Datasheet

Power Management Integrated Circuit

BD71837AMWV

General Description

- BD71837AMWV is a programmable Power Management IC (PMIC) for powering single-core, dual-core, and quad-core SoC's such as NXP-i.MX 8M. It is optimized for low BOM cost and compact solution footprint. It integrates 8 Buck regulators and 7 LDO's to provide all the power rails required by the SoC and the commonly used peripherals.
- QFN package and pinout support low cost Type 3 (non-HDI) PCB. Programmable power sequencing and output voltages, flexible power state control for easier system design and supports a wide variety of processors and system implementations.

Features

- 8 Buck Regulators
  - 2.0 MHz Switching Frequency.
    (BUCK1, BUCK2, BUCK3, BUCK4, BUCK5, BUCK7, and BUCK8).
  - 1.5MHz Switching Frequency. (BUCK6)
  - Target Efficiency: 83% to 95%.
  - Output Current & Voltage.
    BUCK1: 3.6 A, 0.7 V to 1.3 V/10 mV step, DVS
    BUCK2: 4.0 A, 0.7 V to 1.3 V/10 mV step, DVS
    BUCK3: 2.1 A, 0.7 V to 1.3 V/10 mV step, DVS
    BUCK4: 1.0 A, 0.7 V to 1.3 V/10 mV step, DVS
    BUCK5: 2.5 A, 0.70 V to 1.35 V/8steps
    BUCK6: 3.0 A, 3.0 V to 3.3 V/100 mV step
    BUCK7: 1.5 A, 1.605 V to 1.995 V/8steps
    BUCK8: 3.0 A, 0.8 V to 1.4 V/10 mV step
- 7ch Linear Regulators(7 LDOs)
  - LDO1: 10 mA, 3.0 V to 3.3 V, 1.6 V to 1.9 V
  - LDO2: 10 mA, 0.9 V, 0.8 V
  - LDO3: 300 mA, 1.8 V to 3.3 V
  - LDO4: 250 mA, 0.9 V to 1.8 V
  - LDO5: 300 mA, 1.8 V to 3.3 V
  - LDO6: 300 mA, 0.9 V to 1.8 V
  - LDO7: 150 mA, 1.8 V to 3.3 V
- Power Mux Switch
  - 1.8V Input: 200 mΩ(Max)
  - 3.3V Input: 280 mΩ(Max)
- 32.768 kHz Crystal Oscillator Driver
- Power Button Detector
- Protection and Monitoring: Soft Start, Power Rails Fault Detection, UVLO, OVP and TSD
- OTP Configurable Power Sequencing
- OTP and Software Programmable Output Voltage, Ramp rates.
- Hardware Signaling with SoC for Transition into or out of Low Power States
- Interfaces:
  - I2C: 100 kHz/400 kHz, 1 MHz
  - Power-on Reset Output: POR_B, RTC_RESET_B,
  - Watchdog Reset Input: WDOG_B:
  - Power State Control:
    PMIC_STBY_REQ, PMIC_ON_REQ, PWRON_B
  - Interrupt to SoC: IRQ_B
- Type3 PCB Applicable

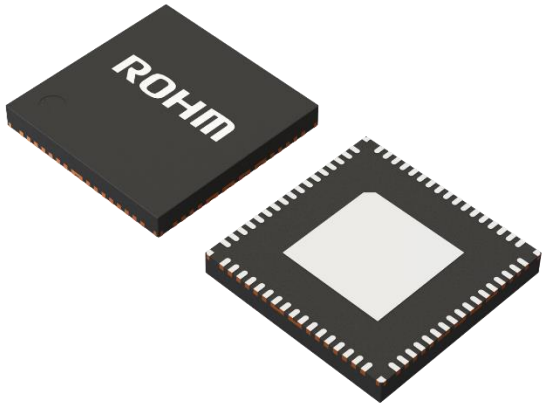

Key Specifications

Input Voltage Range (VSYS):	2.7 V to 5.5 V
SNVS State Current:	30 μA(Typ)
SUSPEND State Current:	137 μA(Typ)
IDLE State Current:	167 μA(Typ)
RUN State Current:	197 μA(Typ)
Operating Temperature Range:	-40 °C to +105 °C

Applications

- Streaming Media Boxes and Dongles
- AV Receivers and Wireless Sound Bars
- Industrial HMI, SBC, IPC and Panel Computer

Package	W(Typ) x D(Typ) x H(Max)
UQFN68CV8080	8.00mm x 8.00mm x 1.00mm

○Product structure : Silicon integrated circuit. ○This product has no designed protection against radioactive rays

1. Introduction

1.1. Terminology

Table 1-1. Acronyms, Conventions and Terminology

Term	Definition
BOM	Bill Of Materials
DAC	Digital to Analog Converter
DVS	Dynamic Voltage Scaling
FET	Field Effect Transistor
I2C	Inter-Integrated Circuit
IRQ	Interrupt Request
LDO	Low Drop-Out regulator
NTC	Negative Temperature Coefficient. (a type of thermistor)
OCP	Over Current Protection
OTP	One Time Programmable memory
OVP	Over Voltage Protection
PFM	Pulse-Frequency Modulation
POR	Power On Reset
PWM	Pulse-Width Modulation
SMPS	Switched Mode Power Supply
SoC	System-On-a-Chip
UVLO	Under Voltage-LockOut
VR	Voltage Regulator

(Note 1) Reset Condition of each register is classified as follows.
UVLO : When INTLDO1P5_UVLO=0, register values are reset to the default value.
READY : When Power State enters READY, register values are reset to the default value.
(Note 2) Regarding registes labeled in this column, its write access is disabled as follows.
PWRSEQ : When PWRSEQ in REGLOCK register is set to 1, write access is disabled.
VREG : When VREG in REGLOCK register is set to 1, write access is disabled.

2. Operating Conditions

2.1. Absolute Maximum Ratings (Ta=25 ˚C)

Table 2-1. Absolute Maximum Ratings

Parameter	Symbol	Limit		Unit
		Min	Max	
Voltage Range in PINs: VSYS, BUCK1_VIN to BUCK8_VIN, VIN_1P8_1, VIN_1P8_2, VIN_3P3, PWRON_B, PMIC_ON_REQ	V_{AMR_1}	-0.3	+6.0	V
Voltage Range in PIN: DVDD	V_{AMR_2}	-0.3	+4.5	V
Voltage Range in PIN: INTLDO1P5	V_{AMR_3}	-0.3	+2.1	V
Voltage Range in PINs: BUCK1_LX to BUCK8_LX	V_{AMR_4}	-1.0(DC) -2.0(10ns)	+7.0	V
Voltage Range in PINs: SCL,SDA,IRQ_B,POR_B,WODG_B PMIC_STB_REQ,SD_VSELECT,C32K_OUT	V_{AMR_5}	-0.3	+4.5	V
Voltage Range in PINs: BUCK1_FB to BUCK8_FB, LDO3_FB, LDO4_FB, LDO1_VOUT to LDO7_VOUT, MUXSW_VOUT	V_{AMR_6}	-0.3	+4.5	V
Voltage Range in PINs: XIN, XOUT	V_{AMR_7}	-0.3	+2.1	V
Maximum Junction Temperature	Tjmax		150	°C
Storage Temperature Range	Tstg	-55	+150	°C

Caution 1: *Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.*

Caution 2: *Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, design a PCB with thermal resistance taken into consideration by increasing board size and copper area so as not to exceed the maximum junction temperature rating.*

2.2. Thermal Resistance

Table 2-2. Thermal Resistance ***(Note 1)***

Parameter	Symbol	Thermal Resistance (Typ)		Unit
		1s *(Note 3)*	2s2p *(Note 4)*	
UQFN68CV8080				
Junction to Ambient	θ_{JA}	76.8	28.1	°C/W
Junction to Top Characterization Parameter *(Note 2)*	Ψ_{JT}	6	6	°C/W

(Note 1) Based on JESD51-2A(Still-Air).

(Note 2) The thermal characterization parameter to report the difference between junction temperature and the temperature at the top center of the outside surface of the component package.

(Note 3) Using a PCB board based on JESD51-3.

(Note 4) Using a PCB board based on JESD51-5, 7.

Layer Number of Measurement Board	Material	Board Size
Single	FR-4	114.3mm x 76.2mm x 1.57mmt

Top	
Copper Pattern	Thickness
Footprints and Traces	70µm

Layer Number of Measurement Board	Material	Board Size	Thermal Via *(Note 5)*	
			Pitch	Diameter
4 Layers	FR-4	114.3mm x 76.2mm x 1.6mmt	1.20mm	Φ0.30mm

Top		2 Internal Layers		Bottom	
Copper Pattern	Thickness	Copper Pattern	Thickness	Copper Pattern	Thickness
Footprints and Traces	70µm	74.2mm x 74.2mm	35µm	74.2mm x 74.2mm	70µm

(Note 5) This thermal via connects with the copper pattern of all layers.

2.3. Recommended Operating Conditions

Table 2-3. Recommended Operating Conditions

Parameter	Symbol	Limit			Unit
		Min	Typ	Max	
Voltage Range in PINs: VSYS, BUCK1_VIN to BUCK8_VIN *(Note 1)*	V_{OPR_1}	2.70	5.00	5.50	V
Voltage Range in PINs: DVDD, VIN_3P3 *(Note 2)*	V_{OPR_2}	2.70	3.30	3.60	V
Voltage Range in PIN: VIN_1P8_1 *(Note 3)*	V_{OPR_3}	1.71	1.80	5.50	V
Voltage Range in PIN: VIN_1P8_2 *(Note 3)*	V_{OPR_4}	1.71	1.80	1.89	V
Operating Temperature	Topr	-40	+25	+105	°C

(Note 1) It is necessary to supply the same voltage to the VSYS pin and the BUCK1_VIN to BUCK8_VIN pins.
(Note 2) The VIN_3P3 pin is recommended to connect with BUCK6 outputs.
(Note 3) The VIN_1P8_1 pin and the VIN_1P8_2 pin are recommended to connect with BUCK7 outputs.

2.4. Current Consumption

Table 2-4. Current Consumption

(Unless otherwise specified, Ta=+25 °C, VSYS=5.0 V, DVDD=3.3 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
VSYS Circuit Current 1	I_{Q_VSYS1}	-	14	23	μA	READY State *(Note 1)*
VSYS Circuit Current 2	I_{Q_VSYS2}	-	30	50	μA	SNVS State *(Note 1)*
VSYS Circuit Current 3	I_{Q_VSYS3}	-	137	205	μA	SUSPEND State *(Note 1)*
VSYS Circuit Current 4	I_{Q_VSYS4}	-	167	250	μA	IDLE State *(Note 1)*
VSYS Circuit Current 5	I_{Q_VSYS5}	-	197	295	μA	Run State *(Note 1)*
DVDD Circuit Current 1	I_{Q_DVDD1}	-	-	2	μA	DVDD static current (OUT32K_EN=0)
DVDD Circuit Current 2	I_{Q_DVDD2}	-	4	-	μA	DVDD oparation current (OUT32K_EN=1) *(Note 2)*

(Note 1) When DVDD is connected with LDO1, total circuit current is the value that added VSYS and DVDD circuit current of this table.
(Note 2) This circuit current is affected by parasitic capacitance of the board.

3.1.1. PWRON_B

PWRON_B is an active-low input for triggering the system to power on or off. Normally, PWRON_B is connected to a power button.

Table 3-1. PWRON_B Electrical Characteristics

(Unless otherwise specified, Ta= +25 °C, VSYS=5.0 V, DVDD=3.3 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Input "H" Level	V_{IH_PWRON}	1.44	-	-	V	
Input "L" Level	V_{IL_PWRON}	-	-	0.40	V	

3.1.2. PMIC_ON_REQ

PMIC_ON_REQ is an active-high input for going to RUN state.

Table 3-2. PMIC_ON_REQ Electrical Characteristics

(Unless otherwise specified, Ta= +25 °C, VSYS=5.0 V, DVDD=3.3 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Input "H" Level	V_{IH_ONREQ}	1.44	-	-	V	
Input "L" Level	V_{IL_ONREQ}	-	-	0.40	V	

3.1.3. PMIC_STBY_REQ

PMIC_STBY_REQ is an active-high input for going to SUSPEND state.

Table 3-3. PMIC_STBY_REQ Electrical Characteristics

(Unless otherwise specified, Ta= +25 °C, VSYS=5.0 V, DVDD=3.3 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Input "H" Level	$V_{IH_STBYREQ}$	DVDD x 0.75	-	-	V	
Input "L" Level	$V_{IL_STBYREQ}$	-	-	DVDD x 0.25	V	

3.1.4. WDOG_B

WDOG_B is an active-low input for triggering Cold Reset or Warm Reset.

Table 3-4. WDOG_B Electrical Characteristics

(Unless otherwise specified, Ta= +25 °C, VSYS=5.0 V, DVDD=3.3 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Input "H" Level	V_{IH_WDOG}	DVDD x 0.75	-	-	V	
Input "L" Level	V_{IL_WDOG}	-	-	DVDD x 0.25	V	

© 2019 ROHM Co., Ltd. All rights reserved.

Downloaded from Arrow.com.

3.1.5. RTC_RESET_B

RTC_RESET_B is an active-low output for RTC.

Table 3-5. RTC_RESET_B Electrical Characteristics

(Unless otherwise specified, Ta= +25 °C, VSYS=5.0 V, DVDD=3.3 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Output "L" Level Voltage	$V_{OL_RTCRESET}$	-	-	DVDD x 0.2	V	I_{OL}=3 mA Sink
Output Off Leak Current	$I_{OLK_RTCRESET}$	-1	-	+1	µA	

3.1.6. POR_B

POR_B is an active-low output for the reset of SoC.

Table 3-6. POR_B Electrical Characteristics

(Unless otherwise specified, Ta= +25 °C, VSYS=5.0 V, DVDD=3.3 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Output "L" Level Voltage	V_{OL_POR}	-	-	DVDD x 0.2	V	I_{OL}=3 mA Sink
Output Off Leak Current	I_{OLK_POR}	-1	-	+1	µA

3.2. Power States

3.2.1. Power State Diagram

BD71837AMWV has eight power states or modes: OFF, READY, SNVS, RUN, IDLE, SUSPEND, PWROFF and EMG. Figure 3-2 shows the state transition diagram along with the conditions to enter and exit each state.
READY_TO_SNVS Condition is described in 3.2.5.2. This condition is configurable by TRANS_COND0 registers.
SNVS_TO_RUN Condition is described in 3.2.5.3. This condition is configurable by TRANS_COND0 registers.
BD71837AMWV has Thermal Shutdown, OCP, VR Fault, and VSYS_UVLO=0 as Emergency Shutdown events. Emergency Shutdown Condition is described in 3.2.5.9. EMG_TO_READY Condition is described in 3.2.5.12. EMG_STAY Condition is described in 3.2.5.13.
BD71837AMWV has WDOG_B, SWRESET, and PWRON_B long detection as Cold Reset events. COLD_RESET Condition is described in 3.2.4.1. After cold reset events or PMIC_ON_REQ=0, BD71837AMWV is configurable that it returns to READY or SNVS state. POFF_TO_READY Condition is described in 3.2.5.16. POFF_TO_SNVS Condition is described in 3.2.5.17. Concerning VSYS_UVLO and INTLDO1P5_UVLO, please refer to 2.5.

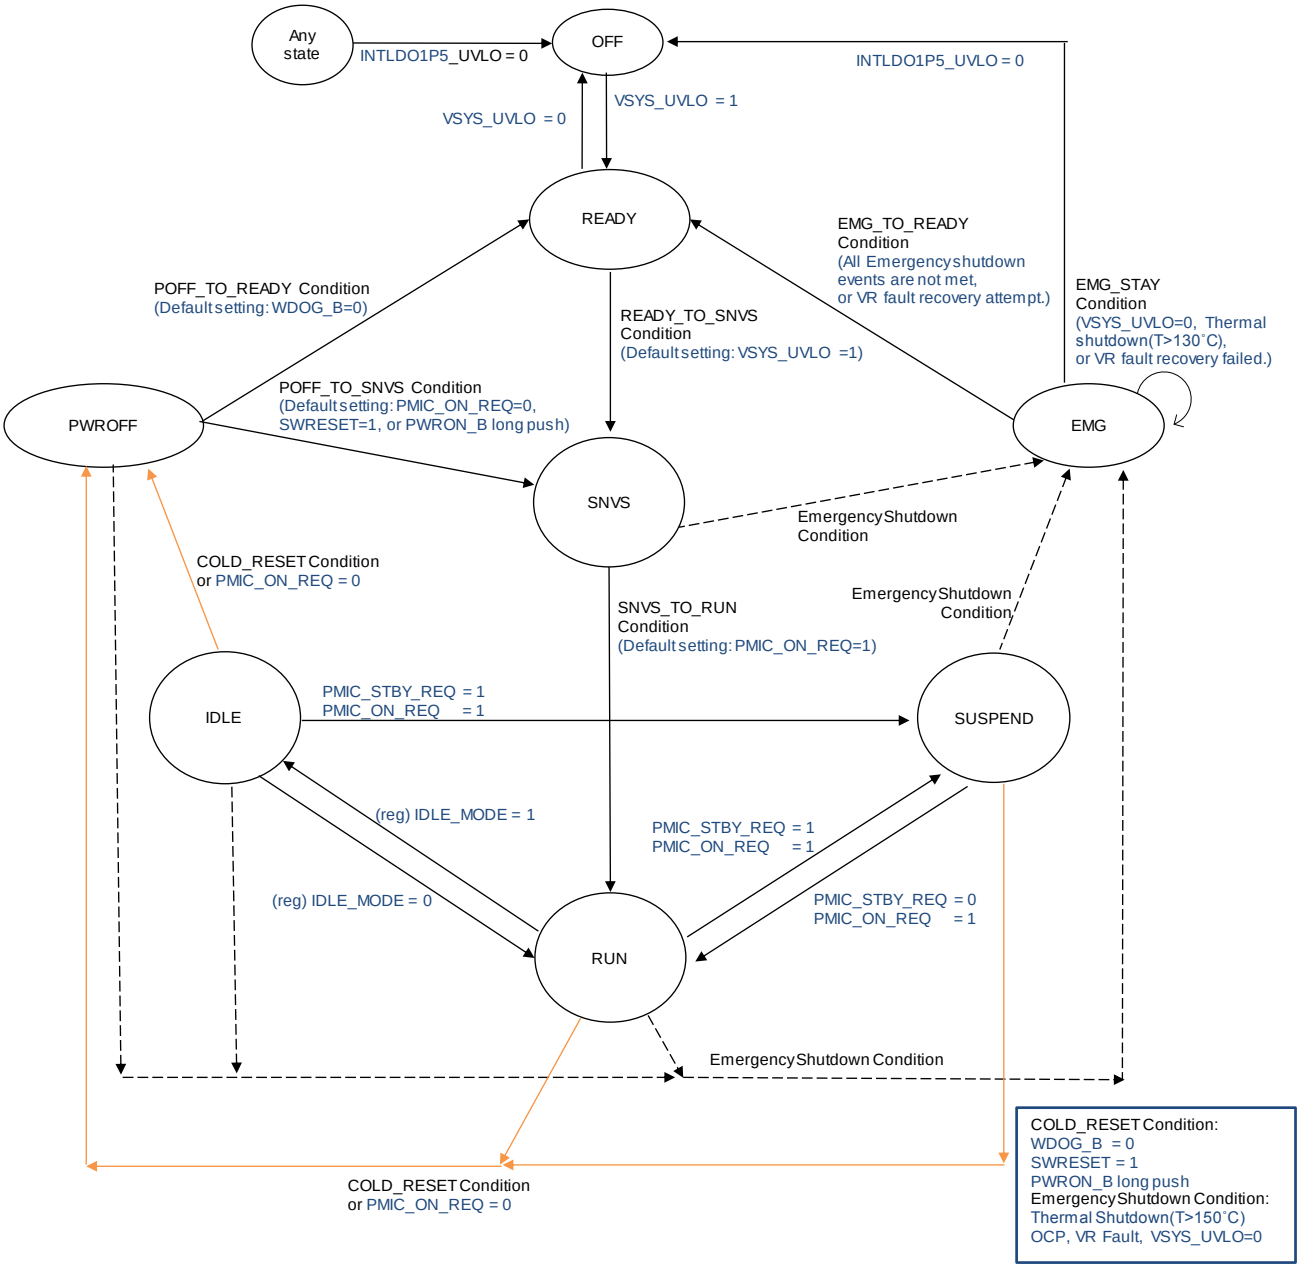

Figure 3-2. Power State Transition

3.2.2. Power State Register

The POW_STATE register shows current power state and power sub state in Table 3-7. The power sub state definition is illustrated in Figure 3-3.

Table 3-7. POW_STATE – Power State Register

Register Name	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Initial	Address
POW_STATE	R	POW_ST[3:0]				-	-	POW_SUB[1:0]		0x00	0x2D

Bit	Name	Function	Initial
D[7:4]	POW_ST[3:0]	This bit field shows current power state. 0x0 = OFF 0x1 = READY 0x2 = SNVS 0x8 = RUN 0x9 = IDLE 0xA = SUSPEND 0xB = PWROFF 0xC = EMG	0000
D[1:0]	POW_SUB[1:0]	This bit field shows current power sub state. 00 = Stable 01 = Up 10 = Down 11 = Counting Cold Reset duration time (set by PONT[3:0])	00

3.2.2. Power State Register – continued

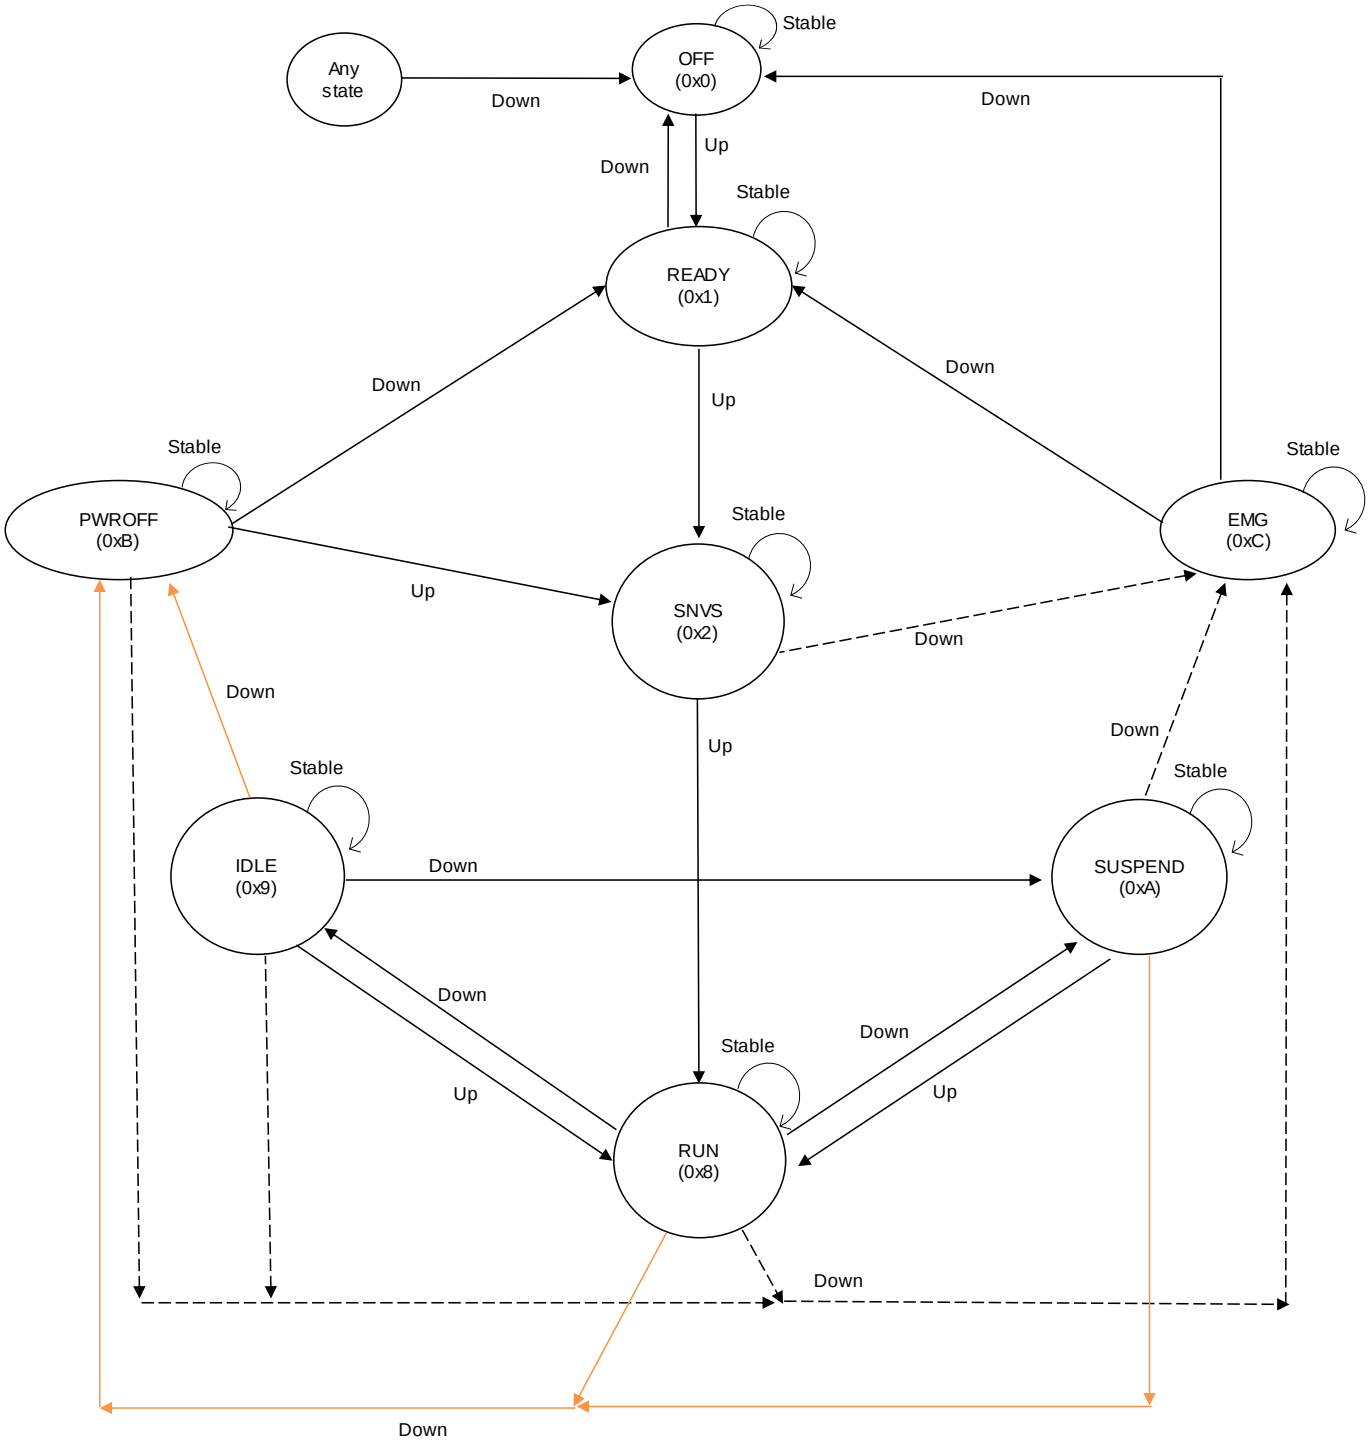

Figure 3-3. Power Sub State Definition

© 2019 ROHM Co., Ltd. All rights reserved.

Downloaded from Arrow.com.

3.2.3. Power State Definition

(a) OFF state

BD71837AMWV is in OFF state when INTLDO1P5_UVLO is detected. If INTLDO1P5_UVLO is 0, the data in all registers are reset to their default values.
To exit this state, VSYS voltage must exceed 3.0 V (VSYS_UVLO = 1)

(b) READY state

In this state, VSYS voltage is over 3.0V. When power state transitions from OFF state to READY state, OTP data will only be loaded to registers with "Yes" in "OTP" column of Register Map (Table 1-4). When power state transitions from PWROFF or EMG state to READY state, OTP data will only be loaded to registers with reset condition during READY state and "Yes" condition in "OTP" column. This OTP loading can be skipped depending on the value of RELOAD_REG in PWRCTRL0 register.

(c) SNVS state

If READY_TO_SNVS condition is satisfied, the power state changes to SNVS state. In this state, LDO1(NVCC_SNVS) and LDO2(VDD_SNVS) are turned on as shown in Table 3-8.

(d) RUN state

If SNVS_TO_RUN condition is satisfied, the power state changes to RUN state. In this state, the VR's shown in Table 3-8 are turned ON.
The value of BUCK3_RUN_ON in BUCK3_CTRL register decides whether BUCK3(VDD_GPU) is ON or OFF. The value of BUCK4_RUN_ON in BUCK4_CTRL register decides whether BUCK4(VDD_VPU) is ON or OFF.
The voltage of BUCK1(VDD_SOC) depends on BUCK1_VOLT_RUN register.
The voltage of BUCK2(VDD_ARM) depends on BUCK2_VOLT_RUN register.
The voltage of BUCK3(VDD_GPU) depends on BUCK3_VOLT_RUN register.
The voltage of BUCK4(VDD_VPU) depends on BUCK4_VOLT_RUN register.

(e) IDLE state

If IDLE_MODE in PWRCTRL1 register is set to 1, the power state changes to IDLE state. The voltage of BUCK1(VDD_SOC) depends on BUCK1_VOLT_IDLE register. The voltage of BUCK2(VDD_ARM) depends on BUCK2_VOLT_IDLE register.

(f) SUSPEND state

If PMIC_STBY_REQ is set to 1, the power state changes to SUSPEND state. The voltage of BUCK1(VDD_SOC) depends on BUCK1_VOLT_SUSP register.

(g) EMG state

If Emergency Shutdown Condition is satisfied, the power state changes to EMG state. In this state, all VR's are OFF.

(h) PWROFF state

If COLD_RESET Condition is satisfied or PMIC_ON_REQ is reset to 0, the power state changes to PWROFF state. In this state, all VR's except LDO1(NVCC_SNVS) and LDO2(VDD_SNVS) are OFF. The next state of PWROFF is either READY or SNVS. TRANS_COND1[3:0] values decide which power state to go.

3.2.4. Power State Control Events

3.2.4.1. Reset Event

BD71837AMWV has Cold and Warm resets.

Cold reset initiates POR_B asserted to L and power rails are turned off. Then, the power state changes to either READY state or SNVS state. Next, the power state returns to RUN state automatically.

Warm reset initiates POR_B asserted to L for 1 ms. It does not affect the on/off status of all power rails. Warm reset does not initiate the power state transition.

BD71837AMWV has three reset sources as follows.
- PWRON_B terminal is set H to L. (PWRON_B Long Push reset)
- WDOG_B terminal is set H to L. (WDOG_B reset)
- SWRESET in SWRESET register is set 0 to 1 (Software reset)

The cold or warm reset selection setting is shown in Table 3-9.
The details of the two registers related to the setting are shown in Table 3-10 and Table 3-11.

© 2019 ROHM Co., Ltd. All rights reserved.

3.2.4.1. Reset Event – continued

Table 3-9. Setting of Cold or Warm Reset Selection

Reset Source	Register Name	Register Bit Name	Value	Cold/Warm Reset or No Reset
PWRON_B Long Push	PWRCTRL0	DEBUG_STATE[1:0]	10 (default)	Cold reset
			11	Warm reset
			00 or 01	No reset action
WDOG_B	PWRCTRL0	WDOGB_SEL[1:0]	10 (default)	Cold reset
			11	Warm reset
			00 or 01	No reset action
Software	SWRESET	SWRESET_SEL[1:0]	10 (default)	Cold reset
			11	Warm reset
			00 or 01	No reset action

Table 3-10. SWRESET - Software Reset Register

Register Name	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Initial	Address
SWRESET	R/W	-	-	-	-	-	SWRESET_SEL[1:0]		SWRESET	0x04	0x01

Bit	Name	Function	Initial
D[2:1]	SWRESET_SEL[1:0]	Select Cold reset, Warm reset or No reset action when SWRESET bit (D[0]) is set to 1. 00 = No reset action 01 = No reset action 10 = Cold reset 11 = Warm reset	10
D[0]	SWRESET	0 – No action 1 – Initiates Cold Reset or Warm Reset in accordance with SWRESET_SEL bit. Writing 1 to SWRESET bit, then SWRESET bit is automatically cleared to 0 when Cold Reset or Warm Reset operation is completed. Writing 1 to SWRESET bit can be done when Power State = RUN, IDLE and SUSPEND.	0

Table 3-11. PWRCTRL0 - Power Control 0 Register

Register Name	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Initial	Address
PWRCTRL0	R/W	DEBUG_STATE[1:0]		RELOAD_ REG	-	-	-	WDOGB_SEL[1:0]		0xA2	0x03

Bit	Name	Function	Initial
D[7:6]	DEBUG_STATE[1:0]	Select Cold reset, Warm reset or No reset action when PWRON_B long push is detected. 00 = No reset action 01 = No reset action 10 = Cold reset 11 = Warm reset	10
D[5]	RELOAD_REG	Select OTP configurable registers initialization when the power state goes through READY state. 0 = No initialization 1= Reload OTP registers and set to initial value	1
D[1:0]	WDOGB_SEL[1:0]	Select Cold reset, Warm reset or No reset action when WDOG_B is asserted to 0. 00 = No reset action 01 = No reset action 10 = Cold reset 11 = Warm reset	10

3.2.4.2. Emergency Shutdown Event

There are four Emergency Shutdown Events as follows:

• Thermal Shutdown (Thermal Protection)

If the die temperature surpasses 150ºC, the thermal protection circuit will shut down all VR's to avoid damage. This detection is not valid at OFF, READY and SNVS state.

• OCP

If the OCP is triggered in any VR's, all VR's are turned off.

• VR Fault

If the voltage of VR is not within the regular range, all VR's are turned off.

• VSYS_UVLO = 0

If the VSYS_UVLO = 0, Emergency Shutdown sequence is initiated.

3.2.5. Power State Transitions

3.2.5.1. OFF to READY

Table 3-12 shows the conditions for exiting OFF state. "VSYS_UVLO = 1" is necessary.

Table 3-12. Conditions from OFF to READY state

Event Trigger	Conditions (All must be satisfied per Event Trigger)	Next State	Notes
1) VSYS Voltage Up from 0 V or 2.7 V	VSYS_UVLO = 1 (VSYS > 3.0 V)	READY	VSYS Insertion or VSYS recovery from 2.7 V

© 2019 ROHM Co., Ltd. All rights reserved.

Downloaded from Arrow.com.

3.2.5.2. READY to SNVS

There are six event triggers for shifting from READY to SNVS as shown in Table 3-13. The event trigger of VSYS_UVLO, PMIC_ON_REQ, PWRON_B Short Push, and PWRON_B Long Push are configurable to be valid or invalid by TRANS_COND0 registers. VSYS_UVLO condition is valid with default setting.

Table 3-13. Conditions from READY to SNVS

Event Trigger	Conditions (All must be satisfied per Event Trigger)	Next State	Notes
1) VSYS_UVLO	VSYS_UVLO = 1	SNVS	No other event is necessary. Valid with default setting
2) PMIC_ON_REQ	VSYS_UVLO = 1 and PMIC_ON_REQ = 1	SNVS	Invalid with default setting
3) PWRON_B Short Push	VSYS_UVLO = 1 and PWRON_B = 0 ==> Short Push Detection	SNVS	Invalid with default setting
4) PWRON_B Long Push	VSYS_UVLO = 1 and PWRON_B = 0 ==> Long Push Detection	SNVS	Invalid with default setting
5) Cold Reset Sequence	VSYS_UVLO = 1 and Cold_Reset_flag = 1	SNVS	On the way back to RUN state in Cold Reset sequence
6) VR Fault Recovery Attempt	VSYS_UVLO = 1 and VR Fault Recovery	SNVS	

1) VSYS_UVLO

The power state shifts to SNVS if VSYS_UVLO = 1 as shown in Figure 3-4. No other conditions are necessary.

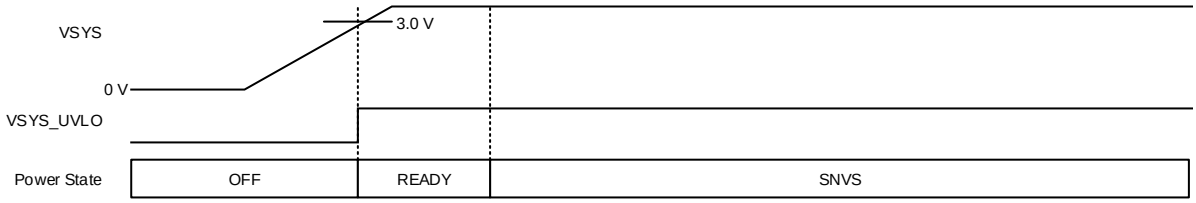

Figure 3-4. VSYS Condition for moving to SNVS

2) PMIC_ON_REQ

The power state shifts to SNVS if PMIC_ON_REQ = 1 as shown in Figure 3-5.

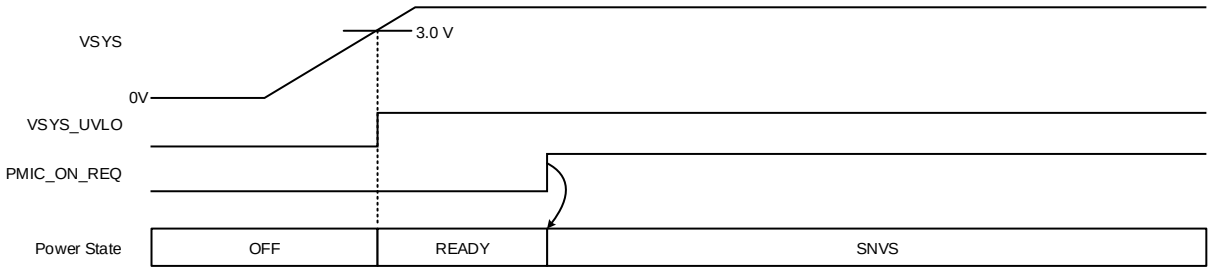

Figure 3-5. PMIC_ON_REQ Condition for moving to SNVS

Downloaded from Arrow.com.

3.2.5.2. READY to SNVS – continued

6) VR Fault Recovery Attempt
Please see 3.2.5.10.

It is possible to use each four event triggers such as:
VSYS_UVLO,
PMIC_ON_REQ,
PWRON_B Short Push and
PWRON_B Long Push
These triggers are configurable to use them respectively by D[3:0] in TRANS_COND0 register as shown in Table 3-14.

Table 3-14. TRANS_COND0 - Transition Condition Select 0 Register

Register Name	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Initial	Address
TRANS_COND0	R/W	C1_ VSYS_3P0_ EN	C1_ PMIC_ON_ REQ_EN	C1_ SHORT_ PUSH_EN	C1_ LONG_ PUSH_EN	C0_ VSYS_3P0_ EN	C0_ PMIC_ON_ REQ_EN	C0_ SHORT_ PUSH_EN	C0_ LONG_ PUSH_EN	0x48	0x1F

Bit	Name	Function	Initial
D[7]	C1_VSYS_3P0_EN	Select only VSYS_UVLO = 1 as SNVS ==> RUN transition condition or not 0 = VSYS_UVLO = 1 is not used as the condition 1 = VSYS_UVLO = 1 is used as the condition	0
D[6]	C1_PMIC_ON_REQ_EN	Select PMIC_ON_REQ as SNVS ==> RUN transition condition or not 0 = PMIC_ON_REQ is not used as the condition 1 = PMIC_ON_REQ is used as the condition	1
D[5]	C1_SHORT_PUSH_EN	Select PWRON_B Short Push as SNVS ==> RUN transition condition or not 0 = PWRON_B Short Push is not used as the condition 1 = PWRON_B Short Push is used as the condition	0
D[4]	C1_LONG_PUSH_EN	Select PWRON_B Long Push as SNVS ==> RUN transition condition or not 0 = PWRON_B Long Push is not used as the condition 1 = PWRON_B Long Push is used as the condition	0
D[3]	C0_VSYS_3P0_EN	Select only VSYS_UVLO = 1 as READY ==> SNVS transition condition or not 0 = VSYS_UVLO = 1 is not used as the condition 1 = VSYS_UVLO = 1 is used as the condition	1
D[2]	C0_PMIC_ON_REQ_EN	Select PMIC_ON_REQ as READY ==> SNVS transition condition or not 0 = PMIC_ON_REQ is not used as the condition 1 = PMIC_ON_REQ is used as the condition	0
D[1]	C0_SHORT_PUSH_EN	Select PWRON_B Short Push as READY ==> SNVS transition condition or not 0 = PWRON_B Short Push is not used as the condition 1 = PWRON_B Short Push is used as the condition	0
D[0]	C0_LONG_PUSH_EN	Select PWRON_B Long Push as READY ==> SNVS transition condition or not 0 = PWRON_B Long Push is not used as the condition 1 = PWRON_B Long Push is used as the condition	0

3.2.5.3. SNVS to RUN

There are six event triggers for shifting from SNVS to RUN as shown in Table 3-15. The event trigger of VSYS_UVLO=1 PMIC_ON_REQ, PWRON_B Short Push, and PWRON_B Long Push are configurable to be valid or invalid by TRANS_COND0 registers. PMIC_ON_REQ condition is valid with default setting.

Table 3-15. Conditions from SNVS to RUN

Event Trigger	Conditions (All must be satisfied per Event Trigger)	Next State	Notes
1) VSYS_UVLO	VSYS_UVLO = 1	RUN	No other event is necessary. Invalid with default setting
2) PMIC_ON_REQ	VSYS_UVLO = 1 and PMIC_ON_REQ = 1	RUN	Valid with default setting
3) PWRON_B Short Push	VSYS_UVLO = 1 and PWRON_B = 0 ==> Short Push Detection	RUN	Invalid with default setting
4) PWRON_B Long Push	VSYS_UVLO = 1 and PWRON_B = 0 ==> Long Push Detection	RUN	Invalid with default setting
5) Cold Reset Sequence	VSYS_UVLO = 1 and Cold_Reset_flag = 1	RUN	On the way back to RUN state in Cold Reset sequence
6) VR Fault Recovery Attempt	VSYS_UVLO = 1 and VR Fault Recovery	RUN	

(Note) Die Temperature must be less than 150 ºC.

1) VSYS_UVLO

The power state shifts to RUN if VSYS_UVLO = 1 as shown in Figure 3-9. No other condition is required.

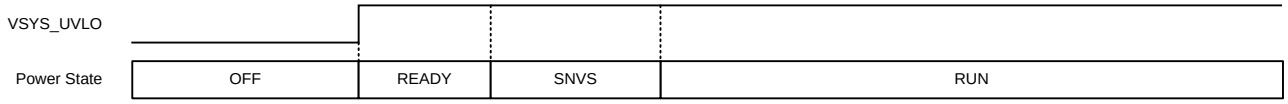

Figure 3-9. VSYS Condition for moving to RUN

2) PMIC_ON_REQ

The power state shifts to RUN if PMIC_ON_REQ = 1 as shown in Figure 3-10.

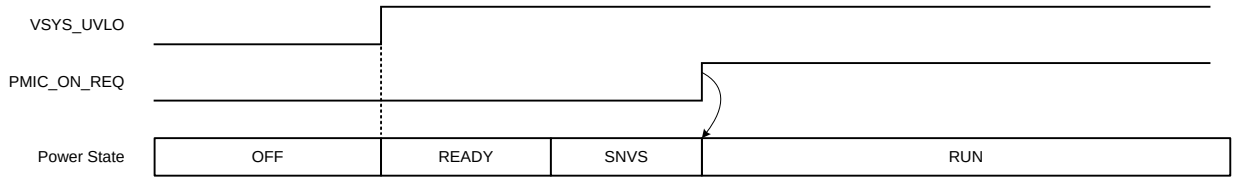

Figure 3-10. PMIC_ON_REQ Condition for moving to RUN

3.2.5.4. RUN to IDLE

Table 3-16 shows the conditions for shifting from RUN to IDLE. The details of PWRCTRL1 register were described in Table 3-17.

Table 3-16. Conditions from RUN to IDLE

Event Trigger	Conditions (All must be satisfied)	Next State	Notes
Set IDLE_MODE (PWRCTRL1 register) = 1	PMIC_STBY_REQ = 0	IDLE	Register Write Operation
	PMIC_ON_REQ = 1		
	Set IDLE_MODE = 1		

(Note) Die Temperature must be less than 150 ºC. VSYS_UVLO = 1.

Table 3-17. PWRCTRL1 - Power Control 1 Register

Register Name	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Initial	Address
PWRCTRL1	R/W	-	-	-	-	-	-	-	IDLE_ MODE	0x00	0x04

Bit	Name	Function	Initial
D[0]	IDLE_MODE	Control power state transition between RUN and IDLE 0 = Exit IDLE and back to RUN, or indicates power state = except IDLE 1 = Enter IDLE from RUN, or indicates power state = IDLE Note : this bit automatically returns to 0 when power state enters PWROFF, EMG and SUSPEND.	0

3.2.5.5. IDLE to RUN

Table 3-18 shows the conditions for shifting from IDLE to RUN.

Table 3-18. Conditions from IDLE to RUN

Event Trigger	Conditions (All must be satisfied)	Next State	Notes
Set IDLE_MODE (PWRCTRL1 register) = 0	PMIC_STBY_REQ = 0	RUN	Register Write Operation
	PMIC_ON_REQ = 1		
	Set IDLE_MODE = 0		

(Note) Die Temperature must be less than 150 ºC. VSYS_UVLO = 1.

3.2.5.6. RUN to SUSPEND

Table 3-19 shows the conditions for shifting from RUN to SUSPEND.

Table 3-19. Conditions from RUN to SUSPEND

Event Trigger	Conditions (All must be satisfied)	Next State	Notes
PMIC_STBY_REQ	PMIC_STBY_REQ = 1	SUSPEND	
	PMIC_ON_REQ = 1		

(Note) Die Temperature must be less than 150 ºC. VSYS_UVLO = 1.

3.2.5.7. SUSPEND to RUN

Table 3-20 shows the conditions for shifting from SUSPEND to RUN.

Table 3-20. Conditions from SUSPEND to RUN

Event Trigger	Conditions (All must be satisfied)	Next State	Notes
PMIC_STBY_REQ	PMIC_STBY_REQ = 0	RUN	
	PMIC_ON_REQ = 1		

(Note) Die Temperature must be less than 150 ºC. VSYS_UVLO = 1.

Downloaded from Arrow.com.

3.2.5.8. IDLE to SUSPEND

Table 3-21 shows the conditions for shifting from IDLE to SUSPEND. IDLE_MODE in PWRCTRL1 register automatically returns to 0.

Table 3-21. Conditions from IDLE to SUSPEND

Event Trigger	Conditions (All must be satisfied)	Next State	Notes
PMIC_STBY_REQ	PMIC_STBY_REQ = 1 PMIC_ON_REQ = 1	SUSPEND	

(Note) Die Temperature must be less than 150 ºC. VSYS_UVLO = 1.

3.2.5.9. Emergency Shutdown

There are four Emergency Shutdown events which are:

Thermal Shutdown (Thermal Protection)
OCP
VR Fault
VSYS_UVLO = 0 as shown in Table 3-22.

Table 3-22. Conditions from SNVS, RUN, IDLE, SUSPEND, PWROFF to EMG

Event Trigger	Conditions (All must be satisfied per Event Trigger)	Next State	Notes
1) Thermal Shutdown	Die Temperature > 150 ºC	EMG	Thermal Protection This protection is invalid at OFF, READY, and SNVS state
2) OCP	Any VR's OCP	EMG	
3) VR Fault	Any VR's out of the target voltage	EMG	
4) VSYS_UVLO = 0	VSYS_UVLO = 0	EMG	

The detail of VR Fault is described in 3.2.5.10.

3.2.5.10. VR Fault

BD71837AMWV has VR fault detection function which monitors all relevant VR's of the system. The system is shut down when a monitored voltage rail goes out of the target voltage. Once the system has shut down, the system tries to boot up several times which is determined by RCVLMT[3:0] in RCVCFG register. Table 3-23 shows the VR fault threshold and monitoring conditions.

Table 3-23. VR FAULT threshold and monitoring condition

VR No.	Function	Rail Name	SNVS		SUSPEND		IDLE		RUN	
			Monitor Y/N	Voltage Target Range	Monitor Y/N	Voltage Target Range	Monitor Y/N	Voltage Target Range	Monitor Y/N	Voltage Target Range

3.2.5.10. VR Fault – continued

BD71837AMWV monitors each rail. If a monitored VR goes out of the target voltage in a certain time, the system will shut down. When the system cannot shift to RUN state after Power ON sequence several times which is defined by RCVLMT[3:0] in RCVCFG register, the system stays at EMG state until INTLDO1P5_UVLO = 0.

If a VR is turned OFF by VR control registers (BUCK1 to BUCK8 and LDO1 to LDO7), VR fault of that VR is masked.

BD71837AMWV has VR individual masking registers as shown in Table 3-25, Table 3-26 and Table 3-27. This masking function is used for mainly debugging in development phase.

Table 3-24. VRFAULTEN - VR FAULT ON/OFF Register: Debugging Purpose

Following a VR Fault and an Emergency Shutdown sequence, BD71837AMWV stays in READY state for a programmed time which is specified by RCVDT[3:0] of RCVCFG register. Power ON sequence is then initiated once RCVDT[3:0] time has elapsed.

To prevent an infinite loop of VR Fault induced power cycles, BD71837AMWV limits the number of attempts to recover the system by RCVLMT[3:0] of RCVCFG register when these failures occur. Once BD71837AMWV has attempted to recover from a VR Fault for a number of times which is specified by RCVLMT[3:0], the next VR Fault results in BD71837AMWV staying in EMG state until INTLDO1P5_UVLO = 0.

The ability to reset RCVNUM register which tracks the number of VR Fault recovery attempts via I2C is supported. This will allow the SoC to reset this count value when needed.

3.2.5.10. VR Fault – continued

Table 3-28. RCVCFG - Recovery Configuration Register

Register Name	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Initial	Address
RCVCFG	R/W	RCVLMT[3:0]				RCVDT[3:0]				0x4C	0x25

Bit	Name	Function	Initial
D[7:4]	RCVLMT[3:0]	The limit number of attempts to recover the system after a VR Fault occurred. 0000 = No recovery. BD71837AMWV stays in EMG state until VSYS is triggered again. 0001 = 1 time 0010 = 2 times 0011 = 3 times 0100 = 4 times : 1110 = 14 times 1111 = No limit of attempts to recover	0100
D[3:0]	RCVDT[3:0]	The duration time during which BD71837AMWV stays in READY state after a VR Fault event. BD71837AMWV remains in READY state for the duration programmed here then BD71837AMWV performs a Power ON sequence, if RCVLMT[3:0] is not 0x0 or 0xF and RCVLMT[3:0] is not equal to RCVNUM[3:0] of RCVNUM register. 0000 = 5 ms 0001 = 10 ms 0010 = 15 ms 0011 = 20 ms 0100 = 25 ms 0101 = 30 ms 0110 = 35 ms 0111 = 40 ms 1000 = 45 ms 1001 = 50 ms 1010 = 75 ms 1011 = 100 ms 1100 = 250 ms 1101 = 500 ms 1110 = 750 ms 1111 = 1500 ms	1100

Table 3-29. RCVNUM - Recovery Number Register

Register Name	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Initial	Address
RCVNUM	R/W	-	-	-	-	RCVNUM[3:0]				0x00	0x26

Bit	Name	Function	Initial
D[3:0]	RCVNUM[3:0]	The number of attempts to recover the system after a VR Fault occurred. Once BD71837AMWV has attempted to recover from a power failure times which is indicated in RCVLMT[3:0] in RCVCFG register, the next failure shall result in BD71837AMWV staying in EMG state until VSYS is triggered again. When SoC writes RCVNUM register via I2C, then RCVNUM[3:0] is cleared to 0000. As a result, the tracking number of power failure recovery attempts is reset. Note : When RCVLMT[3:0] = 0xF (no limit of attempts to recover) and the number of attempt is over 0xF, RCVNUM[3:0] value is fixed to 0xF.	0000

3.2.5.13. EMG_STAY Condition

Table 3-32 shows the conditions for staying at EMG. Basically, the power state stays at EMG when emergency events are found as shown in Figure 3-14, Figure 3-16, and Figure 3-17.
Note: In case of 3) VR Fault Recovery Failure in Table 3-32; in order to exit EMG, VSYS voltage must be less than 2.7V and then the power state goes to OFF.

Table 3-32. Conditions for Stay at EMG

Event Trigger	Conditions (All must be satisfied per Event Trigger)	Next State	Notes
1) VSYS < 2.7 V	VSYS_UVLO = 0	EMG	
	INTLDO1P5_UVLO = 1		
2) Thermal Shutdown	Die Temperature > 150 ºC	EMG	Thermal Protection
	INTLDO1P5_UVLO = 1		
3) VR Fault Recovery Failure	VR Fault Recovery Attempt Failed	EMG	
	INTLDO1P5_UVLO = 1		

3.2.5.14. Warm Reset

Warm Reset is executed when the power state = RUN, IDLE and SUSPEND.
Warm Reset set POR_B = L for 1 ms as shown in Figure 3-18.
Please refer to the Table 3-9 for necessary register setting.

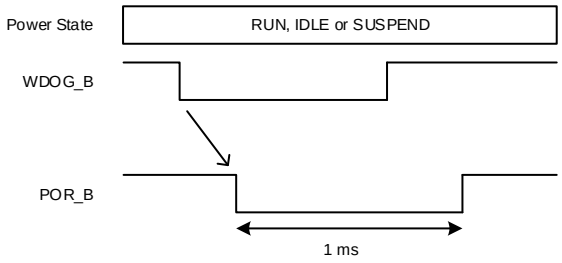

Figure 3-18. Warm Reset by WDOG_B

Downloaded from Arrow.com.

3.2.5.15. PWROFF

Table 3-33 shows the conditions for shifting from RUN, IDLE, SUSPEND to PWROFF.
When the power state is PWROFF, BD71837AMWV runs Power OFF sequence and VR's are turned OFF in a defined sequential order.
In the end of the sequence, the on-off state of C32K_OUT, RTC_RESET_B, LDO2 and LDO1 depends on the setting of TRANS_COND1 register as shown in Table 3-34. The summary is shown in Table 3-35.

Table 3-33. Conditions from RUN, IDLE, SUSPEND to PWROFF

Event Trigger	Conditions (All must be satisfied per Event Trigger)	Next State	Notes
1) PWRON_B Long Push	PWRON_B = 0 ==> Long Push Detection	PWROFF	COLD_RESET event
2) WDOG_B	WDOG_B = 0	PWROFF	COLD_RESET event
3) Software Reset	Write 1 to SWRESET in SWRESET register	PWROFF	COLD_RESET event
4) PMIC_ON_REQ	PMIC_ON_REQ = 0	PWROFF	

(Note) Die Temperature must be less than 150 ºC. VSYS_UVLO = 1.

Table 3-34. TRANS_COND1 - Transition Condition Select 1 Register

3.2.5.16. PWROFF to READY

After the completion of Power OFF sequence, the power state goes READY if the POFF_TO_READY = 1. This is in accordance with PWROFF trigger event in the TRANS_COND1 register.

3.2.5.17. PWROFF to SNVS

After the completion of Power OFF sequence, the power state goes SNVS if the POFF_TO_READY = 0. This is in accordance with PWROFF trigger event in the TRANS_COND1 register.

3.2.5.18. PWRON_B Functionality

The system has a button that can be used for triggering the system to power on or off. PWRON_B is an active-low input to BD71837AMWV. Timer circuitry measures the length of time the button is pressed. Then the timer detects short push and long push events.

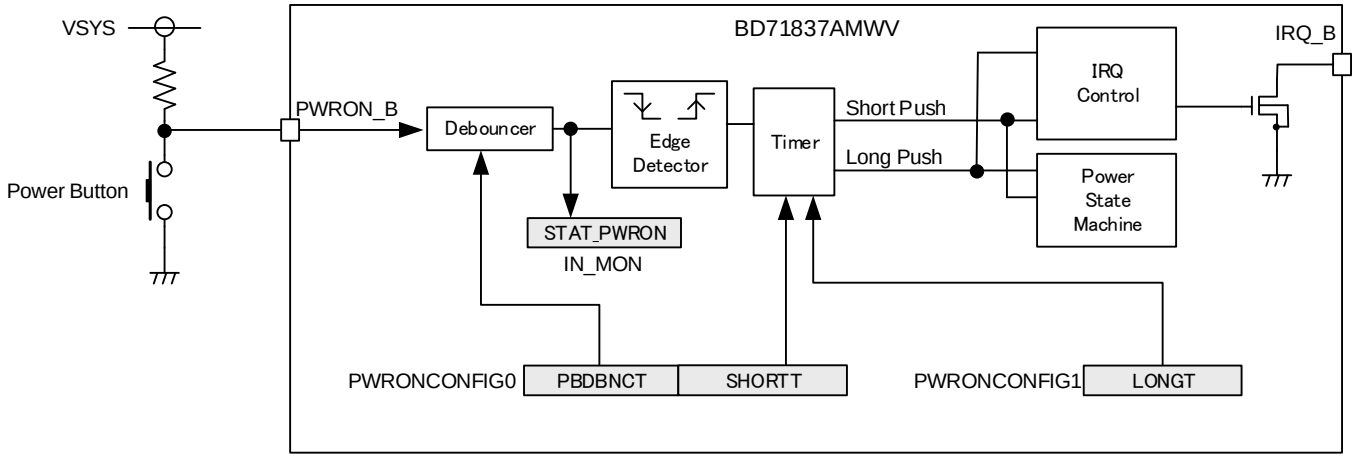

Figure 3-20. Power Button Block Diagram

5.2.1.2. BUCK1 Electrical Characteristics

Table 5-3. BUCK1 Electrical Characteristics

(Unless otherwise specified, Ta=+25 °C, VSYS=5.0 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Output Voltage	V_{O_BK1}	0.891	0.900	0.909	V	Vo = 0.9 V Io = 200 mA, PWM fix Mode
Programmable Output Voltage Range	V_{ORG_BK1}	0.7	-	1.3	V	10 mV step
Quiescent Current	I_{Q_BK1}	-	15	-	µA	Vo = 0.9 V Io = 0 mA, Auto mode
Maximum Output Current	I_{OMAX_BK1}	3600	-	-	mA	
Over Current Protection	I_{OCP_BK1}	5000	-	-	mA	Peak current of inductor *(Note 1)*
DC Output Voltage Load Regulation	ΔV_{LDR_BK1}	-1	0	+1	%	Io = 1 mA to Iomax, PWM fix Mode
Efficiency	η_{BK1_1mA}	-	80	-	%	Io = 1 mA, Vo = 0.9 V
	η_{BK1_500mA}	-	85	-	%	Io = 500 mA, Vo = 0.9 V
	η_{BK1_max}	-	72	-	%	Io = Iomax, Vo = 0.9 V
Oscillating Frequency	f_{SW_BK1}	-	2	-	MHz	PWM fix mode, Io = 0 mA
Start up Time	t_{ST_BK1}	-	160	500	µs	During EN to 90% of nominal Voltage, BUCK1_RAMPRATE_RUN[1:0] = 01
Discharge Resistance	R_{D_BK1}	-	100	-	Ω	
Low Side VR Fault Detect Level	D_{VRFBK1_L}	-	80	-	%	Vo = 0.9 V (FB = Sweep down) VR fault detect level / Vo x 100
Low Side VR Fault Detect Hysteresis	D_{VRFBK1_LHYS}	-	10	-	%	(VR fault release level - detect level) / Vo x 100
High Side VR Fault Detect Level	D_{VRBK1_H}	-	130	-	%	Vo = 0.9 V (FB = Sweep up) Power good detect level / Vo x 100
High Side VR Fault Detect Hysteresis	D_{VRFBK1_HHYS}	-	20	-	%	(VR fault detect level - release level) / Vo x 100
Output Inductance	L_{BK1}	-	0.47	-	µH	*(Note 2)*
Output Capacitance	C_{OBK1}	22	44	100	µF	*(Note 2)* Effective capacitance with BUCK's DC bias Max value is limited by ramp rate. <Output Max Capacitance> ramp rate 1.25 mV, 2.5 mV, 5 mV : 100 µF ramp rate 10 mV : 50 µF

(Note 1) For Buck- DCDC converters, (minimum Over Current Protection Current – ½ inductor ripple current) is the maximum output current.

(Note 2) This part value range need to be guaranteed over the operating surrounding temperature.

5.2.3.2. BUCK3 Electrical Characteristics

Table 5-12. BUCK3 Electrical Characteristics

(Unless otherwise specified, Ta=+25 °C, VSYS=5.0 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Output Voltage	V_{O_BK3}	0.990	1.000	1.010	V	Vo = 1.0 V Io = 200 mA, PWM fix Mode
Programmable Output Voltage Range	V_{ORG_BK3}	0.7	-	1.3	V	10 mV step
Quiescent Current	I_{Q_BK3}	-	15	-	µA	Vo = 1.0 V Io = 0 mA, Auto mode
Maximum Output Current	I_{OMAX_BK3}	2100	-	-	mA	
Over Current Protection	I_{OCP_BK3}	3150	-	-	mA	Peak current of inductor *(Note 1)*
DC Output Voltage Load Regulation	ΔV_{LDR_BK3}	-1	0	+1	%	Io = 1 mA to Iomax, PWM fix Mode
Efficiency	η_{BK3_1mA}	-	80	-	%	Io = 1 mA, Vo = 1.0 V
	η_{BK3_500mA}	-	85	-	%	Io = 500 mA, Vo = 1.0 V
	η_{BK3_max}	-	79	-	%	Io = Iomax, Vo = 1.0 V
Oscillating Frequency	f_{SW_BK3}	-	2	-	MHz	PWM fix mode, Io = 0 mA
Start up Time	t_{ST_BK3}	-	180	500	µs	During EN to 90% of nominal Voltage, BUCK3_RAMPRATE_RUN[1:0] = 01
Discharge Resistance	R_{D_BK3}	-	100	-	Ω	
Low Side VR Fault Detect Level	D_{VRFBK3_L}	-	80	-	%	Vo = 1.0 V (FB = Sweep down) VR fault detect level / Vo x 100
Low Side VR Fault Detect Hysteresis	D_{VRFBK3_LHYS}	-	10	-	%	(VR fault release level - detect level) / Vo x 100
High Side VR Fault Detect Level	D_{VRBK3_H}	-	130	-	%	Vo = 1.0 V (FB = Sweep up) Power good detect level / Vo x 100
High Side VR Fault Detect Hysteresis	D_{VRFBK3_HHYS}	-	20	-	%	(VR fault detect level - release level) / Vo x 100
Output Inductance	L_{BK3}	-	0.47	-	µH	*(Note 2)*
Output Capacitance	C_{OBK3}	11	22	100	µF	*(Note 2)* Effective capacitance with BUCK's DC bias Max value is limited by ramp rate. <Output Max Capacitance> ramp rate 1.25 mV, 2.5 mV, 5 mV : 100 µF ramp rate 10 mV : 50 µF

(Note 1) For Buck- DCDC converters, (minimum Over Current Protection Current – ½ inductor ripple current) is the maximum output current.

(Note 2) This part value range need to be guaranteed over the operating surrounding temperature.

5.2.6. BUCK6

5.2.6.1. BUCK6 Block Diagram

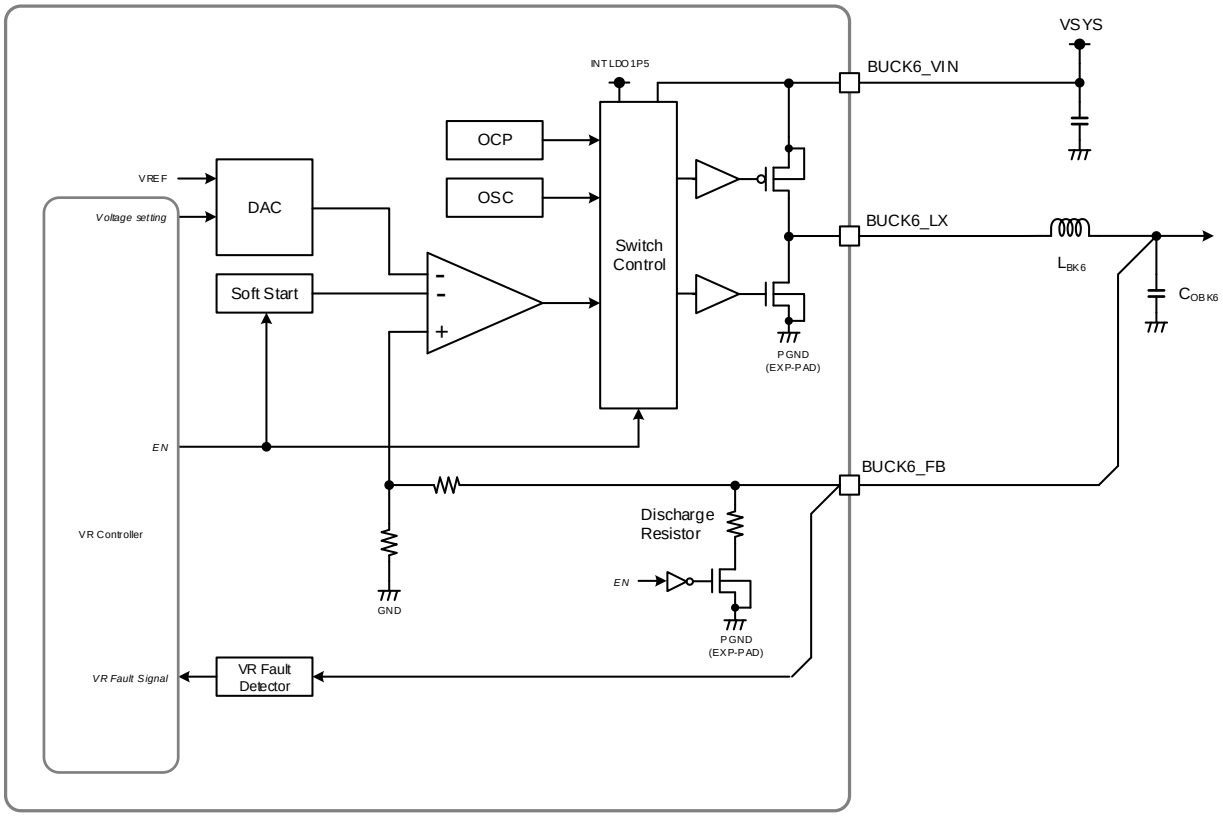

Figure 5-6. BUCK6 Block Diagram

BUCK6 can be configured to the highest output voltage up to 3.3V. There is no concern for subharmonic oscillations even at 50% or higher switching duty cycle as the Buck regulator adopts hysteretic topology. However, there might be consideration required for the input and output voltage headroom as described in the “Headroom for BUCK6” section in the “5.2.6.2 BUCK6 Electrical Characteristics” of this datasheet.

5.2.6.2. BUCK6 Electrical Characteristics

Table 5-21. BUCK6 Electrical Characteristics

(Unless otherwise specified, Ta=+25 °C, VSYS=5.0 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Output Voltage	V_{O_BK6}	3.267	3.300	3.333	V	Vo=3.3 V Io = 200 mA, PWM fix Mode
Programmable Output Voltage Range	V_{ORG_BK6}	3.0	-	3.3	V	3.0 V, 3.1 V, 3.2 V, 3.3 V
Quiescent Current	I_{Q_BK6}	-	9	-	µA	Vo=3.3 V Io=0 mA, Auto mode
Maximum Output Current	I_{OMAX_BK6}	3000	-	-	mA	
Over Current Protection	I_{OCP_BK6}	4500	-	-	mA	Peak current of inductor *(Note 1)*
DC Output Voltage Load Regulation	ΔV_{LDR_BK6}	-1	0	+1	%	Io=1 mA to Iomax, PWM fix Mode
Efficiency	η_{BK6_1mA}	-	92	-	%	Io = 1 mA, Vo=3.3 V
	η_{BK6_500mA}	-	95	-	%	Io = 500 mA, Vo=3.3 V
	η_{BK6_max}	-	88	-	%	Io = Iomax, Vo=3.3 V
Oscillating Frequency	f_{SW_BK6}	-	1.5	-	MHz	PWM fix mode, Io = 0 mA
Start up Time	t_{ST_BK6}	-	240	500	µs	During EN to 90% of nominal Voltage
Discharge Resistance	R_{D_BK6}	-	100	-	Ω	
Low Side VR Fault Detect Level	D_{VRFBK6_L}	-	80	-	%	Vo = 3.3 V (FB = Sweep down) VR fault detect level / Vo x 100
Low Side VR Fault Detect Hysteresis	D_{VRFBK6_LHYS}	-	10	-	%	(VR fault release level - detect level) / Vo x 100
High Side VR Fault Detect Level	D_{VRBK6_H}	-	130	-	%	Vo = 3.3 V (FB = Sweep up) Power good detect level / Vo x 100
High Side VR Fault Detect Hysteresis	D_{VRFBK6_HHYS}	-	20	-	%	(VR fault detect level - release level) / Vo x 100
Output Inductance	L_{BK6}	-	1	-	µH	*(Note 2)*
Output Capacitance	C_{OBK6}	15.4	44	100	µF	*(Note 2)* Effective capacitance with BUCK's DC bias

(Note 1) For Buck- DCDC converters, (minimum Over Current Protection Current – ½ inductor ripple current) is the maximum output current.

(Note 2) This part value range need to be guaranteed over the operating surrounding temperature.

Headroom for BUCK6

BUCK6 cannot maintain output voltage when the input voltage is close to the output voltage. The headroom voltage is determined by output current and the impedance from VSYS to BUCK6 output including the inductor parasitic impedance (DCR). The PMIC internal impedance from BUCK6_VIN to BUCK6_LX is 121 mΩ at the worst case. Please calculate total impedance using this value, and secure enough headroom for VSYS according to the output current and voltage.

(Example – ROHM Evaluation Board case)

Vo = 3.3V setting: V_O
VSYS to BUCK6_VIN impedance of the EVB = 3 mΩ: R_{VIN}
BUCK6_LX to inductor impedance of the EVB = 6 mΩ: R_{LX}
Inductor parasitic impedance (DCR) = 45 mΩ: R_{IND}
PMIC internal impedance from BUCK6_VIN to BUCK6_LX = 121 mΩ: R_{PMIC}
Total impedance = 175 mΩ: $R_{TOTAL}=R_{VIN}+R_{LX}+R_{IND}+R_{PMIC}$
Headroom = R_{TOTAL} x Output Current

Output current	Required minimum VSYS voltage
1.0 A	3.475 V
2.0 A	3.650 V
3.0 A	3.825 V

6. 32.768 kHz Crystal Oscillator Driver

6.1. 32.768 kHz Crystal Oscillator Driver Block Diagram

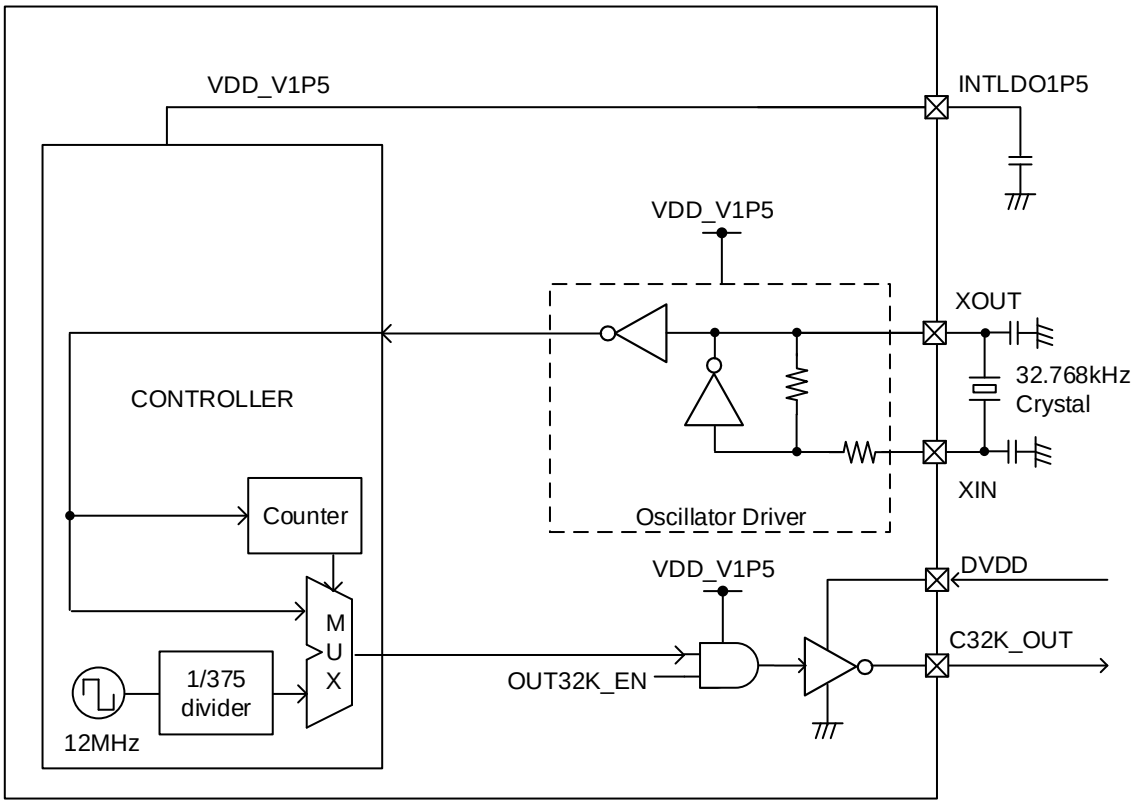

Figure 6-1. 32.768 kHz Crystal Oscillator Driver Block Diagram

Table 6-1. C32K_OUT Control Register

Register Name	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Initial	Address
OUT32K	R/W	-	-	-	-	-	-	-	OUT32K_EN	0x01	0x2E

Bit	Name	Function	Initial
D[0]	OUT32K_EN	0 = Disable (C32K_OUT is Low level) 1 = Enable	1

The C32K_OUT pin outputs 32kHz pulse which is divided internal oscillator output(12 MHz/375), at the beginning of the power on sequence. The C32K_OUT pin output is switched automatically from internal oscillator to 32.768 kHz crystal oscillator driver after 32.768 kHz crystal oscillator driver is begun oscillating stably. The internal controller counts 32.768 kHz crystal oscillator outputs. It judges that the oscillating is stable when the counter expires 3000 counts.

6.2. 32.768 kHz Crystal Oscillator Driver Electrical Characteristics

Table 6-2. 32.768 kHz Crystal Oscillator Driver Electrical Characteristics

(Unless otherwise specified, Ta = +25 °C, VSYS = 5.0 V, DVDD = 3.3 V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max		
Output Frequency	f_{RTCLK}	-	32.768	-	kHz	With external crystal
Output Duty Cycle		40	50	60	%	
Output H Level Voltage	V_{OH32K}	2.64	-	-	V	I_{OH} = -1 mA
Output L Level Voltage	V_{OL32K}	-	-	0.4	V	I_{OL} = 1 mA

(Note) The following 32.768 kHz crystal is recommended.
ST3215SB32768H5HPWAA (KYOCERA: C_L=12.5 pF)

7. Operational Notes

1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. Recommended Operating Conditions

The function and operation of the IC are guaranteed within the range specified by the recommended operating conditions. The characteristic values are guaranteed only under the conditions of each item specified by the electrical characteristics.

6. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

7. Operation Under Strong Electromagnetic Field

Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

8. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

7. Operational Notes – continued

9. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

10. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

11. Regarding the Input Pin of the IC

This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.
When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

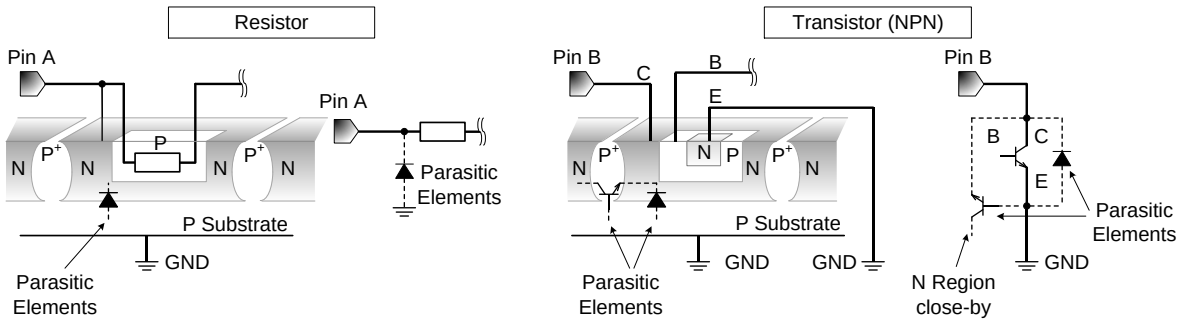

Figure 7-1. Example of Monolithic IC Structure

12. Ceramic Capacitor

When using a ceramic capacitor, determine a capacitance value considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

13. Area of Safe Operation (ASO)

Operate the IC such that the output voltage, output current, and the maximum junction temperature rating are all within the Area of Safe Operation (ASO).

14. Thermal Shutdown Circuit(TSD)

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF power output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.
Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

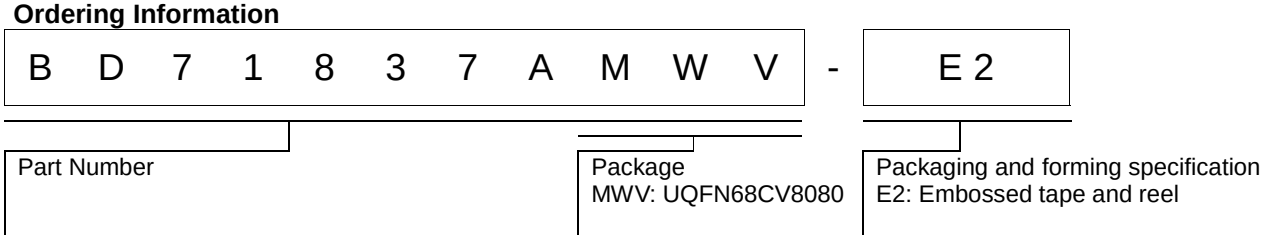

15. Over Current Protection Circuit (OCP)

This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

10. Physical Dimension and Packing Information

Package Name	UQFN68CV8080

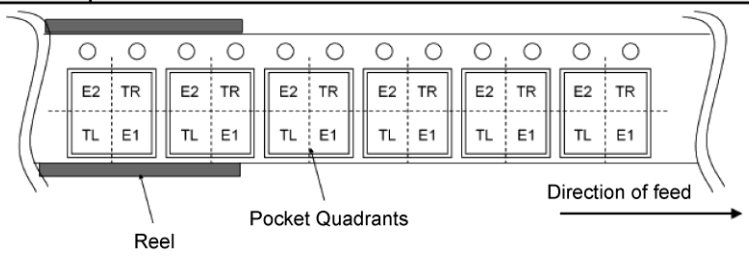

(UNIT : mm)

PKG : UQFN68CV8080

< Tape and Reel Information >

Tape	Embossed carrier tape
Quantity	1000pcs
Direction of feed	E2 The direction is the pin 1 of product is at the upper left when you hold reel on the left hand and you pull out the tape on the right hand

11. Revision History

Date	Revision	Changes
17.Apr.2019	001	New Release
12.Nov.2019	002	p.11 Corrected typo of Pin Description of EXP-PAD. p.42 Added INTLDO1P5 and INTLDO1P5_UVLO signals and corrected VSYS_UVLO signal in Figure 3-15. p.66 Clarified explanation of I2C slave address. p.90 Added the description about subharmonic for BUCK6. p.91 Changed the minimum value of Output Capacitor from 22 µF to 15.4 µF. p.91 Added the description about Headroom of BUCK6. p.74,78,82,85,88,91,94,97 Corrected typos (VR Fault parameter name of BUCK1, 2, 3, 4, 5, 6, 7 and 8. Symbol of VR Fault of BUCK8.).
16.Mar.2020	003	p.1,19 Changed the maximum operating temperature to 105 °C. p.74,78,82,85,88,91,94,97,100,103,105,108,111,114,117,120 Deleted temperature condition of parts. Added note about parts temperature.

Notice

Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipment (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment (Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASSⅢ	CLASSⅢ	CLASSⅡb	CLASSⅢ
CLASSⅣ		CLASSⅢ	

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
   [a] Installation of protection circuits or other protective devices to improve system safety
   [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
   [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
   [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
   [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl_2, H_2S, NH_3, SO_2, and NO_2
   [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
   [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
   [f] Sealing or coating our Products with resin or other coating materials
   [g] Use of our Products without cleaning residue of flux (Exclude cases where no-clean type fluxes is used. However, recommend sufficiently about the residue.) ; or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
   [h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse, is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   - [a] the Products are exposed to sea winds or corrosive gases, including Cl_2, H_2S, NH_3, SO_2, and NO_2
   - [b] the temperature or humidity exceeds those recommended by ROHM
   - [c] the Products are exposed to direct sunshine or condensation
   - [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.

2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.

3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
