

FEATURES

- 400 mV $\pm$ 0.275% threshold
- Supply range: 1.7 V to 5.5 V
- Low quiescent current: 6.5 μ A typical
- Input range includes ground
- Internal hysteresis: 9.3 mV typical
- Low input bias current: $\pm$ 5 nA maximum
- Dual open-drain outputs
- Small SOT-23 package
- Qualified for automotive applications

APPLICATIONS

- Li-Ion monitoring
- Threshold detectors
- Relay driving
- Optoisolator driving
- Industrial control systems
- Handheld instruments

GENERAL DESCRIPTION

The ADCMP361 is a single low power, high accuracy comparator with a 400 mV reference in a 5-lead SOT-23 package. The internal 400 mV reference provides the ability to monitor low voltage supplies. The device operates on a supply voltage from 1.7 V to 5.5 V and only draws 6.5 μ A typical, making it suitable for low power system monitoring and portable applications. Hysteresis is included in the comparators.

There are dual open-drain outputs to enable the comparator and reference circuit to be used in an inverting or noninverting configuration. The outputs can be pulled to any voltage up to a maximum of 5.5 V. The output stage is guaranteed to sink greater than 5 mA over temperature.

The device is suitable for portable, commercial, industrial, and automotive applications.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
V_{DD}	−0.3 V to +6 V
IN	−0.3 V to +6 V
OUT, $\overline{\text{OUT}}$	−0.3 V to +6 V
Operating Temperature Range	−40°C to +125°C
Storage Temperature Range	−65°C to +150°C
Lead Temperature	
Soldering (10 sec)	300°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL CHARACTERISTICS

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 3. Thermal Resistance

Package Type	θ_{JA}	Unit
5-Lead SOT-23	240	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

APPLICATION INFORMATION

The **ADCMP361** is a low power comparator and reference circuit featuring a 400 mV reference that operates from 1.7 V to 5.5 V. The comparator is 0.275% accurate with a built-in hysteresis of 9.3 mV. There are two outputs, one the inverse of the other. This enables the **ADCMP361** to be used as an inverting or a noninverting comparator circuit. These open-drain outputs are capable of sinking 40 mA.

COMPARATORS AND INTERNAL REFERENCE

The comparator has one input available externally; the other comparator input is connected internally to the 400 mV reference. The rising input threshold voltage of the comparators is designed to be equal to that of the reference.

POWER SUPPLY

The **ADCMP361** is designed to operate from 1.7 V to 5.5 V. A 100 nF decoupling capacitor is recommended between V_{DD} and GND.

INPUTS

The comparator input is limited to the maximum V_{DD} voltage range. The voltage on these inputs can be above V_{DD} but never above the maximum allowed V_{DD} voltage. When adding a resistor string to the input, take care when choosing resistor values. This is due to the fact that the input bias current will be in parallel with the bottom resistor, $R2$, of the input resistor divider string. This bottom resistor must therefore be chosen carefully in order to reduce the error introduced by this bias current (see Figure 30).

Figure 30. Input Bias Current Effect on Input Resistor String

OUTPUTS

The open-drain comparator outputs are limited to the maximum specified V_{DD} voltage range, regardless of the V_{DD} voltage. These outputs are capable of sinking up to 40 mA.

ADDING HYSTERESIS

To prevent oscillations at the output caused by noise or slowly moving signals passing the switching threshold, each comparator has built-in hysteresis of approximately 9.3 mV. Positive feedback can be used to increase hysteresis.

For the configuration shown in Figure 31, two resistors are used to create different switching thresholds, depending on whether the input signal is increasing or decreasing in magnitude. When

the input voltage is increasing, the threshold is above V_{REF} , and when it is decreasing, the threshold is below V_{REF} . V_{IN_HI} is the high input threshold used to trigger the output low to high transmission. V_{IN_LO} is the low input threshold used to trigger the output high to low transmission.

The upper input threshold level is given by

$$V_{IN_HI} = \frac{V_{REF}(R1 + R2)}{R2}$$

assuming $R_{LOAD} \gg R2$, R_{PULLUP} where $V_{REF} = 0.4$ V.

The lower input threshold level is given by

$$V_{IN_LO} = \frac{V_{REF}(R1 + R2 + R_{PULLUP}) - V_{CC}R1}{R2 + R_{PULLUP}}$$

The hysteresis is the difference between these voltage levels and is given by

$$\Delta V_{IN} = \frac{V_{CC}R1}{R2 + R_{PULLUP}}$$
