

## Introduction

The OSD335x-SM Family of System-In-Package (SiP) products are building blocks designed to allow easy and cost-effective implementation of systems based on Texas Instruments' powerful Sitara™ AM335x line of processors. The OSD335x-SM integrates the AM335x along with the TI TPS65217C PMIC, the TI TL5209 LDO, up to 1 Gigabyte (GB) of DDR3 Memory, a 4 Kilobyte (KB) EEPROM for non-volatile configuration storage and resistors, capacitors, and inductors into a single 21mm x 21mm design-in-ready package.

With this level of integration, the OSD335x-SM Family of SiPs allows designers to focus on the key aspects of their system without spending time on the complicated high-speed design of the processor/DDR3 interface or the PMIC power distribution. It also reduces the overall size and complexity of the design and the supply chain. The OSD335x-SM can significantly decrease the time to market for AM335x-based products.

## Features

- TI AM335x, TPS65217C, TL5209, DDR3, EEPROM and passive components integrated into a single package
- TI AM335x Features:
  - ARM® Cortex®-A8 up to 1GHz
  - 8 channel 12-bit SAR ADC
  - Ethernet 10/100/1000 x 2
  - USB 2.0 HS OTG + PHY x2
  - MMC, SD and SDIO x3
  - LCD Controller
  - SGX 3D Graphics Engine
  - PRU Subsystem
- Access to all AM335x Peripherals: CAN, SPI, UART, I2C, GPIO, etc.
- Up to 1GB DDR3

OSD335x-SM Block Diagram

- PWR In: AC Adapter, USB or Single cell (1S) Li-Ion / Li-Po Battery
- PWR Out: 1.8V, 3.3V and SYS
- Selectable AM335x I/O Voltage: 1.8V or 3.3V

## Benefits

- Integrates over 100 components into one package
- Compatible with AM335x development tools and software
- Wide BGA ball pitch allows for low-cost assembly.
- Significantly reduces design time
- Decreases layout complexity
- 60% reduction in board space vs discrete implementation
- Increased reliability through reduced number of components

## Package

- 256 Ball BGA (21mm X 21mm)
- 16 X 16 grid, 1.27mm pitch
- Temp Range: 0 to 85°C, -40 to 85°C

## 1 Revision History

Revision Number	Revision Date	Changes	Author
1.0	19 Sept 2017	Initial Release	Greg Sheridan, Erik Welsh
2.0	16 Oct 2017	Added notes for power rails and updated minimum interface connections	Neeraj Dantu
3.0	21 Nov 2017	Updated SYS_VDD2_3P3V max current	Greg Sheridan
4.0	28 December 2017	Updated Mechanical Drawing for Clarity. Fixed table 2.1	Greg Sheridan
5.0	27 January 2018	Adjusted page numbering so they match with PDF page number	Greg Sheridan
6.0	16 February 2018	Updated voltage measurements and notes on EEPROM	Neeraj Dantu
7.0	24 May 2018	Added section on minimum required VDDSHV connections	Neeraj Dantu
8.0	19 March 2018	Updated VIN_BAT information; Passives Table	Erik Welsh

## 2 Block Diagram

The OSD335x-SM family of devices consist of 5 main components serving 4 distinct functions. The main processor is a Texas Instruments Sitara™ AM335x ARM® Cortex®-A8. The power system has 2 devices from Texas Instruments, the TPS65217C Power Management IC (PMIC) and the TL5209 LDO. The system memory uses up to 1GB DDR3 memory. The last main component is the 4KB EEPROM for configuration data. Figure 2.1 shows a detailed block diagram of the OSD335x and breaks out the key functions of the AM335x processor.

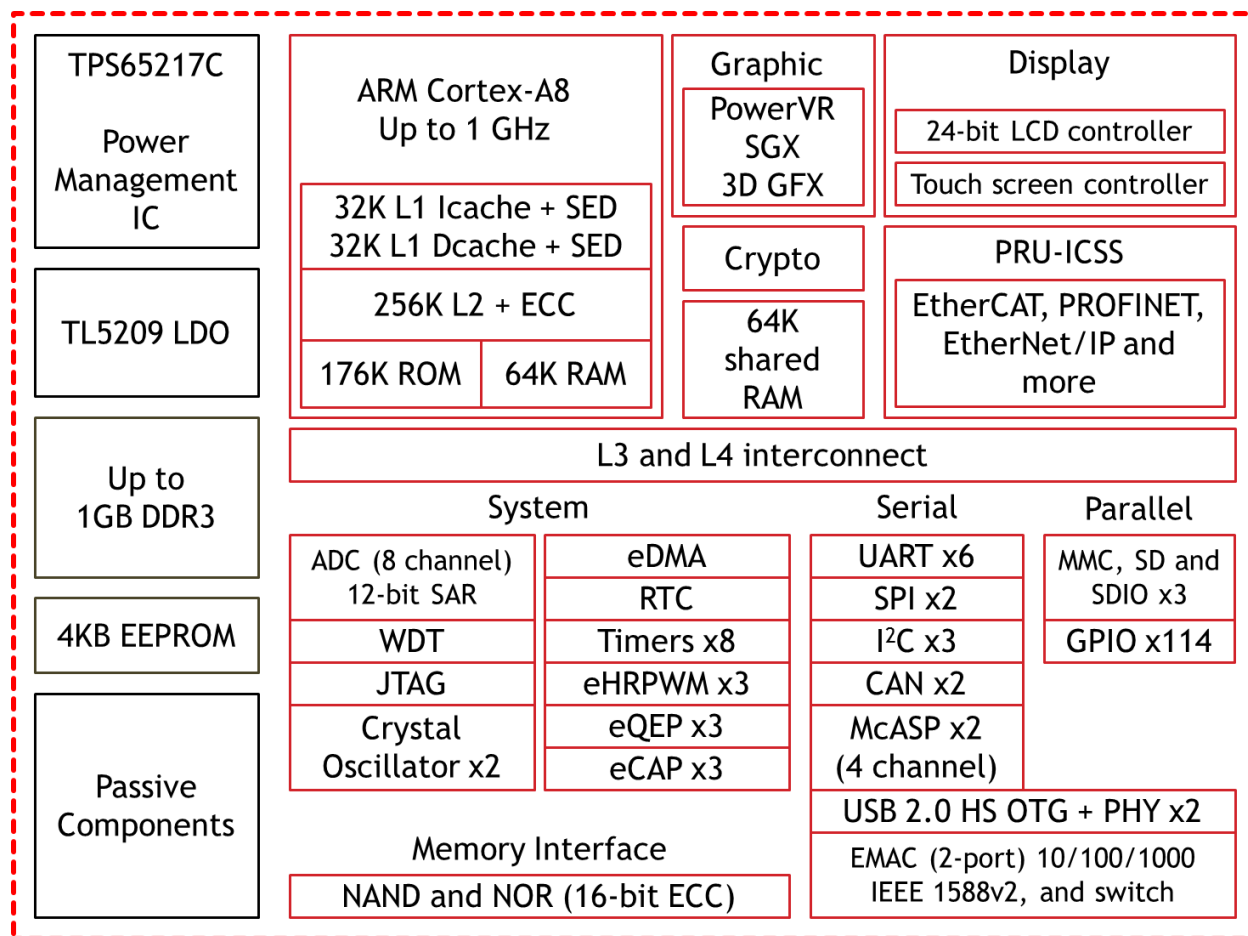

Figure 2.1. OSD335x-SM Detailed Block Diagram

# OSD335x-SM Family

Rev. 8 3/19/2019

## 2.1 Passives

Besides the five major components, the OSD335x-SM also integrates capacitors, resistors, inductors, and ferrite beads (Passives). Table 2-2 and Table 2-3 list the information to design around the OSD335x-SM. This includes the approximate bulk capacitance on input and output power rails as well as all pull-up resistor locations and values. The OSD335x-SM does not require any external decoupling / bypass capacitors in most applications. However, it does require additional bulk capacitance on one of the output power rails.

### 2.1.1 Additional Required Bulk Capacitance

The following output power rails require additional bulk capacitance to avoid in-rush / power up issues.

Table 2-1 - OSD335x-SM Required Additional Capacitors (Approximate Bulk Capacitance)

From	To	Device	Description	Type	Value
<b>SYS_VOUT</b>	DGND	TPS65217C	SYS_VOUT output capacitance	C	~50uF

### 2.1.2 Integrated Bulk Capacitance

The following input and output power have bulk capacitance integrated within the SiP. This table is for informative purposes only.

Table 2-2 - OSD335x-SM Capacitors (Approximate Bulk Capacitance)

From	To	Device	Description	Type	Value
<b>VIN_AC</b>	DGND	TPS65217C	VIN_AC input capacitance	C	10uF
<b>VIN_USB</b>	DGND	TPS65217C	VIN_USB input capacitance	C	10uF
<b>VIN_BAT</b>	DGND	TPS65217C	VIN_BAT input capacitance	C	10uF
<b>SYS_VOUT</b>	DGND	TPS65217C	SYS_VOUT output capacitance	C	30uF
<b>SYS_VDD1_3P3V</b>	DGND	TL5209	SYS_VDD1_3P3V output capacitance	C	2.2uF
<b>SYS_VDD2_3P3V</b>	DGND	TPS65217C	SYS_VDD2_3P3V output capacitance	C	2.2uF
<b>SYS_VDD3_3P3V</b>	DGND	TPS65217C	SYS_VDD3_3P3V output capacitance	C	10uF
<b>SYS_VDD_1P8V</b>	DGND	TPS65217C	SYS_VDD_1P8V output capacitance	C	10uF
<b>SYS_RTC_1P8V</b>	DGND	TPS65217C	SYS_RTC_1P8V output capacitance	C	10uF
<b>CAP_VDD_RTC</b>	DGND	AM335x	CAP_VDD_RTC capacitance	C	1uF

### 2.1.3 Integrated Resistors

The following pins have pull-up or pull-down resistors integrated within the SiP. This table is for informative purposes only.

*Table 2-3 - OSD335x-SM Resistors (Pull-ups / Pull-downs)*

From	To	Device	Description	Type	Value
<b>PMIC_PWR_EN</b>	SYS_RTC_1P8V	TPS65217C	PWR_EN pull-up	R	4.7K Ohm
<b>EXT_WAKEUP</b>	SYS_RTC_1P8V	AM335x	EXT_WAKEUP input pull-up	R	4.7K Ohm
<b>EXTINTIN</b>	VDDSHV6	AM335x	nNMI pull-up	R	4.7K Ohm
<b>I2C0_SCL</b>	VDDSHV6	AM335x	I2C0 SCL pull-up	R	4.7K Ohm
<b>I2C0_SDA</b>	VDDSHV6	AM335x	I2C0 SDA pull-up	R	4.7K Ohm
<b>EEPROM_WP</b>	VDDSHV6	EEPROM	EEPROM WP pull-up	R	4.7K Ohm

## 3 Product Number Information

Figure 3.1 shows an example of an orderable product number for the OSD335x-SM family. This section explains the different sections of the product number. It will also list the valid entries and their meaning for each designator.

**Family Designator** – Three letters that designate the family of device.

Family Designator	Family
OSD	OSD Family of devices.

**Processor Designator** – A set of letters and numbers that designate the specific processor in the device. Table 3-1 shows the valid values for the Processor Designator.

Table 3-1. Processor Designators

Processor Designator	Processor
3358	Texas Instruments AM3358

**Memory Designator** – A set of letters and numbers that designate the DDR3 memory size in the device. Table 3-2 shows the valid values for the Memory Designator.

Table 3-2. Memory Designator

Memory Designator	DDR Memory Size
1G	1GB DDR3
512M	512 MB DDR3

**Temp Designator** – A letter or number that designates the temperature range of the device. Table 3-3 shows the valid values for the Temp Designator.

*Table 3-3. Temp Designator*

Temp Designator	Temperature Range
B	Commercial: 0 to 85°C
I	Industrial: -40 to 85°C

**Trim Designator** – A set of letters and numbers that designate the set of features in the device. Table 3-4 shows the valid values for the Trim Designator.

*Table 3-4. Trim Designator*

Trim Designator	Device Options
SM	Base Model containing the Processor, DDR Memory, PMIC, LDO and 4KB EEPROM in 21mm x 21mm 256 Ball BGA

## 4 Reference Documents

### 4.1 Data Sheets

Below are links to the data sheets for the key devices used in the OSD335x-SM. Please refer to them for specifics on that device. The remainder of this document will describe how the devices are used in the OSD335x-SM system. It will also highlight any differences between the performance stated in the device specific datasheet and what should be expected from its operation in the OSD335x-SM.

- Processor AM335X <http://www.ti.com/product/am3358/datasheet>
- PMIC TPS62517C <http://www.ti.com/product/TPS65217/datasheet>

## 5 Ball Map

The pins on the OSD335x-SM belong to 4 distinct categories, AM335x Signals, TPS65217C signals, Oscillators and Power Domains. The signal names for the AM335x and the TPS65217C have been named so they can be easily cross-referenced to the corresponding pin in the TI Datasheet.

All AM335x signals on the OSD335x-SM Ball Map match the signal names of the default functions in the AM335x datasheet.

All the TPS65217C signals have the prefix PMIC\_ then the TPS65217C signal name from the TI Datasheet.

**NOTE: This is true except for the signal PMIC\_POWER\_EN which is an AM335x signal.**

The arrangement of the signals has been optimized for easy escape of the BGA. Table 5-1 through Table 5-4 show the ball map for the OSD335x-SM.

# OSD335x-SM Family

Rev. 8 3/19/2019

## 5.1 Ball Description

Table 5-5 lists all the unique balls of the OSD335x-SM and gives a brief explanation of their function. The table also lists the equivalent pin number for the signal on the OSD335x package and the AM335x ZCZ package. For more detail please refer to the datasheet in section 4.1 for the individual device that ball is associated with.

Table 5-5 OSD335x-SM Ball Descriptions

Pin Name	Description	Pin Number	
		OSD335x-SM	AM335x (ZCZ)
AGND_ADC	Analog Ground (VSSA_ADC in AM335x)	A9	E8
AIN0	Analog Input / Output	A8	B6
AIN1	Analog Input / Output	B8	C7
AIN2	Analog Input / Output	B6	B7
AIN3	Analog Input / Output	C6	A7
AIN4	Analog Input / Output	C7	C8
AIN5	Analog Input	C8	B8
AIN6	Analog Input	C9	A8
AIN7	Analog Input	D7	C9
CAP_VDD_RTC	RTC Supply Voltage Input	D5	D6
DGND	Digital Ground (VSS in AM335x)	D8, D9, E5, E6, E7, E8, E9, E10, E11, E12, F5, F12, G5, G12, H4, H5, H12, H13, J4, J5, J12, J13, K5, K12, L5, L12, M5, M6, M7, M8, M9, M10, M11, M12, N8, N9	See VSS pin in AM335x datasheet.
ECAP0_IN_PWM0_OUT	Enhanced Capture 0 Input or PWM0 Output	C5	C18
EEPROM_WP	EEPROM Write Protect Pin	M2	N/A
EMU0	Miscellaneous Emulation Pin	E2	C14
EMU1	Miscellaneous Emulation Pin	E3	B14
EXTINTN	AM335x External Interrupt to ARM Cortex-A8	D4	B18
EXT_WAKEUP	AM335x EXT_WAKEUP Input	M4	C5

## 5.2 Not Connected Balls

The OSD335x-SM ball map contains balls which are marked NC (No Connect). These balls must remain unconnected on the system PCB since they may be used for other purposes in future versions of the OSD335x-SM.

## 5.3 Reserved Signals

There is a subset of signals that are available on the OSD335x-SM ball map but **should not be** used externally to the device. These signals are used internally to the OSD335x-SM and using them could significantly affect the performance of the device. They are provided for test purposes only. The list of signals that should not be used can be found in Table 5-6.

Table 5-6. Reserved Signals

Reserved Signals

VDDS_PLL

## 6 OSD335x-SM Components

The OSD335x-SM integrates the Texas Instruments ARM® Cortex®-A8 Sitara™ AM335x processor along with the TI TPS65217C PMIC, the TI TL5209 LDO, up to 1 GB of DDR3 Memory, a 4KB EEPROM for non-volatile configuration storage and the resistors, capacitors, and inductors into a single design-in-ready package. The following section contains any specific device information needed for the integrated components to design your system with the OSD335x-SM.

### 6.1 AM335x Processor

The heart of the OSD335x-SM is the Texas Instruments ARM® Cortex®-A8 Sitara™ AM335x processor. The processor in the OSD335x-SM is configured to perform identically to a standalone device. Please refer to the data sheet in the Reference Documents section for details on using the AM335x processor.

#### 6.1.1 I/O Voltages

The OSD335x-SM allows the I/O voltage domains (VDDSHVx) of the AM335x to be set to either 1.8V or 3.3V. The VDDSHVx pins of the OSD335x-SM (ie VDDSHV1 thru VDDSHV6), which can be found in Table 5-5, must be connected to either a 1.8V or 3.3V power source in order to provide power to the I/Os. Recommendations on how to connect the I/O voltage domain pins is in the OSD335x-SM Layout Guide in the Reference Documents section.

See the AM335x datasheet in the Reference Documents section for more information on the pins associated with each I/O voltage domain.

### 6.2 DDR3 Memory

The OSD335x-SM integrates a DDR3 memory into the device and handles all the connections needed between the AM335x and the DDR3. You will still have to set the proper registers to configure the AM335x DDR PHY to work correctly with the memory included in the OSD335x-SM. Typically, this would require you to run through the procedure outlined in the AM335x DDR PHY register configuration for DDR3 using Software Leveling referred to in the Reference Documents section of this document. This procedure has been run for the OSD335x-SM and a list of the recommended values for the registers is provided in Table 6-1. It is recommended that you use this set of values for optimal performance.

Table 6-1 AM335x DDR EMIF, PHY and Control Module Register Settings

Register Name	Peripheral	Recommended Value
DDR_CMDx_IOCTL <sup>(1)</sup>	Control Module	0x0000018B
DDR_DATAx_IOCTL <sup>(2)</sup>	Control Module	0x0000018B
SDRAM_CONFIG	EMIF	0x61C05332
SDRAM_CONFIG_2	EMIF	0x00000000
SDRAM_REF_CTRL	EMIF	0x00000C30
SDRAM_TIM_1	EMIF	0x0AAAD4DB
SDRAM_TIM_2	EMIF	0x266B7FDA
SDRAM_TIM_3	EMIF	0x501F867F
ZQ_CONFIG	EMIF	0x50074BE4
DDR_PHY_CTRL_1	EMIF	0x00100007
CMDx_REG_PHY_CTRL_SLAVE_RATIO_0 <sup>(1)</sup>	DDR PHY	0x00000080
CMDx_REG_PHY_INVERT_CLKOUT_0 <sup>(1)</sup>	DDR PHY	0x00000000
DATAx_REG_PHY_RD_DQS_SLAVE_RATIO_0 <sup>(2)</sup>	DDR PHY	0x0000003A
DATAx_REG_PHY_WR_DQS_SLAVE_RATIO_0 <sup>(2)</sup>	DDR PHY	0x00000045
DATAx_REG_PHY_FIFO_WE_SLAVE_RATIO_0 <sup>(2)</sup>	DDR PHY	0x00000095
DATAx_REG_PHY_WR_DATA_SLAVE_RATIO_0 <sup>(2)</sup>	DDR PHY	0x0000007F

<sup>(1)</sup> "CMDx" refers to registers where x is in [0, 1, 2]

<sup>(2)</sup> "DATAx" refers to registers where x is in [0, 1]

Settings in Table 6-1 are recommended and supported. Other values may work but are not guaranteed. If you want to rerun the calibration yourself the seed values provided in Table 6-2 should be used.

Table 6-2 AM335x DDR PHY Calibration Seed Values

DATAx_PHY_RD_DQS_SLAVE_RATIO	40
DATAx_PHY_FIFO_WE_SLAVE_RATIO	64
DATAx_PHY_WR_DQS_SLAVE_RATIO	0

# OSD335x-SM Family

Rev. 8 3/19/2019

## 6.3 EEPROM

The OSD335x-SM contains a 4KB EEPROM for non-volatile storage of configuration information. The EEPROM is connected to I2C0 at the 7-bit I2C address 0x50 (0b1010000). Please refer to the data sheet in the Reference Documents section for details on using the EEPROM.

### 6.3.1 EEPROM Contents

EEPROM address space 0x000 to 0xEFF is empty and can be used for board specific information during system boot. The final 256 bytes of the EEPROM (0xF00 to 0xFFF) are reserved for device specific information. The reserved space contents of the EEPROM can be found in Table 6-3

*Table 6-3 EEPROM Contents Programmed by Octavo Systems*

Name	Description	Size (bytes)	Start address	End address	Contents
RSVD	Reserved for Future Use	256	0xF00	0xFFF	All 0xFF

### 6.3.2 EEPROM Write Protection

By default, the EEPROM is write protected (ie. the EEPROM\_WP pin is pulled high as seen in Table 2-3). To program values into the EEPROM, it is required to drive the EEPROM\_WP pin to a logic low. See the OSD335x-SM Layout Guide in the Reference Documents section for layout / manufacturing recommendations for the EEPROM\_WP pin.

## 7 Power Management

The power management portion of the OSD335x-SM consists of two devices, the TPS65217C (PMIC) and the TL5209 (LDO). The PMIC provides the necessary power rails to the AM335x and the DDR3 while the LDO is not used inside the SiP. Both devices provide power supply outputs that may be used to power circuitry external to the OSD335x-SM. This section describes how to power the OSD335x-SM in a system and the outputs that can be used.

### 7.1 Input Power

The OSD335x-SM may be powered by any combination of the following input power supplies. Please refer to the TPS65217C datasheet for details.

The maximum risetime for input rails VIN\_AC and VIN\_USB (defined as time for the input voltage to rise from 100 mV to 4.5 V) is 50 ms. The device may fail to power up properly if this requirement is not met.

#### 7.1.1 VIN\_AC

The OSD335x-SM may be powered by an external AC Adaptor at 5.0 VDC.

#### 7.1.2 VIN\_USB

The OSD335x-SM may be powered by a USB port at 5.0 VDC.

#### 7.1.3 VIN\_BAT

The OSD335x-SM may be powered by a single cell (1S) Li-Ion or Li-Polymer Battery nominally at 3.7 VDC.

Due to the dropout behavior of the LDO TL5209, the output voltage rail SYS\_VDD1\_3P3V cannot be used once VIN\_BAT drops below 3.5V. Please refer to the TL5209 datasheet for details.

When VIN\_BAT is not used, it must be connected to PMIC\_BAT\_SENSE.

### 7.2 Output Power

The OSD335x-SM produces the following output power supplies.

#### 7.2.1 SYS\_VOUT: Switched VIN\_AC, VIN\_USB, or VIN\_BAT

The OSD335x-SM contains a shared supply to power the AM335x, DDR3, and TL5209 which is also used to power external circuitry. This is supplied by the TPS65217C SYS output. The SYS output is a switched connection to one of the input power supplies selected by the TPS65217C as described in the datasheet for that device.

## OSD335x-SM Family

Rev. 8 3/19/2019

### 7.2.2 SYS\_VDD1\_3P3V

The OSD335x-SM contains a dedicated 3.4 VDC supply<sup>1</sup> to power external circuitry. This is supplied by the TL5209, powered by the TPS65217C SYS output, and enabled by the TPS65217C LDO4.

Due to the dropout behavior of the LDO TL5209, the output voltage rail SYS\_VDD1\_3P3V cannot be used once VIN\_BAT drops below 3.5V. Please refer to the TL5209 datasheet for details.

### 7.2.3 SYS\_VDD2\_3P3V

The OSD335x-SM contains a dedicated 3.3 VDC supply to power external circuitry. This is supplied by the TPS65217C LDO2.

### 7.2.4 SYS\_VDD3\_3P3V

The OSD335x-SM contains a shared 3.3 VDC supply that can be used to power the AM335x I/O domains (VDDSHVx). This is supplied by the TPS65217C LDO4.

### 7.2.5 SYS\_RTC\_1P8V

The OSD335x-SM contains a shared 1.8 VDC supply to power the AM335x RTC which may also be used to power external circuitry. This is supplied by the TPS65217C LDO1.

Please note that the AM335x in the OSD335x is powered by TPS65217 PMIC **version C** which does not support RTC only mode.

### 7.2.6 SYS\_VDD\_1P8V

The OSD335x-SM contains a shared 1.8 VDC supply that may be used to power the AM335x I/O domains (VDDSHVx) and external circuitry. It also supplies power to the AM335x SRAM, PLLs and USB. This is supplied by the TPS65217C LDO3.

### 7.2.7 SYS\_ADC\_1P8V

The OSD335x-SM contains a shared 1.8 VDC supply to power the AM335x ADC which may also be used to power external analog circuitry. This is supplied by the TPS65217C LDO3 and filtered for analog applications.

## 7.3 Internal Power

The OSD335x-SM has internal power supplies that are not available to power external circuitry. To do so will prevent the OSD335x from functioning properly. The power supplies are accessible externally for monitoring purposes only.

### 7.3.1 VDDS\_DDR

The OSD335x-SM contains a dedicated 1.5 VDC supply to power the AM335x DDR3 interface and the DDR3 device. This is supplied by the TPS65217C DCDC1.

<sup>1</sup> The LDO has an accuracy of 1 – 2% depending on the ambient temperature which will also affect the nominal voltage. See the TL5209 datasheet for more information.

### 7.3.2 VDD\_MPU

The OSD335x-SM contains a dedicated 1.1 VDC supply to power the AM335x MPU domain. This is supplied by the TPS65217C DCDC2.

### 7.3.3 VDD\_CORE

The OSD335x-SM contains a dedicated 1.1 VDC supply to power the AM335x CORE domain. This is supplied by the TPS65217C DCDC3.

### 7.3.4 VDDS\_PLL

The OSD335x-SM contains a filtered 1.8 VDC supply to power the AM335x PLLs and oscillators. This is supplied by the TPS65217C LDO3.

## 7.4 Total Current Consideration

The total current consumption of all power rails must not exceed the recommended input currents described in Table 8-2. This includes power consumption within the SiP from the AM335x and the DDR3, as well as all external loads on the output power rails from Section 7.2.

The power consumed by the AM335x can be estimated using the *AM335x Power Estimation Tool* found in the Reference Documents section of this document. When estimating power consumption, the efficiencies and types of the OSD335x-SM internal power supplies must be considered. Refer to the “*Connections Diagram for TPS65217C and AM335x*” section of *Powering the AM335x with the TPS65217x* found in the Reference Documents section of this document for more information on the power supplies providing power to the AM335x.

# OSD335x-SM Family

Rev. 8 3/19/2019

## 7.5 Control and Status

The control and status connections for Processor-PMIC interface and RTC subsystem required to power the device are described in this section.

### 7.5.1 Minimum IO voltage domain connections

The IO pins of AM335x are divided into 6 pin groups. The IO voltage levels of a pin group can be configured by connecting the voltage domain pins to the required voltage level. Table 7-1 lists recommended connections for each VDDSHV pin according to the voltage level required. These connections are required for IO pins of OSD335x-SM to function properly.

Table 7-1: VDDSHVx connections for OSD335x-SM

Voltage Domain	Pin	Voltage Level	Recommended pin connection
VDDSHV1	J9	3.3V	J8
		1.8V	J10
VDDSHV2	K9	3.3V	K8
		1.8V	K10
VDDSHV3	L9	3.3V	L8
		1.8V	L10
VDDSHV4	F9	3.3V	F8
		1.8V	F10
VDDSHV5	G9	3.3V	G8
		1.8V	G10
VDDSHV6	H9	3.3V	H8
		1.8V	H10

### 7.5.2 Minimum Processor-PMIC interface Connections

Table 7-2 lists the signals required to coordinate the operation of the AM335x and TPS65217C. Figure 7.1 and Figure 7.2 illustrate the required connections between the AM335x and the TPS65217C with RTC subsystem enabled and disabled respectively. These connections are the minimum required to operate the device in corresponding mode. The accessibility of these signals enables other uses of reset, power control, power status, interrupt, wakeup, and serial communication signals.

The figures 7.1 and 7.2 only illustrate the interface between the AM335x and TPS65217C.

Table 7-2. AM335x and TPS65217C Signal Descriptions

Signal	Description	Notes
PMIC_POWER_EN	PMIC Power Enable from AM335x	
PMIC_PWR_EN	PMIC Power Enable to TPS65217C	1
I2C0_SCL	I2C SCL from AM335x	1
PMIC_SCL	I2C SCL to TPS65217C

RTC_PWRONRSTN	RTC_PWRONRSTN to AM335x	
PMIC_NINT	NINT from TPS65217C	
EXTINTN	EXTINTN to AM335x	1
PMIC_NWAKEUP	NWAKEUP from TPS65217C	
EXT_WAKEUP	EXT_WAKEUP to AM335x	1

1. See Table 2-3 for pull up on this signal

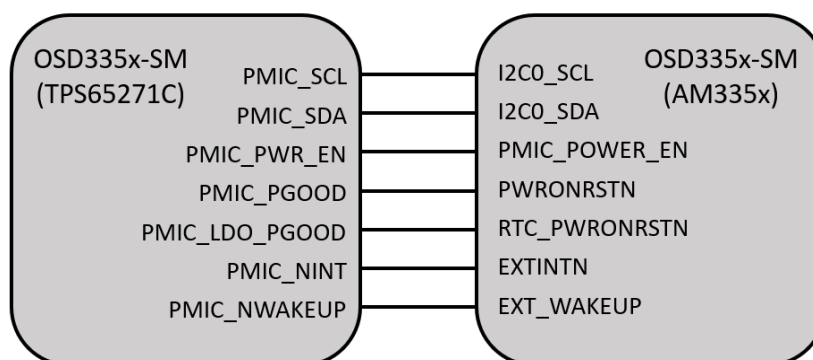

Figure 7.1. OSD335x-SM Minimum Signal Connections with RTC enabled

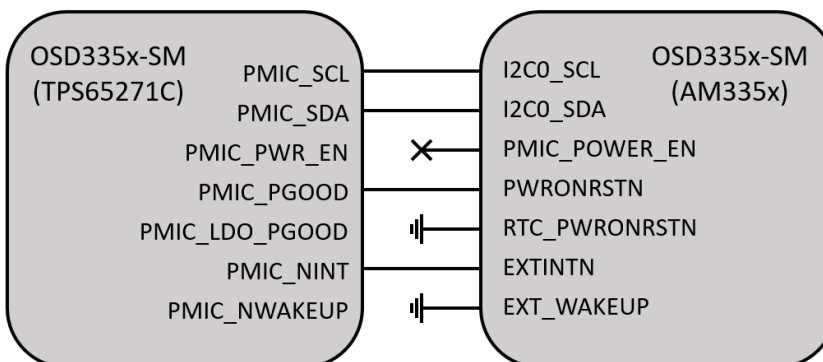

Figure 7.2. OSD335x-SM Minimum Signal Connections with RTC disabled

# OSD335x-SM Family

Rev. 8 3/19/2019

## 7.5.3 Minimum RTC Power Connections

Table 7-3 lists RTC domain signals required to operate the OSD335x-SM. In addition to the required connections described in Section 7.5.2, Figure 7.3 and Figure 7.4 illustrate additional connections with RTC subsystem enabled and disabled respectively. These connections are also included in the minimum required circuitry to operate the device.

Table 7-3. OSD335x-SM RTC Signal Descriptions

Signal	Description	Notes
CAP_VDD_RTC	Supply voltage for the RTC core domain	
RTC_KALDO_ENN	Active low enable input for internal CAP_VDD_RTC voltage regulator	
RTC_PWRONRSTN	RTC_PWRONRSTN to AM335x	
PMIC_POWER_EN	PMIC Power Enable from AM335x	
EXT_WAKEUP	EXT_WAKEUP to AM335x	1

1. See Table 2-3 for pull up on this signal

Figure 7.3. Additional connections for OSD335x-SM with RTC enabled

Figure 7.4. Additional connections for OSD335x-SM with RTC disabled

## 8 Electrical & Thermal Characteristics

Table 8.1 lists electrical and thermal characteristic parameters of OSD335x-SM.

Table 8-1. OSD335x-SM Absolute Maximum Ratings over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup> <sup>(2)</sup>

		Value	Unit
Supply voltage range (with respect to VSS)	VIN_BAT	-0.3 to 7	V
	VIN_USB, VIN_AC	-0.3 to 7	V
Input/Output voltage range (with respect to VSS)	All pins unless specified separately	-0.3 to 3.6	V
Terminal current	SYS_VOUT, VIN_USB, VIN_BAT	3000	mA
T <sub>c</sub> Operating case temperature	Commercial (B)	0 to 85	°C
	Industrial (I)	-40 to 85	°C
T <sub>stg</sub> Storage temperature		-40 to 125	°C
ESD rating	(HBM) Human body model	±2000	V
	(CDM) Charged device model	±500	V

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

Table 8-2. Recommended Operating Conditions over operating free-air temperature range (unless otherwise noted)

	Min	Nom	Max	Unit
Supply voltage, VIN_USB, VIN_AC	4.3		5.8	V
Supply voltage, VIN_BAT	2.75		5.5	V
Input current from VIN_AC			2.0	A
Input current from VIN_USB			1.3	A
VIN_BAT current			2.0	A
Output voltage range for SYS_VDD1_3P3V		3.4		V
Output voltage range for SYS_VDD2_3P3V		3.3		V
Output voltage range for SYS_VDD3_3P3V		3.3		V
Output voltage range for SYS_RTC_1P8V		1.8		V
Output voltage range for SYS_VDD_1P8V		1.8		V
Output voltage range for SYS_ADC_1P8V		1.8		V
Output voltage range for VDDS_DDR <sup>1</sup>		1.5		V
Output voltage range for VDD_MPU <sup>1</sup>		1.1		V
Output voltage range for VDD_CORE <sup>1</sup>		1.1		V
Output voltage range for VDDS_PLL <sup>1</sup>		1.8		V
Output current for SYS_VOUT <sup>2</sup>	0		500	mA
Output current for SYS_VDD1_3P3V <sup>2</sup>	0		500	mA
Output current for SYS_VDD2_3P3V <sup>2</sup>	0		100	mA
Output current for SYS_VDD3_3P3V <sup>2</sup>	0		50	mA
Output current for SYS_RTC_1P8V <sup>2</sup>	0		100	mA
Output current for SYS_VDD_1P8V <sup>2</sup>	0		250	mA
Output current for SYS_ADC_1P8V <sup>2</sup>	0		25	mA

- (1) These voltage rails are for reference only and should not be used to power anything on the PCB.
- (2) Please note that the total input current on VIN\_AC, VIN\_USB or VIN\_BAT must not exceed the recommended maximum value even if individual currents drawn from these power supply outputs are less than or equal to the maximum recommended operating output currents. See section 7.4 for more details.

## 9 Packaging Information

The OSD335x-SM is packaged in a 256 ball, Ball Grid Array (BGA). The package size is 21 X 21 millimeters with a ball pitch of 1.27 millimeters. This section will give you the specifics on the package.

## 9.1 Mechanical Dimensions

The mechanical drawings of the OSD335x-SM show pin A1 in the lower left-hand corner when looking at the top view of the device. Pin A1 is in the upper left-hand corner if looking at the balls from the bottom view of the package.

[illegible]

NOTES:

△ DIMENSION b IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER,  
PARALLEL TO DATUM PLANE C.

△ DATUM C (SEATING PLANE) IS DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS.

△ PARALLELISM MEASUREMENT SHALL EXCLUDE ANY EFFECT OF MARK ON TOP SURFACE OF PACKAGE.

## 9.2 Reflow Instructions

The reflow profile for this package should be in accordance with the Lead-free process for BGA. A peak reflow temperature is recommended to be 245°C.

Texas Instruments provides a good overview of Handling & Process Recommendations in AN-2029 for this type of device. A link to the document can be found in the Reference Documents section of this document.

## 9.3 Storage Recommendations

The OSD335x-SM Family of devices are sensitive to moisture and need to be handled in specific ways to make sure they function properly during and after the manufacturing process. The OSD335x-SM Family of devices are rated with a Moisture Sensitivity Level (MSL) of 4. This means that they are typically stored in a sealed Dry Pack.

Once the sealed Dry Pack is opened the OSD335x-SM needs to be used within 72 hours to avoid further processing. If the OSD335x-SM has been exposed for more than 72 hours, then it is required that you bake the device for 48 hours at 125°C before using.

Alternatively, the devices could be stored in a dry cabinet with humidity <10% to avoid the baking requirement.

For more information, please refer to the Texas Instruments AN-2029 which can be found in the Reference Documents section of this document.
