

SGM8958-1/SGM8958-2

Low V_{OS} , Low Noise, High Precision Zero-Drift Operational Amplifiers

GENERAL DESCRIPTION

The single SGM8958-1 and dual SGM8958-2 are low power, high precision CMOS operational amplifiers. These devices can operate from 1.8V to 5.5V single supply or from $\pm 0.9V$ to $\pm 2.75V$ dual power supplies, and consume only 165 μA quiescent current per amplifier. The SGM8958-1/2 support rail-to-rail input and output operation. The input common mode voltage range is from $(-V_S) - 0.1V$ to $(+V_S) + 0.1V$, and the output range is from $(-V_S) + 0.005V$ to $(+V_S) - 0.005V$.

The SGM8958-1/2 are designed to provide optimal performance in low voltage and low power systems. They have high impedance inputs and zero-drift 10 μV (MAX) offset voltage. These specifications make SGM8958-1/2 appropriate for a wide range of applications requiring high precision, such as high linearity driver of high precision ADC.

The SGM8958-1 is available in Green SOT-23-5, SC70-5 and SOIC-8 packages. The SGM8958-2 is available in Green SOIC-8 and TDFN-3 $\times$ 3-8L packages. They are specified over $-40^{\circ}C$ to $+125^{\circ}C$ temperature range.

FEATURES

- **Low Input Offset Voltage:** 10 μV (MAX)
- **Low Noise:** 0.3 μV_{P-P} at 0.1Hz to 10Hz
- **Input Voltage Noise:** 12nV/ $\sqrt{Hz}$
- **Gain-Bandwidth Product:** 1.8MHz
- **Slew Rate :** 0.7V/ μs
- **Integrated EMI Filter**
- **Rail-to-Rail Input and Output**
- **Support Single or Dual Power Supplies:**
1.8V to 5.5V or $\pm 0.9V$ to $\pm 2.75V$
- **Quiescent Current:** 165 μA /Amplifier (TYP)
- **$-40^{\circ}C$ to $+125^{\circ}C$ Operating Temperature Range**
- **Small Packaging:**
SGM8958-1 Available in Green SOT-23-5, SC70-5 and SOIC-8 Packages
SGM8958-2 Available in Green SOIC-8 and TDFN-3 $\times$ 3-8L Packages

APPLICATIONS

Industrial Equipment
Battery-Powered Equipment
Sensor Signal Conditioning

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

Supply Voltage.....	6V
Signal Input Current Terminals ⁽¹⁾	±10mA
Junction Temperature.....	+150°C
Storage Temperature Range.....	-65°C to +150°C
Lead Temperature (Soldering, 10s).....	+260°C
ESD Susceptibility	
HBM.....	4000V
MM.....	400V
CDM.....	1000V

NOTE: 1. The input terminals are protected by diodes connected to the power supply rails. Any input signals exceeding 0.5V beyond the power supply rails should be limited to a maximum current of 10mA.

RECOMMENDED OPERATING CONDITIONS

Specified Voltage Range.....	1.8V to 5.5V
Operating Temperature Range.....	-40°C to +125°C

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

APPLICATION INFORMATION

Rail-to-Rail Input

When SGM8958-1/2 work at the power supply between 1.8V and 5.5V, the input common mode voltage range is from $(-V_S) - 0.1V$ to $(+V_S) + 0.1V$. In Figure 1, the ESD diodes between the inputs and the power supply rails will clamp the input voltage so that it does not exceed the rails.

Figure 1. Input Equivalent Circuit

Input Current-Limit Protection

For ESD diode clamping protection, when the current flowing through ESD diode exceeds the maximum rating value, the ESD diode and amplifier will be damaged, so current-limit protection will be added in some applications. One resistor is selected to limit the current not to exceed the maximum rating value. In Figure 2, a series input resistor is used to limit the input current to less than 10mA, but the drawback of this current-limit resistor is that it contributes thermal noise at the amplifier input. If this resistor must be added, its value must be selected as small as possible.

Figure 2. Input Current-Limit Protection

Rail-to-Rail Output

The SGM8958-1/2 support rail-to-rail output operation. In single power supply application, for example, when $+V_S = 5V$, $-V_S = GND$, 10k Ω load resistor is tied from OUT pin to $V_S/2$, the typical output swing range is from 0.005V to 4.995V.

Driving Capacitive Loads

The SGM8958-1/2 are designed for driving the 1nF capacitive load with unity-gain stable. If greater capacitive load must be driven in application, the circuit in Figure 3 can be used. In this circuit, the IR drop voltage generated by R_{ISO} is compensated by feedback loop.

Figure 3. Circuit to Drive Heavy Capacitive Load

Power Supply Decoupling and Layout

A clean and low noise power supply is very important in amplifier circuit design. Besides of input signal noise, the power supply is one of important source of noise to the amplifiers through $+V_S$ and $-V_S$ pins. Power supply bypassing is an effective method to clear up the noise at power supply, and the low impedance path to ground of decoupling capacitor will bypass the noise to GND. In application, 10 μ F ceramic capacitor paralleled with 0.1 μ F or 0.01 μ F ceramic capacitor is used in Figure 4. The ceramic capacitors should be placed as close as possible to $+V_S$ and $-V_S$ power supply pins.

Figure 4. Amplifier Power Supply Bypassing

APPLICATION INFORMATION (continued)

Grounding

In low speed application, one node grounding technique is the simplest and most effective method to eliminate the noise generated by grounding. In high speed application, the general method to eliminate noise is to use a complete ground plane technique, and the whole ground plane will help distribute heat and reduce EMI noise pickup.

Reduce Input-to-Output Coupling

To reduce the input-to-output coupling, the input traces must be placed as far away from the power supply or output traces as possible. The sensitive trace must not be placed in parallel with the noisy trace in the same layer. They must be placed perpendicularly in different layers to reduce the crosstalk. These PCB layout techniques will help to reduce unwanted positive feedback and noise.

Typical Application Circuits

Difference Amplifier

The circuit in Figure 5 is a design example of classical difference amplifier. If $R_4/R_3 = R_2/R_1$, then $V_{OUT} = (V_P - V_N) \times R_2/R_1 + V_{REF}$.

Figure 5. Difference Amplifier

High Input Impedance Difference Amplifier

The circuit in Figure 6 is a design example of high input impedance difference amplifier. The added amplifiers at the input are used to increase the input impedance and eliminate drawback of low input impedance in Figure 5.

Figure 6. High Input Impedance Difference Amplifier

Active Low-Pass Filter

The circuit in Figure 7 is a design example of active low-pass filter, the DC gain is equal to $-R_2/R_1$ and the -3dB corner frequency is equal to $1/(2\pi R_2 C)$. In this design, the filter bandwidth must be less than the bandwidth of the amplifier, and the resistor values must be selected as low as possible to reduce ringing or oscillation generated by the parasitic parameters in PCB layout.

Figure 7. Active Low-Pass Filter
