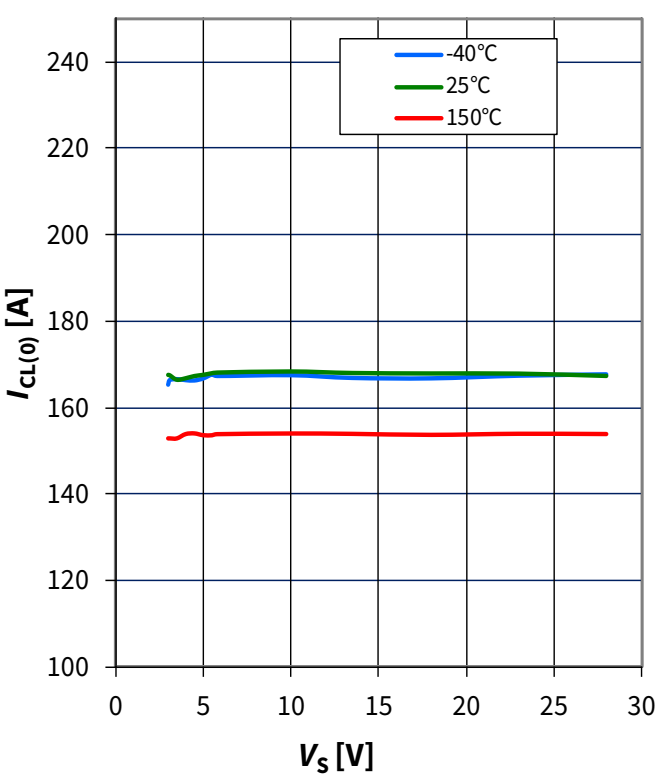


Figure 31 Typical performance characteristics (continued)

7 Application information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device. These are very simplified examples of an application circuit. The function must be verified in the real application.

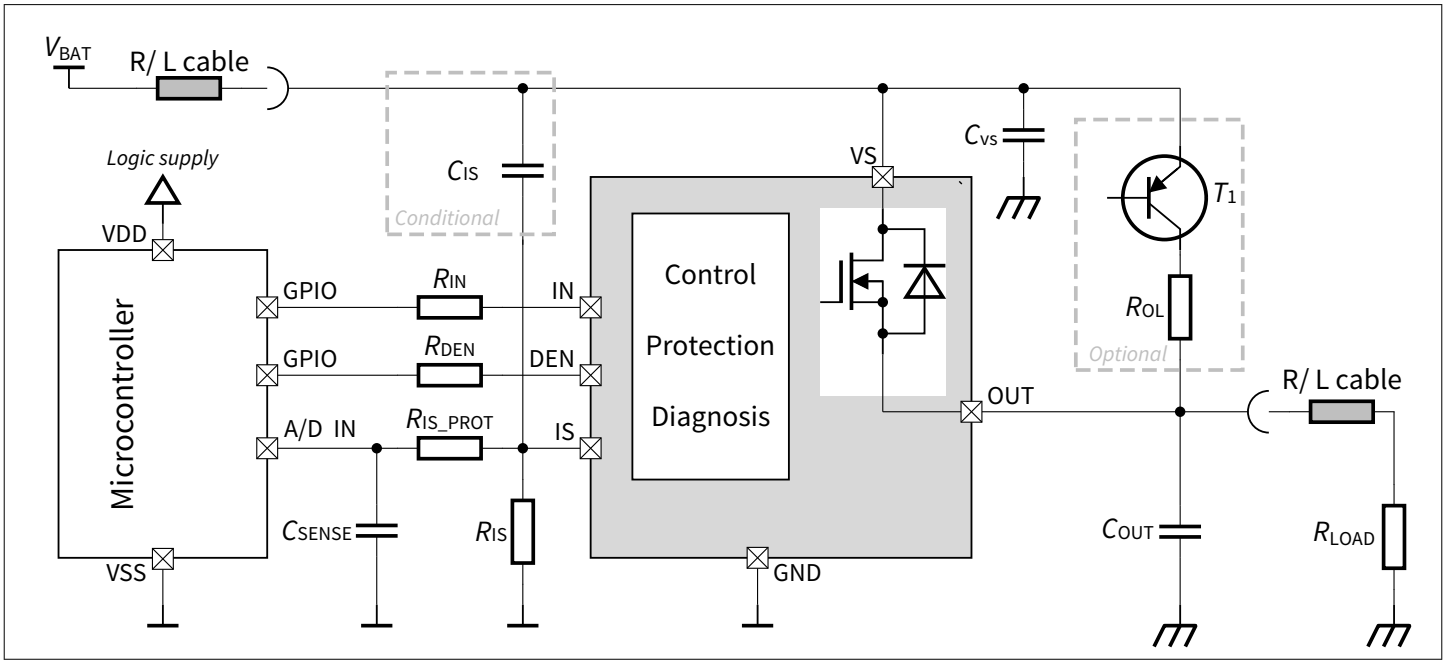

Figure 32 Application diagram: device controlled by a microcontroller

Table 7 Bill of material

Reference	Value	Purpose
R_{IN}	4.7 kΩ	Protection of the microcontroller during reverse polarity
R_{DEN}	4.7 kΩ	Protection of the microcontroller during reverse polarity
R_{IS}	1 kΩ	Sense resistor
R_{IS_PROT}	4.7 kΩ	Protection of the microcontroller during reverse polarity and during loss of ground
C_{SENSE}	10 nF	Sense signal filtering
C_{VS}	100 nF	Improved EMC behavior (in layout, please place close to the pins)
C_{OUT}	10 nF	Protection against EMC
R_{OL}	Application specific	Open load detection in off state: to have V_{OUT} higher than $V_{OUT(OL\_OFF)}$. The value depends on the leakage outside the ECU between OUT and GND
C_{IS}	1 nF	Conditional: connect if R_{IS} is bigger than 2 kΩ

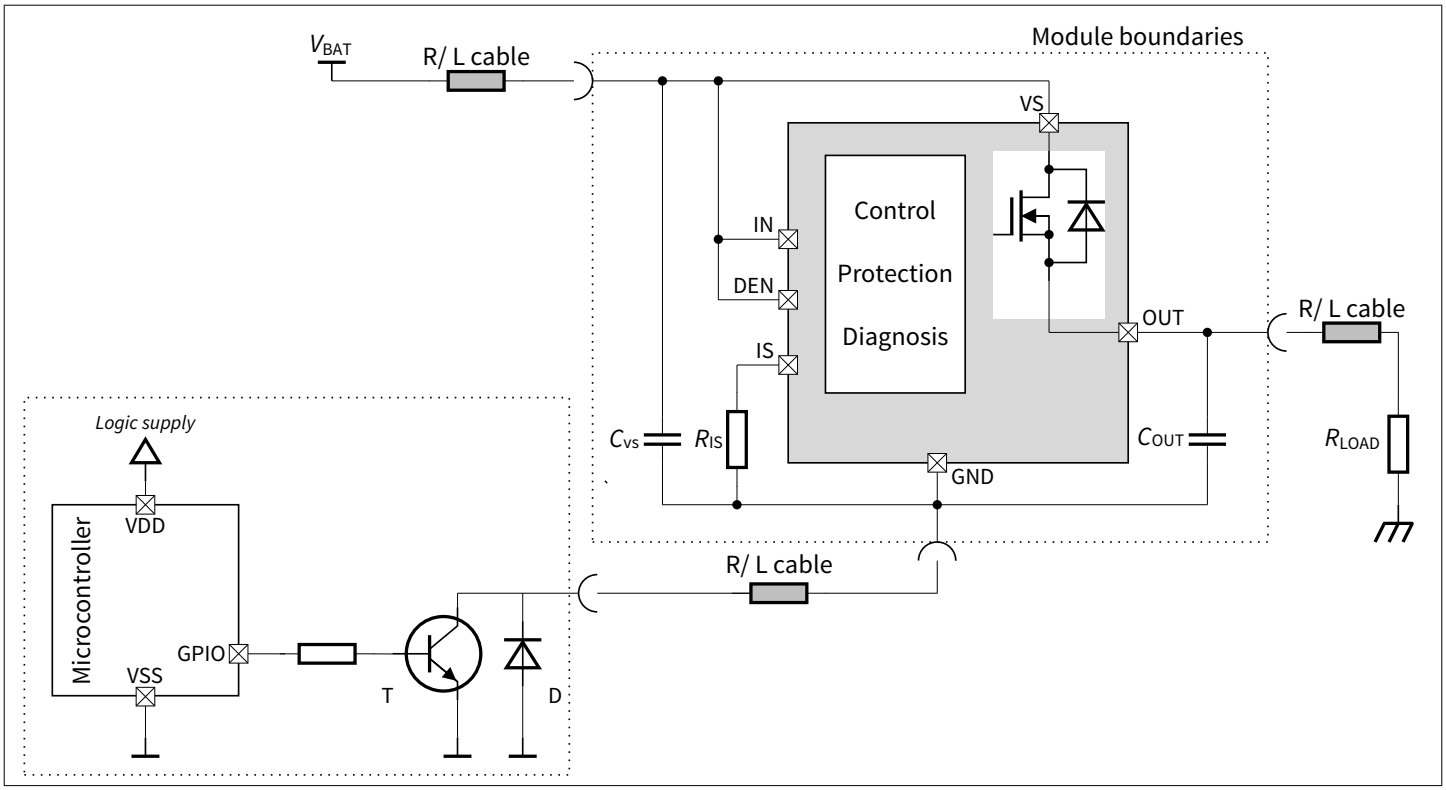

Figure 33 Application diagram: solid state relay for direct relay replacement

Table 8 Bill of material

Reference	Value	Purpose
R_{IS}	1 kΩ	Sense resistor
C_{VS}	100 nF	Improved EMC behavior (in layout, please place close to the pins)
C_{OUT}	10 nF	Protection against EMC
T	Bipolar or MOSFET	Switch to turn on and off the device
D	–	Enable Reverse ON protection during reverse battery. Not required if a MOSFET is used for T

8 Package information

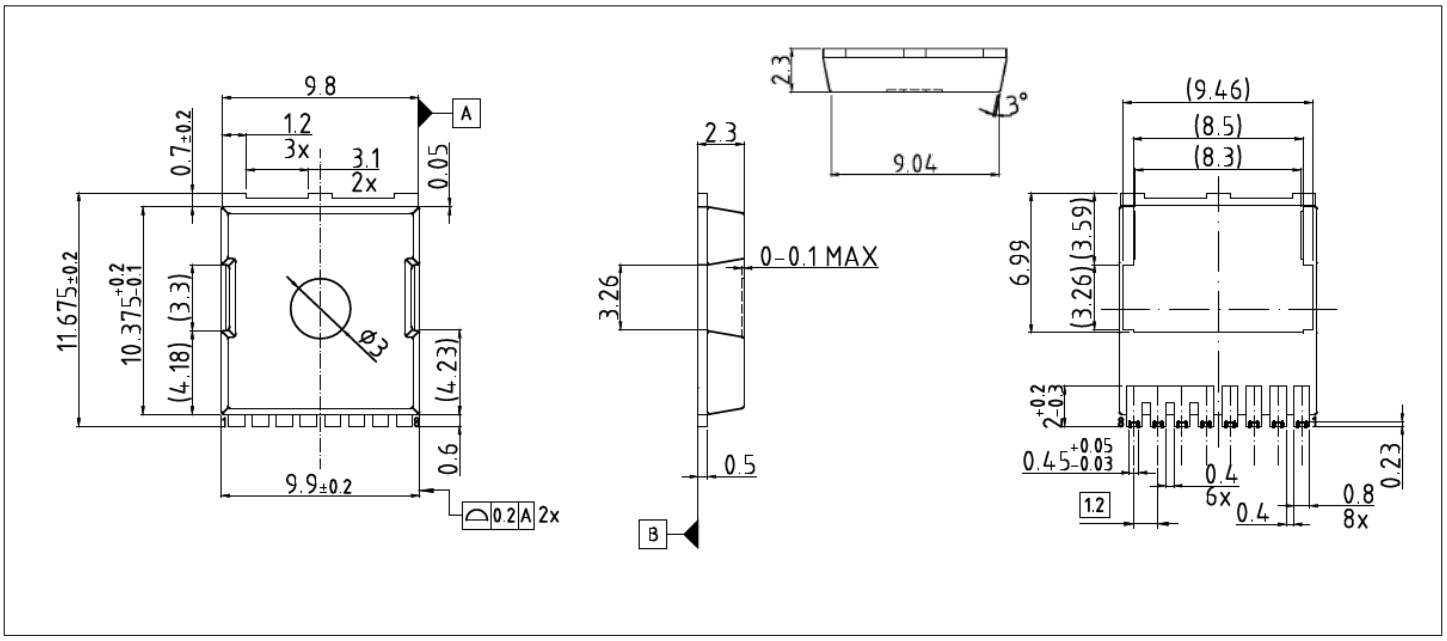

Figure 34 PG-HSOF-8 (8-pin TO-Leadless) package dimensions

Green Product (RoHS compliant) To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e. Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
