

LA5771MP

Monolithic Linear IC

Separately-excited Step-down Switching Regulator (3.3V)

ON Semiconductor®

<http://onsemi.com>

Overview

The LA5771MP is a separately-excited step-down switching regulator (3.3V).

Features

- High efficiency
- Four external parts
- Time-base generator (160kHz) incorporated
- Current limiter incorporated
- Thermal shutdown circuit incorporated
- Soft start circuit incorporated

Specifications

Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Input voltage	V _{IN} max		30	V
Output current	I _O max		3	A
SW pin application reverse voltage	V _{sw}		-1	V
Allowable power dissipation	P _d max	Mounted on the specified board *	3.9	W
Operating temperature	T _{opr}		-30 to +125	°C
Storage temperature	T _{stg}		-40 to +150	°C

* Mounted on a specified board: 114.3mm×76.1mm×1.6mm, Copper foil ratio 60% FR4

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Recommended Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Input voltage range	V _{IN}		5.5 to 28	V

Electrical Characteristics at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Output voltage	V_O	$V_{IN}=15\text{V}$, $I_O=1.0\text{A}$	3.17	3.30	3.43	V
Efficiency	η	$V_{IN}=15\text{V}$, $I_O=1.0\text{A}$		79		%
Switching frequency	f	$V_{IN}=15\text{V}$, $I_O=1.0\text{A}$	128	160	192	kHz
Line regulation	ΔV_{OLINE}	$V_{IN}=8$ to 20V , $I_O=1.0\text{A}$		25	80	mV
Load regulation	ΔV_{OLOAD}	$V_{IN}=15\text{V}$, $I_O=0.5$ to 1.5A		10	30	mV
Output voltage temperature coefficient	$\Delta V_O/\Delta T_a$	Designed target value*		± 0.5		mV/ $^\circ\text{C}$
Ripple attenuation factor	RREJ	$f=100$ to 120Hz		45		dB
Current limiter operating voltage	V_S	$V_{IN}=15\text{V}$	3.1			A
Thermal shutdown operating temperature	TSD	Designed target value*		165		$^\circ\text{C}$
Thermal shutdown hysteresis width	ΔTSD	Designed target value*		15		$^\circ\text{C}$

* Designed target value: No measurement made.

Package Dimensions

Application Circuit Example

Notes: C3 is for the soft start function. Delete C3 and keep the SS pin open when the soft function is not necessary.

Description of Functional Settings

1. Start delay function

The SS pin has the internally-connected 22 μ A (typ) constant-current supply. When the voltage of SS pin exceeds the threshold voltage, the regulator starts operation. As the threshold is 0.62V(typ), the start delay time can be calculated as follows:

ex. For setting at 1 μ F

$$T_d = \frac{C \times V}{i} = \frac{1\mu\text{F} \times 0.62\text{V}}{22\mu\text{A}} = 28.2\text{ms}$$

2. Soft start function

The internal PWM waveform has the voltage value as shown in the right. If down-conversion from the voltage of V_{IN}=15V to 3.3V output is to be made, for example, the PWM-ON duty has the value as shown below.

$$\text{PWMduty} = \frac{V_{\text{OUT}}}{V_{\text{IN}} - V_{\text{sat}} + V_{\text{F}}} = 23\%$$

(Note that calculation is made with V_{sat}=1V and V_F=0.2V)

The output voltage of error amplifier, which is 3.3V, is the value with PWM=23%, as calculated in the above equation, so that this voltage is determined as follows:

$$V_{\text{er}} = (\Delta V_{\text{PWM}}) \times \text{PWMduty} + V_{\text{PWML}} = 0.88\text{V} \times 0.23 + 0.62\text{V} = 0.82\text{V}$$

(ΔV_{PWM} is the PWM amplitude value or 0.88V(typ) while V_{PWML} is the lower limit voltage of PWM waveform or 0.62V(typ))

SS pin and error amplifier output voltages are designed to prefer the lower voltages, so that V_{OUT} will reach the designed regulation voltage in timing when the SS pin voltage exceeds the error amplifier output. Therefore, the soft start time is calculated as follows:

$$T_{\text{ss}} = \frac{C \times \Delta V_{\text{PWM}} \times \text{PWMduty}}{i} = \frac{C \times 0.88\text{V} \times \text{PWMduty}}{22\mu\text{A}}$$

For the set conditions of C=1 μ F and PWMduty=23%:

$$T_{\text{ss}} = \frac{1\mu\text{A} \times 0.88\text{V} \times 0.23}{22\mu\text{A}} = 9.2\text{ms}$$
