

## High Speed Optocoupler, 1 MBd, Transistor Output

### DESCRIPTION

The SFH6316, SFH6343, high speed optocouplers, each consists of a GaAlAs infrared emitting diode, optically coupled with an integrated photo detector and a high speed transistor. The photo detector is junction isolated from the transistor to reduce miller capacitance effects. The open collector output function allows circuit designers to adjust the load conditions when interfacing with different logic systems such as TTL, CMOS, etc.

Because the SFH6343 has a faraday shield on the detector chip, it can also reject and minimize high input to output common mode transient voltages. The SFH6343 provides an isolated base connection to further reduce the potential electrical noise entering the package.
