To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: http://www.renesas.com

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (http://www.renesas.com)

Send any inquiries to http://www.renesas.com/inquiry.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.

   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.

   "Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

MOS INTEGRATED CIRCUIT

μPD44647094A, 44647184A, 44647364A, 44647096A, 44647186A, 44647366A

72M-BIT QDR™ II+ SRAM
2.0 & 2.5 CLOCK CYCLES READ LATENCY
4-WORD BURST OPERATION

Description

The μPD44647094A and μPD44647096A are 8,388,608-word by 9-bit, the μPD44647184A and μPD44647186A are 4,194,304-word by 18-bit and the μPD44647364A and μPD44647366A are 2,097,152-word by 36-bit synchronous quad data rate static RAM fabricated with advanced CMOS technology using full CMOS six-transistor memory cell.
The μPD44647xx4A is for 2.0 clock cycles and the μPD44647xx6A is for 2.5 clock cycles read latency. The μPD44647094A, μPD44647096A, μPD44647184A, μPD44647186A, μPD44647364A and μPD44647366A integrate unique synchronous peripheral circuitry and a burst counter. All input registers controlled by an input clock pair (K and K#) are latched on the positive edge of K and K#.

These products are suitable for application which require synchronous operation, high speed, low voltage, high density and wide bit configuration.

These products are packaged in 165-pin PLASTIC BGA.

Features

- 1.8 ± 0.1 V power supply
- 165-pin PLASTIC BGA (15 x 17)
- HSTL interface
- DLL/PLL circuitry for wide output data valid window and future frequency scaling
- Separate independent read and write data ports with concurrent transactions
- 100% bus utilization DDR READ and WRITE operation
- Four-tick burst for reduced address frequency
- Two input clocks (K and K#) for precise DDR timing at clock rising edges only
- Two Echo clocks (CQ and CQ#)
- Data Valid pin (QVLD) supported
- Read latency : 2.0 & 2.5 clock cycles (Not selectable by user)
- Internally self-timed write control
- Clock-stop capability. Normal operation is restored in 20 μs after clock is resumed.
- User programmable impedance output (35 to 70 Ω)
- Fast clock cycle time : 2.5 ns (400 MHz) for 2.0 clock cycles read latency,
  2.0 ns (500 MHz) for 2.5 clock cycles read latency
- Simple control logic for easy depth expansion
- JTAG 1149.1 compatible test access port
- On-Die Termination (ODT) for better signal quality (Selectable ON/OFF by user)

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.
Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.

Feature Differences between QDR II and QDR II+

Features	QDR II	QDR II+	Note
Frequency (DLL/PLL ON)	200 MHz to 333 MHz	300 MHz to 500 MHz	
Organization	x9 / x18 / x36	x9 / x18 / x36	
V_{DD}	1.8 ± 0.1 V	1.8 ± 0.1 V	
$V_{DD}Q$	1.8 ± 0.1 V or 1.5 ± 0.1 V	1.8 ± 0.1 V or 1.5 ± 0.1 V	
Read Latency	1.5 clock cycles	2.0 & 2.5 clock cycles	1
Write Latency	1.0 clock cycle	1.0 clock cycle	2
Input Clocks (K, K#)	Single Ended (K, K#)	Single Ended (K, K#)	
Output Clocks (C, C#)	Yes	No	
Echo Clock Number (CQ, CQ#)	1 Pair	1 Pair	3
Package	165-pin PLASTIC BGA (15 x 17)	165-pin PLASTIC BGA (15 x 17)	
Individual Byte Write (BWx#)	Yes	Yes	
QVLD	No	Yes	4
ODT	No	Yes	5

Notes 1. QDR II+ read latency is not user selectable. Offered as two different devices. 2.5 clock cycle is consortium standard, and 2.0 clock cycle is vendor option.

2. QDR II+ write latency is 1.0 clock cycle regardless of read latency.

3. Echo Clocks are single-ended outputs.

4. Edge aligned with Echo Clocks

5. ODT ON/OFF is user selectable.

Pin Identification

Symbol	Type	Description
A	Input	Synchronous Address Inputs: These inputs are registered and must meet the setup and hold times around the rising edge of K. All transactions operate on a burst of four words (two clock periods of bus activity). These inputs are ignored when device is deselected, i.e., NOP (R# = W# = HIGH).
D0 to Dxx	Input	Synchronous Data Inputs: Input data must meet setup and hold times around the rising edges of K and K# during WRITE operations. See **Pin Configurations** for ball site location of individual signals. x9 device uses D0 to D8. x18 device uses D0 to D17. x36 device uses D0 to D35.
Q0 to Qxx	Output	Synchronous Data Outputs: Output data is synchronized to the respective K and K# rising edges. Data is output in synchronization with K and K#, depending on the R# command. See **Pin Configurations** for ball site location of individual signals. x9 device uses Q0 to Q8. x18 device uses Q0 to Q17. x36 device uses Q0 to Q35.
R#	Input	Synchronous Read: When LOW this input causes the address inputs to be registered and a READ cycle to be initiated. This input must meet setup and hold times around the rising edge of K. If a READ command (R# = LOW) is input, an input of R# on the subsequent rising edge of K is ignored.
W#	Input	Synchronous Write: When LOW this input causes the address inputs to be registered and a WRITE cycle to be initiated. This input must meet setup and hold times around the rising edge of K. If a WRITE command (W# = LOW) is input, an input of W# on the subsequent rising edge of K is ignored.
BWx#	Input	Synchronous Byte Writes: When LOW these inputs cause their respective byte to be registered and written during WRITE cycles. These signals must meet setup and hold times around the rising edges of K and K# for each of the two rising edges comprising the WRITE cycle. See **Pin Configurations** for signal to data relationships. x9 device uses BW0#. x18 device uses BW0#, BW1#. x36 device uses BW0# to BW3#. See **Byte Write Operation** for relation between BWx# and Dxx.
K, K#	Input	Input Clock: This input clock pair registers address and control inputs on the rising edge of K, and registers data on the rising edge of K and the rising edge of K#. K# is ideally 180 degrees out of phase with K. All synchronous inputs must meet setup and hold times around the clock rising edges.
CQ, CQ#	Output	Synchronous Echo Clock Outputs. The rising edges of these outputs are tightly matched to the synchronous data outputs and can be used as a data valid indication. These signals run freely and do not stop when Q tristates. If K and K# are stopped, CQ and CQ# will also stop.
ZQ	Input	Output Impedance Matching Input: This input is used to tune the device outputs to the system data bus impedance. Q, CQ, CQ# and QVLD output impedance are set to 0.2 x RQ, where RQ is a resistor from this bump to ground. The output impedance can be minimized by directly connect ZQ to $V_{DD}Q$. This pin cannot be connected directly to GND or left unconnected. The output impedance is adjusted every 20 μs upon power-up to account for drifts in supply voltage and temperature. After replacement for a resistor, the new output impedance is reset by implementing power-on sequence.
DLL#	Input	DLL/PLL Disable: When DLL# is LOW, the operation can be performed at a clock frequency slower than TKHKH (MAX.) without the DLL/PLL circuit being used. The AC/DC characteristics cannot be guaranteed. For normal operation, DLL# must be HIGH and it can be connected to $V_{DD}Q$ through a 10 kΩ or less resistor.
QVLD	Output	Q valid Output: The Q Valid indicates valid output data. QVLD is edge aligned with CQ and CQ#.
ODT	Input	ODT Control Input: When the ODT control pin is HIGH, the ODT function is turned on at Dxx and BWx# pins. The ODT resistors are set to 0.6 x RQ, where RQ is a resistor from ZQ pin bump to ground. When the ODT Control pin is LOW or No Connect, the ODT function is turned off. The ODT ON/OFF is set at power-on sequence. The ODT can not change the state after power-on. To enable ODT function, ODT pin must be HIGH and it can be connected to $V_{DD}Q$ through a 10 kΩ or less resistor.
TMS TDI	Input	IEEE 1149.1 Test Inputs: 1.8 V I/O level. These balls may be left Not Connected if the JTAG function is not used in the circuit.
TCK	Input	IEEE 1149.1 Clock Input: 1.8 V I/O level. This pin must be tied to V_{SS} if the JTAG function is not used in the circuit.
TDO	Output	IEEE 1149.1 Test Output: 1.8 V I/O level. When providing any external voltage to TDO signal, it is recommended to pull up to V_{DD}.
V_{REF}	–	HSTL Input Reference Voltage: Nominally $V_{DD}Q/2$. Provides a reference voltage for the input buffers.
V_{DD}	Supply	Power Supply: 1.8 V nominal. See **Recommended DC Operating Conditions** and **DC Characteristics** for range.
$V_{DD}Q$	Supply	Power Supply: Isolated Output Buffer Supply. Nominally 1.5 V. 1.8 V is also permissible. See **Recommended DC Operating Conditions** and **DC Characteristics for range.**
V_{SS}	Supply	Power Supply: Ground
NC	–	No Connect: These signals are not connected internally.

Power-On Sequence in QDR II+ SRAM

QDR II+ SRAMs must be powered up and initialized in a predefined manner to prevent undefined operations. The following timing charts show the recommended power-on sequence.

The following power-up supply voltage application is recommended: V_{SS}, V_{DD}, $V_{DD}Q$, V_{REF}, then V_{IN}. V_{DD} and $V_{DD}Q$ can be applied simultaneously, as long as $V_{DD}Q$ does not exceed V_{DD} by more than 0.5 V during power-up. The following power-down supply voltage removal sequence is recommended: V_{IN}, V_{REF}, $V_{DD}Q$, V_{DD}, V_{SS}. V_{DD} and $V_{DD}Q$ can be removed simultaneously, as long as $V_{DD}Q$ does not exceed V_{DD} by more than 0.5 V during power-down.

Power-On Sequence

Apply power and tie DLL# to HIGH.

- Apply V_{DD} before $V_{DD}Q$.
- Apply $V_{DD}Q$ before V_{REF} or at the same time as V_{REF}.

Select ODT ON/OFF.

Provide stable clock for more than 20 μs to lock the DLL/PLL.

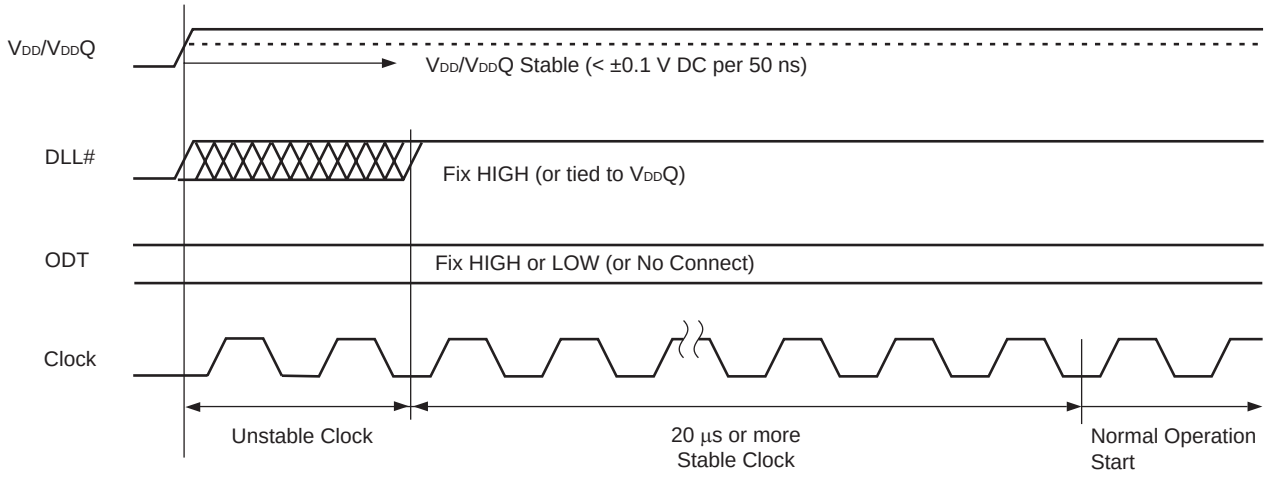

DLL/PLL Constraints

The DLL/PLL uses K clock as its synchronizing input and the input should have low phase jitter which is specified as TKC var. The DLL/PLL can cover 190 MHz as the lowest frequency. If the input clock is unstable and the DLL/PLL is enabled, then the DLL/PLL may lock onto an undesired clock frequency.

ODT initialization

The ODT ON/OFF is set at power-on sequence. When the ODT Control pin is HIGH before applying stable clock, the ODT function is turn on. When the ODT Control pin is LOW or No Connect, the ODT function is off. The ODT can not change the state after power-on.

Power-On Waveforms

Downloaded from Arrow.com.

On-Die Termination (ODT)

On-Die Termination (ODT) is enabled by setting ODT control pin to HIGH at power-on sequence. The ODT resistors (R_{TT}) are set to 0.6 x RQ, where RQ is a resistor from ZQ pin bump to ground. With ODT on, all the Ds and BW#s are terminated to $V_{DD}Q$ and V_{SS} with a resistance R_{TT} x 2. The command, address, and clock signals are not terminated. Figure below shows the equivalent circuit of a Dxx and BWx# receiver with ODT. ODT at the Ds and BW#s are always on.

When the ODT control pin is LOW or No Connect at power-on sequence, the ODT function is always off.

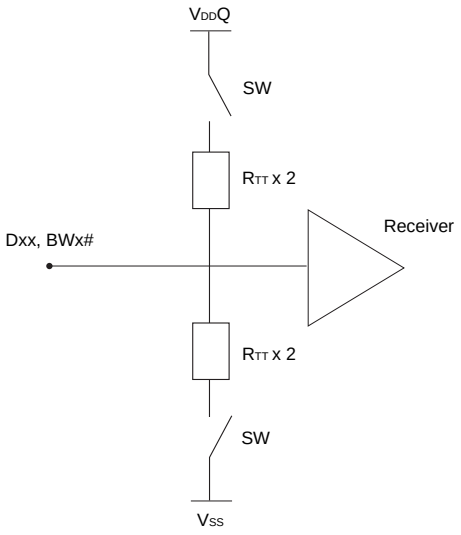

When the ODT be changed the state after power-on, the AC/DC characteristics cannot be guaranteed.

On-Die Termination DC Parameters

Description	Symbol	MIN.	TYP.	MAX.	Units
On-Die termination	R_{TT}	105	150	210	Ω
External matching resistor	RQ	175	250	350	Ω

Remark The allowable range of RQ to guarantee impedance matching a tolerance of ± 20 % is between 175 Ω and 350 Ω.

On- Die Termination-Equivalent Circuit

QDR Consortium specification for ODT is defined when 6R is HIGH and vendor specification when 6R is LOW or Floating. NEC specification is "Disabled" with 6R LOW or Floating as follows.

ODT-option clarification

6R input	ODT function		Termination value	
	Consortium specification	NEC specification	Consortium specification	NEC specification
HIGH	Active	Active	R_{TT} = 0.6 x RQ	R_{TT} = 0.6 x RQ
LOW	Vendor specification	Disabled	Vendor specification	–
Floating	Vendor specification	Disabled	Vendor specification	–

Note In case of nominal value (RQ = 250 Ω), R_{TT} = 150 Ω.

Truth Table

2.0 Clock Cycles Read Latency

[μPD44647094A], [μPD44647184A], [μPD44647364A]

Operation	CLK	R#	W#	D or Q				
WRITE cycle	L → H	H	L	Data in				
Load address, input write data on two				Input data	D_A(A+0)	D_A(A+1)	D_A(A+2)	D_A(A+3)
consecutive K and K# rising edge				Input clock	K(t+1) ↑	K#(t+1) ↑	K(t+2) ↑	K#(t+2) ↑
READ cycle	L → H	L	X	Data out				
Load address, read data on two				Output data	Q_A(A+0)	Q_A(A+1)	Q_A(A+2)	Q_A(A+3)
consecutive K and K# rising edge				Output clock	K(t+2) ↑	K#(t+2) ↑	K(t+3) ↑	K#(t+3) ↑
NOP (No operation)	L → H	H	H	D = X, Q = High-Z				
Clock stop	Stopped	X	X	Previous state				

2.5 Clock Cycles Read Latency

[μPD44647096A], [μPD44647186A], [μPD44647366A]

Operation	CLK	R#	W#	D or Q				
WRITE cycle	L → H	H	L	Data in				
Load address, input write data on two				Input data	D_A(A+0)	D_A(A+1)	D_A(A+2)	D_A(A+3)
consecutive K and K# rising edge				Input clock	K(t+1) ↑	K#(t+1) ↑	K(t+2) ↑	K#(t+2) ↑
READ cycle	L → H	L	X	Data out				
Load address, read data on two				Output data	Q_A(A+0)	Q_A(A+1)	Q_A(A+2)	Q_A(A+3)
consecutive K and K# rising edge				Output clock	K#(t+2) ↑	K(t+3) ↑	K#(t+3) ↑	K(t+4) ↑
NOP (No operation)	L → H	H	H	D = X, Q = High-Z				
Clock stop	Stopped	X	X	Previous state				

Remarks Remarks listed below are for both products with 2.0 and 2.5 Clock Cycles Read Latency.

1. H : HIGH, L : LOW, × : don't care, ↑ : rising edge.
2. Data inputs are registered at K and K# rising edges. Data outputs are delivered at K and K# rising edges.
3. All control inputs in the truth table must meet setup/hold times around the rising edge (LOW to HIGH) of K. All control inputs are registered during the rising edge of K.
4. This device contains circuitry that ensure the outputs to be in high impedance during power-up.
5. Refer to state diagram and timing diagrams for clarification.
6. It is recommended that K = K# when clock is stopped. This is not essential but permits most rapid restart by overcoming transmission line charging symmetrically.
7. If R# was LOW to initiate the previous cycle, this signal becomes a don't care for this WRITE operation however it is strongly recommended that this signal is brought HIGH as shown in the truth table.
8. W# during write cycle and R# during read cycle were HIGH on previous K clock rising edge. Initiating consecutive READ or WRITE operations on consecutive K clock rising edges is not permitted. The device will ignore the second request.

Downloaded from Arrow.com.

Byte Write Operation

[μPD44647094A], [μPD44647096A]

Operation	K	K#	BW0#
Write D0 to D8	L → H	–	0
	–	L → H	0
Write nothing	L → H	–	1
	–	L → H	1

Remarks 1. H : HIGH, L : LOW, → : rising edge.

2. Assumes a WRITE cycle was initiated. BW0# can be altered for any portion of the BURST WRITE operation provided that the setup and hold requirements are satisfied.

[μPD44647184A], [μPD44647186A]

Operation	K	K#	BW0#	BW1#
Write D0 to D17	L → H	–	0	0
	–	L → H	0	0
Write D0 to D8	L → H	–	0	1
	–	L → H	0	1
Write D9 to D17	L → H	–	1	0
	–	L → H	1	0
Write nothing	L → H	–	1	1
	–	L → H	1	1

Remarks 1. H : HIGH, L : LOW, → : rising edge.

2. Assumes a WRITE cycle was initiated. BW0# and BW1# can be altered for any portion of the BURST WRITE operation provided that the setup and hold requirements are satisfied.

[μPD44647364A], [μPD44647366A]

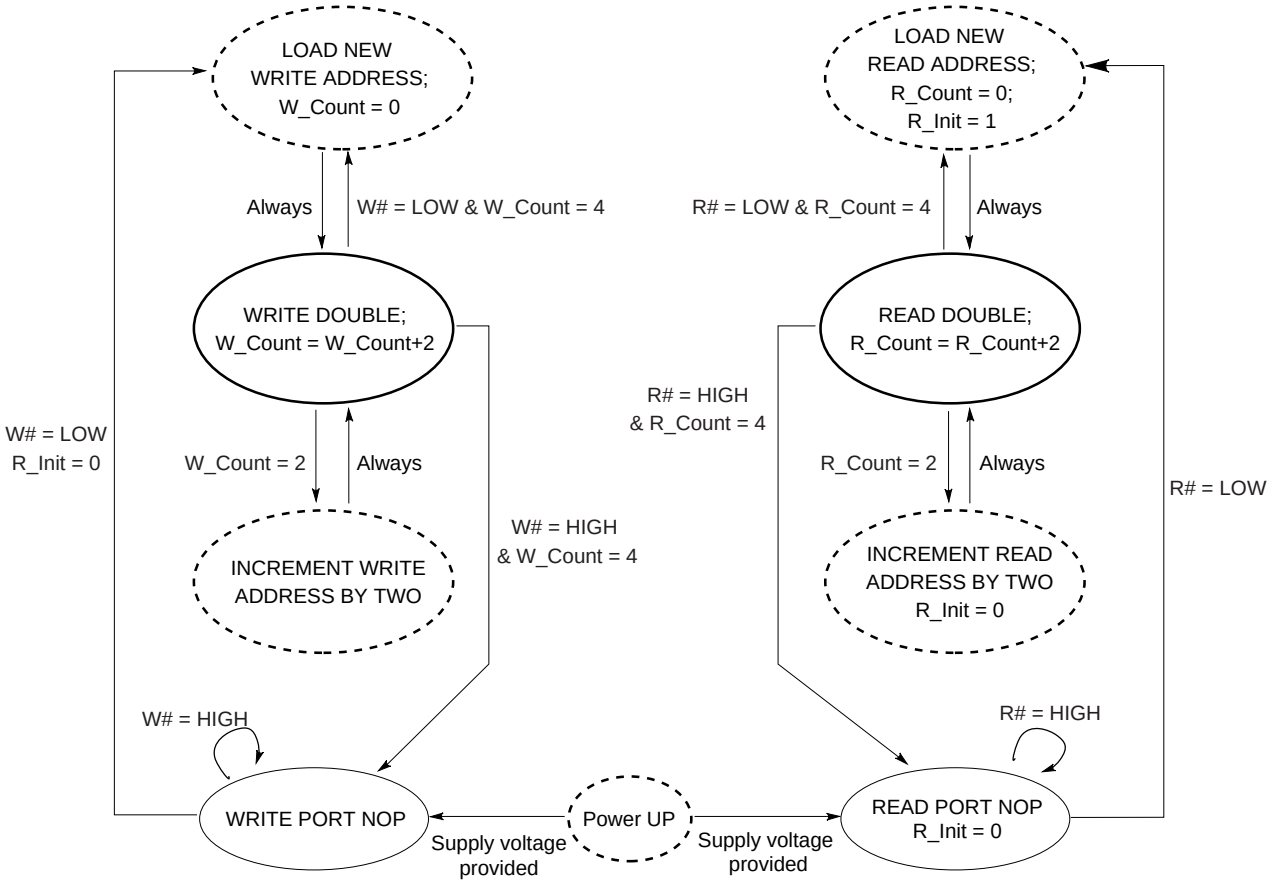

Operation	K	K#	BW0#	BW1#	BW2#	BW3#
Write D0 to D35	L → H	–	0	0	0	0
	–	L → H	0	0	0	0
Write D0 to D8	L → H	–	0	1	1	1
	–	L → H	0	1	1	1
Write D9 to D17	L → H	–	1	0	1	1
	–	L → H	1	0	1	1
Write D18 to D26	L → H	–	1	1	0	1
	–	L → H	1	1	0	1
Write D27 to D35	L → H	–	1	1	1	0
	–	L → H	1	1	1	0
Write nothing	L → H	–	1	1	1	1
	–	L → H	1	1	1	1

Remarks 1. H : HIGH, L : LOW, → : rising edge.

2. Assumes a WRITE cycle was initiated. BW0# to BW3# can be altered for any portion of the BURST WRITE operation provided that the setup and hold requirements are satisfied.

Downloaded from Arrow.com.

Bus Cycle State Diagram

Remarks 1. The address is concatenated with two additional internal LSBs to facilitate burst operation.
The address order is always fixed as: xxx...xxx+0, xxx...xxx+1, xxx...xxx+2, xxx...xxx+3.
Bus cycle is terminated at the end of this sequence (burst count = 4).

2. Read and write state machines can be active simultaneously.
Read and write cannot be simultaneously initiated. Read takes precedence.

3. State machine control timing is controlled by K.

Electrical Specifications

Absolute Maximum Ratings

Parameter	Symbol	Conditions	Rating	Unit
Supply voltage	V_{DD}		–0.5 to +2.5	V
Output supply voltage	V_{DDQ}		–0.5 to V_{DD}	V
Input voltage	V_{IN}		–0.5 to V_{DD} + 0.5 (2.5 V MAX.)	V
Input / Output voltage	$V_{I/O}$		–0.5 to V_{DDQ} + 0.5 (2.5 V MAX.)	V
Operating ambient temperature	T_A		0 to 70	°C
Storage temperature	T_{stg}		–55 to +125	°C

Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Recommended DC Operating Conditions (T_A = 0 to 70°C)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit	Note
Supply voltage	V_{DD}		1.7	1.8	1.9	V	
Output supply voltage	V_{DDQ}		1.4		V_{DD}	V	1
Input HIGH voltage	$V_{IH (DC)}$		V_{REF} + 0.1		V_{DDQ} + 0.3	V	1, 2
Input LOW voltage	$V_{IL (DC)}$		–0.3		V_{REF} – 0.1	V	1, 2
Clock input voltage	V_{IN}		–0.3		V_{DDQ} + 0.3	V	1, 2
Reference voltage	V_{REF}		0.68		0.95	V	

Notes 1. During normal operation, V_{DDQ} must not exceed V_{DD}.

2. Power-up: $V_{IH} \leq V_{DDQ}$ + 0.3 V and $V_{DD} \leq$ 1.7 V and $V_{DDQ} \leq$ 1.4 V for t ≤ 200 ms

Recommended AC Operating Conditions (T_A = 0 to 70°C)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit	Note
Input HIGH voltage	$V_{IH (AC)}$		V_{REF} + 0.2		V	1
Input LOW voltage	$V_{IL (AC)}$			V_{REF} – 0.2	V	1

Note 1. Overshoot: $V_{IH (AC)} \leq V_{DD}$ + 0.7 V (2.5 V MAX.) for t ≤ TKHKH/2

Undershoot: $V_{IL (AC)} \geq$ – 0.5 V for t ≤ TKHKH/2

Control input signals may not have pulse widths less than TKHKL (MIN.) or operate at cycle rates less than TKHKH (MIN.).

Downloaded from Arrow.com.

DC Characteristics (T_A = 0 to 70°C, V_{DD} = 1.8 ± 0.1 V)

Parameter	Symbol	Test condition		MIN.	MAX.			Unit	Note
					x9	x18	x36		
Input leakage current	I_{LI}			–2	+2			μA	4, 5
I/O leakage current	I_{LO}			–2	+2			μA	4
Operating supply current (Read cycle / Write cycle)	I_{DD}	$V_{IN} \leq V_{IL}$ or $V_{IN} \geq V_{IH}$	-E20 Note1		780	850	1000	mA	
		$I_{I/O}$ = 0 mA	-E22 Note1		730	795	925		
		Cycle = MAX.	-E25		690	740	850		
			-E30		580	650	720		
			-E33		520	590	650		
Standby supply current (NOP)	I_{SB1}	$V_{IN} \leq V_{IL}$ or $V_{IN} \geq V_{IH}$	-E20 Note1		460	480	530	mA	
		$I_{I/O}$ = 0 mA	-E22 Note1		440	455	500		
		Cycle = MAX.	-E25		410	430	470		
		Inputs static	-E30		380	400	440		
			-E33		370	390	430		
Output HIGH voltage	$V_{OH(Low)}$	$\|I_{OH}\| \leq 0.1$ mA		$V_{DD}Q$ – 0.2	$V_{DD}Q$			V	6, 7
	V_{OH}	**Note3**		$V_{DD}Q/2$–0.12	$V_{DD}Q/2$+0.12				6, 7
Output LOW voltage	$V_{OL(Low)}$	$I_{OL} \leq 0.1$ mA		V_{SS}	0.2			V	6, 7
	V_{OL}	**Note4**		$V_{DD}Q/2$–0.12	$V_{DD}Q/2$+0.12				6, 7

Notes 1. -E20 and -E22 are valid for 2.5 Clock Cycles Read Latency products.

2. Outputs are impedance-controlled. $|I_{OH}| = (V_{DD}Q/2)/(RQ/5)$ ±15% for values of 175 Ω ≤ RQ ≤ 350 Ω.

3. Outputs are impedance-controlled. $I_{OL} = (V_{DD}Q/2)/(RQ/5)$ ±15% for values of 175 Ω ≤ RQ ≤ 350 Ω.

4. Measured with ODT off.

5. ODT pin is internally tied to V_{SS}, so input leakage current value is ±5 μA.

6. AC load current is higher than the shown DC values.

7. HSTL outputs meet JEDEC HSTL Class I standards.

Capacitance (T_A = 25°C, f = 1 MHz)

Parameter	Symbol	Test conditions	MIN.	MAX.	Unit
Input capacitance (Address, Control)	C_{IN}	V_{IN} = 0 V		4	pF
Input / Output capacitance (D, Q, CQ, CQ#, QVLD)	$C_{I/O}$	$V_{I/O}$ = 0 V		5	pF
Clock Input capacitance	C_{clk}	V_{clk} = 0 V		4	pF

Remark These parameters are periodically sampled and not 100% tested.

Hold Times													
K rising edge to address hold	TKHAX	0.33		0.4		0.4		0.4		0.4		ns	8
K rising edge to control inputs (R#, W#) hold	TKHIX	0.33		0.4		0.4		0.4		0.4		ns	8
K, K# rising edge to data inputs and write data select inputs (BWx#) hold	TKHDX	0.25		0.28		0.28		0.28		0.28		ns	8

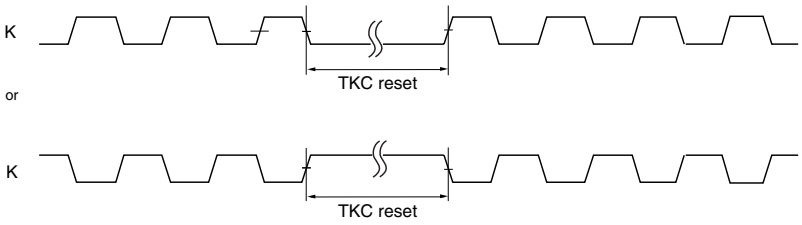

Notes 1. -E20 and -E22 are valid for 2.5 Clock Cycles Read Latency products.

2. When debugging the system or board, these products can operate at a clock frequency slower than TKHKH (MAX.) without the DLL/PLL circuit being used, if DLL# = LOW. Read latency (RL) is changed to 1.0 clock cycle regardless of RL = 2.0 and 2.5 clock cycles products in this operation. The AC/DC characteristics cannot be guaranteed, however.

3. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge. TKC var (MAX.) indicates a peak-to-peak value.

Downloaded from Arrow.com.

4. V_{DD} slew rate must be less than 0.1 V DC per 50 ns for DLL/PLL lock retention.
   DLL/PLL lock time begins once V_{DD} and input clock are stable.
   It is recommended that the device is kept NOP (R# = W# = HIGH) during these cycles.
5. K input is monitored for this operation. See below for the timing.

6. Guaranteed by design.
7. Echo clock is very tightly controlled to data valid / data hold. By design, there is a ± 0.1 ns variation from echo clock to data. The data sheet parameters reflect tester guardbands and test setup variations.
8. This is a synchronous device. All addresses, data and control lines must meet the specified setup and hold times for all latching clock edges.

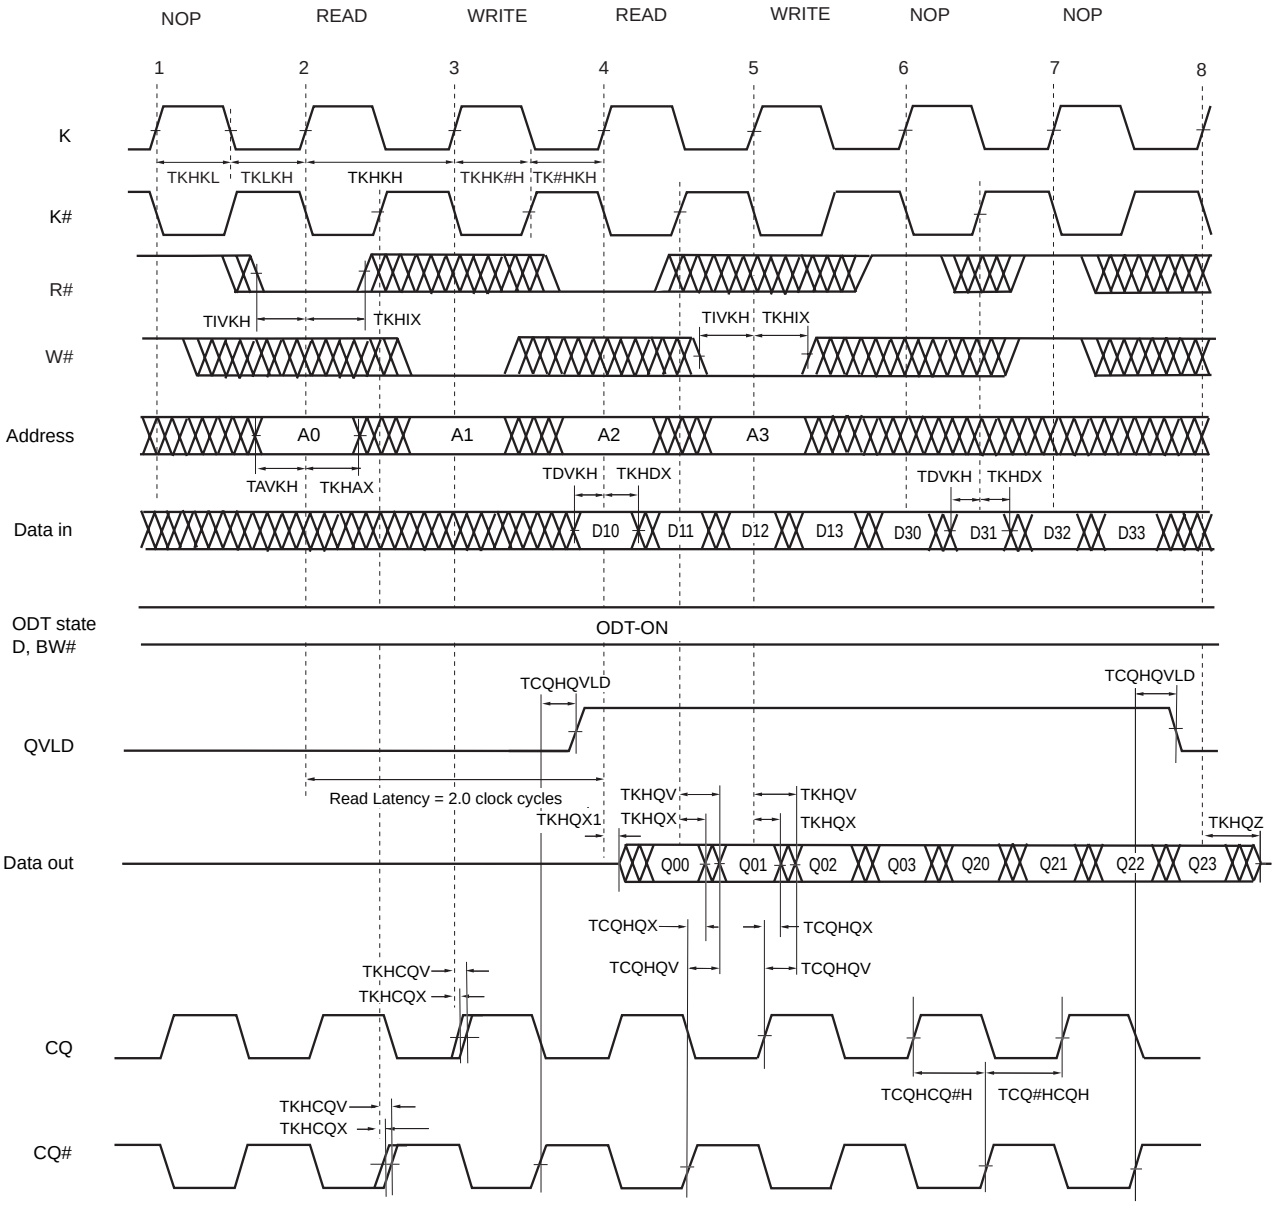

Remarks 1. This parameter is sampled.
2. Test conditions as specified with the output loading as shown in AC Test Conditions unless otherwise noted.
3. Control input signals may not be operated with pulse widths less than TKHKL (MIN.).
4. $V_{DD}Q$ is 1.5 V DC.

Downloaded from Arrow.com.

Read and Write Timing

2.0 Clock Cycles Read Latency

[μPD44647094A], [μPD44647184A], [μPD44647364A]

Remarks 1. Q00 refers to output from address A0+0.
Q01 refers to output from the next internal burst address following A0,i.e.,A0+1.

2. Outputs are disabled (high impedance) 4.0 clock cycles after the last READ (R# = LOW) is input in the sequences of [READ]-[NOP]-[NOP], [READ]-[WRITE]-[NOP] and [READ]-[NOP]-[WRITE].

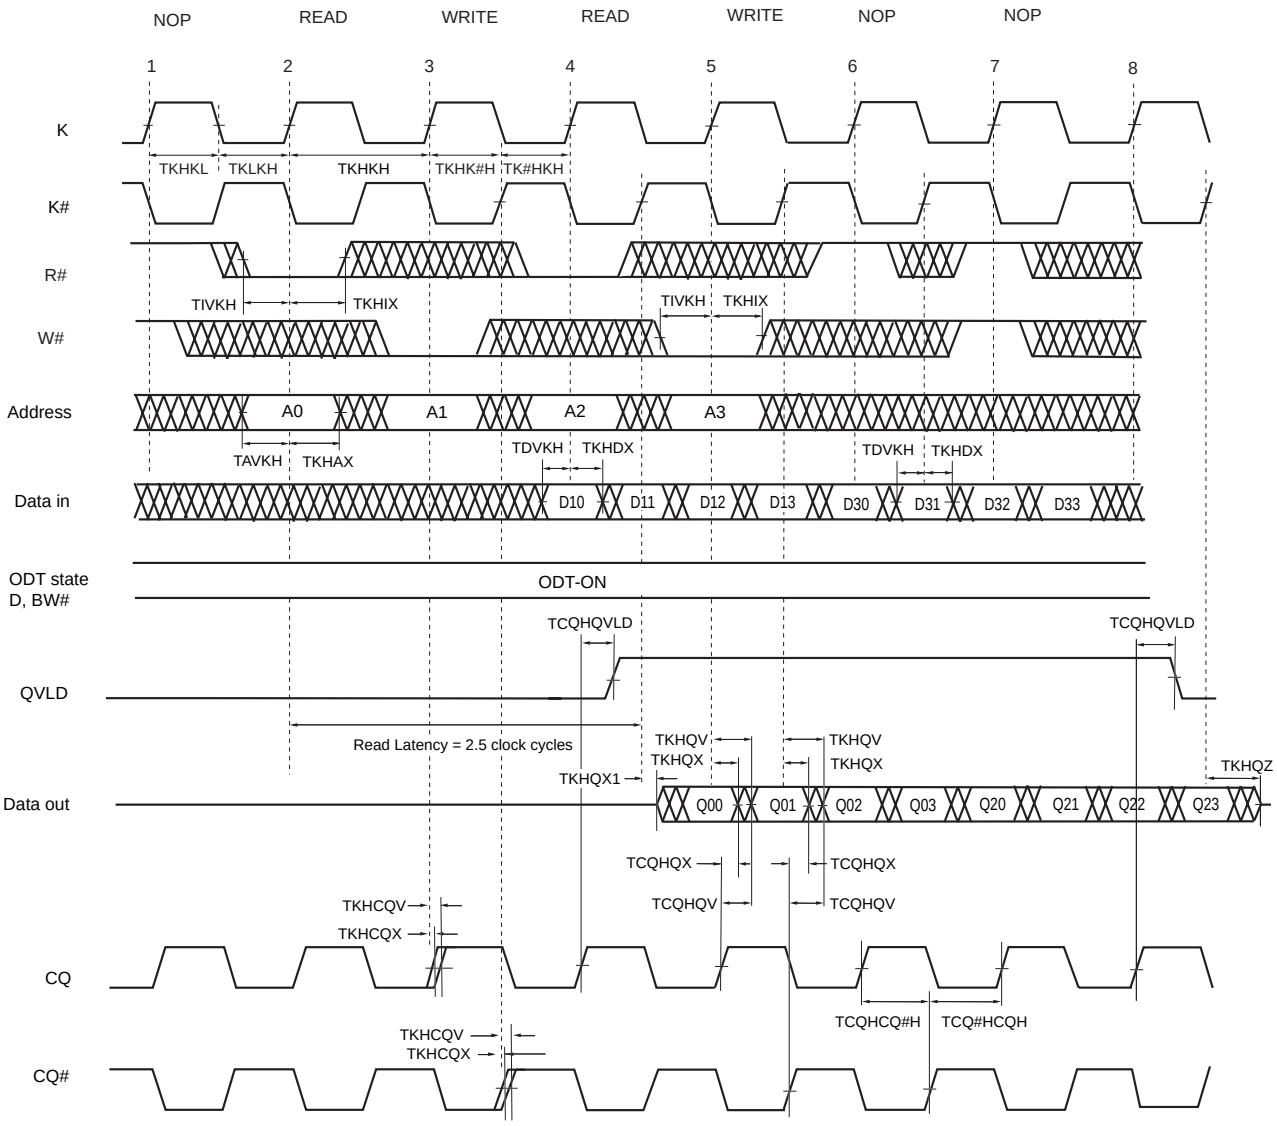

3. In this example, if address A2 = A1, data Q20 = D10, Q21 = D11, Q22 = D12 and Q23 = D13.
Write data is forwarded immediately as read results. This remark applies to whole diagram.

4. When the ODT control pin is LOW or No Connect, the ODT function is always off.

Downloaded from Arrow.com.

2.5 Clock Cycles Read Latency

[μPD44647096A], [μPD44647186A], [μPD44647366A]

Remarks 1. Q00 refers to output from address A0+0.
Q01 refers to output from the next internal burst address following A0,i.e.,A0+1.

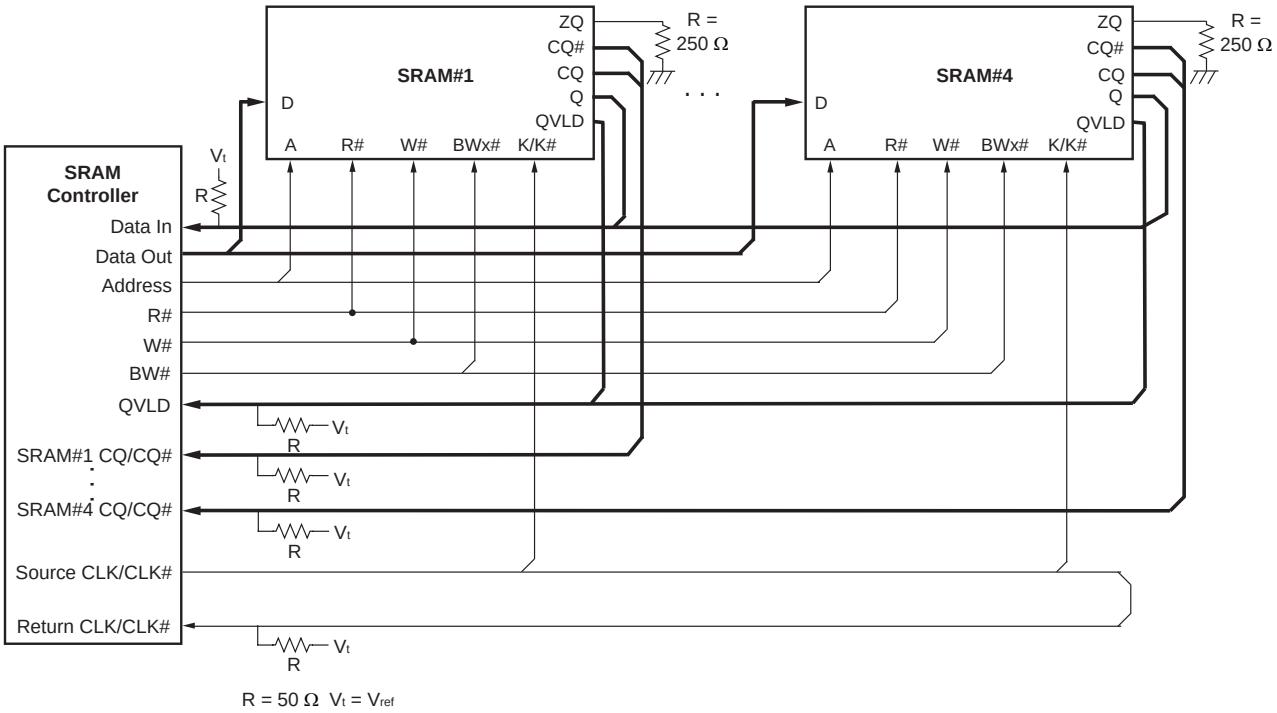

2. Outputs are disabled (high impedance) 4.5 clock cycles after the last READ (R# = LOW) is input in the sequences of [READ]-[NOP]-[NOP], [READ]-[WRITE]-[NOP] and [READ]-[NOP]-[WRITE].

3. In this example, if address A2 = A1, data Q20 = D10, Q21 = D11, Q22 = D12 and Q23 = D13.
Write data is forwarded immediately as read results. This remark applies to the whole diagram.

4. When the ODT control pin is LOW or No Connect, the ODT function is always off.

Downloaded from Arrow.com.

Application Example

Remark AC specifications are defined at the condition of SRAM outputs, CQ, CQ#, QVLD and Q with termination. Ds and BW#s have ODT.

Downloaded from Arrow.com.

JTAG Specification

These products support a limited set of JTAG functions as in IEEE standard 1149.1.

Test Access Port (TAP) Pins

Pin name	Pin assignments	Description
TCK	2R	Test Clock Input. All input are captured on the rising edge of TCK and all outputs propagate from the falling edge of TCK.
TMS	10R	Test Mode Select. This is the command input for the TAP controller state machine.
TDI	11R	Test Data Input. This is the input side of the serial registers placed between TDI and TDO. The register placed between TDI and TDO is determined by the state of the TAP controller state machine and the instruction that is currently loaded in the TAP instruction.
TDO	1R	Test Data Output. This is the output side of the serial registers placed between TDI and TDO. Output changes in response to the falling edge of TCK.

Remark The device does not have TRST (TAP reset). The Test-Logic Reset state is entered while TMS is held HIGH for five rising edges of TCK. The TAP controller state is also reset on the SRAM POWER-UP.

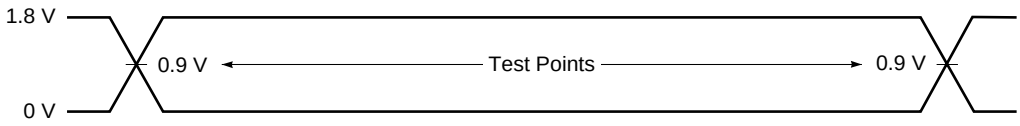

JTAG DC Characteristics (T_A = 0 to 70°C, V_{DD} = 1.8 ± 0.1 V, unless otherwise noted)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
JTAG Input leakage current	I_{LI}	0 V ≤ V_{IN} ≤ V_{DD}	–5.0	+5.0	μA
JTAG I/O leakage current	I_{LO}	0 V ≤ V_{IN} ≤ V_{DD}Q, Outputs disabled	–5.0	+5.0	μA
JTAG input HIGH voltage	V_{IH}		1.3	V_{DD}+0.3	V
JTAG input LOW voltage	V_{IL}		–0.3	+0.5	V
JTAG output HIGH voltage	V_{OH1}	| I_{OHC} | = 100 μA	1.6		V
	V_{OH2}	| I_{OHT} | = 2 mA	1.4		V
JTAG output LOW voltage	V_{OL1}	I_{OLC} = 100 μA		0.2	V
	V_{OL2}	I_{OLT} = 2 mA		0.4	V

Scan Register Definition (1)

Register name	Description
Instruction register	The instruction register holds the instructions that are executed by the TAP controller when it is moved into the run-test/idle or the various data register state. The register can be loaded when it is placed between the TDI and TDO pins. The instruction register is automatically preloaded with the IDCODE instruction at power-up whenever the controller is placed in test-logic-reset state.
Bypass register	The bypass register is a single bit register that can be placed between TDI and TDO. It allows serial test data to be passed through the RAMs TAP to another device in the scan chain with as little delay as possible.
ID register	The ID Register is a 32 bit register that is loaded with a device and vendor specific 32 bit code when the controller is put in capture-DR state with the IDCODE command loaded in the instruction register. The register is then placed between the TDI and TDO pins when the controller is moved into shift-DR state.
Boundary register	The boundary register, under the control of the TAP controller, is loaded with the contents of the RAMs I/O ring when the controller is in capture-DR state and then is placed between the TDI and TDO pins when the controller is moved to shift-DR state. Several TAP instructions can be used to activate the boundary register. The Scan Exit Order tables describe which device bump connects to each boundary register location. The first column defines the bit's position in the boundary register. The second column is the name of the input or I/O at the bump and the third column is the bump number.

Scan Register Definition (2)

Register name	Bit size	Unit
Instruction register	3	bit
Bypass register	1	bit
ID register	32	bit
Boundary register	109	bit

JTAG Instructions

Instructions	Description
EXTEST	The EXTEST instruction allows circuitry external to the component package to be tested. Boundary-scan register cells at output pins are used to apply test vectors, while those at input pins capture test results. Typically, the first test vector to be applied using the EXTEST instruction will be shifted into the boundary scan register using the PRELOAD instruction. Thus, during the update-IR state of EXTEST, the output drive is turned on and the PRELOAD data is driven onto the output pins.
IDCODE	The IDCODE instruction causes the ID ROM to be loaded into the ID register when the controller is in capture-DR mode and places the ID register between the TDI and TDO pins in shift-DR mode. The IDCODE instruction is the default instruction loaded in at power up and any time the controller is placed in the test-logic-reset state.
BYPASS	When the BYPASS instruction is loaded in the instruction register, the bypass register is placed between TDI and TDO. This occurs when the TAP controller is moved to the shift-DR state. This allows the board level scan path to be shortened to facilitate testing of other devices in the scan path.
SAMPLE / PRELOAD	SAMPLE / PRELOAD is a Standard 1149.1 mandatory public instruction. When the SAMPLE / PRELOAD instruction is loaded in the instruction register, moving the TAP controller into the capture-DR state loads the data in the RAMs input and Q pins into the boundary scan register. Because the RAM clock(s) are independent from the TAP clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while the input buffers are in transition (i.e., in a metastable state). Although allowing the TAP to sample metastable input will not harm the device, repeatable results cannot be expected. RAM input signals must be stabilized for long enough to meet the TAPs input data capture setup plus hold time (t_{CS} plus t_{CH}). The RAMs clock inputs need not be paused for any other TAP operation except capturing the I/O ring contents into the boundary scan register. Moving the controller to shift-DR state then places the boundary scan register between the TDI and TDO pins.
SAMPLE-Z	If the SAMPLE-Z instruction is loaded in the instruction register, all RAM Q pins are forced to an inactive drive state (high impedance) and the boundary register is connected between TDI and TDO when the TAP controller is moved to the shift-DR state.

JTAG Instruction Coding

IR2	IR1	IR0	Instruction	Note
0	0	0	EXTEST	
0	0	1	IDCODE	
0	1	0	SAMPLE-Z	1
0	1	1	RESERVED	2
1	0	0	SAMPLE / PRELOAD	
1	0	1	RESERVED	2
1	1	0	RESERVED	2
1	1	1	BYPASS	

Notes 1. TRISTATE all Q pins and CAPTURE the pad values into a SERIAL SCAN LATCH.

2. Do not use this instruction code because the vendor uses it to evaluate this product.

Downloaded from Arrow.com.

Output Pin States of CQ, CQ#, QVLD and Q

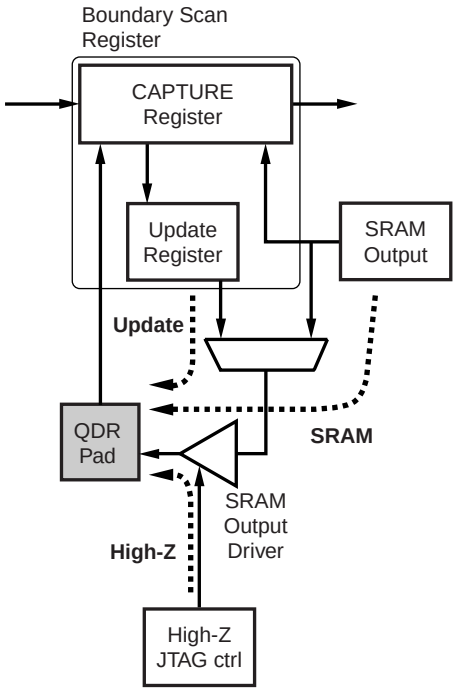

Instructions	Control-Register Status	Output Pin Status	
		CQ, CQ#, QVLD	Q
EXTEST	0	Update	High-Z
	1	Update	Update
IDCODE	0	SRAM	SRAM
	1	SRAM	SRAM
SAMPLE-Z	0	High-Z	High-Z
	1	High-Z	High-Z
SAMPLE	0	SRAM	SRAM
	1	SRAM	SRAM
BYPASS	0	SRAM	SRAM
	1	SRAM	SRAM

Remark The output pin statuses during each instruction vary according to the Control-Register status (value of Boundary Scan Register, bit no. 109).
There are three statuses:

Update : Contents of the “Update Register” are output to the output pin (QDR Pad).
SRAM : Contents of the SRAM internal output “SRAM Output” are output to the output pin (QDR Pad).
High-Z : The output pin (QDR Pad) becomes high impedance by controlling of the “High-Z JTAG ctrl”.

The Control-Register status is set during Update-DR at the EXTEST or SAMPLE instruction.

In case checking the QVLD output status in EXTEST mode, please make sure stay DLL# pin HIGH.

Downloaded from Arrow.com.

Boundary Scan Register Status of Output Pins CQ, CQ#, QVLD and Q

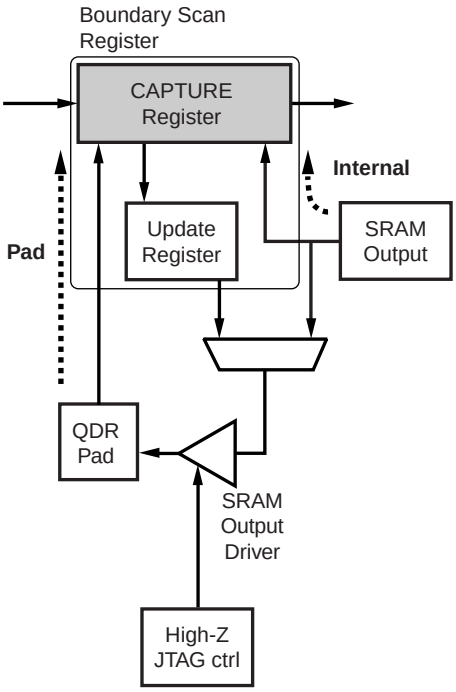

Instructions	SRAM Status	Boundary Scan Register Status		Note
		CQ, CQ#, QVLD	Q	
EXTEST	READ (Low-Z)	Pad	Pad	
	NOP (High-Z)	Pad	Pad	
IDCODE	READ (Low-Z)	–	–	No definition
	NOP (High-Z)	–	–	
SAMPLE-Z	READ (Low-Z)	Pad	Pad	
	NOP (High-Z)	Pad	Pad	
SAMPLE	READ (Low-Z)	Internal	Internal	
	NOP (High-Z)	Internal	Pad	
BYPASS	READ (Low-Z)	–	–	No definition
	NOP (High-Z)	–	–	

Remark The Boundary Scan Register statuses during execution each instruction vary according to the instruction code and SRAM operation mode.

There are two statuses:

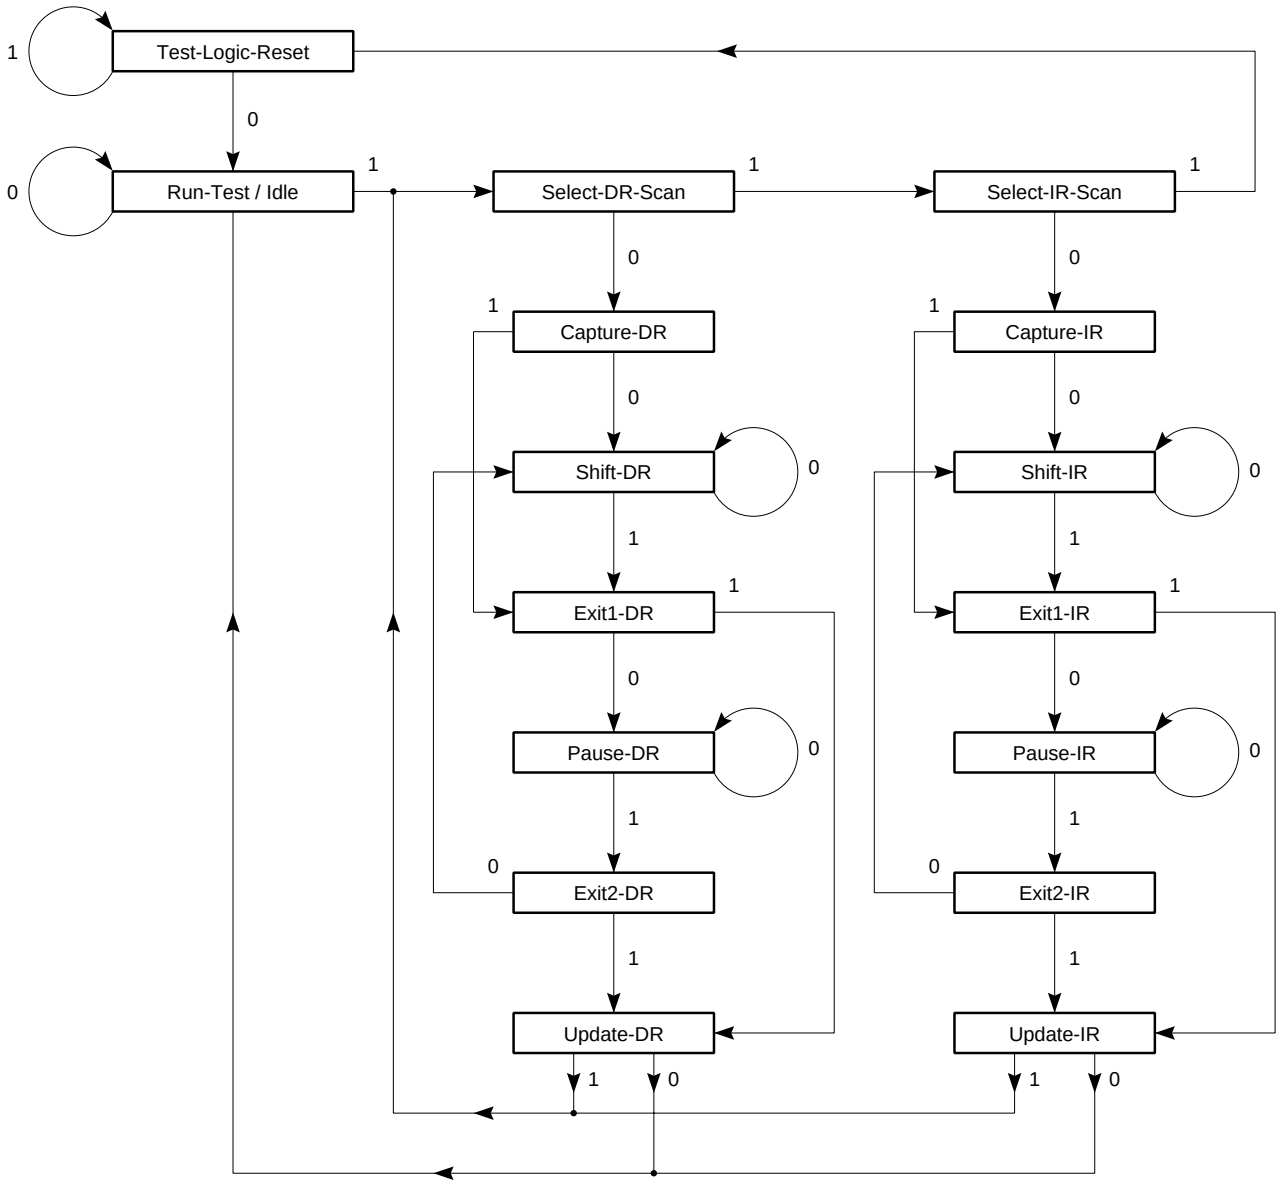

Pad : Contents of the output pin (QDR Pad) are captured in the “CAPTURE Register” in the Boundary Scan Register.

Internal : Contents of the SRAM internal output “SRAM Output” are captured in the “CAPTURE Register” in the Boundary Scan Register.

TAP Controller State Diagram

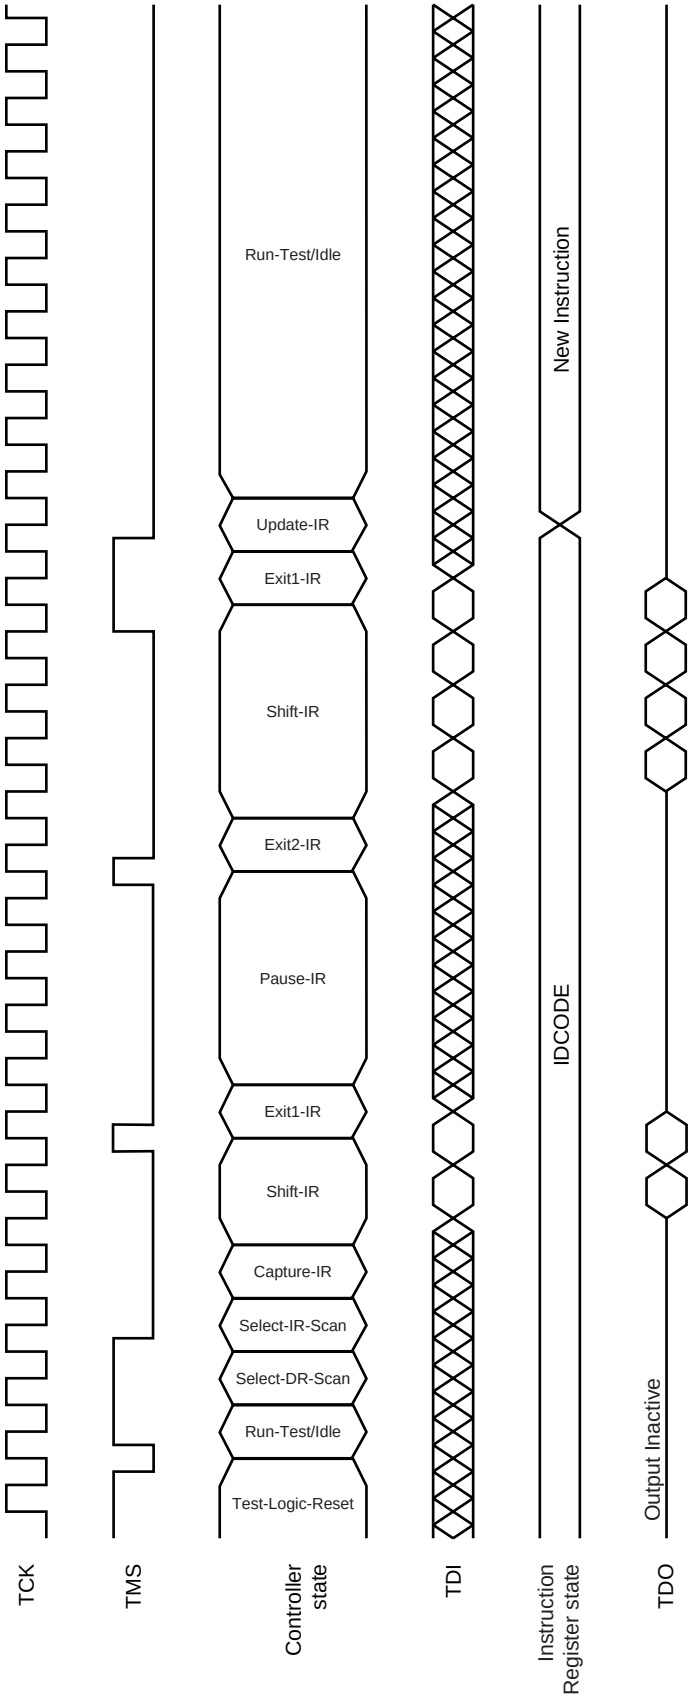

Disabling the Test Access Port

It is possible to use this device without utilizing the TAP. To disable the TAP Controller without interfering with normal operation of the device, TCK must be tied to V_{SS} to preclude mid level inputs. TDI and TMS may be left open but fix them to V_{DD} via a resistor of about 1 kΩ when the TAP controller is not used. TDO should be left unconnected also when the TAP controller is not used.

NOTES FOR CMOS DEVICES

① **VOLTAGE APPLICATION WAVEFORM AT INPUT PIN**

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (MAX) and V_{IH} (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (MAX) and V_{IH} (MIN).

② **HANDLING OF UNUSED INPUT PINS**

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

③ **PRECAUTION AGAINST ESD**

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

④ **STATUS BEFORE INITIALIZATION**

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

⑤ **POWER ON/OFF SEQUENCE**

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current.

The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

⑥ **INPUT OF SIGNAL DURING POWER OFF STATE**

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements.

Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

QDR RAMs and Quad Data Rate RAMs comprise a new series of products developed by Cypress Semiconductor, Renesas, IDT, NEC Electronics, and Samsung.

- **The information in this document is current as of March, 2010. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**
- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. In addition, NEC Electronics products are not taken measures to prevent radioactive rays in the product design. When customers use NEC Electronics products with their products, customers shall, on their own responsibility, incorporate sufficient safety measures such as redundancy, fire-containment and anti-failure features to their products in order to avoid risks of the damages to property (including public or social property) or injury (including death) to persons, as the result of defects of NEC Electronics products.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".
  The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.
  "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.
  "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).
  "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)
(1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
(2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).
