

LMX2492, LMX2492-Q1

SNAS624B - MARCH 2014-REVISED MAY 2015

# LMX2492/LMX2492-Q1 14 GHz Low Noise Fractional N PLL with Ramp/Chirp Generation

#### 1 Features

- -227 dBc/Hz Normalized PLL Noise
- 500 MHz 14 GHz Wideband PLL
- 3.15 5.25 V Charge Pump PLL Supply
- · Versatile Ramp / Chirp Generation
- 200 MHz Max Phase Detector Frequency
- FSK / PSK Modulation Pin
- Digital Lock Detect
- Single 3.3 V Supply Capability
- Automotive 125°C Q100 Grade 1 Qualification
- Non-Automotive (LMX2492) Option

# 2 Applications

- · Automotive FMCW Radar
- Military Radar
- · Microwave Backhaul
- · Test and Measurement
- Satellite Communications
- Wireless Infrastructure
- · Sampling Clock for High Speed ADC/DAC

# 3 Description

The LMX2492/92-Q1 is a low noise 14 GHz wideband delta-sigma fractional N PLL with ramp and chirp generation. It consists of a phase frequency detector, programmable charge pump, and high frequency input for the external VCO. LMX2492/92-Q1 supports a broad and flexible class of ramping capabilities, including FSK, PSK, and configurable piecewise linear FM modulation profiles of up to 8 segments. It supports fine PLL resolution and fast ramp with up to a 200 MHz phase detector rate. The LMX2492/92-Q1 allows any of its registers to be read back. The LMX2492/92-Q1 can operate with a single 3.3 V supply. Moreover, supporting up to 5.25 V charge pump can eliminate the need of external amplifier, leading to a simpler solution with improved phase noise performance.

#### **Device Information**

| PART NUMBER   | PACKAGE   | BODY SIZE (NOM)   |  |
|---------------|-----------|-------------------|--|
| LMX2492-Q1RTW | WQFN (24) | 4.00 mm x 4.00 mm |  |
| LMX2492RTW    | WQFN (24) | 4.00 mm x 4.00 mm |  |

(1) For all available packages, see the orderable addendum at the end of the datasheet.

# 5 Revision History

| CI | hanges from Revision A (June 2014) to Revision B                      | Page |
|----|---|------|
| •  | Changed Changed CLK, DATA, and LE to right Input/Output Format        | 3    |
| •  | Changed terminal to pin   | 3    |
| •  | Changed Same specs, but new format tables for storage and ESD Ratings | 4    |
| •  | Changed TYP to NOM  | 4    |
| •  | Added Added comment for lower voltage operation.                      | 5    |
| •  | Changed Fixed Diagram. A14 is hightest bit                            | 6    |
| •  | Added note in Applications and Implementation section                 | 27   |

| CI | hanges from Original (March 2014) to Revision A | Page |
|----|---|------|
| •  | Changed from 35 to 10                           |      |
| •  | Changed from 10 to 4                            | 6    |
| •  | Changed from 10 to 4                            | 6    |
| •  | Changed from 25 to 10                           | 6    |
| •  | Changed from 25 t o10                           | 6    |

# 6 Pin Configuration and Functions

### **Pin Functions**

| PI     | N              |              | DECORPORTOR   |  |  |  |
|--------|----------------|--------------|---|--|--|--|
| NUMBER | NAME           | 1/0          | DESCRIPTION   |  |  |  |
| 0      | DAP            | GND          | Die Attach Pad. Connect to PCB ground plane.  |  |  |  |
| 1      | GND            | GND          | Ground for charge pump.   |  |  |  |
| 2,3    | GND            | GND          | Ground for Fin Buffer   |  |  |  |
| 4,5    | Fin<br>Fin*    | Input        | Complimentary high frequency input pins. Should be AC coupled. If driving single-ended, impedance as seen from Fin and Fin* pins looking outwards from the part should be roughly the same. |  |  |  |
| 6      | Vcc            | Supply       | Power Supply for Fin Buffer   |  |  |  |
| 7      | Vcc            | Supply       | Supply for On-chip LDOs   |  |  |  |
| 8      | Vcc            | Supply       | Supply for OSCin Buffer   |  |  |  |
| 9      | OSCin          | Input        | Reference Frequency Input   |  |  |  |
| 10     | GND/<br>OSCin* | GND/Input    | Complimentary input for OSCin. If not used, it is recommended to match the termination as seen from the OSCin terminal looking outwards. However, this may also be grounded as well.        |  |  |  |
| 11     | GND            | GND          | Ground for OSCin Buffer   |  |  |  |
| 12     | MOD            | Input/Output | Multiplexed Pin for Ramp Triggers, FSK/PSK Modulation, FastLock, Readback, and Diagnostics.   |  |  |  |
| 13     | CE             | Input        | Chip Enable   |  |  |  |
| 14     | CLK            | Input        | Serial Programming Clock.   |  |  |  |
| 15     | DATA           | Input        | Serial Programming Data   |  |  |  |
| 16     | LE             | Input        | Serial Programming Latch Enable   |  |  |  |
| 17     | MUXout         | Input/Output | Multiplexed Pin for Ramp Triggers, FSK/PSK Modulation, FastLock, Readback, and Diagnostics.   |  |  |  |
| 18     | Vcc            | Supply       | Supply for delta sigma engine.  |  |  |  |
| 19     | Vcc            | Supply       | Supply for general circuitry.   |  |  |  |
| 20     | TRIG1          | Input/Output | Multiplexed Pin for Ramp Triggers, FSK/PSK Modulation, FastLock, Readback, and Diagnostics.   |  |  |  |
| 21     | TRIG2          | Input/Output | Multiplexed Pin for Ramp Triggers, FSK/PSK Modulation, FastLock, Readback, and Diagnostics.   |  |  |  |
| 22     | Vcp            | Supply       | Power Supply for the charge pump.   |  |  |  |
| 23     | Rset           | NC           | No connect.   |  |  |  |
| 24     | CPout          | Output       | Charge Pump Output  |  |  |  |

# 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

|                       |                                     | N | /IN | MAX       | UNIT |
|-----------------------|-------------------------------------|---|-----|-----------|------|
| Vcp                   | Supply voltage for charge pump      | \ | /cc | 5.5       | V    |

| Vcc                   | All Vcc pins                        | - | 0.3 | 3.6       | V    |
| Others                | All other I/O pins                  | - | 0.3 | Vcc + 0.3 | V    |
| T <sub>Solder</sub>   | Lead temperature (solder 4 seconds) |   |     | 260       | °C   |
| T <sub>Junction</sub> | Junction temperature                |   |     | 150       | °C   |

<sup>(1)</sup> Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## 7.2 Storage Conditions

applicable before the DMD is installed in the final product

|                  |                            | MIN | MAX | UNIT |
|------------------|----------------------------|-----|-----|------|
| T <sub>stg</sub> | DMD storage temperature    | -65 | 150 | °C   |
| MSL              | Moisture sensitivity level |     | 3   | n/a  |

# 7.3 ESD Ratings

|                    |                         |  | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
|                    |                         | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)                         | ±2500 |      |
| V <sub>(ESD)</sub> | Electrostatic discharge | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±1500 | V    |

<sup>(1)</sup> JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 7.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

For optimal phase noise performance, a slew rate of at least 3 V/ns is recommended

Tested to 13.5 GHz, Guaranteed to 14 GHz by characterization

PLL Noise Metrics are measured with a clean OSCin signal with a high slew rate using a wide loop bandwidth. The noise metrics model the PLL noise for an infinite loop bandwidth as:
PLL\_Total = 10xlog( 10<sup>PLL\_Flat/10</sup> + 10<sup>PLL\_Flicker(Offset)/10</sup>)
PLL\_Flat = PN1Hz + 20xlog(N) + 10xlog(Fpd/1Hz)
PLL\_Flicker = PN10kHz - 10xlog(Offset/10kHz) + 20xlog(Fvco/1GHz)

Charge pump mismatch varies as a function of charge pump voltage. Consult typical performance characteristics to see this variation.

| T <sub>EWH</sub> | Enable Pulse Width High    | 10  |         | ns   |

Figure 1. Serial Data Input Timing

There are several other considerations for programming:

- The DATA is clocked into a shift register on each rising edge of the CLK signal. On the rising edge of the LE signal, the data is sent from the shift register to an actual counter.
- If no LE signal is given after the last data bit and the clock is kept toggling, then these bits will be read into the next lower register. This eliminates the need to send the address each time.
- A slew rate of at least 30 V/us is recommended for the CLK, DATA, and LE signals
- Timing specifications also apply to readback. Readback can be done through the MUXout, TRIG1, TRIG2, or MOD terminals.

## 7.8 Typical Characteristics

For a charge pump supply of 3.3 V, optimal performance is for a typical charge pump output voltage between 0.5 and 2.8 volts.

Figure 2. Charge Pump Current for Vcp = 3.3 V

For a charge pump supply voltage of 5 volts or higher, optimal performance is typically for a charge pump output voltage between 0.5 and 4.5 volts.

Figure 3. Charge Pump Current for Vcp = 5.5 V

Typical value of lowest power level as a function of frequency. Design to electrical specifications for input sensitivity, not typical performance graphs.

Figure 4. Fin Input Sensitivity

# **Typical Characteristics (continued)**

This plot is for a phase detector of 100 MHz, 2 MHz loop bandwidth, and VCO at 9600 MHz. However, the plot shown is the divide by 2 port at 4800 MHz. The input was a 100 MHz Wenzel Oscillator. The model shows this phase noise has a figure of merit of -227 dBc/Hz and a normalized 1/f noise of -120.5 dBc/Hz. The charge pump supply was 5 V and the charge pump output voltage was 1.34 V.

Figure 5. LMX2492/92-Q1 Phase Noise for Fpd =100 MHz, Fvco = 9600 MHz/2

### 8 Detailed Description

#### 8.1 Overview

The LMX2492/92-Q1 is a microwave PLL, consisting of a reference input and divider, high frequency input and divider, charge pump, ramp generator, and other digital logic. The Vcc power supply pins run at a nominal 3.3 volts, while the charge pump supply pin, Vcp, operates anywhere from Vcc to 5 volts. The device is designed to operate with an external loop filter and VCO. Modulation is achieved by manipulating the MASH engine.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 OSCin Input

The reference can be applied in several ways. If using a differential input, this should be terminated differentially with a 100 ohm resistance and AC coupled to the OSCin and GND/OSCin\* terminals. If driving this single-ended, then the GND/OSCin\* terminal may be grounded, although better performance is attained by connecting the GND/OSCin\* terminal through a series resistance and capacitance to ground to match the OSCin terminal impedance.

#### 8.3.2 OSCin Doubler

The OSCin doubler allows the input signal to the OSCin to be doubled in order to have higher phase detector frequencies. This works by clocking on both the rising and falling edges of the input signal, so it therefore requires a 50% input duty cycle.

#### 8.3.3 R Divider

The R counter is 16 bits divides the OSCin signal from 1 to 65535. If DIFF\_R = 0, then any value can be chosen in this range. If DIFF R=1, then the divide is restricted to 2,4,8, and 16, but allows for higher OSCin frequencies.

#### 8.3.4 PLL N Divider

The 16 bit N divider divides the signal at the Fin terminal down to the phase detector frequency. It contains a 4/5 prescaler that creates minimum divide restrictions, but allows the N value to increment in values of one.

| Modulator Order                      | Minimum N<br>Divide |
|--------------------------------------|---------------------|
| Integer Mode, 1st<br>Order Modulator | 16                  |
| 2nd Order Modulator                  | 17                  |
| 3rd Order Modulator                  | 19                  |
| 4th Order Modulator                  | 25                  |

### 8.3.5 Fractional Circuitry

The fractional circuitry controls the N divider with delta sigma modulation that supports a programmable first, second, third, and fourth order modulator. The fractional denominator is a fully programmable 24-bit denominator that can support any value from  $1,2,...,2^{24}$ , with the exception when the device is running one of the ramps, and in this case it is a fixed size of  $2^{24}$ .

### 8.3.6 PLL Phase Detector and Charge Pump

The phase detector compares the outputs of the R and N dividers and generates a correction voltage corresponding to the phase error. This voltage is converted to a correction current by the charge pump. The phase detector frequency,  $f_{PD}$ , can be calculated as follows:  $f_{PD} = f_{OSC_{in}} \times OSC_{2X} / R$ .

The charge pump supply voltage on this device, Vcp, can be either run at the Vcc voltage, or up to 5.25 volts in order to get higher tuning voltages to present to the VCO.

#### 8.3.7 External Loop Filter

The loop filter is external to the device and is application specific. Texas Instruments website has details on this at www.ti.com.

### 8.3.8 Fastlock and Cycle Slip Reduction

The Fastlock<sup>™</sup> and Cycle Slip Reduction features can be used to improved lock time. When the frequency is changed, a timeout counter can be used to engage these features for a prescribed number of phase detector cycles. During this time that the timeout counter is counting down, the device can be used to pull a terminal from high impedance to ground switch in an extra resistor (R2pLF), change the charge pump current (FL\_CPG), or change the phase detector frequency. TRIG2 is recommended for switching the resistor with a setting of TRIG2\_MUX = Fastlock (2) and TRIG2\_PIN = Inverted/Open Drain (5).

| Parameter                                    | Normal Operation | Fastlock Operation |  |  |
|--|------------------|--------------------|--|--|
| Charge Pump Gain                             | CPG              | FL_CPG             |  |  |
| Device Pin<br>(TRIG1, TRIG2, MOD, or MUXout) | High Impedance   | Grounded           |  |  |

The resistor and the charge pump current are changed simultaneously so that the phase margin remains the same while the loop bandwidth is by a factor of K as shown in the following table:

| Parameter                    | Symbol | Calculation                      |  |  |  |
|------------------------------|--------|----------------------------------|--|--|--|
| Charge Pump Gain in Fastlock | FL_CPG | Typically use the highest value. |  |  |  |
| Loop Bandwidth Multiplier    | К      | K=sqrt(FL_CPG/CPG)               |  |  |  |
| External Resistor            | R2pLF  | R2 / (K-1)                       |  |  |  |

Downloaded from Arrow.com.

Cycle slip reduction is another method that can also be used to speed up lock time by reducing cycle slipping. Cycle slipping typically occurs when the phase detector frequency exceeds about 100x the loop bandwidth of the PLL. Cycle slip reduction works in a different way than fastlock. To use this, the phase detector frequency is decreased while the charge pump current is simultaneously increased by the same factor. Although the loop bandwidth is unchanged, the ratio of the phase detector frequency to the loop bandwidth is, and this is helpful for cases when the phase detector frequency is high. Because cycle slip reduction changes the phase detector rate. it also impacts other things that are based on the phase detector rate, such as the fastlock timeout-counter and ramping controls.

# 8.3.9 Lock Detect and Charge Pump Voltage Monitor

The LMX2492/92-Q1 offers two methods to determine if the PLL is in lock, charge pump voltage monitoring and digital lock detect. These features can be used individually or in conjunction to give a reliable indication of when the PLL is in lock. The output of this detection can be routed to the TRIG1, TRIG2, MOD, or MUXout terminals.

#### 8.3.9.1 Charge Pump Voltage Monitor

The charge pump voltage monitor allows the user to set low (CMP\_THR\_LOW) and high (CMP\_THR\_HIGH) thresholds for a comparator that monitors the charge pump output voltage.

| Vcp   | Threshold                                  | Suggested Level   |
|-------|--|-------------------|
| 0.01/ | CPM_THR_LOW<br>= (Vthresh + 0.08) / 0.085  | 6 for 0.5V limit  |
| 3.3 V | CPM_THR_HIGH<br>= (Vthresh - 0.96) / 0.044 | 42 for 2.8V limit |
| 5.0 V | CPM_THR_LOW<br>= (Vthresh + 0.056) / 0.137 | 4 for 0.5V limit  |
|       | CPM_THR_HIGH<br>= (Vthresh -1.23) / 0.071  | 46 for 4.5V limit |

#### 8.3.9.2 Digital Lock Detect

Digital lock detect works by comparing the phase error as presented to the phase detector. If the phase error plus the delay as specified by the PFD DLY bit is outside the tolerance as specified by DLD TOL, then this comparison would be considered to be an error, otherwise passing. The DLD\_ERR\_CNT specifies how may errors are necessary to cause the circuit to consider the PLL to be unlocked. The DLD PASS CNT specifies how many passing comparisons are necessary to cause the PLL to be considered to be locked and also resets the count for the errors. The DLD TOL value should be set to no more than half of a phase detector period plus the PFD DLY value. The DLD ERR CNT and DLD PASS CNT values can be decreased to make the circuit more sensitive. If the circuit is too sensitive, then chattering can occur and the DLD ERR CNT. DLD\_PASS\_CNT, or DLD\_TOL values should be increased.

Note that if the OSCin signal goes away and there is no noise or self-oscillation at the OSCin pin, then it is possible for the digital lock detect to indicate a locked state when the PLL really is not in lock. If this is a concern. then digital lock detect can be combined with charge pump voltage monitor to detect this situation...

### 8.3.10 FSK/PSK Modulation

Two level FSK or PSK modulation can be created whenever a trigger event, as defined by the FSK TRIG field is detected. This trigger can be defined as a transition on a terminal (TRIG1, TRIG2, MOD, or MUXout) or done purely in software. The RAMP\_PM\_EN bit defines the modulation to be either FSK or PSK and the FSK\_DEV register determines the amount of the deviation. Remember that the FSK\_DEV[32:0] field is programmed as the 2's complement of the actual desired FSK DEV value. This modulation can be added to the modulation created from the ramping functions as well.

| RAMP_PM_EN | Modulation Type | Deviation                        |
|------------|-----------------|----------------------------------|
| 0          | 2 Level FSK     | Fpd × FSK_DEV / 2 <sup>24</sup>  |
| 1          | 2 Level PSK     | 360° × FSK_DEV / 2 <sup>24</sup> |

### 8.3.11 Ramping Functions

The LMX2492/92-Q1 supports a broad and flexible class of FMCW modulation formed by up to 8 linear ramps. When the ramping function is running, the denominator is fixed to a forced value of  $2^{2^4} = 16777216$ . The waveform always starts at RAMP0 when the LSB of the PLL\_N (R16) is written to. After it is set up, it will start at the initial frequency and have piecewise linear frequency modulation that deviates from this initial frequency as specified by the modulation. Each of the eight ramps can be individually programmed. Various settings are as follows

| Ramp Characteristic   | Programming Field Name              | Description  |
|-----------------------|-------------------------------------|--|
| Ramp Length           | RAMPx_LEN<br>RAMPx_DLY              | The user programs the length of the ramp in phase detector cycles. If RAMPx_DLY=1, then each count of RAMPx_LEN is actually two phase detector cycles.   |
| Ramp Slope            | RAMPx_LEN<br>RAMPx_DLY<br>RAMPx_INC | The user does not directly program slope of the line, but rather this is done by defining how long the ramp is and how much the fractional numerator is increased per phase detector cycle. The value for RAMPx_INC is calculated by taking the total expected increase in the frequency, expressed in terms of how much the fractional numerator increases, and dividing it by RAMPx_LEN. The value programmed into RAMPx_INC is actually the two's complement of the desired mathematical value. |
| Trigger for Next Ramp | RAMPx_NEXT_TRIG                     | The event that triggers the next ramp can be defined to be the ramp finishing or can wait for a trigger as defined by TRIG A, TRIG B, or TRIG C.   |
| Next Ramp             | RAMPx_NEXT                          | This sets the ramp that follows. Waveforms are constructed by defining a chain ramp segments. To make the waveform repeat, make RAMPx_NEXT point to the first ramp in the pattern.   |
| Ramp Fastlock         | RAMPx_FL                            | This allows the ramp to use a different charge pump current or use Fastlock  |
| Ramp Flags            | RAMPx_FLAG                          | This allows the ramp to set a flag that can be routed to external terminals to trigger other devices.  |

### 8.3.11.1 Ramp Count

If it is desired that the ramping waveform keep repeating, then all that is needed is to make the RAMPx\_NEXT of the final ramp equal to the first ramp. This will run until the RAMP\_EN bit is set to zero. If this is not desired, then one can use the RAMP\_COUNT to specify how may times the specified pattern is to repeat.

#### 8.3.11.2 Ramp Comparators and Ramp Limits

The ramp comparators and ramp limits use programable thresholds to allow the device to detect whenever the modulated waveform frequency crosses a limit as set by the user. The difference between these is that comparators set a flag to alert the user while a ramp limits prevent the frequency from going beyond the prescribed threshold. In either case, these thresholds are expressed by programming the Extended\_Fractional\_Numerator.

Extended\_Fractional\_Numerator = Fractional\_Numerator +  $(N-N^*)$  ×  $2^{2^4}$  In the above, N is the PLL feedback value without ramping and N\* is the instantaneous value during ramping. The actual value programmed is the 2's complement of Extended\_Fractional\_Numerator.

| Туре                | Programming Bit        | Threshold   |
|---------------------|------------------------|---|
| Domo Limito         | RAMP_LIMIT_LOW         | Lower Limit   |
| Ramp Limits         | RAMP_LIMIT_HIGH        | Upper Limit   |
| Ramp<br>Comparators | RAMP_CMP0<br>RAMP_CMP1 | For the ramp comparators, if the ramp is increasing and exceeds the value as specified by RAMP_CMPx, then the flag will go high, otherwise it is low. If the ramp is decreasing and goes below the value as specified by RAMP_CMPx, then the flag will go high, otherwise it will be low. |

#### 8.3.12 Power on Reset (POR)

The power on reset circuitry sets all the registers to a default state when the device is powered up. This same reset can be done by programming SWRST=1. In the programming section, the power on reset state is given for all the programmable fields.

#### 8.4 Device Functional Modes

The two primary ways to use the LMX2492/92-Q1 are to run it to generate a set of frequencies

### 8.4.1 Continuous Frequency Generator

In this mode, the LMX2492/92-Q1 generates a single frequency that only changes when the N divider is programmed to a new value. In this mode, the RAMP\_EN bit is set to 0 and the ramping controls are not used. The fractional denominator can be programmed to any value from 1 to 16777216. In this kind of application, the PLL is tuned to different channels, but at each channel, the goal is to generate a stable fixed frequency.

### 8.4.1.1 Integer Mode Operation

In integer mode operation, the VCO frequency needs to be an integer multiple of the phase detector frequency. This can be the case when the output frequency or frequencies are nicely related to the input frequency. As a rule of thumb, if this an be done with a phase detector of as high as the lesser of 10 MHz or the OSCin frequency, then this makes sense. To operate the device in integer mode, disable the fractional circuitry by programming the fractional order (FRAC\_ORDER), dithering (FRAC\_DITH), and numerator (FRAC\_NUM) to zero.

### 8.4.1.2 Fractional Mode Operation

In fractional mode, the output frequency does not need to be an integer multiple of the phase detector frequency. This makes sense when the channel spacing is more narrow or the input and output frequencies are not nicely related. There are several programmable controls for this such as the modulator order, fractional dithering, fractional numerator, and fractional denominator. There are many trade-offs with choosing these, but here are some guidelines

| Parameter                               | Field Name           | How to Choose   |
|---|----------------------|---|
| Fractional Numerator and<br>Denominator | FRAC_NUM<br>FRAC_DEN | The first step is to find the fractional denominator. To do this, find the frequency that divides the phase detector frequency by the channel spacing. For instance, if the output ranges from 5000 to 5050 in 5 MHz steps and the phase detector is 100 MHz, then the fractional denominator is 100 MHz/5 = 20. So for a an output of 5015 MHz, the N divider would be 50 + 3/20. In this case, the fractional numerator is 3 and the fractional denominator is 20. Sometimes when dithering is used, it makes sense to express this as a larger equivalent fraction. Note that if ramping is active, the fractional denominator is forced to $2^{24}$ . |
| Fractional Order                        | FRAC_ORDER           | There are many trade-offs, but in general try either the 2nd or 3rd order modulator as starting points. The 3rd order modulator may give lower main spurs, but may generate others. Also if dithering is involved, it can generate phase noise.   |
| Dithering                               | FRAC_DITH            | Dithering can reduce some fractional spurs, but add noise. Consult application note AN-1879 for more details on this.   |

#### 8.4.2 Modulated Waveform Generator

In this mode, the device can generate a broad class of frequency sweeping waveforms. The user can specify up to 8 linear segments in order to generate these waveforms. When the ramping function is running, the denominator is fixed to a forced value of  $2^{24} = 16777216$ 

In addition to the ramping functions, there is also the capability to use a terminal to add phase or frequency modulation that can be done by itself or added on top of the waveforms created by the ramp generation functions.

### 8.5 Programming

### 8.5.1 Loading Registers

The device is programmed using several 24 bit registers. The first 16 bits of the register are the address, followed by the next 8 bits of data. The user has the option to pull the LE terminal high after this data, or keep sending data and it will apply this data to the next lower register. So instead of sending three registers of 24 bits each, one could send a single 40 bit register with the 16 bits of address and 24 bits of data. For that matter, the entire device could be programmed as a single register if desired.

### 8.6 Register Map

Registers are programmed in REVERSE order from highest to lowest. Registers NOT shown in this table or marked as reserved can be written as all 0's unless otherwise stated. The POR value is the power on reset value that is assigned when the device is powered up or the SWRST bit is asserted.

## 8.7 Register Field Descriptions

The following sections go through all the programmable fields and their states. Additional information is also available in the applications and feature descriptions sections as well. The POR column is the power on reset state that this field assumes if not programmed.

#### 8.7.1 POWERDOWN and Reset Fields

**Table 2. POWERDOWN and Reset Fields** 

| Field     | Location | POR | Description and States   |       |  |
|-----------|----------|-----|--|-------|--|
|           |          |     |  | Value | POWERDOWN State                          |
|           |          |     |  | 0     | POWERDOWN, ignore CE                     |
| POWERDOWN | R2[1:0]  | 0   | POWERDOWN Control  | 1     | Power Up, ignore CE                      |
| [1:0]     | 112[110] |     |  | 2     | Power State Defined by CE terminal state |
|           |          |     |  | 3     | Reserved                                 |
|           | R2[2]    |     |  | Value | Reset State                              |
| SWRST     |          | 0   | Software Reset. Setting this bit sets all registers to their POR default values. | 0     | Normal Operation                         |
|           |          |     | regional to them. For deliduit values.   | 1     | Register Reset                           |

### 8.7.2 Dividers and Fractional Controls

# **Table 3. Dividers and Fractional Controls**

| Field              | Location            | POR | Description and States   |              |                              |  |
|--------------------|---------------------|-----|--|--------------|------------------------------|--|
| PLL_N<br>[17:0]    | R18[1] to<br>R16[0] | 16  | Feedback N counter Divide value. Minimum the register R16 begins any ramp execution  |              |                              |  |
|                    |                     |     |  | Value        | Dither                       |  |
|                    |                     |     |  | 0            | Weak                         |  |
| FRAC_ DITHER [1:0] | R18[3:2]            | 0   | Dither used by the fractional modulator  | 1            | Medium                       |  |
| [1.0]              |                     |     |  | 2            | Strong                       |  |
|                    |                     |     |  | 3            | Disabled                     |  |
|                    |                     |     |  | Value        | Modulator Order              |  |
|                    |                     |     |  | 0            | Integer Mode                 |  |
|                    |                     |     |  | 1            | 1st Order Modulator          |  |
| FRAC_ ORDER [2:0]  | R18[6:4]            | 0   | Fractional Modulator order   | 2            | 2nd Order Modulator          |  |
| [2.0]              |                     |     |  | 3            | 3rd Order Modulator          |  |
|                    |                     |     |  | 4            | 4th Order Modulator          |  |
|                    |                     |     |  | 5-7          | Reserved                     |  |
| FRAC_NUM<br>[23:0] | R21[7] to<br>R19[0] | 0   | Fractional Numerator. This value should denominator.   | be less that | n or equal to the fractional |  |
| FRAC_DEN<br>[23:0] | R24[7] to<br>R22[0] | 0   | Fractional Denominator. If the RAMP_EN=1, this field is ignored and the denominator is fixed to 2 <sup>24</sup> .            |              |                              |  |
| PLL_R<br>[15:0]    | R26[7] to<br>R25[0] | 1   | Reference Divider value. Selecting 1 will bypass counter.  |              |                              |  |
|                    | R27[0]              |     |  | Value        | Doubler                      |  |
| OSC_2X             |                     | 0   | Enables the Doubler before the Reference divider   | 0            | Disabled                     |  |
|                    |                     |     |  | 1            | Enabled                      |  |
|                    | R27[2]              |     | Enables the Differential R counter. This allows for higher OSCin frequencies, but restricts PLL_R to divides of 2,4,8 or 16. | Value        | R Divider                    |  |
| PLL_R _DIFF        |                     | 0   |  | 0            | Single-Ended                 |  |
|                    |                     |     |  | 1            | Differential                 |  |
|                    |                     |     |  | Value        | Pulse Width                  |  |
|                    |                     |     | Sets the charge pump minimum pulse   | 0            | Reserved                     |  |
| PFD_DLY<br>[1:0]   | R27[4:3]            | 1   | width. This could potentially be a trade-off between fractional spurs and phase noise.                                       | 1            | 860 ps                       |  |
| [1.0]              |                     |     | Setting 1 is recommended for general use.  | 2            | 1200 ps                      |  |
|                    |                     |     |  | 3            | 1500 ps                      |  |
|                    |                     |     |  | Value        | Charge Pump State            |  |
|                    |                     |     |  | 0            | Tri-State                    |  |
| CPG                | D00[4.0]            | 0   | Charma avera asia  | 1            | 100 uA                       |  |
| [4:0]              | R28[4:0]            | 0   | Charge pump gain   | 2            | 200 uA                       |  |
|                    |                     |     |  |              |                              |  |
|                    |                     |     |  | 31           | 3100 uA                      |  |
|                    |                     |     | Charge Pump Polarity   | Value        | Charge Pump Polarity         |  |
| CPPOL              | R28[5]              | 0   | Positive is for a positive slope VCO   | 0            | Negative                     |  |
|                    |                     |     | characteristic, negative otherwise.  | 1            | Positive                     |  |

# 8.8 Lock Detect and Charge Pump Monitoring

# **Table 5. Lock Detect and Charge Pump Monitor**

| Field                  | Location | POR  | Description and States   |                           |  |
|------------------------|----------|------|--|---------------------------|--|
|                        |          |      |  | Value                     | Threshold  |
| CPM_THR _LOW           | D20[E:0] | 0x0A | Charge pump voltage low threshold value.   | 0                         | Lowest   |
| [5:0]                  | R30[5:0] | UXUA | When the charge pump voltage is below this threshold, the LD goes low.   |                           |  |
|                        |          |      |  | 63                        | Highest  |
|                        |          |      |  | Value                     | Flag Indication  |
| CPM_FLAGL              | R30[6]   | -    | This is a read only bit. Low indicates the charge pump voltage is  | 0                         | Charge pump is below CPM_THR_LOW threshold                   |
|                        |          |      | below the minimum threshold.   | 1                         | Charge pump is above CPM_THR_LOW threshold                   |
|                        |          |      |  | Value                     | Threshold  |
| CPM_THR _HIGH          | D04[E-0] | 020  | Charge pump voltage high threshold value.  | 0                         | Lowest   |
| [5:0]                  | R31[5:0] | 0x32 | When the charge pump voltage is above this threshold, the LD goes low.   |                           |  |
|                        |          |      | , ,  | 63                        | Highest  |
|                        | R31[6]   |      | This is a read only bit.  Charge pump voltage high comparator reading. High indicates the charge pump                                      | Value                     | Threshold  |
| CPM_FLAGH              |          | -    |  | 0                         | Charge pump is below CPM_THR_HIGH threshold                  |
|                        |          |      | voltage is above the maximum threshold.  | 1                         | Charge pump is above CPM_THR_HIGH threshold                  |
| DLD_ PASS_CNT<br>[7:0] | R33[7:0] | 0xff | Digital Lock Detect Filter amount. There mu<br>and less than DLD_ERR edges before the D<br>smaller will speed the detection of lock, but a | LD is conside             | ered in lock. Making this number                             |
| DLD_ ERR_CNT<br>[4:0]  | R34[4:0] | 0    | Digital Lock Detect error count. This is th DLD_TOL that are allowed before DLD is recommended value is 4.                                 | e maximum<br>de-asserted. | number of errors greater than Although the default is 0, the |
|                        |          |      |  | Value                     | Window and Fpd Frequency                                     |
|                        |          |      |  | 0                         | 1 ns (Fpd > 130 MHz)   |
|                        |          |      | Digital Lock detect edge window. If both N and R edges are within this window, it is considered a "good" edge. Edges that are              | 1                         | 1.7 ns (80 MHz , Fpd ≤ 130<br>MHz)                           |
| DLD _TOL               | D24[7:5] | 0    | farther apart in time are considered "error"   | 2                         | 3 ns (60 MHz , Fpd ≤ 80 MHz)                                 |
| [2:0]                  | R34[7:5] | U    | edges. Window choice depends on phase  | 3                         | 6 ns (45 MHz , Fpd ≤ 60 MHz)                                 |
|                        |          |      | detector frequency, charge pump minimum pulse width, fractional modulator order and the users desired margin.                              | 4                         | 10 ns (30 MHz < Fpd ≤ 45<br>MHz)                             |

# **Ramping Functions (continued)**

# **Table 8. Ramping Functions (continued)**

| Field                     | Location                        | POR            | DR Description and States  |       |   |  |  |  |
|---------------------------|---------------------------------|----------------|--|-------|---|--|--|--|
| RAMP_LIMIT_LOW<br>[32:0]  | R70[3],<br>R78[7] to<br>75[0]   | 0x000<br>00000 | Twos compliment of the ramp lower limit that the ramp can not go below . The ramp limit occurs before any deviation values are included. Care must be taken if the deviation is used and the ramp limit must be set appropriately. Be aware that the MSB is in Register R70. |       |   |  |  |  |
| RAMP_LIMIT_HIGH<br>[32:0] | R70[4],<br>R82[7] to<br>79.0[0] | 0xfffffff<br>f | Twos compliment of the ramp higher limit that the ramp can not go above. The ramp limit occurs before any deviation values are included. Care must be taken if the deviation is used and the ramp limit must be set appropriately. Be aware that the MSB is in Register R70. |       |   |  |  |  |
| RAMP_COUNT<br>[12:0]      | R84[4] to<br>R83[0]             | 0              | Number of RAMPs that will be executed before a trigger or ramp enable is brought down. Load zero if this feature is not used. Counter is automatically reset when RAMP_EN goes from 0 to 1.  |       |   |  |  |  |
|                           | R84[5]                          |                | Automatically clear RAMP_EN when RAMP Count hits terminal count.   | Value | Ramp  |  |  |  |
| RAMP_AUTO                 |                                 | 0              |  | 0     | RAMP_EN unaffected by ramp counter (default)                        |  |  |  |
| 10 1011                   |                                 |                |  | 1     | RAMP_EN automatically brought low when ramp counter terminal counts |  |  |  |
|                           |                                 |                |  | Value | Source  |  |  |  |
| RAMP_TRIG_INC             |                                 |                | Increment Trigger source for RAMP  | 0     | Increments occur on each ramp transition                            |  |  |  |
| [1:0]                     | R84[7:6]                        | 0              | Counter. To disable ramp counter, load a count value of 0.   | 1     | Increment occurs on trigA   |  |  |  |
|                           |                                 |                |  | 2     | Increment occurs on trigB   |  |  |  |
|                           |                                 |                |  | 3     | Increment occurs on trigC   |  |  |  |

# 8.11 Individual Ramp Controls

These bits apply for all eight ramps. For the field names, x can be 0,1,2,3,4,5,6, or 7.

# **Table 9. Individual Ramp Controls**

| Field               | Location | POR      | Description and States  |       |                                     |   |       |  |                              |  |
|---------------------|----------|----------|---|-------|-------------------------------------|---|-------|--|------------------------------|--|
| RAMPx<br>_INC[29:0] | Varies   | 0        | Signed ramp increment.  |       |                                     |   |       |  |                              |  |
|                     |          |          |   | Value | CPG                                 |   |       |  |                              |  |
| RAMPx _FL           | Varies   | 0        | This enables fastlock and cycle slip reduction for ramp x.  | 0     | Disabled                            |   |       |  |                              |  |
|                     |          |          |   | 1     | Enabled                             |   |       |  |                              |  |
|                     |          |          |   | Value | Clocks                              |   |       |  |                              |  |
| RAMPx<br>_DLY       | Varies   | 0        | During this ramp, each increment takes 2 PFD cycles per LEN clock instead of the normal 1 PFD cycle. Slows the      | 0     | 1 PFD clock per RAMP tick.(default) |   |       |  |                              |  |
| _52.                |          |          | ramp by a factor of 2.  | 1     | 2 PFD clocks per RAMP tick.         |   |       |  |                              |  |
| RAMPx<br>_LEN       | Varies   | 0        | Number of PFD clocks (if DLY is 0) to continue to increment RAMP. 1=>1 cycle, 2=>2 etc. Maximum of 65536 cycles.    |       |                                     |   |       |  |                              |  |
|                     |          | Varies 0 | s 0   | 0     | 0                                   |   | Value | Flag                                     |                              |  |
|                     |          |          |   |       |                                     | General purpose FLAGS sent out of RAMP. | 0     | Both FLAG1 and FLAG0 are zero. (default) |                              |  |
| RAMPx<br>_FLAG[1:0] | Varies   |          |   |       |                                     |   | 1     | FLAG0 is set, FLAG1 is clear             |                              |  |
| _1 [.0]             |          |          |   |       |                                     |   |       | 2  | FLAG0 is clear, FLAG1 is set |  |
|                     |          |          |   | 3     | Both FLAG0 and FLAG1 are set.       |   |       |  |                              |  |
|                     |          |          | Forces a clear of the ramp accumulator. This is used to   | Value | Reset                               |   |       |  |                              |  |

# 9 Applications and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The LMX2492/92-Q1 can be used in a broad class of applications such as generating a single frequency for a high frequency clock, generating a tunable range of frequencies, or generating swept waveforms that can be used in applications such as radar.

## 9.2 Typical Applications

The following schematic is an example of hat could be used in a typical application.

## 9.2.1 Design Requirements

For these examples, it will be assumed that there is a 100 MHz input signal and the output frequency is between 9400 and 9800 MHz with various modulated waveforms.

## **Typical Applications (continued)**

| Parameter                   | Symbol | Value                                   | Comments   |  |  |
|-----------------------------|--------|---|--|--|--|
| Input Frequency             | OSCin  | 100 MHz                                 |  |  |  |
| Phase Detector<br>Frequency | Fpd    | 100 MHz                                 | There are many possibilities, but this choice gives good performance and saves a little current (as shown in the electrical specifications). |  |  |
|                             |        | 9400 - 9800 MHz (Simple Chirp)          |  |  |  |
| VCO Frequency               | Fvco   | 9400 - 9800 (Flattened Ramp)            | In the different examples, the VCO frequency is actually changing. However, the same loop filter   |  |  |
|                             |        | 9500 - 9625 MHz (Complex Triggered Ramp | design can be used for all three.  |  |  |
| VCO Gain                    | Kvco   | 200 MHz/V                               | This parameter has nothing to do with the LMX2492/92-Q1, but is rather set by the external VCO choice.                                       |  |  |

## 9.2.2 Detailed Design Procedure

The first step is to calculate the reference divider (PLL\_R) and feedback divider (PLL\_N) values as shown in the table that follows.

| Parameter                 | Symbol and Calculations                    | Value     | Comments  |
|---------------------------|--|-----------|---|
| Average<br>VCO Frequency  | $Fvco_{Avg} = (Fvco_{Max} + Fvco_{Min})/2$ | 9600 MHz  | To design a loop filter, one designs for a fixed VCO value, although it is understood that the VCO will tune around. This typical value is usually chosen as the average VCO frequency. |
| VCO Gain                  | Kvco                                       | 200 MHz/V | This parameter has nothing to do with the LMX2492/92-Q1, but is rather set by the external VCO choice. In this case, it was the RFMD1843 VCO.   |
| PLL Loop Bandwidth        | BW   | 380 kHz   | This bandwidth is very wide to allow the VCO frequency to be modulated.   |
| Charge Pump Gain          | CPG  | 3.1 mA    | Using the larger gain allows a wider loop bandwidth and gives good phase performance.   |
| R Divider                 | PLL_R<br>= OSCin / Fpd                     | 1         | This value is calculated from previous values.  |
| N Divider                 | PLL_N<br>= Fvco / Fpd                      | 96        | This value is calculated from previous values.  |
|                           | C1_LF                                      | 68 pF     |   |
|                           | C2_LF                                      | 3.9 nF    |   |
| Loop Filter<br>Components | C3_LF                                      | 150 pF    | These were calculated by TI design tools.   |
| Componento                | R2_LF                                      | 390 ohm   |   |
|                           | R3_LF                                      | 390 ohm   |   |

Once a loop filter bandwidth is chosen, the external loop filter components of C1\_LF, C2\_LF, C3\_LF, R2\_LF, and R3\_LF can be calculated with a tool such as the Clock Architect tool available at www.ti.com. It is also highly recommended to look at the EVM instructions. The CodeLoader software is an excellent starting point and example to see how to program this device.

### 9.2.3 Application Performance Plot - Sawtooth Waveform Example

Using the above design, it can be programmed to generate a sawtooth waveform with the following paramters.

| Parameter     | Symbol | Value                            |  |  |
|---------------|--------|----------------------------------|--|--|
| Ramp Duration | ΔΤ     | 100 uS                           |  |  |
| VCO Frequency | Fvco   | 9400 - 9800 MHz                  |  |  |
| Range         | ΔF     | 9400 - 9800 MHz = 400 MHz Change |  |  |

Because we want the ramp length to be 100 us, this works out to 10,000 phase detector cycles which means that RAMP0\_LEN=10000. To change 400 MHz, we know that each one of the 10000 steps is 40 kHz. Given the fractional denominator is  $2^{24} = 16777216$  and the phase detector frequency is 100 MHz, this implies that the fractional numerator at the end of the ramp will be 6711. However, since this 6711 number is not exact (closer to 6718.8864), the ramp will creep if we do not reset it. Therefore, we set reset the ramp. After the ramp finishes, we want to start with the same ramp, so RAMP0\_NEXT is RAMP0. The results of this analysis are in the table below:

| RAMP  | RAMP0_LEN  | RAMP0_INC   | RAMP0_NEXT | RAMP0_RST |
|-------|--|---|------------|-----------|
| RAMP0 | $\Delta T \times Fpd = 100 \text{ us } / 100 \text{ MHz}$<br>= 10000 | (ΔF / Fpd) /RAMP0_LEN × 2 <sup>24</sup><br>= (400/100)/10000 ×16777216 = 6711 | 0          | 1         |

The actual measured waveform for this is shown in the following figure. Note that the frequency that was actually measured was from the divide by two output of the VCO and therefore the measured frequency was half of the actual frequency presented to the PLL. This ramping waveform does show some undershoot as the frequency rapidly returns from 9800 MHz (4900 MHz on the plot) to 9400 MHz (4700 MHz on the plot). This undershoot can be mitigated by adding additional ramps.

### 9.2.4 Application Performance Plot - Flat Top Triangle Waveform

Now consider pattern as shown below. The ramp is sometimes used because it can better account for Doppler Shift. The purpose for making the top and bottom portions flat is to help reduce the impact of the PLL overshooting and undershooting in order to make the sloped ramped portions more linear.

| Parameter     | Symbol | Value    |
|---------------|--------|----------|
|               | ΔΤ0    | 10 uS    |
| Down Duration | ΔΤ1    | 90 uS    |
| Ramp Duration | ΔΤ2    | 10 uS    |
|               | ΔΤ3    | 90 uS    |
|               | ΔF0    | 0        |
| Dongo         | ΔF1    | 400 MHz  |
| Range         | ΔF2    | 0        |
|               | ΔF3    | -400 MHz |

| RAMP  | RAMPx_LEN                | RAMPx_INC  | RAMPx_NEXT | RAMPx_RST |
|-------|--------------------------|--|------------|-----------|
| RAMP0 | 10 us/ 100 MHz<br>=1000  | 0  | 1          | 1         |
| RAMP1 | 90 us / 100 MHz<br>=9000 | (ΔF / Fpd) /RAMP1_LEN × 2 <sup>24</sup><br>= (400/100)/9000 ×16777216 =<br>7457  | 2          | 0         |
| RAMP2 | 10 us/ 100 MHz<br>=1000  | 0  | 3          | 0         |
| RAMP3 | 90 us / 100 MHz<br>=9000 | $(\Delta F / Fpd) / RAMP1_LEN \times 2^{24}$<br>= (-400/100)/9000 ×16777216 = -7457<br>Program in 2's complement of -7457<br>= $2^{30}$ -7457 = 1073734367 | 0          | 0         |

The actual measured waveform for this is shown in the following figure. Note that the frequency that was actually measured was from the divide by two output of the VCO and therefore the measured frequency was half of the actual frequency presented to the PLL. The flattened top and bottom of this triangle wave help mitigate the overshoot and undersoot in the frequency.

The actual measured waveform for this is shown in the following figure. Note that the frequency that was actually measured was from the divide by two output of the VCO and therefore the measured frequency was half of the actual frequency presented to the PLL. The flattened top and bottom of this triangle wave help mitigate the overshoot and undersoot in the frequency.

### 9.2.5 Applications Performance Plot -- Complex Triggered Ramp

In this example, the modulation is not started until a trigger pulse from the MOD terminal goes high. Assume a phase detector frequency of 100 MHz and we RAMP1 to be 60 us and ramps 2,3,and 4 to be 12 us each. We set the next trigger for RAMP0 to be trigger A and define trigger A to be the MOD terminal. Then we configure as follows:

Figure 6. Complex Triggered Ramp Example

| RAMP  | RAMPx<br>_LEN | RAMPx_<br>INC | RAMPx_FL | RAMPx<br>_NEXT | RAMPx_FLAG         | RAMPx_<br>NEXT_TRIG | RAMPx_RS<br>T |
|-------|---------------|---------------|----------|----------------|--------------------|---------------------|---------------|
| RAMP0 | 1             | 0             | 0        | 1              | FLAG0 and<br>FLAG1 | TRIG A              | 1             |
| RAMP1 | 6000          | 1073730639    | 0        | 2              | FLAG0 and<br>FLAG1 | TOC Timeout         | 1             |
| RAMP2 | 1200          | 27963         | 1        | 3              | Disabled           | TOC Timeout         | 0             |
| RAMP3 | 1200          | 17476         | 0        | 4              | FLAG1              | TOC Timeout         | 0             |
| RAMP4 | 1200          | 10486         | 0        | 1              | FLAG0 and<br>FLAG1 | TOC Timeout         | 0             |

The actual measured waveform for this is shown in the following figure. Note that the frequency that was actually measured was from the divide by two output of the VCO and therefore the measured frequency was half of the actual frequency presented to the PLL. The flattened top and bottom of this triangle wave help mitigate the overshoot and undersoot in the frequency.

Figure 7. Actual Measurement for Complex Triggered Ramp

## 10 Power Supply Recommendations

For power supplies, it is recommended to place 100 nF close to each of the power supply pins. If fractional spurs are a large concern, using a ferrite bead to each of these power supply pins can reduce spurs to a small degree.

## 11 Layout

### 11.1 Layout Guidelines

For layout examples, the EVM instructions are the most comprehensive document. In general, the layout guidelines are similar to most other PLL devices. For the high frequency Fin pin, it is recommended to use 0402 components and match the trace width to these pad sizes. Also the same needs to be done on the Fin\* pin. If layout is easier to route the signal to Fin\* instead of Fin, then this is acceptable as well.

### 11.2 Layout Example

## 12 Device and Documentation Support

### 12.1 Device Support

### 12.1.1 Development Support

Texas Instruments has several software tools to aid in the development process including CodeLoder for programming, Clock Design Tool for Loop filter design and phase noise/spur simulation, and the Clock Architect. All these tools are available at www.ti.com.

### 12.2 Documentation Support

TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No. RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

www.ti.com 23-May-2025

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

### OTHER QUALIFIED VERSIONS OF LMX2492, LMX2492-Q1:

Automotive : LMX2492-Q1

NOTE: Qualified Version Definitions:

- Catalog TI's standard catalog product
- Automotive Q100 devices qualified for high-reliability automotive applications targeting zero defects

PLASTIC QUAD FLATPACK - NO LEAD

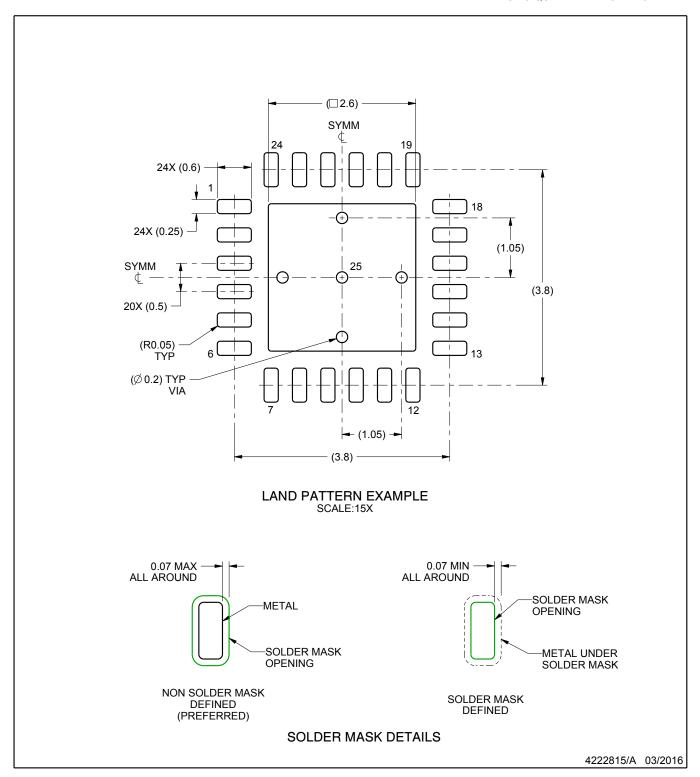

### NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
  2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

### IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource.
