NCP1129DIPGEVB: 25W Offline Power Supply High Voltage Switcher Evaluation Board

The NCP1129 switcher offers everything needed to build reliable and compact AC-DC switching power supplies with minimal surrounding elements. Incorporating an avalanche rated 650 V MOSFET, converters built with the NCP112X can be safely designed for international conditions without jeopardizing the overall reliability. The NCP112X implements peak current mode control with adjustable ramp compensation that ensures stability in Continuous Conduction Mode (CCM) operation. With an external resistor, the maximum peak current is adjustable, allowing the designer the ability to inject ramp compensation to stabilize CCM power supplies. A short circuit fault condition is independently detected from the auxiliary winding voltage resulting in improved short circuit protection with true overload detection. The Source pin provides access to the MOSFET source, allowing for overpower compensation. With a supply range up to 26 V, the switcher also provides a jittered 65 kHz or 100 kHz switching frequency operated in peak current mode control. When the power on the secondary side starts to decrease, the switcher automatically folds back its switching frequency down to a minimum level of 26 kHz. As the power further goes down, the part enters skip cycle while limiting the peak current.

Evaluation/Development Tool Information

Product	Status	Compliance	Short Description	Parts Used	Action
NCP1129DIPGEVB	Active	Pb-free	25W Offline Power Supply High Voltage Switcher Evaluation Board	NCP1129AP100G	» Contact Local Sales Office » Inventory

With the AC source OFF, set the current limit on the AC source to 400 mA (or 200 mA for the 120V AC).
Tweak the AC source up or down. Connect the scope probe to the demo board's output terminals.
Turn on the AC source and observe the output voltage. The output voltage (switching frequency) should be:
• 120V AC source and the power supply output voltage should be 12.00V AC $\pm 5\%$ • 150V AC $\pm 0.2\%$
• 200V AC $\pm 0.2\%$
Adjust the electronic load from 100 mA load slowly up to 1.25A, for the 12V output and 3.3A for the 5V output (full load). The output voltage should remain within $\pm 0.5\%$ of nominal if properly regulating. The output ripple (switching frequency) on the oscilloscope should be less than 200 mV peak-to-peak at full load. (Note: - scope probe tip should be decoupled at 0.1 μ F ceramic capacitor and ground wire should be as short as possible for accuracy and mass attenuation of switching noise.)
