

OPTIREG™ Linear TLS115D0

High Precision Voltage Tracker

Features

- 150 mA current capability
- Very high accuracy voltage tracking
- Output voltage adjustable down to 2.0 V
- Stable with ceramic output capacitors
- Very low dropout voltage
- Very low current consumption in OFF mode
- Power Good output indicates overvoltage and undervoltage
- Internally controlled soft start
- Wide input voltage range: $-16\text{ V} \leq V_{\text{IN}} \leq 45\text{ V}$
- Wide temperature range: $-40^{\circ}\text{C} \leq T_{\text{j}} \leq 150^{\circ}\text{C}$
- Short circuit protected output (to GND and to battery)
- Reverse polarity protected input
- Overtemperature protection
- Green Product (RoHS compliant)
- AEC Qualified

Applications

- Automotive sensor supply
- Protected sensor supply for off-board sensors
- Secondary voltage supply in automotive ECU
- High-precision voltage tracking
- Precision voltage replication
- Power switch for off-board load

Description

The OPTIREG™ Linear TLS115D0 is a monolithic integrated low-dropout voltage tracking regulator with high accuracy in small PG-DSO-8 exposed pad and PG-TSON-10 packages. The TLS115D0 is designed to supply off-board systems, for example sensors in powertrain management systems under the severe conditions of automotive applications. Therefore, the TLS115D0 is equipped with protection functions against reverse polarity and against short circuit to GND and battery.

Up to a supply voltage of 45 V and output currents up to 150 mA, the output voltage follows the reference voltage that is applied to the ADJ input with very high accuracy. The required minimum reference voltage at ADJ is 2.0 V.

Type	Package	Marking

ESD susceptibility to GND	V _{ESD,HBM}	-4	–	4	kV	Human Body Model (HBM) ²⁾	P_3.1.9
ESD susceptibility to GND	V _{ESD,CDM}	-1	–	1	kV	Charge Device Model (CDM) ³⁾	P_3.1.10
ESD susceptibility to GND	V _{ESD,CDM}	-1	–	1	kV	Charge Device Model (CDM) at corner pins ³⁾	P_3.1.11

1) Not subject to production test, specified by design.

2) ESD susceptibility, HBM according to ANSI/ESDA/JEDEC JS001 (1.5 kΩ, 100 pF)

3) ESD susceptibility, Charged Device Model “CDM” according JEDEC JESD22-C101

Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

General product characteristics

3.2 Functional range

Table 2 Functional range

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Input voltage range	V_{IN}	4	–	45	V	–	P_3.2.1
Adjust input voltage range (voltage tracking range)	V_{ADJ}	2	–	14	V	–	P_3.2.2
Output capacitor	C_{OUT}	1	–	–	μF	– ¹⁾²⁾	P_3.2.3
Output capacitor's Equivalent Series Resistance	ESR (C_{OUT})	–	–	5	Ω	– ²⁾	P_3.2.4
Junction temperature	T_j	–40	–	150	°C	– ²⁾	P_3.2.5

1) The minimum output capacitance requirement is applicable for a worst case capacitance tolerance of 30%.

2) Not subject to production test, specified by design.

Note: Within the functional or operating range, the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the Electrical Characteristics table.

3.3 Thermal resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to www.jedec.org.

4 Block description and electrical characteristics

4.1 Tracking regulator

The regulator controls the output voltage V_{OUT} by comparing it to the voltage applied to the ADJ pin and driving a PNP pass transistor accordingly. The stability of the control loop depends on:

- the output capacitor C_{OUT}
- load current
- chip temperature
- the poles and zeroes in the frequency response of the circuit consisting of TLS115D0 and the load

An input capacitor C_{IN} is strongly recommended for buffering the line influence.

To ensure stable operation, the output capacitor's capacitance and its equivalent series resistance ESR requirements given in the table "**Functional range**" on Page 8 must be maintained. For details see also the typical performance graph "**Output capacitor ESR(C_{OUT}) vs. output current I_{OUT}** " on Page 14. The output capacitor must be sized suitably to buffer load transients.

Connect each capacitor close to the pins.

Protection circuitry prevents the TLS115D0 itself as well as the application from destruction in case of catastrophic events. These safeguards contain:

- output current limitation
- reverse polarity protection
- thermal shutdown

In order to protect the pass element and the package from excessive power dissipation the TLS115D0 reduces the maximum output current at high input voltage.

The TLS115D0 allows a negative supply voltage. However, in reverse polarity condition several low currents flowing into the TLS115D0 increase junction temperature. Thermal design must consider this effect, because in reverse polarity condition the overtemperature protection circuit does not operate.

The overtemperature protection circuit prevents immediate destruction of the TLS115D0 in certain fault conditions (for example a permanent short circuit at output) by switching off the power stage. After the chip cools down, the regulator restarts. If the fault is not removed, then this leads to an oscillatory behavior of the output voltage. Please note, that a junction temperature above 150°C is outside the maximum ratings and reduces the lifetime of the TLS115D0.

Table 5 Electrical characteristics tracking regulator

$V_{IN} = 13.5 \text{ V}$, $2.0 \text{ V} \leq V_{ADJ} \leq 14 \text{ V}$, $V_{EN} \geq 2.0 \text{ V}$, $T_j = -40^\circ\text{C}$ to $+150^\circ\text{C}$, all voltages with respect to ground, positive current flowing into pin (unless otherwise specified).

junction temperature T_j (I_{OUT} low)**

**Current consumption in OFF mode $I_{q,off}$ vs.
junction temperature T_j**

Block description and electrical characteristics

4.5 Enable input

In order to minimize the quiescent current, the TLS115D0 can be switched to stand-by mode by setting the corresponding enable input “EN” to “low”.

If the EN pin is not connected, then the “low” level from the internal pull-down resistor switches off the regulator.

Table 7 Electrical characteristics Enable input

$V_{IN} = 13.5\text{ V}$, $2.0\text{ V} \leq V_{ADJ} \leq 14\text{ V}$, $T_j = -40^\circ\text{C}$ to $+150^\circ\text{C}$, all voltages with respect to ground, positive current flowing into pin (unless otherwise specified).

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Enable off voltage range	$V_{EN,off}$	–	–	0.8	V	$V_{OUT} = 0\text{ V}$, $I_{OUT} \leq 5\text{ }\mu\text{A}$, $T_j \leq 125^\circ\text{C}$	P_4.5.1
Enable on voltage range	$V_{EN,on}$	2	–	–	V	V_{OUT} settled	P_4.5.2
Enable input current	I_{EN}	–	2	4	μA	$V_{EN} = 5\text{ V}$	P_4.5.3

4.6 Typical performance characteristics Enable input

**Enable input current I_{EN} vs.
Enable input voltage V_{EN}**

Block description and electrical characteristics

4.7 Adjust input

The Adjust input must be connected to the reference voltage, which is tracked.

Table 8 Electrical characteristics Adjust input

$V_{IN} = 13.5\text{ V}$, $2.0\text{ V} \leq V_{ADJ} \leq 14\text{ V}$, $V_{EN} \geq 2.0\text{ V}$, $T_j = -40^\circ\text{C}$ to $+150^\circ\text{C}$, all voltages with respect to ground, positive current flowing into pin (unless otherwise specified).

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Adjust input current	I_{ADJ}	–	0.03	1	μA	$V_{ADJ} = 5\text{ V}$	P_4.7.1

4.8 Typical performance characteristics Adjust input

**Adjust input current I_{ADJ} vs.
Adjust input voltage V_{ADJ}**

**Adjust input current I_{ADJ} vs.
junction temperature T_j**

Block description and electrical characteristics

4.9 Power Good output

The Power Good output PG indicates an overvoltage or undervoltage condition of the tracker output. For this the TLS115D0 compares the output voltage V_{OUT} to the reference voltage V_{ADJ} . Variations of the output voltage beyond the Power Good switching thresholds are indicated by a “low” signal at the Power Good output PG. Transients shorter than the Power Good reaction time $t_{PG,r}$ do not trigger the Power Good output.

The Power Good output PG is an open collector output that requires a pull-up resistor to a positive voltage rail. The pull-up voltage must not exceed the absolute maximum ratings of Power Good PG (see **“Absolute maximum ratings” on Page 7**).

Table 9 Electrical characteristics Power Good output

$V_{IN} = 13.5 \text{ V}$, $2.0 \text{ V} \leq V_{ADJ} \leq 14 \text{ V}$, $V_{EN} \geq 2.0 \text{ V}$, $T_j = -40^\circ\text{C}$ to $+150^\circ\text{C}$, all voltages with respect to ground, positive current flowing into pin (unless otherwise specified).

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Power Good switching threshold, undervoltage	$V_{OUT,UV}$	$V_{ADJ} - 120$	$V_{ADJ} - 70$	$V_{ADJ} - 50$	mV	V_{OUT} decreasing, $V_{IN} \geq V_{ADJ} + 150 \text{ mV}$	P_4.9.1
Power Good switching threshold, overvoltage	$V_{OUT,OV}$	$V_{ADJ} + 50$	$V_{ADJ} + 70$	$V_{ADJ} + 120$	mV	V_{OUT} increasing, $V_{IN} \geq V_{ADJ} + 150 \text{ mV}$	P_4.9.2
Power Good reaction time	$t_{PG,r}$	10	15	30	μs	–	P_4.9.3
Power Good output low voltage	$V_{PG,low}$	–	0.2	0.4	V	$V_{IN} \geq 4 \text{ V}$, $I_{PG,ext} \leq 1.8 \text{ mA}$	P_4.9.4
Power Good output external input current	$I_{PG,ext}$	–	–	1.8	mA	$V_{PG} \leq 0.4 \text{ V}$	P_4.9.5
Power Good output leakage current	$I_{PG,leak}$	–	0	2	μA	$V_{OUT} = V_{ADJ}$, $V_{PG} = 5 \text{ V}$	P_4.9.6

Application information

5 Application information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

5.1 Application diagram

Figure 4 TLS115D0 application circuit

5.2 Selection of external components

5.2.1 Input pin

Figure 4 shows the typical input circuitry for a voltage tracking regulator. The following external components at the input are recommended in case of possible external disturbance.

A ceramic capacitor C_{IN1} (100 nF to 470 nF) at the input filters high frequency disturbance imposed by the line, such as ISO pulses 3a/b. Place C_{IN1} very close to the input pin of the voltage tracking regulator on the PCB.

An aluminum electrolytic capacitor C_{IN2} (10 μ F to 470 μ F) at the input smoothens high energy pulses, such as ISO pulse 2a. Place C_{IN2} close to the input pin of the voltage tracking regulator on the PCB.

An accordingly sized overvoltage suppressor diode D_1 suppresses high voltage beyond the maximum ratings of the circuit components and protects the devices from damage due to overvoltage.

Application information

5.2.2 Output pin

An output capacitor C_{OUT} is mandatory for the stability of the voltage tracking regulator. The requirements for C_{OUT} are described in the table **“Functional range” on Page 8**. The graph **“Output capacitor ESR(COUT) vs. output current IOUT” on Page 14** shows the stable operation range of the TLS115D0.

For automotive environment, ceramic capacitors with X5R or X7R dielectrics are recommended.

Place C_{OUT} on the same side of the PCB as the regulator itself and as close as possible to both the tracker output pin and GND pin.

In case of rapid transients of input voltage or load current, C_{OUT} must be dimensioned properly to ensure the output stability in the application.

5.2.3 Adjust pin

Figure 4 shows a typical Adjust circuitry for a voltage tracking regulator. Typically the Adjust Pin is connected to a fixed voltage reference that the regulator tracks. In the example of the application diagram ADJ is connected to the supply voltage of a microcontroller. The voltage reference can also be adjusted by a voltage divider.

5.2.4 Power Good pin

The Power Good output is an open collector output, which requires a pull-up resistor to a positive voltage rail. The pull-up voltage must not exceed the maximum ratings of the Power Good PG shown in **“Absolute maximum ratings” on Page 7**. In **Figure 4** the supply voltage VDD of a microcontroller is used as pull-up voltage for example.

To limit the external input current according to the requirement (see **“Power Good output” on Page 19**), the resistor must be sized depending on the pull-up voltage.

5.3 Thermal considerations

Knowing the input voltage, the output voltage and the load profile of the application, the total power dissipation can be calculated:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_q \quad (5.1)$$

with

- P_D : continuous power dissipation
- V_{IN} : input voltage
- V_{OUT} : output voltage
- I_{OUT} : output current
- I_q : quiescent current

The maximum acceptable thermal resistance R_{thJA} can then be calculated:

$$R_{thJA, \max} = \frac{T_{j, \max} - T_a}{P_D} \quad (5.2)$$

with

- $T_{j, \max}$: maximum allowed junction temperature
- T_a : ambient temperature

Application information

Based on the above calculation the proper PCB type and the necessary heat sink area can be determined with reference to the specification in **“Thermal resistance” on Page 8**.

Example

Application conditions:

$$V_{IN} = 13.5 \text{ V}$$

$$V_{OUT} = V_{ADJ} = 5 \text{ V}$$

$$I_{OUT} = 100 \text{ mA}$$

$$T_a = 75^\circ\text{C}$$

Calculation of $R_{thJA,max}$:

$$\begin{aligned} P_D &= (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_q \\ &= (13.5\text{V} - 5\text{V}) \times 100 \text{ mA} + 13.5 \text{ V} \times 3.5 \text{ mA} \\ &= 0.897 \text{ W} \end{aligned}$$

$$\begin{aligned} R_{thJA,max} &= (T_{j,max} - T_a) / P_D \\ &= (150^\circ\text{C} - 75^\circ\text{C}) / 0.897 \text{ W} \\ &= 83.61 \text{ K/W} \end{aligned}$$

As a result, the PCB design must ensure a thermal resistance R_{thJA} lower than 83.61 K/W. According to **“Thermal resistance” on Page 8**, at least 300 mm² heatsink area is required on the FR4 1s0p PCB, or the FR4 2s2p board can be used.

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
