

Description

The AL58263 is a 16-channel constant-current LED driver with 16-bit grayscale Adaptive Pulse Density Modulation (APDM) and supports error diagnostics, power-saving functionality, and current gain control. This distinctive APDM technology abates the non-ideal IOUT distortion due to non-symmetric transient responses and enhances the refresh rate by efficiently separating the frame waveform.

The device operates over a 3V to 5.5V input voltage range, 15V output channel voltage, fast 25MHz DCK input, and delivers up to 55mA of high-accuracy current to each LED string. Each channel's output current can be programmable through a digital interface individually. All channels' output current can be set by one external sensing resistor, along with a 6-bit global current control register.

The AL58263 has built-in diagnostics and LED open/short protection, including error detection. These error results are stored in a register for the MCU to read out.

The AL58263 is available in the TSSOP-24EP (Type A1-B) and wettable flank W-QFN4040-24/SWP (Type A1) packages. The device is specified over the -40°C to +105°C ambient temperature range.

Features

- Input Voltage VDD: 3V to 5.5V
- Output Current Range
 - 2~55mA/5V, 2~35mA/3.3V
 - ±0.1% Output current regulation capability
 - 6-bit global current control: from 12.5% to 200%
- 16 Constant-Current Sink Output Channel
 - 16-bit grayscale resolution with Adaptive Pulse Density Modulation control
 - 15V rated output channels for long LED strings
 - Fast Transient Response – supports external grayscale clock with double edge up to 16MHz
 - ±1.5% (typ.) LED Current accuracy between channels
 - ±3% (typ.) LED Current accuracy between chips
 - Non-scramble waveform for high power LED application
 - Grayscale counter reset selection
 - Grayscale data synchronization selection
- Diagnosis and Protections
 - Error detection includes LED Open, LED Short, Output port leakage, Output short-to-GND, Output short-to-Power and REXT short-to-GND
 - Error detection LEDs on at 0.1mA to avoid any flickering
 - Short detection threshold voltage selection (2/3/4/4.5V)
 - Sleep and 0-data mode to lower down the supply current
 - Pre-overtemperature warning
- 4-Wire Serial Interface (LAT, DI, DO, DCK)
 - 25MHz clock frequency for data transfer
 - EMI reduction grayscale clock
 - Cascaded capability (Max 1,440 devices)
 - External GCK watchdog
 - Stagger outputs delay for EMI reduction
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**
- **An automotive-compliant part is available under a separate datasheet ([AL58263Q](#)).**

- Notes:
1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.
 2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
 3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

- LCD display backlighting

Typical Applications Circuit

Pin Descriptions

NAME	PIN	PIN	DESCRIPTION
	TSSOP-24EP (Type A1-B)	W-QFN4040-24/SWP (Type A1)	
GND	1	10	Ground terminal
DI	2	23	Serial data input terminal.
DCK	3	24	Synchronous clock input terminal for serial data transfer. Data is sampled at the rising edge of DCK.
LAT	4	1	Input terminal of data strobe and mode setting. Combine DCK with LAT signal to execute the mode control
OUT0 to OUT15	5 to 20	2 to 9, 11 to 18	Sink constant-current outputs (open-drain).
GCK	21	20	External double-edge grayscale clock input for APDM operations
DO	22	19	Serial data output terminal.
REXT	23	21	External resistors connected between REXT and GND for output current value setting.
VDD	24	22	Supply voltage terminal.

Equivalent Circuit of Inputs and Outputs

1. DCK, DI, LAT, GCK terminals

2. DO terminal

Functional Block Diagram

Absolute Maximum Ratings

Symbol	Parameters	Ratings	Unit
VDD	Supply Voltage	-0.3 ~ 7.0	V
V _{DI} , V _{DCK} , V _{GCK} , V _{LAT}	Input Voltage	-0.3 ~ VDD+0.3	V
I _{OUT}	Output Current	60	mA
V _{OUT}	Output Voltage	-0.3 ~ 16	V
FDCK	Input Clock Frequency	25	MHz
FGCK	Input Grayscale Frequency	16	MHz
IGND	GND Terminal Current	960	mA

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only and functional operation of the device at these or any other condition beyond those specified is not supported.

(2) All voltage values are with respect to ground terminal.

(3) Operation at T_J(max) = 150°C may reduce the device reliability; therefore, the suggested junction temperature of the device is under 125°C.

ESD Ratings

Symbol	Parameter	Value	Unit
V _{ESD}	Human-Body Model (HBM)	2000	V
	Charged-Device Model (CDM)	750	V

Package Thermal Data (Note 4)

Symbol	Thermal Resistance	Device		Unit
		TSSOP-24EP (Type A1-B)	W-QFN4040-24/SWP (Type A1)	
R _{θJA}	Junction-to-ambient thermal resistance	25.57	31.16	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	14.47	17.25	°C/W
R _{θJB}	Junction-to-board thermal resistance	9.57	9.34	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.33	0.41	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	9.39	9.14	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	3.21	3.33	°C/W

Note: 4. Test condition: Device mounted on FR-4 PCB (51mm x 51mm 2oz copper, minimum recommended pad layout on top layer and thermal vias to bottom layer with maximum area ground plane. For better thermal performance, larger copper pad for heat-sink is needed.

Recommended Operating Conditions

Symbol	Parameter	Min	Typ	Max	Unit
V _{DD}	Operating Supply Voltage	3.0	3.3	5.5	V
I _{OUT}	Output Current (Note 5)	2	—	55	mA
V _{OUT}	Output Voltage	1	—	15	V

Functional Descriptions

Fast Transient Response

The AL58263 supports fast transient response times, making high image resolutions possible. The GCK period of 50ns is enough for a complete Vout waveform.

Stagger Outputs Delay

Large in-rush currents will be induced when the system activates all outputs at once. To reduce EMI interference, the AL58263 is designed to have a constant length of delay time (around 16ns) between two output groups. The first group is OUT2n and the second group is OUT2n+1 (n=0~7).

Global Current Control (GCC)

The AL58263 provides 6 bits of global current control (GCC), which can adjust output current by 64 steps.

GCC bits are included in the command data as defined below:

F	E	D	C	B	A	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	HC	DA4	DA3	DA2	DA1	DA0	—	—	—	—

The relationship between the Gain value and GCC bits is described below:

HC=1, Gain $\div (3 \times D + 33) / 65 \times (1 - 0.001 \times D)$, the gain range is from 0.508 to 1.878

HC=0, Gain $\div (3 \times D + 32) / 256 \times (1 - 0.0006 \times D)$, the gain range is from 0.125 to 0.479

Where $D = DA4 \times 2^4 + DA3 \times 2^3 + DA2 \times 2^2 + DA1 \times 2^1 + DA0 \times 2^0$

For example, HC=1 and DA[4:0]=11000

$D = 1 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 0 \times 2^1 + 0 \times 2^0 = 24$

Gain $\div (3 \times 24 + 33) / 65 \times (1 - 0.001 \times 24) \div 1.577$

Reference Resistor

The constant current values are determined by an external resistor placed between REXT pin and GND pin. The following formula is utilized to calculate the current value:

$$I_{out} \text{ (mA)} \div 13.45 / R_{ext}(\text{K}\Omega) \times \text{Gain}$$

Where Rext is a resistor placed between REXT and GND.

This 13.45 constant center at 10mA may need to be adjusted slightly based on user application and test conditions.

For example, Iout is around 24.12mA when Rext=560Ω and with GCC=101011.

AL58263 IOUT vs. Rext Curve

Functional Descriptions (continued)

Constant-Current Output

The current characteristics are maintained invariably in the influence of loading voltage. Therefore, the AL58263 can minimize the interference of different LED forward voltages and produce constant current. The following figures illustrate the suitable output voltage that should be determined to keep excellent performance.

AL58263 IOUT vs. Vout Curve @ VDD=5V

AL58263 IOUT vs. Vout Curve @ VDD=3.3V

Functional Descriptions (continued)

Control Instructions

Instruction Name	Number of DCK Pulses when LAT is at High	Function Description
Data Latch	0 or 1	Strobes image data into temporary registers. In this time, constant current outputs are not updated to a new frame data.
Global Latch	2 or 3	Strobes image data from temporary registers into an APDM/PWM generator. In this time, constant current outputs are updated to a new frame data.
Reading Image Data and Command Data	6 or 7	Read out image data and command data from the latch cell to the 272-bit shift registers. And the read data could shift out from DO pin by serial DCK pulses.
Return to Normal Mode	8 or 9	Switch Back from the reading data mode to the normal operating mode.
Writing Command	10 or 11	Strobes command data from the 16-bits shift register into the command latch cell.
Reset APDM/PWM Counter	12 or 13	This instruction will reset APDM/PWM counter to synchronize a new frame if CMD[11]="H".

Functional Descriptions (continued)

Reset APDM/PWM Counter (set CMD[11]="1")

EMI Reduction Grayscale Clock (Double-edge Grayscale Clock)

A whole period of 16 bits of resolution must be composed by 65536 traditional grayscale clocks, as constant current outputs are only triggered at the rising edge of clocks. Therefore, a controller must transmit fast grayscale clocks in order to accomplish a high refresh rate when users adopt traditional PWM chips. The AL58263 supports a specific mode of double-edge grayscale clocks, which triggers both at the rising and falling edges of the clocks. By this approach, a whole period of 16 bits of resolution is composed by only 32768 double-edge grayscale clocks, and the electromagnetic interference decreases substantially due to the slow grayscale clocks.

Functional Descriptions (continued)

Command Data Format

CMD Bit	Initial Value	Value	Function	Description
CMD[15]	1'b0	1'b0	Mode0	Data transmitting Format: 15 times of data latch + one global latch
		1'b1	Mode1	Data transmitting Format: 16 times of data latch + one global latch
CMD[14]	1'b0	1'b0	Enable	When the voltage of REXT is below 0.15V, all outputs will be forced off.
		1'b1	Disable	Disable
CMD[13]	1'b0	1'b0	External GCK	The GCK signal stems from an external source
		1'b1	Internal GCK	The GCK signal stems from an internal oscillator, 1.5MHz. (When CMD[13]="1", please set CMD[0]="0")
CMD[12]	1'b0	1'b0	APDM mode	Enter the PWM mode to abate the transient loss when AL58263 is as a PWM generator
		1'b1	PWM mode	when CMD[12]=1'b0 => APDM mode when CMD[12]=1'b1 => PWM mode
CMD[11]	1'b0	1'b0	Disable	Disable
		1'b1	Enable	Execute counter reset by inserting 12 or 13 DCKs (rising edge) when LAT keeps at high
CMD[10]	1'b0	1'b0	Auto Synchronization	When the device receives a latch signal, the new frame is updated until the end of old frame
		1'b1	Manual Synchronization	When the device receives a latch signal, the new frame is updated immediately
CMD[9:4]	6'b101011	6'b000000~ 6'b111111	G.C.C	6-bit DA data for global current control (allow 64-step programmable current gain)
CMD[3:2]	2'b00	2'b00 2'b01 2'b10 2'b11	2.0V 3.0V 4.0V 4.5V	Threshold voltage for LED short detection (both at VDD = 5V and 3.3V)
CMD[1]	1'b0	1'b0	Disable	Enter 0-data power saving mode
		1'b1	Enable	when 16bits PWM data of 16ch are all zeros
CMD[0]	1'b0	1'b0	Disable	GCK watchdog
		1'b1	Enable	All IOUTs will be turned off automatically when GCK keeps high or low level over 30ms. (Result can be read out by "Thermal Detection Mode" or "Rext Detection Mode")

Functional Descriptions (continued)

Image Data Format

16 bits of APDM/PWM data are transmitted into the 16-bit shift register, according to the format illustrated above. The first input bit is the most significant bit of each channel.

Data Transmitting Protocol

MODE0 (CMD[15]="0")

This data transmitting mode is comprised of 15 data latches and one global latch. The first data latch strobes image data for OUT[15]. The last global latch strobes image data for OUT[0] and loads all the image data of the 16 channels into the APDM/PWM generator. N is the number of devices in series.

MODE1 (CMD[15]="1")

This data transmitting mode is comprised of 16 data latches and one global latch. The first data latch strobes image data for OUT[15]. The last global latch loads all the image data of the 16 channels into the APDM/PWM generator, but does not strobe any image data for output channels. N is the number of devices in series.

Functional Descriptions (continued)

Data Synchronization

Auto Synchronization (CMD[10]="0")

The AL58263 can abate grayscale loss during the frame renewal by using auto synchronization. When the command bit CMD[10] is set to "0", this function can be executed automatically. After a global latch, all OUTs can accomplish a complete frame of old data and then update new frame data. Therefore, each frame maintains a fixed time and assigned grayscale. A controller just provides a free-running GCK for grayscale display in this mode.

Manual Synchronization (CMD[10]="1")

When the command bit CMD[10] is set to "1", the new frame data can be updated immediately. The old frame may lose a small amount of grayscale due to a non-complete frame time. In this mode, the controller must calculate carefully the number of GCKs in order to synchronize a frame.

Functional Descriptions (continued)

Adaptive Pulse Density Modulation with Δ -Width Correction

Adaptive Pulse Density Modulation (APDM) is a technique to improve output current waveform distortion and increase visual refresh rate. The adaptive output waveform is determined automatically by the grayscale value. When all outputs operate at high grayscale resolution (grayscale resolution $\geq 50\%$), the output waveform is divided into 128 segments to increase visual refresh rate. Otherwise, the output waveform is divided into 64 segments at a low grayscale resolution to improve output current waveform distortion. The Δ -width correction ($\Delta \neq 0$) is used to compensate the non-ideal output current transient response.

When CMD[12]="0", the output waveform operates according to APDM.

When CMD[12]="1", the output waveform is a form of non-scrambling PWM in order to drive high-power LEDs and decrease transient loss.

Functional Descriptions – Diagnosis and Protections

Error Detection Mode Instructions

Instruction Name	Number of DI Pulses when LAT is at High	Function Description
LED Open Detection	2	Execute the LED Open Detection no matter what the image data is. The image strobe will occur at the falling edge of LAT signal.
LED Short Detection	4	Execute the LED Short Detection no matter what the image data is. The image strobe will occur at the falling edge of LAT signal.
Short-to-GND Detection	6	Execute the Short-to-GND Detection no matter what the image data is. The device will detect each IOUT pin if short-to-ground or not. The image strobe will occur at the falling edge of LAT signal.
Thermal Detection & Watchdog Result Read Out	8	The device will load thermal detection result and watchdog detection result into the 16 th and 1 st image shift register by this instruction. The thermal error occurs when the junction temperature is over 155°C.
LED Smart Detection	10	Execute the LED Smart Detection no matter what the image data is. The device will detect LED Open and LED Short error simultaneously by this instruction. The image strobe will occur at the falling edge of LAT signal.
Sleep Mode	12	This instruction forces the device into Sleep Mode at the falling edge of LAT signal, then keeps GCK=high most internal circuits will shutdown. The device will be activated in the following LAT signal.
REXT Pin Detection & Watchdog Result Read Out	14	The device will load REXT detection result and watchdog detection result into the 16 th and 1 st image shift register by this instruction. The REXT error occurs when the REXT pin is short-to-GND or above 2.5V.

Functional Descriptions – Diagnosis and Protections (continued)

Error Bit

Error Bit	Symbol	Description
0	Error	When errors, such as open errors, short errors, short-to-GND errors, and thermal errors (PreOTP), are detected in the channel, the error bit, zero, will be loaded into the corresponding image shift register.
1	Normal	In the detecting mode, the bit, one, will be loaded into the corresponding image shift register if the device is under normal operating conditions.

LED Open Error Detection

When the LED open error detection instruction is executed, it is necessary to input two DI pulses in Error Detection Mode. No matter what the image latch data is, the output ports of the AL58263 will turn on with 0.1mA for error detection. The detection time is defined from the falling edge of LAT to the rising edge of the following DCK.

When the voltage of the IOUT pins is below 0.3V, the error bit, zero, will be loaded into the corresponding image shift register. The error bit will be shifted out from the DO pin on the synchronization of the rising edge of DCK. A retiming DO signal, which is similar to a DI signal, appears when the LAT signal stays in a high level for cascading applications.

Functional Descriptions – Diagnosis and Protections (continued)

LED Short Error Detection (Output Short-to-Power Included)

When the LED short error detection instruction is executed, it is necessary to input four DI pulses in the Error Detection Mode. No matter what the image latch data is, the output ports of the AL58263 will turn on with 0.1mA for error detection. The detection time is defined from the falling edge of LAT to the rising edge of the following DCK. When the voltage of the IOUT pins is above the threshold voltage of LED short detection, as determined by CMD[14:13], the error bit, zero, will be loaded into the corresponding image shift register. The error bit will be shifted out from the DO pin on the synchronization of the DCK's rising edge. And a retiming DO signal, which is similar to a DI signal, appears when the LAT signal stays in a high level for cascading applications.

Short-to-GND Error Detection (Output Port Leakage Included)

When the short-to-GND error detection instruction is executed, it is necessary to input six DI pulses in Error Detection Mode. No matter what the image latch data is, this instruction forces the output ports of the AL58263 to turn off for error detection. The detection time is defined from the falling edge of LAT to the rising edge of the following DCK.

When the voltage of IOUT pins is below 0.3V, the error bit, zero, will be loaded into the corresponding image shift register. The error bit will be shifted out from the DO pin on the synchronization of the DCK's rising edge. And a retiming DO signal, which is similar to a DI signal, appears when the LAT signal stays in a high level for cascading applications.

Functional Descriptions – Diagnosis and Protections (continued)

Pre-OTP Warning - Thermal Detection & Watchdog Result Read Out

The AL58263 has a pre-thermal warning threshold of +155°C (typical).

When the thermal detection instruction is executed, it is necessary to input eight DI pulses in Error Detection Mode. The AL58263 will judge of junction temperature by instruction. If the junction temperature is over 155°C, it will lead to thermal error. The device will load the PreOTP and watchdog result into the 16th and 1st image shift register and fill out the other image shift registers with bit code, 1. The error report will be shifted out from the DO pin on the synchronization of the DCK's rising edge. And a retiming DO signal, which is similar to a DI signal, appears when the LAT signal stays in a high level for cascading applications. When CMD[0]=1 and GCK keeps low or high over 30ms, the watchdog result can be "0", otherwise it would be "1".

LED Smart Detection

When the LED smart detection instruction is executed, it is necessary to input ten DI pulses in Error Detection Mode. No matter what the image latch data is, the output ports of the AL58263 will turn on with 0.1mA for error detection. The detection time is defined from the falling edge of LAT to the rising edge of the following DCK. When the voltage of the IOOUT pins is below 0.3V for LED open detection or above the threshold voltage of LED short detection, as determined by CMD[14:13], the error bit, zero, will be loaded into the corresponding image shift register. The error bit will be shifted out from the DO pin on the synchronization of the DCK's rising edge. A retiming DO signal, which is similar to a DI signal, appears when the LAT signal stays in a high level for cascading applications.

Functional Descriptions – Diagnosis and Protections (continued)

Sleep Mode

To save power, the AL58263 supports sleep mode to turn off most circuits. It is necessary to input twelve pulses in Error Detection Mode to execute this instruction, as well as keeping GCK=high at sleep mode. In this sleep mode, the supply current maintains $< 0.1\text{mA}$ because most analog circuits are shutdown, but the digital interface is still activated in order to receive external digital data. The AL58263 will enter into sleep mode at the falling edge of this LAT signal and revive at the falling edge of the following LAT signal. The serial image data will be shifted out from the DO pin on the synchronization of the DCK's rising edge. A retiming DO signal, which is similar to aDI signal, appears when the LAT signal stays in a high level for cascading applications.

REXT Detection & Watchdog Result Read Out

When the REXT detection instruction is executed, it is necessary to input fourteen DI pulses in Error Detection Mode. The AL58263 will detect the voltage of the REXT pin by the instructions. If the REXT pin is open or above 2.5V or below 0.15V, it will lead to REXT error. The device will load the REXT report and watchdog the result into the 16th and 1st image shift register, as well as filling out the other image shift registers with bit code, 1. The error report will be shifted out from the DO pin on the synchronization of the DCK's rising edge. A retiming DO signal, which is similar to a DI signal, appears when the LAT signal stays in a high level for cascading applications. When CMD[0]=1 and GCK keeps low or high over 30ms, the watchdog result will be "0", otherwise it will be "1".

Functional Descriptions (continued)

Power Dissipation

When the 16 output channels are turned on, the practical power dissipation is determined by the following equation:

$$PD (practical) = V_{DD} \times I_{DD} + V_{out(0)} \times I_{out(0)} \times Duty_{(0)} + \dots + V_{out(N)} \times I_{out(N)} \times Duty_{(N)}, \text{ where } N=1 \text{ to } 15$$

In secure operating conditions, the power consumption of an integrated chip should be less than the maximum permissible power dissipation, which is determined by package types and ambient temperature. The formula for maximum power dissipation is described as follows:

$$PD (max) = \frac{T_j(max)(^{\circ}C) - T_a(^{\circ}C)}{R_{th(j-a)}(^{\circ}C/Watt)}$$

The PD(max) declines as the ambient temperature raises. Therefore, suitable operating conditions should be designed with caution according to the chosen package and the ambient temperature. The following figure illustrates the relation between the maximum power dissipation and the ambient temperature in the two different packages.

Design Tools (Note 16)

- AL58263EV1, AL58263EV2 Demo Board
- Demo Board Gerber File for PCB Layout Reference
- Design Calculator

Mechanical Data

Package: TSSOP-24EP (Type A1-B)

- Moisture Sensitivity: Level 1 per J-STD-020
- Terminals: Finish – Matte Tin Plated Leads, Solderable per MIL-STD-202, Method 208 (e3)
- Weight: 0.096 grams (Approximate)

Package: W-QFN4040-24/SWP (Type A1)

- Moisture Sensitivity: Level 1 per J-STD-020
- Terminals: Finish – Matte Tin Plated Leads, Solderable per JESD22-B102 (e3)
- Weight: 0.037 grams (Approximate)
