

CC2640R2L SimpleLink™ Bluetooth® 5.1 Low Energy Wireless MCU

1 Features

- Microcontroller
 - Powerful Arm® Cortex®-M3
 - EEMBC CoreMark® score: 142
 - Up to 48-MHz clock speed
 - 275KB of nonvolatile memory including 128KB of in-system programmable flash
 - Up to 28KB of system SRAM, of which 20KB is ultra-low leakage SRAM
 - 8KB of SRAM for cache or system RAM use
 - 2-pin cJTAG and JTAG debugging
 - Supports over-the-air upgrade (OTA)
- Efficient code size architecture, placing drivers, TI-RTOS, and Bluetooth® software in ROM to make more Flash available for the application
- RoHS-compliant packages
 - 5-mm × 5-mm RHB VQFN32 (15 GPIOs)
 - 7-mm × 7-mm RGZ VQFN48 (31 GPIOs)
- Peripherals
 - All digital peripheral pins can be routed to any GPIO
 - Four general-purpose timer modules (eight 16-bit or four 32-bit timers, PWM each)
 - 12-bit ADC, 200-ksamples/s, 8-channel analog MUX
 - UART, I²C, and I2S
 - 2× SSI (SPI, MICROWIRE, TI)
 - Real-time clock (RTC)
 - AES-128 security module
 - True random number generator (TRNG)
 - Integrated temperature sensor
- External system
 - On-chip internal DC/DC converter
 - Seamless integration with CC2590 and CC2592 range extenders
 - Very few external components
 - Pin compatible with the SimpleLink™ CC2640, CC2640R2F, and CC2650 devices in 5-mm × 5-mm and 7-mm × 7-mm VQFN packages
 - Pin compatible with the SimpleLink™ CC2642R and CC2652R devices in 7-mm × 7-mm VQFN packages
 - Pin compatible with the SimpleLink™ CC1350 device in 5-mm × 5-mm VQFN packages
- Low power
 - Wide supply voltage range
 - Normal operation: 1.8 to 3.8 V
 - External regulator mode: 1.7 to 1.95 V
 - Active-mode RX: 5.9 mA
 - Active-mode TX at 0 dBm: 6.1 mA
 - Active-mode TX at +5 dBm: 9.1 mA
 - Active-mode MCU: 61 µA/MHz
 - Active-mode MCU: 48.5 CoreMark/mA
 - Standby: 1.5 µA (RTC running and RAM/CPU retention)
 - Shutdown: 100 nA (wake up on external events)
- RF section
 - 2.4-GHz RF transceiver compatible with Bluetooth low energy 5.1 and earlier LE specifications
 - Excellent receiver sensitivity (–97 dBm for BLE), selectivity, and blocking performance
 - Link budget of 102 dB for BLE
 - Programmable output power up to +5 dBm
 - Single-ended or differential RF interface
 - Suitable for systems targeting compliance with worldwide radio frequency regulations
 - ETSI EN 300 328 (Europe)
 - EN 300 440 Class 2 (Europe)
 - FCC CFR47 Part 15 (US)
 - ARIB STD-T66 (Japan)

3 Description

The CC2640R2L device is a 2.4 GHz wireless microcontroller (MCU) supporting [Bluetooth® 5.1 Low Energy](#) and Proprietary 2.4 GHz applications. The device is optimized for low-power wireless communication and advanced sensing in [medical](#), [asset tracking](#), personal electronics, retail automation, and building automation markets, and applications where industrial performance is required. The highlighted features of this device include:

- Support for [Bluetooth® 5.1](#) features: LE Coded PHYs (Long Range), LE 2-Mbit PHY (High Speed), Advertising Extensions, Multiple Advertisement Sets, as well as backwards compatibility and support for key features from the [Bluetooth® 5.0](#) and earlier Low Energy specifications.
- Fully-qualified [Bluetooth® 5.1](#) software protocol stack included with the [SimpleLink™ CC2640R2 Software Development Kit \(SDK\)](#) for developing applications on the powerful Arm® Cortex®-M3 processor.
- Flash-based architecture with Cryptographic Accelerators and provision for on-chip and off-chip OAD.
- Dedicated software controlled radio controller (Arm® Cortex®-M0) providing flexible low-power RF transceiver capability to support multiple physical layers and RF standards.
- Excellent radio sensitivity and robustness (selectivity and blocking) performance for [Bluetooth® Low Energy](#) (-97 dBm for 1Mbps PHY).

The CC2640R2L device is part of the SimpleLink™ microcontroller (MCU) platform, which consists of Wi-Fi®, Bluetooth Low Energy, Thread, ZigBee®, Sub-1 GHz MCUs, and host MCUs that all share a common, easy-to-use development environment with a single core software development kit (SDK) and rich tool set. A one-time integration of the SimpleLink™ platform enables you to add any combination of the portfolio's devices into your design, allowing 100 percent code reuse when your design requirements change. - (1) The package designator replaces the xxx in device name to form a complete device name, RGZ is 7-mm × 7-mm VQFN48, RHB is 5-mm × 5-mm VQFN32, RSM is 4-mm × 4-mm VQFN32, and YFV is 2.7-mm × 2.7-mm DSBGA.
- (2) CC2640R2L devices contain Bluetooth Low Energy Host and Controller libraries in ROM, leaving more of the 128KB Flash memory available for the customer application when used with supported BLE-Stack software protocol stack releases. Actual use of ROM and Flash memory by the protocol stack may vary depending on device software configuration. See www.ti.com for more details.
- (3) The CC2650 device supports all PHYs and can be reflashed to run all the supported standards.

SimpleLink™ CC2640R2 Wireless MCU LaunchPad™ Development Kit

The CC2640R2 LaunchPad™ development kit brings easy Bluetooth® low energy (BLE) connection to the LaunchPad ecosystem with the SimpleLink ultra-low power CC26xx family of devices. Compared to the CC2650 LaunchPad, the CC2640R2 LaunchPad provides the following:

- More free flash memory for the user application in the CC2640R2 wireless MCU
- Out-of-the-box support for Bluetooth 4.2 specification
- 4× faster Over-the-Air download speed compared to Bluetooth 4.1

SimpleLink™ Bluetooth low energy/Multi- standard SensorTag

The new SensorTag IoT kit invites you to realize your cloud-connected product idea. The new SensorTag now includes 10 low-power MEMS sensors in a tiny red package. And it is expandable with DevPacks to make it easy to add your own sensors or actuators.

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT
Supply voltage (VDD, VDD2, and VDD3)	VDD supplied by internal DC/DC regulator or internal GLDO. VDD_DDC connected to VDD on PCB	−0.3	4.1	V
Supply voltage (VDD ⁽³⁾ and VDD)	External regulator mode (VDD and VDD pins connected on PCB)	−0.3	2.25	V
Voltage on any digital pin ^{(4) (5)}		−0.3	VDDx + 0.3, max 4.1	V
Voltage on crystal oscillator pins, X32K_Q1, X32K_Q2, X24M_N and X24M_P		−0.3	VDD + 0.3, max 2.25	V
Voltage on ADC input (V _{in})	Voltage scaling enabled	−0.3	VDD	V
	Voltage scaling disabled, internal reference	−0.3	1.49	
	Voltage scaling disabled, VDD as reference	−0.3	VDD / 2.9	
Input RF level			5	dBm
T _{stg}	Storage temperature	−40	150	°C

- (1) All voltage values are with respect to ground, unless otherwise noted.
- (2) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (3) In external regulator mode, VDD2 and VDD3 must be at the same potential as VDD.
- (4) Including analog-capable DIO.
- (5) Each pin is referenced to a specific VDDx (VDD, VDD2 or VDD3). For a pin-to-VDD mapping table, see [Table 9-2](#).

8.2 ESD Ratings

			VALUE	UNIT
V _{ESD}	Electrostatic discharge (RHB and RGZ packages)	Human body model (HBM), per ANSI/ESDA/JEDEC JS001 ⁽¹⁾	All pins	±2500
		Charged device model (CDM), per JESD22-C101 ⁽²⁾	RF pins	±500
			Non-RF pins	±500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
Ambient temperature			−40	85	°C
Operating supply voltage (VDD and VDD), external regulator mode	For operation in 1.8-V systems (VDD and VDD pins connected on PCB, internal DC/DC cannot be used)		1.7	1.95	V
Operating supply voltage VDD	For operation in battery-powered and 3.3-V systems (internal DC/DC can be used to minimize power consumption)		1.8	3.8	V
Operating supply voltages VDD2 and VDD3		VDD < 2.7 V	1.8	3.8	V
Operating supply voltages VDD2 and VDD3		VDD ≥ 2.7 V	1.9	3.8	V

8.4 Power Consumption Summary

Measured on the TI CC2650EM-5XD reference design with $T_c = 25^\circ\text{C}$, $V_{\text{DD5}} = 3.0\text{ V}$ with internal DC/DC converter, unless otherwise noted.

(1) The frequency accuracy of the Real Time Clock (RTC) is not directly dependent on the frequency accuracy of the 32-kHz RC Oscillator. The RTC can be calibrated to an accuracy within ± 500 ppm of 32.768 kHz by measuring the frequency error of RCOSC_LF relative to XOSC_HF and compensating the RTC tick speed. The procedure is explained in [Running Bluetooth® Low Energy on CC2640 Without 32 kHz Crystal](#).

9 Detailed Description

9.1 Overview

The core modules of the CC2640R2L MCU are shown in [Section 9.2](#).

9.2 Functional Block Diagram

9.3 Main CPU

The SimpleLink™ CC2640R2L Wireless MCU contains an Arm Cortex-M3 (CM3) 32-bit CPU, which runs the application and the higher layers of the protocol stack.

The CM3 processor provides a high-performance, low-cost platform that meets the system requirements of minimal memory implementation, and low-power consumption, while delivering outstanding computational performance and exceptional system response to interrupts.

Arm Cortex-M3 features include:

- 32-bit Arm Cortex-M3 architecture optimized for small-footprint embedded applications
- Outstanding processing performance combined with fast interrupt handling
- Arm Thumb®-2 mixed 16- and 32-bit instruction set delivers the high performance expected of a 32-bit Arm core in a compact memory size usually associated with 8- and 16-bit devices, typically in the range of a few kilobytes of memory for microcontroller-class applications:
 - Single-cycle multiply instruction and hardware divide
 - Atomic bit manipulation (bit-banding), delivering maximum memory use and streamlined peripheral control
 - Unaligned data access, enabling data to be efficiently packed into memory
- Fast code execution permits slower processor clock or increases sleep mode time
- Harvard architecture characterized by separate buses for instruction and data
- Efficient processor core, system, and memories
- Hardware division and fast digital-signal-processing oriented multiply accumulate
- Saturating arithmetic for signal processing
- Deterministic, high-performance interrupt handling for time-critical applications
- Enhanced system debug with extensive breakpoint and trace capabilities
- Serial wire trace reduces the number of pins required for debugging and tracing
- Migration from the ARM7™ processor family for better performance and power efficiency
- Optimized for single-cycle flash memory use
- Ultra-low-power consumption with integrated sleep modes
- 1.25 DMIPS per MHz

9.4 RF Core

The RF Core contains an Arm Cortex-M0 processor that interfaces the analog RF and base-band circuits, handles data to and from the system side, and assembles the information bits in a given packet structure. The RF core offers a high level, command-based API to the main CPU.

The RF core is capable of autonomously handling the time-critical aspects of the radio protocols (Bluetooth low energy) thus offloading the main CPU and leaving more resources for the user application.

The RF core has a dedicated 4-KB SRAM block and runs initially from separate ROM memory. The Arm Cortex-M0 processor is not programmable by customers.

9.5 Memory

The Flash memory provides nonvolatile storage for code and data. The Flash memory is in-system programmable.

The SRAM (static RAM) can be used for both storage of data and execution of code and is split into two 4-KB blocks and two 6-KB blocks. Retention of the RAM contents in standby mode can be enabled or disabled individually for each block to minimize power consumption. In addition, if flash cache is disabled, the 8-KB cache can be used as a general-purpose RAM.

The ROM provides preprogrammed embedded TI-RTOS kernel, Driverlib, and lower layer protocol stack software (Bluetooth low energy controller). It also contains a bootloader that can be used to reprogram the device using SPI or UART. For CC2640R2Lxxx devices, the ROM contains Bluetooth 4.2 low energy host- and controller software libraries, leaving more of the flash memory available for the customer application.

9.6 Debug

The on-chip debug support is done through a dedicated cJTAG (IEEE 1149.7) or JTAG (IEEE 1149.1) interface.

9.7 Power Management

To minimize power consumption, the CC2640R2L MCU supports a number of power modes and power management features (see [Table 9-1](#)).

Table 9-1. Power Modes

(1) Not including RTOS overhead

In active mode, the application CM3 CPU is actively executing code. Active mode provides normal operation of the processor and all of the peripherals that are currently enabled. The system clock can be any available clock source (see [Table 9-1](#)).

In idle mode, all active peripherals can be clocked, but the Application CPU core and memory are not clocked and no code is executed. Any interrupt event will bring the processor back into active mode.

In standby mode, only the always-on domain (AON) is active. An external wake-up event or RTC event is required to bring the device back to active mode. MCU peripherals with retention do not need to be reconfigured when waking up again, and the CPU continues execution from where it went into standby mode. All GPIOs are latched in standby mode.

In shutdown mode, the device is turned off entirely, including the AON domain. The I/Os are latched with the value they had before entering shutdown mode. A change of state on any I/O pin defined as a *wake-up from Shutdown pin* wakes up the device and functions as a reset trigger. The CPU can differentiate between a reset in this way, a reset-by-reset pin, or a power-on-reset by reading the reset status register. The only state retained in this mode is the latched I/O state and the Flash memory contents.

9.8 Clock Systems

The CC2640R2L supports two external and two internal clock sources.

A 24-MHz crystal is required as the frequency reference for the radio. This signal is doubled internally to create a 48-MHz clock.

The 32-kHz crystal is optional. *Bluetooth* low energy requires a slow-speed clock with better than ± 500 ppm accuracy if the device is to enter any sleep mode while maintaining a connection. The internal 32-kHz RC oscillator can in some use cases be compensated to meet the requirements. The low-speed crystal oscillator is designed for use with a 32-kHz watch-type crystal.

The internal high-speed oscillator (48-MHz) can be used as a clock source for the CPU subsystem.

The internal low-speed oscillator (32.768-kHz) can be used as a reference if the low-power crystal oscillator is not used.

The 32-kHz clock source can be used as external clocking reference through GPIO.

9.9 General Peripherals and Modules

The I/O controller controls the digital I/O pins and contains multiplexer circuitry to allow a set of peripherals to be assigned to I/O pins in a flexible manner. All digital I/Os are interrupt and wake-up capable, have a programmable pullup and pulldown function and can generate an interrupt on a negative or positive edge (configurable). When configured as an output, pins can function as either push-pull or open-drain. Five GPIOs have high drive capabilities (marked in **bold** in [Section 7](#)).

The SSIs are synchronous serial interfaces that are compatible with SPI, MICROWIRE, and Texas Instruments synchronous serial interfaces. The SSIs support both SPI master and slave up to 4 MHz.

The UART implements a universal asynchronous receiver/transmitter function. It supports flexible baud-rate generation up to a maximum of 3 Mbps.

Timer 0 is a general-purpose timer module (GPTM), which provides two 16-bit timers. The GPTM can be configured to operate as a single 32-bit timer, dual 16-bit timers or as a PWM module.

Timer 1, Timer 2, and Timer 3 are also GPTMs. Each of these timers is functionally equivalent to Timer 0.

In addition to these four timers, the RF core has its own timer to handle timing for RF protocols; the RF timer can be synchronized to the RTC.

The I²C interface is used to communicate with devices compatible with the I²C standard. The I²C interface supports 100-kHz and 400-kHz operation, and can serve as both I²C master and I²C slave.

The TRNG module provides a true, nondeterministic noise source for the purpose of generating keys, initialization vectors (IVs), and other random number requirements. The TRNG is built on 24 ring oscillators that create unpredictable output to feed a complex nonlinear combinatorial circuit.

The watchdog timer is used to regain control if the system fails due to a software error after an external device fails to respond as expected. The watchdog timer can generate an interrupt or a reset when a predefined time-out value is reached.

The device includes a direct memory access (μ DMA) controller. The μ DMA controller provides a way to offload data transfer tasks from the CM3 CPU, allowing for more efficient use of the processor and the available bus bandwidth. The μ DMA controller can perform transfer between memory and peripherals. The μ DMA controller has dedicated channels for each supported on-chip module and can be programmed to automatically perform transfers between peripherals and memory as the peripheral is ready to transfer more data. Some features of the μ DMA controller include the following (this is not an exhaustive list):

- Highly flexible and configurable channel operation of up to 32 channels
- Transfer modes:
 - Memory-to-memory
 - Memory-to-peripheral
 - Peripheral-to-memory
 - Peripheral-to-peripheral
- Data sizes of 8, 16, and 32 bits

The AON domain contains circuitry that is always enabled, except for in Shutdown (where the digital supply is off). This circuitry includes the following:

- The RTC can be used to wake the device from any state where it is active. The RTC contains three compare and one capture registers. With software support, the RTC can be used for clock and calendar operation. The RTC is clocked from the 32-kHz RC oscillator or crystal. The RTC can also be compensated to tick at the correct frequency even when the internal 32-kHz RC oscillator is used instead of a crystal.
- The battery monitor and temperature sensor are accessible by software and give a battery status indication as well as a coarse temperature measure.

The ADC is a 12-bit, 200 ksamples per second (ksps) ADC with eight inputs and a built-in voltage reference. The ADC can be triggered by many different sources, including timers, I/O pins, software, and the RTC.

9.10 Voltage Supply Domains

The CC2640R2L device can interface to two or three different voltage domains depending on the package type. On-chip level converters ensure correct operation as long as the signal voltage on each input/output pin is set with respect to the corresponding supply pin (VDDS, VDDS2 or VDDS3). [Table 9-2](#) lists the pin-to-VDDS mapping.

Table 9-2. Pin Function to VDDS Mapping Table

	Package	
	VQFN 7 × 7 (RGZ)	VQFN 5 × 5 (RHB)
VDDS⁽¹⁾	DIO 23–30 Reset_N	DIO 7–14 Reset_N
VDDS2	DIO 0–11	DIO 0–6 JTAG
VDDS3	DIO 12–22 JTAG	N/A

(1) VDDS_DCDC must be connected to VDDS on the PCB.

9.11 System Architecture

Depending on the product configuration, CC26xx can function either as a Wireless Network Processor (WNP—an IC running the wireless protocol stack, with the application running on a separate MCU), or as a System-on-Chip (SoC), with the application and protocol stack running on the Arm Cortex-M3 core inside the device.

In the first case, the external host MCU communicates with the device using SPI or UART. In the second case, the application must be written according to the application framework supplied with the wireless protocol stack.

10 Application, Implementation, and Layout

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

Very few external components are required for the operation of the CC2640R2L device. This section provides some general information about the various configuration options when using the CC2640R2L in an application, and then shows two examples of application circuits with schematics and layout. This is only a small selection of the many application circuit examples available as complete reference designs from the product folder on www.ti.com.

Figure 10-1 shows the various RF front-end configuration options. The RF front end can be used in differential- or single-ended configurations with the options of having internal or external biasing. These options allow for various trade-offs between cost, board space, and RF performance. Differential operation with external bias gives the best performance while single-ended operation with internal bias gives the least amount of external components and the lowest power consumption. Reference designs exist for each of these options.

Figure 10-1. CC2640R2L Application Circuit

Figure 10-2 shows the various supply voltage configuration options. Not all power supply decoupling capacitors or digital I/Os are shown. Exact pin positions will vary between the different package options. For a detailed overview of power supply decoupling and wiring, see the TI reference designs and the CC26xx technical reference manual ().

11 Device and Documentation Support

11.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to all pre-production part numbers or date-code markings. Each device has one of three prefixes/identifications: X, P, or null (no prefix) (for example, CC2640R2L is in production; therefore, no prefix/identification is assigned).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Production devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, RGZ).

For orderable part numbers of the CC2640R2L device in the RHB and RGZ package types, see the *Package Option Addendum* of this document, the TI website (www.ti.com), or contact your TI sales representative.

11.2 Tools and Software

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of the CC2640R2L device applications:

Software Tools:

SmartRF Studio 7 is a PC application that helps designers of radio systems to easily evaluate the RF-IC at an early stage in the design process.

- Test functions for sending and receiving radio packets, continuous wave transmit and receive
- Evaluate RF performance on custom boards by wiring it to a supported evaluation board or debugger
- Can also be used without any hardware, but then only to generate, edit and export radio configuration settings
- Can be used in combination with several development kits for Texas Instruments' CCxxxx RF-ICs

IDEs and Compilers:

Code Composer Studio™ Integrated Development Environment (IDE):

- Integrated development environment with project management tools and editor
- Code Composer Studio (CCS) 7.0 and later has built-in support for the CC26xx device family
- Best support for XDS debuggers; XDS100v3, XDS110 and XDS200
- High integration with TI-RTOS with support for TI-RTOS Object View

IAR Embedded Workbench® for Arm®:

- Integrated development environment with project management tools and editor
- IAR EWARM 7.80.1 and later has built-in support for the CC26xx device family
- Broad debugger support, supporting XDS100v3, XDS200, IAR I-Jet and Segger J-Link
- Integrated development environment with project management tools and editor
- RTOS plugin available for **TI-RTOS**

For a complete listing of development-support tools for the CC2640R2L platform, visit the Texas Instruments website at www.ti.com. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

11.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on ti.com (**CC2640R2L**). 11.7 Trademarks

SmartRF™, Code Composer Studio™, LaunchPad™, TI E2E™ are trademarks of Texas Instruments.

IEEE Std 1241™ is a trademark of Institute of Electrical and Electronics Engineers, Incorporated.

ARM7™ is a trademark of Arm Limited (or its subsidiaries).

Arm®, Cortex®, and Thumb® are registered trademarks of Arm Limited (or its subsidiaries).

CoreMark® is a registered trademark of Embedded Microprocessor Benchmark Consortium.

Bluetooth® is a registered trademark of Bluetooth SIG Inc.

IAR Embedded Workbench® are registered trademarks of IAR Systems AB.

Wi-Fi® is a registered trademark of Wi-Fi Alliance.

ZigBee® is a registered trademark of ZigBee Alliance.

All other trademarks are the property of their respective owners.

11.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.9 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

11.10 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
CC2640R2LRGZR	Active	Production	VQFN (RGZ) 48	2500 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	CC2640 R2L
CC2640R2LRHBR	Active	Production	VQFN (RHB) 32	2500 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	CC2640 R2L

- (1) **Status:** For more details on status, see our [product life cycle](#).
- (2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.
- (3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.
- (4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

PLASTIC QUADFLAT PACK- NO LEAD

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
