

# Low-Power Stereo Audio DAC With Audio Processing and Mono Class-D Speaker Amplifier

Check for Samples: [TLV320DAC3100-Q1](#)

## 1 INTRODUCTION

### 1.1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified with the Following Results:
  - Device Temperature Grade 3: –40°C to 85°C
  - Ambient Operating Temperature Range
  - Device HBM ESD Classification Level H2
  - Device CDM ESD Classification Level C4B
- Stereo Audio DAC with 95-dB SNR
- Supports 8-kHz to 192-kHz Sample Rates
- Mono Class-D BTL Speaker Driver (2.5 W Into 4-Ω or 1.6 W Into 8-Ω)
- Two Single-Ended Inputs With Mixing and Output Level Control
- Stereo Headphone/Lineout and Mono Class-D Speaker Outputs Available
- Microphone Bias
- Headphone Detection
- 25 Built-in Digital Audio Processing Blocks (PRB\_P1 – PRB\_P25) Providing Biquad and FIR Filters, DRC, and 3-D Structures
- Digital Mixing Capability
- Pin Control or Register Control for Digital-

### Playback Volume-Control Settings

- Digital Sine-Wave Generator for Beeps and Key Clicks (PRB\_P25)
- Programmable PLL for Flexible Clock Generation
- I<sup>2</sup>S, Left-Justified, Right-Justified, DSP, and TDM Audio Interfaces
- I<sup>2</sup>C Control With Register Auto-Increment
- Full Power-Down Control
- Power Supplies:
  - Analog: 2.7 V–3.6 V
  - Digital Core: 1.65 V–1.95 V
  - Digital I/O: 1.1 V–3.6 V
  - Class-D: 2.7 V–5.5 V (SPKVDD ≥ AVDD)
- 5-mm × 5-mm 32-QFN Package

### 1.2 Applications

- Automotive Applications
- Portable Audio Devices
- Mobile Internet Devices
- eBooks

### 1.3 Description

The TLV320DAC3100-Q1 is a low-power, highly-integrated, high-performance stereo-audio DAC with 24-bit stereo playback and digital audio processing blocks.

The device integrates headphone drivers and speaker drivers. The mono speaker driver drives loads down to 4 Ω. The TLV320DAC3100-Q1 has a suite of built-in processing blocks for digital audio processing. The digital audio data format is programmable to work with popular audio standard protocols (I<sup>2</sup>S, left and right-justified) in master, slave, DSP, and TDM modes. Bass boost, treble, or EQ is supported by the programmable digital signal-processing block. An on-chip PLL provides the high-speed clock required by the digital signal-processing block. The volume level is controlled either by pin control or by register control. The audio functions are controlled using the I<sup>2</sup>C serial bus.

The TLV320DAC3100-Q1 has a programmable digital sine-wave generator and is available in a 32-pin QFN package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### NOTE

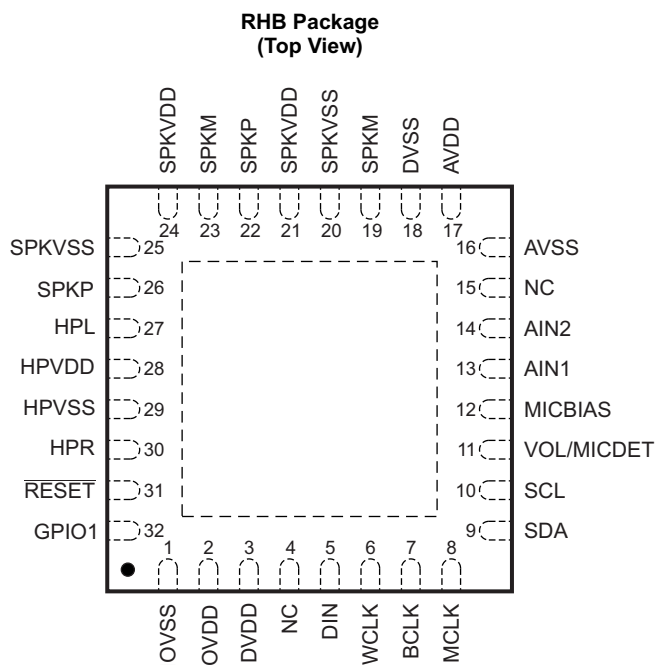

This data manual is designed using PDF document-viewing features that allow quick access to information. For example, performing a global search on "page 0 / register 27" produces all references to this page and register in a list. This makes it easy to traverse the list and find all information related to a page and register. Note that the search string must be of the indicated format. Also, this document includes document hyperlinks to allow the user to find a document reference quickly. To come back to the original page, click the green left arrow near the PDF page number at the bottom of the file. The hot-key for this function is alt-left arrow on the keyboard. Another way to find information quickly is to use the PDF bookmarks.

## 2 PACKAGE AND SIGNAL DESCRIPTIONS

### 2.1 Package/Ordering Information

See the *Package Option Addendum* at the end of this data manual for information regarding the device package and ordering of parts.

### 2.2 Device Information

P0048-16

**Table 2-1. TERMINAL FUNCTIONS**

| TERMINAL |       | I/O | DESCRIPTION  |
|----------|-------|-----|--|
| NAME     | NO.   |     |  |
| AIN1     | 13    | I   | Analog input No. 1 routed to output mixer              |
| AIN2     | 14    | I   | Analog input No. 2 routed to output mixer              |
| AVDD     | 17    | –   | Analog power supply                                    |
| AVSS     | 16    | –   | Analog ground  |
| BCLK     | 7     | I/O | Audio serial bit clock                                 |
| DIN      | 5     | I   | Audio serial data input                                |
| DVDD     | 3     | –   | Digital power – digital core                           |
| DVSS     | 18    | –   | Digital ground   |
| GPIO1    | 32    | I/O | General-purpose input/output pin and multifunction pin |
| HPL      | 27    | O   | Left-channel headphone/line driver output              |
| HPR      | 30    | O   | Right-channel headphone/line driver output             |
| HPVDD    | 28    | –   | Headphone/line driver and PLL power                    |
| HPVSS    | 29    | –   | Headphone/line driver and PLL ground                   |
| IOVDD    | 2     | –   | Interface power  |
| IOVSS    | 1     | –   | Interface ground                                       |
| MCLK     | 8     | I   | External master clock                                  |
| MICBIAS  | 12    | –   | Microphone bias voltage                                |
| NC       | 4, 15 | I   | No connection  |
| RESET    | 31    | I   | Device reset   |

**Table 2-1. TERMINAL FUNCTIONS (continued)**

| TERMINAL   |        | I/O | DESCRIPTION  |
|------------|--------|-----|--|
| NAME       | NO.    |     |  |
| SCL        | 10     | I/O | I <sup>2</sup> C control bus clock input   |
| SDA        | 9      | I/O | I <sup>2</sup> C control-bus data input  |
| SPKM       | 19, 23 | I/O | Cass-D speaker driver inverting output   |
| SPKP       | 22, 26 | –   | Class-D speaker driver noninverting output   |
| SPKVDD     | 21, 24 | –   | Class-D speaker driver power supply  |
| SPKVSS     | 20, 25 | –   | Class-D speaker driver power-supply ground   |
| VOL/MICDET | 11     | I   | Volume control or headphone detection. Note that microphone detection is also available on devices that have an ADC. |
| WCLK       | 6      | I/O | Audio serial word clock  |

### 3 ELECTRICAL SPECIFICATIONS

#### 3.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

|   |  | VALUE       |             | UNIT |
|---|--|-------------|-------------|------|
|   |  | MIN         | MAX         |      |
| AVDD to AVSS                                |  | –0.3        | 3.9         | V    |
| DVDD to DVSS                                |  | –0.3        | 2.5         | V    |
| HPVDD to HPVSS                              |  | –0.3        | 3.9         | V    |
| SPKVDD to SPKVSS                            |  | –0.3        | 6           | V    |
| IOVDD to IOVSS                              |  | –0.3        | 3.9         | V    |
| Digital input voltage                       |  | IOVSS – 0.3 | IOVDD + 0.3 | V    |
| Analog input voltage                        |  | AVSS – 0.3  | AVDD + 0.3  | V    |
| Ambient temperature range (T <sub>A</sub> ) |  | –40         | 85          |      |
| Storage temperature range                   |  | –55         | 150         | °C   |
| Junction temperature (T <sub>J</sub> Max)   |  |             | 125         |      |
| ESD Ratings                                 | Human-body model (HBM) AEC-Q100 classification level H2      |             | 2           | kV   |
|   | Charged-device model (CDM) AEC-Q100 classification level C4B |             | 750         | V    |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

#### 3.2 THERMAL INFORMATION

| THERMAL METRIC     |  | TLV320DAC3100-Q1 | UNITS |
|--------------------|--|------------------|-------|
|                    |  | RHB (32 PINS)    |       |
| θ <sub>JA</sub>    | Junction-to-ambient thermal resistance       | 31.9             | °C/W  |
| θ <sub>JCtop</sub> | Junction-to-case (top) thermal resistance    | 22.6             |       |
| θ <sub>JB</sub>    | Junction-to-board thermal resistance         | 6                |       |
| ψ <sub>JT</sub>    | Junction-to-top characterization parameter   | 0.2              |       |
| ψ <sub>JB</sub>    | Junction-to-board characterization parameter | 6                |       |
| θ <sub>JCbot</sub> | Junction-to-case (bottom) thermal resistance | 1.3              |       |

#### 3.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                       |                                       |   | MIN   | NOM | MAX  | UNIT             |
|-----------------------|---------------------------------------|---|-------|-----|------|------------------|
| AVDD <sup>(1)</sup>   | Power-supply voltage range            | Referenced to AVSS <sup>(2)</sup>                   | 2.7   | 3.3 | 3.6  | V                |
| DVDD                  |                                       | Referenced to DVSS <sup>(2)</sup>                   | 1.65  | 1.8 | 1.95 |                  |
| HPVDD                 |                                       | Referenced to HPVSS <sup>(2)</sup>                  | 2.7   | 3.3 | 3.6  |                  |
| SPKVDD <sup>(1)</sup> |                                       | Referenced to SPKVSS <sup>(2)</sup>                 | 2.7   |     | 5.5  |                  |
| IOVDD                 |                                       | Referenced to IOVSS                                 | 1.1   | 3.3 | 3.6  |                  |
| Speaker impedance     |                                       | Resistance applied across class-D output pins (BTL) | 4     |     |      | Ω                |
| Headphone impedance   |                                       | AC coupled to R <sub>L</sub>                        | 16    |     |      | Ω                |
| V <sub>I</sub>        | Analog audio full-scale input voltage | AVDD = 3.3 V, single-ended                          | 0.707 |     |      | V <sub>RMS</sub> |

- (1) To minimize battery-current leakage, the SPKVDD voltage level should not be below the AVDD voltage level.  
(2) All grounds on board are tied together, so they should not differ in voltage by more than 0.2-V maximum for any combination of ground signals. By use of a wide trace or ground plane, ensure a low-impedance connection between HPVSS and DVSS.

## Recommended Operating Conditions (continued)

over operating free-air temperature range (unless otherwise noted)

|                     |                                   | MIN | NOM | MAX | UNIT |
|---------------------|-----------------------------------|-----|-----|-----|------|
|                     | Stereo line output load impedance |     | 10  |     | kΩ   |
| MCLK <sup>(3)</sup> | Master clock frequency            |     |     | 50  | MHz  |
| f <sub>SCL</sub>    | SCL clock frequency               |     |     | 400 | kHz  |
| T <sub>A</sub>      | Operating free-air temperature    | –40 |     | 85  | °C   |

(3) The maximum input frequency should be 50 MHz for any digital pin used as a general-purpose clock.

## 3.4 Electrical Characteristics

At 25°C, AVDD = HPVDD = IOVDD = 3.3 V, SPKVDD = 3.6 V, DVDD = 1.8 V, f<sub>s</sub> (audio) = 48 kHz, CODEC\_CLKIN = 256 × f<sub>s</sub>, PLL = Off, VOL/MICDET pin disabled (unless otherwise noted)

| PARAMETER  |   | TEST CONDITIONS  |  | MIN   | TYP | MAX              | UNIT |   |
|--|---|--|--|-------|-----|------------------|------|---|
| INTERNAL OSCILLATOR-RC_CLK   |   |  |  |       |     |                  |      |   |
| Oscillator frequency   |   |  |  | 8.2   |     | MHz              |      |   |
| VOLUME CONTROL PIN (ADC); VOL/MICDET pin enabled   |   |  |  |       |     |                  |      |   |
| Input voltage range  |   | VOL/MICDET pin configured as volume control (page 0 / register 116, bit D7 = 1 and page 0 / register 67, bit D7 = 0)   |  | 0     |     | 0.5 x AVDD<br>V  |      |   |
| Input capacitance  |   |  |  | 2     |     | pF               |      |   |
| Volume control steps   |   |  |  | 128   |     | Steps            |      |   |
| Microphone Bias  |   |  |  |       |     |                  |      |   |
| Voltage output   |   | Page 1 / register 46, bits D1–D0 = 10  |  | 2.25  |     | 2.5 2.75         |      | V |
|  |   | Page 1 / register 46, bits D1–D0 = 01  |  | 2     |     |                  |      |   |
| Voltage regulation   |   | At 4-mA load current, page 1 / register 46, bits D1–D0 = 10 (MICBIAS = 2.5 V)  |  | 5     |     | mV               |      |   |
|  |   | At 4-mA load current, page 1 / register 46, bits D1–D0 = 01 (MICBIAS = 2 V)  |  | 7     |     |                  |      |   |
| AUDIO DAC  |   |  |  |       |     |                  |      |   |
| DAC HEADPHONE OUTPUT, AC-coupled load = 16 Ω (single-ended), driver gain = 0 dB, parasitic capacitance = 30 pF |   |  |  |       |     |                  |      |   |
| Full-scale output voltage (0 dB)   |   | Output common-mode setting = 1.65 V  |  | 0.707 |     | V <sub>RMS</sub> |      |   |
| SNR  | Signal-to-noise ratio                       | Measured as idle-channel noise, A-weighted <sup>(1) (2)</sup>  |  | 80    | 95  | dB               |      |   |
| THD  | Total harmonic distortion                   | 0-dBFS input   |  | –85   |     | –65 dB           |      |   |
| THD+N  | Total harmonic distortion + noise           | 0-dBFS input   |  | –82   |     | –60 dB           |      |   |

| DAC Output to Class-D SPEAKER OUTPUT; Load = 4 Ω (Differential), 50 pF   |   |  |  |       |     |                  |      |   |
| Output voltage   |   | SPKVDD = 3.6 V, BTL measurement, DAC input = 0 dBFS, CM = 1.8 V, class-D gain = 6 dB, THD = –16.5 dB   |  | 2.3   |     | V <sub>RMS</sub> |      |   |
|  |   | SPKVDD = 3.6 V, BTL measurement, DAC input = –2 dBFS, CM = 1.8 V, class-D gain = 6 dB, THD = –20 dB  |  | 2.1   |     |                  |      |   |
| Output, common-mode  |   | SPKVDD = 3.6 V, BTL measurement, DAC input = mute, class-D gain = 6 dB   |  | 1.8   |     | V                |      |   |
| SNR  | Signal-to-noise ratio                       | SPKVDD = 3.6 V, BTL measurement, class-D gain = 6 dB, measured as idle-channel noise, A-weighted (with respect to full-scale output value of 2.3 V <sub>RMS</sub> ) <sup>(1) (2)</sup> |  | 88    |     | dB               |      |   |
| THD  | Total harmonic distortion                   | SPKVDD = 3.6 V, BTL measurement, DAC input = –6 dBFS, CM = 1.8 V, class-D gain = 6 dB  |  | –65   |     | dB               |      |   |

(1) Ratio of output level with 1-kHz full-scale sine-wave input, to the output level with the inputs short-circuited, measured A-weighted over a 20-Hz to 20-kHz bandwidth using an audio analyzer.

(2) All performance measurements done with 20-kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter may result in higher THD+N and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, may affect dynamic specification values.

(3) DAC to headphone-out PSRR measurement is calculated as PSRR = 20 × log (ΔV<sub>HPL</sub> / ΔV<sub>HPVDD</sub>).

## Electrical Characteristics (continued)

At 25°C, AVDD = HPVDD = IOVDD = 3.3 V, SPKVDD = 3.6 V, DVDD = 1.8 V,  $f_s$  (audio) = 48 kHz, CODEC\_CLKIN = 256 ×  $f_s$ , PLL = Off, VOL/MICDET pin disabled (unless otherwise noted)

| PARAMETER   |  | TEST CONDITIONS  | MIN         | TYP | MAX | UNIT |
|---|--|--|-------------|-----|-----|------|
| THD+N   | Total harmonic distortion + noise                          | SPKVDD = 3.6 V, BTL measurement, DAC input = −6 dBFS, CM = 1.8 V, lass-D gain = 6 dB   |             | −63 |     | dB   |
| PSRR  | Power-supply rejection ratio <sup>(4)</sup>                | SPKVDD = 3.6 V, BTL measurement, ripple on SPKVDD = 200 mVp-p at 1 kHz   |             | −44 |     | dB   |

## 5 APPLICATION INFORMATION

### 5.1 Typical Circuit Configuration

S0400-08

**Figure 5-1. Typical Circuit Configuration**

### 5.2 Overview

The TLV320DAC3100-Q1 is a highly integrated stereo audio DAC for portable computing, communication, and entertainment applications. A register-based architecture eases integration with microprocessor-based systems through standard serial-interface buses. This device supports the two-wire I<sup>2</sup>C bus interface which provides full register access. All peripheral functions are controlled through these registers and the onboard state machines.

The TLV320DAC3100-Q1 consists of the following blocks:

- Stereo Audio DAC
- Dynamic range compressor (DRC)

- Digital sine-wave generator for clicks and beeps
- Stereo headphone and lineout amplifier
- Class-D mono amplifier capable of driving 4-Ω speakers
- Pin-controlled or register-controlled volume level
- Power-down de-pop and power-up soft start
- Analog inputs
- I<sup>2</sup>C control interface
- Power-down control block

Following a toggle of the  $\overline{\text{RESET}}$  pin or a software reset, the device operates in the default mode. The I<sup>2</sup>C interface is used to write to the control registers to configure the device.

The I<sup>2</sup>C address assigned to the TLV320DAC3100-Q1 is 001 1000. This device always operates in an I<sup>2</sup>C slave mode. This device always operates in an I<sup>2</sup>C slave mode. All registers are 8-bit, and all writable registers have read-back capability. The device auto-increments to support sequential addressing and can be used with I<sup>2</sup>C fast mode. Once the device is reset, all appropriate registers are updated by the host processor to configure the device as needed by the user.

## 5.2.1 Device Initialization

### 5.2.1.1 Power-Supply Sequence

The TLV320DAC3100-Q1 requires multiple power supply rails for operation. All the power rails must be powered up for the device to operate at the fullest potentation. The following is the recommended power-up sequencing for proper operation:

1. Power up SPKVDD
2. Power up IOVDD
3. Power up DVDD shortly after IOVDD
4. Power up AVDD and HPVDD

Although not necessary, if the system requires, during shutdown, remove the power supplies in the reverse order of the above sequence.

### 5.2.1.2 Reset

The TLV320DAC3100-Q1 internal logic must be initialized to a known condition for proper device function. To initialize the device to its default operating condition, the hardware reset pin ( $\overline{\text{RESET}}$ ) must be pulled low for at least 10 ns. For this initialization to work, both the IOVDD and DVDD supplies must be powered up. TI recommends that while the DVDD supply powers up, the  $\overline{\text{RESET}}$  pin is pulled low.

The device can also be reset via software reset. Writing a 1 into page 0 / register 1, bit D0 resets the device.

### 5.2.1.3 Device Start-Up Lockout Times

After the TLV320DAC3100-Q1 is initialized through hardware reset at power up or software reset, the internal memories are initialized to default values. This initialization takes place within 1 ms after pulling the  $\overline{\text{RESET}}$  signal high. During this initialization phase, no register-read or register-write operation should be performed on DAC coefficient buffers. Also, no block within the codec should be powered up during the initialization phase.

### 5.2.1.4 PLL Start-Up

Whenever the PLL is powered up, a start-up delay of approximately of 10 ms occurs after the power-up command of the PLL and before the clocks are available to the codec. This delay is to ensure stable operation of the PLL and clock-divider logic.

### 5.2.1.5 Power-Stage Reset

The power-stage-only reset is used to reset the device after an overcurrent latching shutdown has occurred. Using this reset re-enables the output stage without resetting all of the registers in the device. Each of the four power stages has its own dedicated reset bit. The headphone power-stage reset is performed by setting page 1 / register 31, bit D7 for HPL and by setting page 1 / register 31, bit D6 for HPR. The speaker power-stage reset is performed by setting page 1 / register 32, bit D7 for SPKP and SPKM.

### 5.2.1.6 Software Power Down

By default, all circuit blocks are powered down following a reset condition. Hardware power up of each circuit block can be controlled by writing to the appropriate control register. This approach allows the lowest power-supply current for the functionality required. However, when a block is powered down, all of the register settings are maintained as long as power is still being applied to the device.

## 5.2.2 Audio Analog I/O

The TLV320DAC3100-Q1 has a stereo audio DAC. The device supports a wide range of analog interfaces to support different headsets and analog outputs. The TLV320DAC3100-Q1 has features to interface output drivers (8-Ω, 16-Ω, 32-Ω). A special circuit has also been included in the TLV320DAC3100-Q1 to insert a short key-click sound into the stereo audio output. The key-click sound is used to provide feedback to the user when a particular button is pressed or item is selected. The specific sound of the keyclick can be adjusted by varying several register bits that control its frequency, duration, and amplitude (see [Section 5.5.7](#)).

## 5.3 Digital Processing Low-Power Modes

The TLV320DAC3100-Q1 device can be tuned to minimize power dissipation, to maximize performance, or to an operating point between the two extremes to best fit the application. The choice of processing blocks, PRB\_P1 to PRB\_P25 for stereo playback, also influences the power consumption. In fact, the numerous processing blocks have been implemented to offer a choice among configurations having a different balance of power optimization and signal-processing capabilities.

### 5.3.1 DAC Playback on Headphones, Stereo, 48 kHz, DVDD = 1.8 V, AVDD = 3.3 V, HPVDD = 3.3 V

DOSR = 128, Processing Block = PRB\_P7 (Interpolation Filter B)

Power consumption = 24.28 mW

**Table 5-1. PRB\_P7 Alternative Processing Blocks, 24.28 mW**

| Processing Block | Filter | Estimated Power Change (mW) |
|------------------|--------|-----------------------------|
| PRB_P1           | A      | 1.34                        |

### 5.3.5 DAC Playback on Headphones, Stereo, 192 kHz, DVDD = 1.8 V, AVDD = 3.3 V, HPVDD = 3.3 V

**DOSR = 32, Processing Block = PRB\_P17 (Interpolation Filter C)**

Power consumption = 27.05 mW

**Table 5-9. PRB\_P17 Alternative Processing Blocks, 27.05 mW**

| Processing Block | Filter | Estimated Power Change (mW) |
|------------------|--------|-----------------------------|
| PRB_P18          | C      | 5.28                        |
| PRB_P19          | C      | 1.98                        |

### 5.3.6 DAC Playback on Line Out (10 k-Ω load), Stereo, 48 kHz, DVDD = 1.8 V, AVDD = 3 V, HPVDD = 3 V

**DOSR = 64, Processing Block = PRB\_P7 (Interpolation Filter B)**

Power consumption = 12.85 mW

## 5.4 Analog Signals

The TLV320DAC3100-Q1 analog signals consist of:

- Microphone bias (MICBIAS)
- Analog inputs AIN1 and AIN2
- Analog outputs, class-D speaker driver and headphone and lineout driver, providing output capability for the DAC, AIN1, AIN2 or a mix of the three

### 5.4.1 MICBIAS

The TLV320DAC3100-Q1 includes a microphone bias circuit which can source up to 4 mA of current and is programmable to a 2-V, 2.5-V, or AVDD level. The level can be controlled by writing to page 1 / register 46, bits D1–D0. This functionality is shown in [Table 5-10](#).

**Table 5-10. MICBIAS Settings**

| D1 | D0 | FUNCTIONALITY                       |
|----|----|-------------------------------------|
| 0  | 0  | MICBIAS output is powered down.     |
| 0  | 1  | MICBIAS output is powered to 2 V.   |
| 1  | 0  | MICBIAS output is powered to 2.5 V. |
| 1  | 1  | MICBIAS output is powered to AVDD.  |

During normal operation, MICBIAS can be set to 2.5 V for better performance. However, depending on the model of microphone that is selected, optimal performance might be obtained at another setting, so the performance at a given setting should be verified.

The lowest current consumption occurs when MICBIAS is powered down. The next-lowest current consumption occurs when MICBIAS is set at AVDD. The highest current consumption occurs when MICBIAS is set at 2 V.

#### 5.4.2 Analog Inputs AIN1 and AIN2

AIN1 (pin 13) and AIN2 (pin 14) are inputs to the output mixer along with the DAC output. Page 1 / register 35 provides control signals for determining the signals routed through the output mixer. The output of the output mixer then can be attenuated or gained through the class-D and, or, headphone and lineout drivers.

### 5.5 Audio DAC and Audio Analog Outputs

Each channel of the stereo audio DAC consists of a digital audio processing block, a digital interpolation filter, a digital delta-sigma modulator, and an analog reconstruction filter. This high oversampling ratio (typically DOSR is between 32 and 128) exhibits good dynamic range by ensuring that the quantization noise generated within the delta-sigma modulator stays outside of the audio frequency band. Audio analog outputs include stereo headphone, or lineouts, and stereo class-D speaker outputs.

#### 5.5.1 DAC

The TLV320DAC3100-Q1 stereo audio DAC supports data rates from 8 kHz to 192 kHz. Each channel of the stereo audio DAC consists of a signal-processing engine with fixed processing blocks, a digital interpolation filter, a multibit digital delta-sigma modulator, and an analog reconstruction filter. The DAC is designed to provide enhanced performance at low sampling rates through increased oversampling and image filtering, thereby keeping quantization noise generated within the delta-sigma modulator and signal images strongly suppressed within the audio band to beyond 20 kHz. To handle multiple input rates and optimize power dissipation and performance, the TLV320DAC3100-Q1 allows the system designer to program the oversampling rates over a wide range from 1 to 1024 by configuring page 0 / register 13 and page 0 / register 14. The system designer can choose higher oversampling ratios for lower input data rates and lower oversampling ratios for higher input data rates.

The TLV320DAC3100-Q1 DAC channel includes a built-in digital interpolation filter to generate oversampled data for the delta-sigma modulator. The interpolation filter can be chosen from three different types, depending on required frequency response, group delay, and sampling rate.

DAC power up is controlled by writing to page 0 / register 63, bit D7 for the left channel and bit D6 for the right channel. The left-channel DAC clipping flag is provided as a read-only bit on page 0 / register 39, bit D7. The right-channel DAC clipping flag is provided as a read-only bit on page 0 / register 39, bit D6

##### 5.5.1.1 DAC Processing Blocks

The TLV320DAC3100-Q1 implements signal-processing capabilities and interpolation filtering via processing blocks. These fixed processing blocks give users the choice of how much and what type of signal processing they use and which interpolation filter is applied.

The choices among these processing blocks allow the system designer to balance power conservation and signal-processing flexibility. [Table 5-11](#) gives an overview of all available processing blocks of the DAC channel and their properties. The resource-class column gives an approximate indication of power consumption for the digital (DVDD) supply; however, based on the out-of-band noise spectrum, the analog power consumption of the drivers (HPVDD) may differ.

The signal processing blocks available are:

- First-order IIR
- Scalable number of biquad filters

- 3D effect
- Digital sine-wave (beep) generator

The processing blocks are tuned for common cases and can achieve high image rejection or low group delay in combination with various signal-processing effects such as audio effects and frequency shaping. The available first-order IIR and biquad filters have fully user-programmable coefficients.

**Table 5-11. Overview – DAC Predefined Processing Blocks**

| Processing Block No. | Interpolation Filter | Channel | First-Order IIR Available | Number of Biquads | DRC | 3D  | Beep Generator | Resource Class |
|----------------------|----------------------|---------|---------------------------|-------------------|-----|-----|----------------|----------------|

### 5.5.1.3 DAC User-Programmable Filters

Depending on the selected processing block, different types and orders of digital filtering are available. Up to six biquad sections are available for specific processing blocks.

The coefficients of the available filters are arranged as sequentially-indexed coefficients in two banks. If adaptive filtering is chosen, the coefficient banks can be switched in real time.

When the DAC is running, the user-programmable filter coefficients are locked and cannot be accessed for either read or write.

However, the TLV320DAC3100-Q1 offers an adaptive filter mode as well. Setting page 8 / register 1, bit D2 = 1 turns on double buffering of the coefficients. In this mode, filter coefficients can be updated through the host and activated without stopping and restarting the DAC. This enables advanced adaptive filtering applications.

In the double-buffering scheme, all coefficients are stored in two buffers (buffers A and B). When the DAC is running and the adaptive filtering mode is turned on, setting page 8 / register 1, bit D0 = 1 switches the coefficient buffers at the next start of a sampling period. This bit is set back to 0 after the switch occurs. At the same time, page 8 / register 1, bit D1 toggles.

The flag in page 8 / register 1, bit D1 indicates which of the two buffers is actually in use.

Page 8 / register 1, bit D1 = 0: buffer A is in use by the DAC engine; bit D1 = 1: buffer B is in use.

While the device is running, coefficient updates are always made to the buffer not in use by the DAC, regardless of the buffer to which the coefficients have been written.

**Table 5-12. Adaptive-Mode Filter-Coefficient Buffer Switching**

| DAC Powered Up | Page 8, Reg 1, Bit D1 | Coefficient Buffer in Use | Writing to | Updates  |
|----------------|-----------------------|---------------------------|------------|----------|
| No             | 0                     | None                      | Buffer A   | Buffer A |
| No             | 0                     | None                      | Buffer B   | Buffer B |
| Yes            | 0                     | Buffer A                  | Buffer A   | Buffer B |
| Yes            | 0                     | Buffer A                  | Buffer B   | Buffer B |
| Yes            | 1                     | Buffer B                  | Buffer A   | Buffer A |
| Yes            | 1                     | Buffer B                  | Buffer B   | Buffer A |

The user-programmable coefficients for the DAC processing blocks are defined on page 8 and page 9 for buffer A and page 12 and page 13 for buffer B.

The coefficients of these filters are each 16-bit, 2s-complement format, occupying two consecutive 8-bit registers in the register space. Specifically, the filter coefficients are in 1.15 (one dot 15) format with a range from –1.0 (0x8000) to 0.999969482421875 (0x7FFF) as shown in [Figure 5-13](#).

**Figure 5-13. 1.15 2s-Complement Coefficient Format**

#### 5.5.1.3.1 First-Order IIR Section

The IIR is of first order and its transfer function is given by [Equation 1](#).

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (1)$$

The frequency response for the first-order IIR section with default coefficients is flat.

**Table 5-13. DAC IIR Filter Coefficients**

| Filter          | Coefficient | Left DAC Channel                            | Right DAC Channel                             | Default (Reset) Value            |
|-----------------|-------------|---|---|----------------------------------|
| First-order IIR | N0          | Page 9 / register 2 and page 9 / register 3 | Page 9 / register 8 and page 9 / register 9   | 0x7FFF (decimal 1.0 – LSB value) |
|                 | N1          | Page 9 / register 4 and page 9 / register 5 | Page 9 / register 10 and page 9 / register 11 | 0x0000                           |
|                 | D1          | Page 9 / register 6 and page 9 / register 7 | Page 9 / register 12 and page 9 / register 13 | 0x0000                           |

**5.5.1.3.2 Biquad Section**

The transfer function of each of the biquad filters is given by [Equation 2](#).

$$H(z) = \frac{N_0 + 2 \times N_1 z^{-1} + N_2 z^{-2}}{2^{15} - 2 \times D_1 z^{-1} - D_2 z^{-2}} \quad (2)$$

**Table 5-14. DAC Biquad Filter Coefficients**

| Filter   | Coefficient | Left DAC Channel                              | Right DAC Channel                             | Default (Reset) Value            |
|----------|-------------|---|---|----------------------------------|
| Biquad A | N0          | Page 8 / register 2 and page 8 / register 3   | Page 8 / register 66 and page 8 / register 67 | 0x7FFF (decimal 1.0 – LSB value) |

#### 5.5.1.4 DAC Interpolation Filter Characteristics

##### 5.5.1.4.1 Interpolation Filter A

Filter A is designed for an  $f_s$  up to 48 ksp/s with a flat passband of 0 to 20 kHz.

**Table 5-15. Specification for DAC Interpolation Filter A**

| Parameter             | Condition           | Value (Typical) | Units |
|-----------------------|---------------------|-----------------|-------|
| Filter-gain pass band | 0 ... 0.45 $f_s$    | $\pm 0.015$     | dB    |
| Filter-gain stop band | 0.55... 7.455 $f_s$ | –65             | dB    |
| Filter group delay    |                     | 21 / $f_s$      | s     |

Figure 5-14. Frequency Response of DAC Interpolation Filter A

#### 5.5.1.4.2 Interpolation Filter B

Filter B is specifically designed for an  $f_s$  of up to 96 ksp/s. Thus, the flat passband region easily covers the required audio band of 0 to 20 kHz.

Table 5-16. Specification for DAC Interpolation Filter B

| Parameter             | Condition          | Value (Typical) | Units |
|-----------------------|--------------------|-----------------|-------|
| Filter-gain pass band | 0 ... 0.45 $f_s$   | $\pm 0.015$     | dB    |
| Filter-gain stop band | 0.55... 3.45 $f_s$ | –58             | dB    |
| Filter group delay    |                    | 18 / $f_s$      | s     |

Figure 5-15. Frequency Response of Channel Interpolation Filter B

### 5.5.1.4.3 Interpolation Filter C

Filter C is specifically designed for the 192-ksps mode. The pass band extends up to  $0.4 \times f_s$  (corresponds to 80 kHz), more than sufficient for audio applications.

**Table 5-17. Specification for DAC Interpolation Filter C**

| Parameter             | Condition           | Value (Typical) | Units |
|-----------------------|---------------------|-----------------|-------|
| Filter-gain pass band | $0 \dots 0.35 f_s$  | $\pm 0.03$      | dB    |
| Filter-gain stop band | $0.6 \dots 1.4 f_s$ | -43             | dB    |
| Filter group delay    |                     | $13 / f_s$      | s     |

**Figure 5-16. Frequency Response of DAC Interpolation Filter C**

### 5.5.2 DAC Digital-Volume Control

The DAC has a digital-volume control block which implements programmable gain. Each channel has an independent volume control that can be varied from 24 dB to -63.5 dB in 0.5-dB steps. The left-channel DAC volume can be controlled by writing to page 0 / register 65, bits D7–D0. The right-channel DAC volume can be controlled by writing to page 0 / register 66, bits D7–D0. DAC muting and setting up a master gain control to control both channels is done by writing to page 0 / register 64, bits D3–D0. The gain is implemented with a soft-stepping algorithm, which only changes the actual volume by 0.125 dB per input sample, either up or down, until the desired volume is reached. The rate of soft-stepping can be slowed to one step per two input samples by writing to page 0 / register 63, bits D1–D0. Note that the default source for volume-control level settings is control by register writes (page 0 / register 65 and page 0 / register 66 to control volume). Use of the VOL/MICDET pin to control the DAC volume is ignored until the volume control source selected has been changed to pin control (page 0 / register 116, bit D7 = 1). This functionality is shown in [Figure 1-1](#).

During soft-stepping, the host does not receive a signal when the DAC has been completely muted. This may be important if the host must mute the DAC before making a significant change, such as changing sample rates. In order to help with this situation, the device provides a flag back to the host via a read-only register, page 0 / register 38, bit D4 for the left channel and bit D0 for the right channel. This information alerts the host when the part has completed the soft-stepping and the actual volume has reached the desired volume level. The soft-stepping feature can be disabled by writing to page 0 / register 63, bits D1–D0.

If soft-stepping is enabled, the CODEC\_CLKIN signal should be kept active until the DAC power-up flag is cleared. When this flag is cleared, the internal DAC soft-stepping process is complete, and CODEC\_CLKIN can be stopped if desired. (The analog volume control can be ramped down using an internal oscillator.)

### 5.5.3 Volume Control Pin

The volume-control pin is not enabled by default but it can be enabled by writing 1 to page 0 / register 116, bit D7. The default DAC volume control uses software control of the volume, which occurs if page 0 / register 116, bit D7 = 0. Soft-stepping the volume level is set up by writing to page 0 / register 63, bits D1–D0.

When the volume-pin function is used, a 7-bit Vol ADC reads the voltage on the VOL/MICDET pin and updates the digital volume control. (It overwrites the current value of the volume control.) The new volume setting which has been applied due to a change of voltage on the volume control pin can be read on page 0 / register 117, bits D6–D0. The 7-bit Vol ADC clock source can be selected on page 0 / register 116, bit D6. The update rate can be programmed on page 0 / register 116, bits D2–D0 for this 7-bit SAR ADC.

The VOL/MICDET pin gainmapping is shown in [Table 5-18](#).

**Table 5-18. VOL/MICDET Pin Gain Mapping**

| VOL/MICDET PIN SAR OUTPUT | DIGITAL GAIN APPLIED |
|---------------------------|----------------------|
| 0                         | 18 dB                |
| 1                         | 17.5 dB              |
| 2                         | 17 dB                |
| :                         | :                    |
| 35                        | 0.5 dB               |
| 36                        | 0.0 dB               |
| 37                        | –0.5 dB              |
| :                         | :                    |
| 89                        | –26.5 dB             |
| 90                        | –27 dB               |
| 91                        | –28 dB               |
| :                         | :                    |
| 125                       | –62 dB               |
| 126                       | –63 dB               |
| 127                       | Mute                 |

Figure 10 is a block diagram of the audio path. It shows the signal flow from the microphone input through a 7-bit ADC, a volume level register, and two digital programmable DSP engines to two DACs (DAC\_L and DAC\_R). The input stage includes a differential microphone input (VOL/MICDET) with a biasing network (R1, R2, P1) connected to AVDD and AVSS, and a decoupling capacitor (C\_VOL). The 7-bit ADC has a VREF\_IN pin connected to AVDD. The signal path includes gain stages with gains of 18 dB to Mute and 24 dB to Mute. The DACs are Delta-Sigma DACs. The DSP engines are Digital Programmable DSP Engines with Vol Ctl pins. A note indicates that the Tone Generator and Mixer are not shown.

As shown in [Table 5-18](#), the VOL/MICDET pin has a range of volume control from 18 dB down to –63 dB, and mute. However, if less maximum gain is required, then a smaller range of voltage should be applied to the VOL/MICDET pin. This can be done by increasing the value of R2 relative to the value of (P1 + R1), so that more voltage is available at the bottom of P1. The circuit should also be designed such that for the values of R1, R2, and P1 chosen, the maximum voltage (top of the potentiometer) does not exceed AVDD/2 (see [Figure 5-17](#)). The recommended values for R1, R2, and P1 for several maximum gains are shown in [Table 5-19](#).

| R1<br>(kΩ) | P1<br>(kΩ) | R2<br>(kΩ) | ADC VOLTAGE<br>for AVDD = 3.3 V<br>(V) | DIGITAL GAIN RANGE<br>(dB) |
|------------|------------|------------|--|----------------------------|
| 25         | 25         | 0          | 0 to 1.65                              | 18 to –63                  |
| 33         | 25         | 7.68       | 0.386 to 1.642                         | 3 to –63                   |
| 34.8       | 25         | 9.76       | 0.463 to 1.649                         | 0 to –63                   |

Typical music signals are characterized by crest factors, the ratio of peak signal power to average signal power, of 12 dB or more. To avoid audible distortions due to clipping of peak signals, the gain of the DAC channel must be adjusted so as not to cause hard clipping of peak signals. As a result, during nominal periods, the applied gain is low, causing the perception that the signal is not loud enough. To overcome this problem, dynamic range compression (DRC) in the TLV320DAC3100-Q1 continuously monitors the output of the DAC digital volume control to detect its power level relative to 0 dBFS. When the power level is low, DRC increases the input signal gain to make it sound louder. At the same time, if a peaking signal is detected, it autonomously reduces the applied gain to avoid hard clipping. This results in sounds more pleasing to the ear as well as sounding louder during nominal periods.

DRC can be disabled by writing to page 0 / register 68, bits D6–D5.

DRC typically works on the filtered version of the input signal. The input signals have no audio information at dc and extremely low frequencies; however, they can significantly influence the energy estimation function in the dynamic range compressor (the DRC). Also, most of the information about signal energy is concentrated in the low-frequency region of the input signal.

To estimate the energy of the input signal, the signal is first fed to the DRC high-pass filter and then to the DRC low-pass filter. These filters are implemented as first-order IIR filters given by

$$H_{\text{HPF}}(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (3)$$

$$H_{\text{LPF}}(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (4)$$

The coefficients for these filters are 16 bits wide in 2s-complement format and are user-programmable through register write as given in [Table 5-20](#).

**Table 5-20. The DRC HPF and LPF Coefficients**

| Coefficient | Location   |
|-------------|--|
| HPF N0      | C71 page 9 / register 14 and page 9 / register 15  |
| HPF N1      | C72 page 9 / registers 16 and page 9 / register 17 |
| HPF D1      | C73 page 9 / registers 18 and page 9 / register 19 |
| LPF N0      | C74 page 9 / registers 20 and page 9 / register 21 |
| LPF N1      | C75 page 9 / registers 22 and page 9 / register 23 |
| LPF D1      | C76 page 9 / registers 24 and page 9 / register 25 |

The default values of these coefficients implement a high-pass filter with a cutoff at  $0.000083 \times \text{DAC}_f_s$ , and a low-pass filter with a cutoff at  $0.000165 \times \text{DAC}_f_s$ .

The output of the DRC high-pass filter is fed to the processing block selected for the DAC channel. The absolute value of the DRC LPF filter is used for energy estimation within the DRC.

The gain in the DAC digital volume control is controlled by page 0 / register 65 and page 0 / register 66. When the DRC is enabled, the applied gain is a function of the digital volume control register setting and the output of the DRC.

The DRC parameters are described in sections that follow.

#### 5.5.4.1 DRC Threshold

DRC threshold represents the level of the DAC playback signal at which the gain compression becomes active. The output of the digital volume control in the DAC is compared with the set threshold. The threshold value is programmable by writing to page 0 / register 68, bits D4–D2. The threshold value can be adjusted between –3 dBFS and –24 dBFS in steps of 3 dB. Keeping the DRC threshold value too high may not leave enough time for the DRC block to detect peaking signals, and can cause excessive distortion at the outputs. Keeping the DRC threshold value too low can limit the perceived loudness of the output signal.

The recommended DRC threshold value is –24 dB.

When the output signal exceeds the set DRC threshold, the interrupt flag bits at page 0 / register 44, bits D3–D2 are updated. These flag bits are *sticky* in nature, and are reset only after they are read back by the user. The non-sticky versions of the interrupt flags are also available at page 0 / register 46, bits D3–D2.

### 5.5.4.2 DRC Hysteresis

DRC hysteresis is programmable by writing to page 0 / register 68, bits D1–D0. These bits can be programmed to represent values between 0 dB and 3 dB in steps of 1dB. DRC hysteresis provides a programmable window around the programmed DRC threshold that must be exceeded for the *disabled* DRC to become enabled, or the *enabled* DRC to become disabled. For example, if the DRC threshold is set to –12 dBFS and the DRC hysteresis is set to 3 dB, then if the gain compression in the DRC is inactive, the output of the DAC digital volume control must exceed –9 dBFS before gain compression due to the DRC is activated. Similarly, when the gain compression in the DRC is active, the output of the DAC digital volume control must fall below –15 dBFS for gain compression in the DRC to be deactivated. The DRC hysteresis feature prevents the rapid activation and de-activation of gain compression in the DRC in cases when the output of the DAC digital volume control rapidly fluctuates in a narrow region around the programmed DRC threshold. By programming the DRC hysteresis as 0 dB, the hysteresis action is disabled.

The recommended value of DRC hysteresis is 3 dB.

### 5.5.4.3 DRC Hold

DRC hold is intended to slow the start of decay for a specified period of time in response to a decrease in energy level. To minimize audible artifacts, TI recommends to set the DRC hold time to 0 through programming page 0 / register 69, bits D6–D3 = 0000.

### 5.5.4.4 DRC Attack Rate

When the output of the DAC digital volume control exceeds the programmed DRC threshold, the gain applied in the DAC digital volume control is progressively reduced to avoid the signal from saturating the channel. This process of reducing the applied gain is called *attack*. To avoid audible artifacts, the gain is reduced slowly with a rate equaling the attack rate, programmable via page 0 / register 70, bits D7–D4. Attack rates can be programmed from 4-dB gain change per sample period to  $1.2207\text{e-}5$ -dB gain change per sample period.

Attack rates should be programmed such that before the output of the DAC digital volume control can clip, the input signal should be sufficiently attenuated. High attack rates can cause audible artifacts, and too-slow attack rates may not be able to prevent the input signal from clipping.

The recommended DRC attack rate value is  $1.9531\text{e-}4$  dB per sample period.

### 5.5.4.5 DRC Decay Rate

When the DRC detects a reduction in output signal swing beyond the programmed DRC threshold, the DRC enters a decay state, where the applied gain in the digital-volume control is gradually increased to programmed values. To avoid audible artifacts, the gain is slowly increased with a rate equal to the decay rate programmed through page 0 / register 70, bits D3–D0. The decay rates can be programmed from  $1.5625\text{e-}3$  dB per sample period to  $4.7683\text{e-}7$  dB per sample period. If the decay rates are programmed too fast, then sudden gain changes can cause audible artifacts. However, if it is programmed too slow, then the output may be perceived as too low for a long time after the peak signal has passed.

The recommended value of DRC decay rate is  $2.4414\text{e-}5$  dB per sample period.

### 5.5.4.6 Example Setup for DRC

- Digital Vol gain = 12 dB
- Threshold = –24 dB
- Hysteresis = 3 dB
- Hold time = 0 ms
- Attack rate =  $1.9531\text{e-}4$  dB per sample period
- Decay rate =  $2.4414\text{e-}5$  dB per sample period

### 5.5.5 Headphone Detection

The TLV320DAC3100-Q1 includes capability to monitor a headphone jack to determine if a plug has been inserted into the jack. [Figure 5-18](#) shows the circuit configuration to enable this feature.

**Figure 5-18. Jack Connections for Headphone Detection**

Headphone Detection is enabled by programming page 0 / register 67, bit D1. In order to avoid false detections due to mechanical vibrations in headset jacks or microphone buttons, a debounce function is provided for glitch rejection. For the case of headset insertion, a debounce function with a range of 32 ms to 512 ms is provided. This can be programmed via page 0 / register 67, bits D4–D2. For improved button-press detection, the debounce function has a range of 8 ms to 32 ms by programming page 0 / register 67, bits D1–D0.

The TLV320DAC3100-Q1 also provides feedback to the user through register-readable flags, as well as an interrupt on the I/O pins when a button press or a headset insertion/removal event is detected. The value in page 0 / register 46, bits D5–D4 provides the instantaneous state of button press and headset insertion. Page 0 / register 44, bit D5 is a sticky (latched) flag that is set when the button-press event is detected. Page 0 / register 44, bit D4 is a sticky flag which is set when the headset insertion or removal event is detected. These sticky flags are set by the event occurrence, and are reset only when read. This requires polling page 0 / register 44. To avoid polling and the associated overhead, the TLV320DAC3100-Q1 also provides an interrupt feature, whereby events can trigger the INT1, the INT2, or both interrupts. These interrupt events can be routed to one of the digital output pins. See [Section 5.5.6](#) for details.

The TLV320DAC3100-Q1 not only detects a headset insertion event, but also is able to distinguish between the different headsets inserted, such as stereo headphones or cellular headphones. After the headset-detection event, the user can read page 0 / register 67, bits D6–D5 to determine the type of headset inserted.

**Table 5-21. Headphone Detection Block Registers**

| Register                         | Description   |
|----------------------------------|---|
| Page 0 / register 67, bits D4–D2 | Debounce programmability for headset detection      |
| Page 0 / register 67, bits D1–D0 | Debounce programmability for button press           |
| Page 0 / register 44, bit D5     | Sticky flag for button-press event                  |
| Page 0 / register 44, bit D4     | Sticky flag for headset-insertion or -removal event |
| Page 0 / register 46, bit D5     | Status flag for button-press event                  |
| Page 0 / register 46, bit D4     | Status flag for headset insertion and removal       |
| Page 0 / register 67, bits D6–D5 | Flags for type of headset detected                  |

The headset detection block requires AVDD to be powered. The headset detection feature in the TLV320DAC3100-Q1 is achieved with very low power overhead, requiring less than 20  $\mu$ A of additional current from the AVDD supply.

### 5.5.6 Interrupts

Some specific events in the TLV320DAC3100-Q1 which may require host processor intervention, can be used to trigger interrupts to the host processor. This avoids polling the status-flag registers continuously. The TLV320DAC3100-Q1 has two defined interrupts, INT1 and INT2, that can be configured by programming page 0 / register 48 and page 0 / register 49. A user can configure interrupts INT1 and INT2 to be triggered by one or many events, such as:

- Headset detection
- Button press
- DAC DRC signal exceeding threshold
- Overcurrent condition in headphone drivers and speaker drivers
- Data overflow in ADC and DAC processing blocks and filters

Each of these INT1 and INT2 interrupts can be routed to output pins GPIO1. These interrupt signals can either be configured as a single pulse or a series of pulses by programming page 0 / register 48, bit D0 and page 0 / register 49, bit D0. If the user configures the interrupts as a series of pulses, the events trigger the start of pulses that stop when the flag registers in page 0 / registers 44, 45, and 50 are read by the user to determine the cause of the interrupt.

### 5.5.7 Key-Click Functionality With Digital Sine-Wave Generator (PRB\_P25)

A special algorithm has been included in the digital signal processing block PRB\_P25 for generating a digital sine-wave signal that is sent to the DAC. The digital sine-wave generator is also referred to as the beep generator in this document.

This functionality is intended for generating key-click sounds for user feedback. The sine-wave generator is very flexible (see [Table 5-22](#)) and is completely register programmable. Programming page 0 / register 71 through page 0 / register 79 (8 bits each) completely controls the functionality of this generator and allows for differentiating sounds.

The two registers used for programming the 16-bit sine-wave coefficient are page 0 / register 76 and page 0 / register 77. The two registers used for programming the 16-bit cosine-wave coefficient are page 0 / register 78 and page 0 / register 79. This coefficient resolution allows virtually any frequency of sine wave in the audio band to be generated, up to  $f_s / 2$ .

The three registers used to control the length of the sine-burst waveform are page 0 / register 73 through page 0 / register 75. The resolution (bit) in the registers of the sine-burst length is one sample time, so this allows great control on the overall time of the sine-burst waveform. This 24-bit length timer supports 16 777 215 sample times. For example, if  $f_s$  is set at 48 kHz, and the register value equals 96 000 d (01 7700h), then the sine burst lasts exactly 2 seconds. The default settings for the tone generator, based on using a sample rate of 48 kHz, are 1-kHz (approximately) sine wave, with a sine-burst length of five cycles (5 ms).

**Table 5-22. Beep Generator Register Locations (Page 0x00)**

| REGISTER | LEFT BEEP CONTROL | RIGHT BEEP CONTROL | BEEP LENGTH |     |     | SINE |     | COSINE |     |
|----------|-------------------|--------------------|-------------|-----|-----|------|-----|--------|-----|
|          |                   |                    | MSB         | MID | LSB | MSB  | LSB | MSB    | LSB |
|          | 71                | 72                 | 73          | 74  | 75  | 76   | 77  | 78     | 79  |

**Table 5-23. Example Beep-Generator Settings for a 1000-Hz Tone**

| BEEP FREQUENCY      | BEEP LENGTH |           |           | SINE      |           | COSINE    |           | SAMPLE RATE |
|---------------------|-------------|-----------|-----------|-----------|-----------|-----------|-----------|-------------|
| Hz                  | MSB (hex)   | MID (hex) | LSB (hex) | MSB (hex) | LSB (hex) | MSB (hex) | LSB (hex) | Hz          |
| 1000 <sup>(1)</sup> | 0           | 0         | EE        | 10        | D8        | 7E        | E3        | 48 000      |

(1) These are the default settings.

Two registers are used to control the left sine-wave volume and the right sine-wave volume independently. The 6-bit digital volume control used allows level control of 2 dB to –61 dB in 1-dB steps. The left-channel volume is controlled by writing to page 0 / register 71, bits D5–D0. The right-channel volume is controlled by writing to page 0, register 72, bits D5–D0. A master volume control that controls the left and right channels of the beep generator can be set up by writing to page 0 / register 72, bits D7–D6. The default volume control setting is 2 dB, which provides the maximum tone-generator output level.

For generating other tones, the three tone-generator coefficients can be found by running the following script using MATLAB™:

```
Sine = round(sin(2*pi*Fin/Fs)*32768)
Cosine = round(cos(2*pi*Fin/Fs)*32768)
Beep Length = floor(Cycles*Fs/Fin)
```

where,

Fin = Beep frequency desired

Fs = Sample rate

Cycle = Number of beep (sine wave) cycles that are required

#### NOTES:

1. Fin must always be less than  $0.5 \cdot F_s$  and cannot equal 0 or  $0.25 \cdot F_s$ .
2. For the sine and cosine values, if the number of bits is less than the full 16-bit value, then the unused MSBs must be written as 0s.
3. For the beep-length values, if number of bits is less than the full 24-bit value, then the unused MSBs must be written as 0s.

Following the beep-volume control is a digital mixer that mixes in a playback data stream whose level has already been set by the DAC volume control. Therefore, once the key-click volume level is set, the key-click volume is not affected by the DAC volume control, which is the main control available to the end user. This functionality is shown in [Figure 1-1](#).

Following the DAC, the signal can be further scaled by the analog output volume control and power-amplifier level control.

The beep generator is used for the key-click function. A single beep is generated by writing to page 0 / register 71, bit D7. After the programmed beep length has finished, register 71, bit D7 is reset back to zero.

To insert a beep in the middle of an already-playing signal over DAC, use the following sequence.

Before the beep is desired, program the desired beep frequency, volume, and length in the configuration registers. When a beep is desired, use the example configuration script.

```
w 30 00 00      # change to Page 0
w 30 40 0C      # mute DACs
f 30 26 xxxlxxx1 # wait for DAC gain flag to be set
w 30 0B 02      # power down NDAC divider
w 30 47 80      # enable beep generator with left channel volume = 0dB, volume level could
                # be different as per requirement
w 30 0B 82      # power up NDAC divider, in this specific example NDAC = 2, could be
                # different value as per overall setup
w 30 40 00      # un-mute DAC to resume playing audio
```

Note that in this scheme the audio signal on the DAC is temporarily muted to enable beep generation. Because powering down of NDAC clock divider is required, do not use the DAC\_CLK or DAC\_MOD\_CLK for generation of I<sup>2</sup>S clocks.

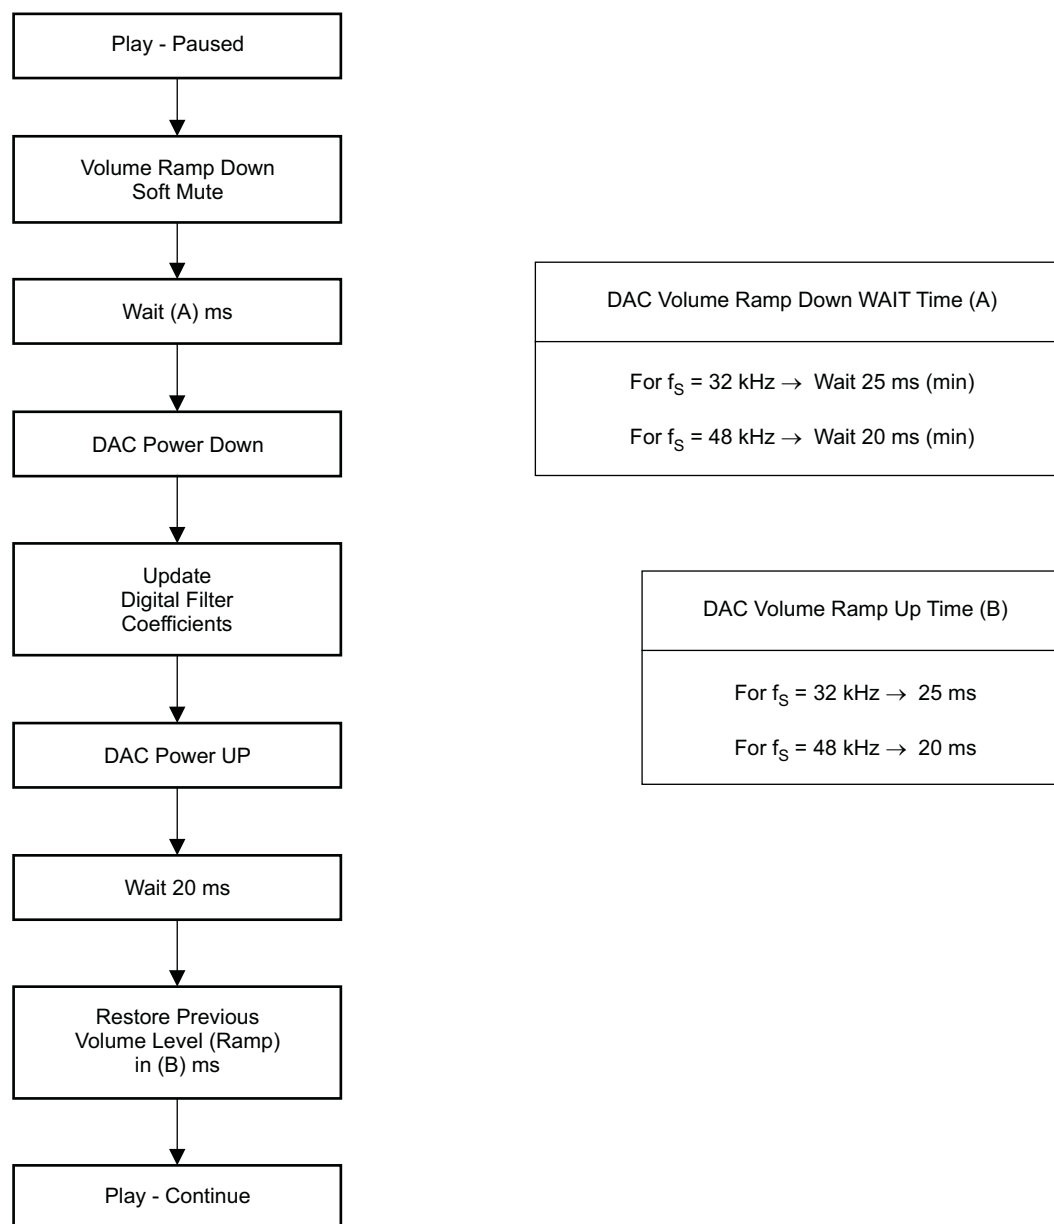

### 5.5.8 Programming DAC Digital Filter Coefficients

The digital filter coefficients must be programmed through the I<sup>2</sup>C interface. All digital filtering for the DAC signal path must be loaded into the RAM before the DAC is powered on. Note that default ALLPASS filter coefficients for programmable biquads are located in boot ROM. The boot ROM automatically loads the default values into the RAM following a hardware reset (toggling the  $\overline{\text{RESET}}$  pin) or after a software reset. After resetting the device, loading boot ROM coefficients into the digital filters requires 100  $\mu\text{s}$  of programming time. During this time, reading or writing to page 8 through page 15 for updating DAC filter coefficient values is not permitted. The DAC should not be powered up until after all of the DAC configurations have been done by the system microprocessor.

### 5.5.9 Updating DAC Digital Filter Coefficients During PLAY

When it is required to update the DAC digital filter coefficients or beep generator during play, care must be taken to avoid click and pop noise or even a possible oscillation noise. These artifacts can occur if the DAC coefficients are updated without following the proper update sequence. The correct sequence is shown in [Figure 5-19](#). The values for times listed in [Figure 5-19](#) are conservative and should be used for software purposes.

There is also an adaptive mode, in which DAC coefficients can be updated while the DAC is on. For details, see [Section 5.5.1.3](#).

F0024-02

**Figure 5-19. Example Flow For Updating DAC Digital Filter Coefficients During Play**

### 5.5.10 Digital Mixing and Routing

The TLV320DAC3100-Q1 has four digital mixing blocks. Each mixer can provide either mixing or multiplexing of the digital audio data. This arrangement of digital mixers allows independent volume control for both the playback data and the key-click sound. The first set of mixers can be used to make monaural signals from left and right audio data, or they can even be used to swap channels to the DAC. This function is accomplished by selecting left audio data for the right DAC input, and right data for the left DAC input. The second set of mixers provides mixing of the audio data stream and the key-click sound. The digital routing can be configured by writing to page 0 / register 63, bits D5–D4 for the left channel and bits D3–D2 for the right channel.

Because the key-click function uses the digital signal processing block, the CODEC\_CLKIN, DAC, analog volume control, and output driver must be powered on for the key-click sound to occur.

### 5.5.11 Analog Audio Routing

The TLV320DAC3100-Q1 has the capability to route the DAC output to either the headphone or the speaker output. If desirable, both output drivers can operate at the same time while playing at different volume levels. The TLV320DAC3100-Q1 provides various digital routing capabilities, allowing digital mixing or even channel swapping in the digital domain. All analog outputs other than the selected ones can be powered down for optimal power consumption.

#### 5.5.11.1 Analog Output Volume Control

The output volume control can be used to fine-tune the level of the mixer amplifier signal supplied to the headphone driver or the speaker driver. This architecture supports separate and concurrent volume levels for each of the four output drivers. This volume control can also be used as part of the output pop-noise reduction scheme. This feature is available even if the DAC is powered down.

#### 5.5.11.2 Headphone Analog-Output Volume Control

For the headphone outputs, the analog volume control has a range from 0 dB to –78 dB in 0.5-dB steps for most of the useful range plus mute, which is shown in [Table 5-24](#). This volume control includes soft-stepping logic. Routing the left-channel DAC output signal to the left-channel analog volume control is done by writing to page 1 / register 35, bit D6. Routing the right-channel DAC output signal to the right-channel analog volume control is done by writing to page 1 / register 35, bit D2.

Changing the left-channel analog volume for the headphone is controlled by writing to page 1 / register 36, bits D6–D0. Changing the right-channel analog volume for the headphone is controlled by writing to page 1 / register 37, bits D6–D0. Routing the signal from the output of the left-channel analog volume control to the input of the left-channel headphone power amplifier is done by writing to page 1 / register 36, bit D7. Routing the signal from the output of the right-channel analog volume control to the input of the right-channel headphone power amplifier is done by writing to page 1 / register 37, bit D7.

The analog volume-control soft-stepping time is based on the setting in page 0 / register 63, bits D1–D0.

**Table 5-24. Analog Volume Control for Headphone and Speaker Outputs (for D7 = 1)<sup>(1)</sup>**

| Register Value (D6–D0) | Analog Gain (dB) | Register Value (D6–D0) | Analog Gain (dB) | Register Value (D6–D0) | Analog Gain (dB) | Register Value (D6–D0) | Analog Gain (dB) |
|------------------------|------------------|------------------------|------------------|------------------------|------------------|------------------------|------------------|
| 0                      | 0                | 30                     | –15              | 60                     | –30.1            | 90                     | –45.2            |
| 1                      | –0.5             | 31                     | –15.5            | 61                     | –30.6            | 91                     | –45.8            |
| 2                      | –1               | 32                     | –16              | 62                     | –31.1            | 92                     | –46.2            |
| 3                      | –1.5             | 33                     | –16.5            | 63                     | –31.6            | 93                     | –46.7            |
| 4                      | –2               | 34                     | –17              | 64                     | –32.1            | 94                     | –47.4            |
| 5                      | –2.5             | 35                     | –17.5            | 65                     | –32.6            | 95                     | –47.9            |
| 6                      | –3               | 36                     | –18.1            | 66                     | –33.1            | 96                     | –48.2            |
| 7                      | –3.5             | 37                     | –18.6            | 67                     | –33.6            | 97                     | –48.7            |
| 8                      | –4               | 38                     | –19.1            | 68                     | –34.1            | 98                     | –49.3            |
| 9                      | –4.5             | 39                     | –19.6            | 69                     | –34.6            | 99                     | –50              |
| 10                     | –5               | 40                     | –20.1            | 70                     | –35.2            | 100                    | –50.3            |
| 11                     | –5.5             | 41                     | –20.6            | 71                     | –35.7            | 101                    | –51              |
| 12                     | –6               | 42                     | –21.1            | 72                     | –36.2            | 102                    | –51.4            |
| 13                     | –6.5             | 43                     | –21.6            | 73                     | –36.7            | 103                    | –51.8            |
| 14                     | –7               | 44                     | –22.1            | 74                     | –37.2            | 104                    | –52.2            |
| 15                     | –7.5             | 45                     | –22.6            | 75                     | –37.7            | 105                    | –52.7            |
| 16                     | –8               | 46                     | –23.1            | 76                     | –38.2            | 106                    | –53.7            |
| 17                     | –8.5             | 47                     | –23.6            | 77                     | –38.7            | 107                    | –54.2            |
| 18                     | –9               | 48                     | –24.1            | 78                     | –39.2            | 108                    | –55.3            |
| 19                     | –9.5             | 49                     | –24.6            | 79                     | –39.7            | 109                    | –56.7            |
| 20                     | –10              | 50                     | –25.1            | 80                     | –40.2            | 110                    | –58.3            |
| 21                     | –10.5            | 51                     | –25.6            | 81                     | –40.7            | 111                    | –60.2            |
| 22                     | –11              | 52                     | –26.1            | 82                     | –41.2            | 112                    | –62.7            |
| 23                     | –11.5            | 53                     | –26.6            | 83                     | –41.7            | 113                    | –64.3            |
| 24                     | –12              | 54                     | –27.1            | 84                     | –42.1            | 114                    | –66.2            |
| 25                     | –12.5            | 55                     | –27.6            | 85                     | –42.7            | 115                    | –68.7            |
| 26                     | –13              | 56                     | –28.1            | 86                     | –43.2            | 116                    | –72.2            |
| 27                     | –13.5            | 57                     | –28.6            | 87                     | –43.8            | 117–127                | –78.3            |
| 28                     | –14              | 58                     | –29.1            | 88                     | –44.3            |                        |                  |
| 29                     | –14.5            | 59                     | –29.6            | 89                     | –44.8            |                        |                  |

(1) Mute when D7 = 0 and D6–D0 = 127 (0x7F).

**5.5.11.3 Class-D Speaker Analog Output Volume Control**

For the mono speaker outputs, the analog volume control has a range from 0 dB to –78 dB in 0.5-dB steps for most of the useful range plus mute, as seen in [Table 5-24](#). The implementation includes soft-stepping logic.

Routing the left-channel DAC output signal to the left-channel analog volume control is done by writing to page 1 / register 35, bit D6. Routing the right-channel DAC output signal to the right-channel analog volume control is done by writing to page 1 / register 35, bit D2. Changing the left-channel analog volume for the speaker is controlled by writing to page 1 / register 38, bits D6–D0. Changing the right-channel analog volume for the speaker is controlled by writing to page 1 / register 39, bits D6–D0.

Routing the signal from the output of the left-channel analog volume control to the input of the mono speaker amplifier is done by writing to page 1 / register 38, bit D7.

The analog volume-control soft-stepping time is based on the setting in page 0 / register 63, bits D1–D0.

## 5.5.12 Analog Outputs

Various analog routings are supported for playback. All the options can be conveniently viewed on the functional block diagram, [Figure 1-1](#).

### 5.5.12.1 Headphone Drivers

The TLV320DAC3100-Q1 features a stereo headphone driver (HPL and HPR) that delivers up to 30 mW per channel, at 3.3-V supply voltage, into a 16-Ω load. The headphones are used in a single-ended configuration where an ac-coupling capacitor (dc-blocking) is connected between the device output pins and the headphones. The headphone driver also supports 32-Ω and 10-kΩ loads without changing any control register settings.

The headphone drivers can be configured to optimize the power consumption in the lineout-drive mode by writing 11 to page 1 / register 44, bits D2–D1.

The output common mode of the headphone and lineout drivers is programmed to 1.35 V, 1.5 V, 1.65 V, or 1.8 V by setting page 1 / register 31, bits D4–D3. Set the common-mode voltage to  $\leq AVDD / 2$ .

The left headphone driver can be powered on by writing to page 1 / register 31, bit D7. The right headphone driver can be powered on by writing to page 1 / register 31, bit D6. The left-output driver gain can be controlled by writing to page 1 / register 40, bits D6–D3, and it can be muted by writing to page 1 / register 40, bit D2. The right-output driver gain can be controlled by writing to page 1 / register 41, bits D6–D3, and it can be muted by writing to page 1 / register 41, bit D2.

The TLV320DAC3100-Q1 has a short-circuit protection feature for the headphone drivers, which is always enabled to provide protection. The output condition of the headphone driver during short circuit is programmed by writing to page 1 / register 31, bit D1. If D1 = 0 when a short circuit is detected, the device limits the maximum current to the load. If D1 = 1 when a short circuit is detected, the device powers down the output driver. The default condition for headphones is the current-limiting mode. In case of a short circuit on either channel, the output is disabled and a status flag is provided as read-only bits on page 1 / register 31, bit D0. If shutdown mode is enabled, then as soon as the short circuit is detected, page 1 / register 31, bit D7 (for HPL) or page 1 / register 31, bit D6, or both (for HPR) clear automatically. Next, the device requires a reset to re-enable the output stage. Resetting can be done in two ways. First, the device master reset can be used, which requires either toggling the RESET pin or using the software reset. If master reset is used, it resets all of the registers. Second, a dedicated headphone power-stage reset can also be used to re-enable the output stage, and that keeps all of the other device settings. The headphone power stage reset is done by setting page 1 / register 31, bit D7 for HPL and by setting page 1 / register 31, bit D6 for HPR. If the fault condition has been removed, then the device returns to normal operation. If the fault is still present, then another shutdown occurs. Repeated resetting (more than three times) is not recommended, as this could lead to overheating.

### 5.5.12.2 Speaker Drivers

The TLV320DAC3100-Q1 has an integrated class-D mono speaker driver (SPKP/SPKM) capable of driving a 4-Ω or an 8-Ω differential load. The speaker driver can be powered directly from the battery supply (2.7 V to 5.5 V) on the SPKVDD pins; however, the voltage (including spike voltage) must be limited below the absolute-maximum voltage of 6 V.

The speaker driver is capable of supplying 2.5 W with a 5.5-V power supply (4-Ω load). Through the use of digital mixing, the device can connect one or both digital audio playback data channels to the speaker driver.

The mono class-D speaker driver can be powered on by writing to page 1 / register 32, bit D7. The mono output-driver gain can be controlled by writing to page 1 / register 42, bits D4–D3, and it can be muted by writing to page 1 / register 42, bit D2.

The TLV320DAC3100-Q1 has a short-circuit protection feature for the speaker drivers that is always enabled to provide protection. If the output is shorted, the output stage shuts down on the overcurrent condition. (Current limiting is not an available option for the higher-current speaker driver output stage.) In case of a short circuit on either channel, the output is disabled and a status flag is provided as a read-only bit on page 1 / register 32, bit D0.

If shutdown occurs due to an overcurrent condition, then the device requires a reset to re-enable the output stage. Resetting can be done in two ways. First, the device master reset can be used, which requires either toggling the  $\overline{\text{RESET}}$  pin or using the software reset. If master reset is used, it resets all of the registers. Second, a dedicated speaker power-stage reset can be used that keeps all of the other device settings. The speaker power-stage reset is done by setting page 1 / register 32, bit D7 SPKP and SPKM. If the fault condition has been removed, then the device returns to normal operation. If the fault is still present, then another shutdown occurs. Repeated resetting (more than three times) is not recommended, as this could lead to overheating.

**To minimize battery current leakage, the SPKVDD and SPKVDD voltage levels should not be less than the AVDD voltage level.**

The TLV320DAC3100-Q1 has a thermal protection (OTP) feature for the speaker drivers which is always enabled to provide protection. If the device overheats, then the output stops switching. When the device cools down, the device resumes switching. An overtemperature status flag is provided as a read-only bit on page 0 / register 3, bit D1. The OTP feature is for self-protection of the device. If die temperature can be controlled at the system or board level, then overtemperature does not occur.

### 5.5.13 Audio-Output Stage-Power Configurations

After the device has been configured (following a  $\overline{\text{RESET}}$ ) and the circuitry has been powered up, the audio output stage can be powered up and powered down by register control.

These functions soft-start automatically. By using these register controls, it is possible to control these three output-stage configurations independently.

See [Table 5-25](#) for register control of audio output stage power configurations.

**Table 5-25. Audio-Output Stage-Power Configurations**

| Audio Output Pins | Desired Function                | Page 1 / Register, Bit Values    |
|-------------------|---------------------------------|----------------------------------|
| HPL               | Power down HPL driver           | Page 1 / register 31, bit D7 = 0 |
|                   | Power up HPL driver             | Page 1 / register 31, bit D7 = 1 |
| HPR               | Power down HPR driver           | Page 1 / register 31, bit D6 = 0 |
|                   | Power up HPR driver             | Page 1 / register 31, bit D6 = 1 |
| SPKP / SPKM       | Power down mono class-D drivers | Page 1 / register 32, bit D7 = 0 |
|                   | Power up mono class-D drivers   | Page 1 / register 32, bit D7 = 1 |

### 5.5.14 DAC Setup

The following paragraphs are intended to guide a user through the steps necessary to configure the TLV320DAC3100-Q1.

#### Step 1

The system clock source (master clock) and the targeted DAC sampling frequency must be identified.

Depending on the targeted performance, the decimation filter type (A, B, or C) and DOSR value can be determined:

- Filter A should be used for 48-kHz high-performance operation; DOSR must be a multiple of 8.
- Filter B should be used for up to 96-kHz operations; DOSR must be a multiple of 4.
- Filter C should be used for up to 192-kHz operations; DOSR must be a multiple of 2.

In all cases, DOSR is limited in its range by the following condition:

$$2.8 \text{ MHz} < \text{DOSR} \times \text{DAC}_{f_s} < 6.2 \text{ MHz}$$

Based on the identified filter type and the required signal-processing capabilities, the appropriate processing block can be determined from the list of available processing blocks (PRB\_P1 to PRB\_P25).

Based on the available master clock, the chosen DOSR and the targeted sampling rate, the clock-divider values NDAC and MDAC can be determined. If necessary, the internal PLL can add a large degree of flexibility.

In summary, CODEC\_CLKIN (derived directly from the system clock source or from the internal PLL) divided by MDAC, NDAC, and DOSR must be equal to the DAC sampling rate,  $\text{DAC}_{f_s}$ . The CODEC\_CLKIN clock signal is shared with the DAC clock-generation block.

$$\text{CODEC\_CLKIN} = \text{NDAC} \times \text{MDAC} \times \text{DOSR} \times \text{DAC}_{f_s}$$

To a large degree, NDAC and MDAC can be chosen independently in the range of 1 to 128. In general, NDAC should be as large as possible as long as the following condition can still be met:

$$\text{MDAC} \times \text{DOSR} / 32 \geq \text{RC}$$

RC is a function of the chosen processing block and is listed in [Table 5-11](#).

The common-mode voltage setting of the device is determined by the available analog power supply.

At this point, the following device-specific parameters are known: PRB\_Px, DOSR, NDAC, MDAC, input and output common-mode values. If the PLL is used, the PLL parameters P, J, D, and R are determined as well.

## Step 2

Setting up the device via register programming:

The following list gives an example sequence of items that must be executed in the time between powering the device up and reading data from the device. Note that there are other valid sequences, depending on which features are used.

1. Define starting point:
  - (a) Power up applicable external power supplies
  - (b) Set register page to 0
  - (c) Initiate SW reset
2. Program clock settings
  - (a) Program PLL clock dividers P, J, D, and R (if PLL is used)
  - (b) Power up PLL (if PLL is used)
  - (c) Program and power up NDAC
  - (d) Program and power up MDAC
  - (e) Program OSR value
  - (f) Program I<sup>2</sup>S word length if required (16, 20, 24, or 32 bits)
  - (g) Program the processing block to be used
  - (h) Miscellaneous page 0 controls

3. Program analog blocks
  - (a) Set register page to 1
  - (b) Program common-mode voltage
  - (c) Program headphone-specific de-pop settings (in case headphone driver is used)
  - (d) Program routing of DAC output to the output amplifier (headphone/lineout or speaker)
  - (e) Unmute and set gain of output drivers
  - (f) Power up output drivers
4. Apply waiting time determined by the de-pop settings and the soft-stepping settings of the driver gain, or poll page 1 / register 63
5. Power up DAC
  - (a) Set register page to 0
  - (b) Power up DAC channels and set digital gain
  - (c) Unmute digital volume control

A detailed example can be found in [Section 5.5.15](#).

### 5.5.15 Example Register Setup to Play Digital Data Through DAC and Headphone/Speaker Outputs

A typical EVM I<sup>2</sup>C register control script follows to show how to set up the TLV320DAC3100-Q1 in playback mode with  $f_s = 44.1$  kHz and MCLK = 11.2896 MHz.

```
# Key: w 30 XX YY ==> write to I2C address 0x30, to register 0xXX, data 0xYY

#           # ==> comment delimiter

#
# The following list gives an example sequence of items that must be executed in the time
# between powering the # device up and reading data from the device. Note that there are
# other valid sequences depending on which features are used.
# 1. Define starting point:
#   (a) Power up applicable external hardware power supplies
#   (b) Set register page to 0
#
w 30 00 00
#
#   (c) Initiate SW reset (PLL is powered off as part of reset)
#
w 30 01 01
#
# 2. Program clock settings
#   (a) Program PLL clock dividers P, J, D, R (if PLL is used)
#
# PLL_clkin = MCLK, codec_clkin = PLL_CLK
w 30 04 03
# J = 8
w 30 06 08
# D = 0000, D(13:8) = 0, D(7:0) = 0
w 30 07 00 00
#
#   (b) Power up PLL (if PLL is used)
# PLL Power up, P = 1, R = 1
#
w 30 05 91
#
#   (c) Program and power up NDAC
#
# NDAC is powered up and set to 8
w 30 0B 88
#
#   (d) Program and power up MDAC
#
# MDAC is powered up and set to 2
w 30 0C 82
#
#   (e) Program OSR value
```

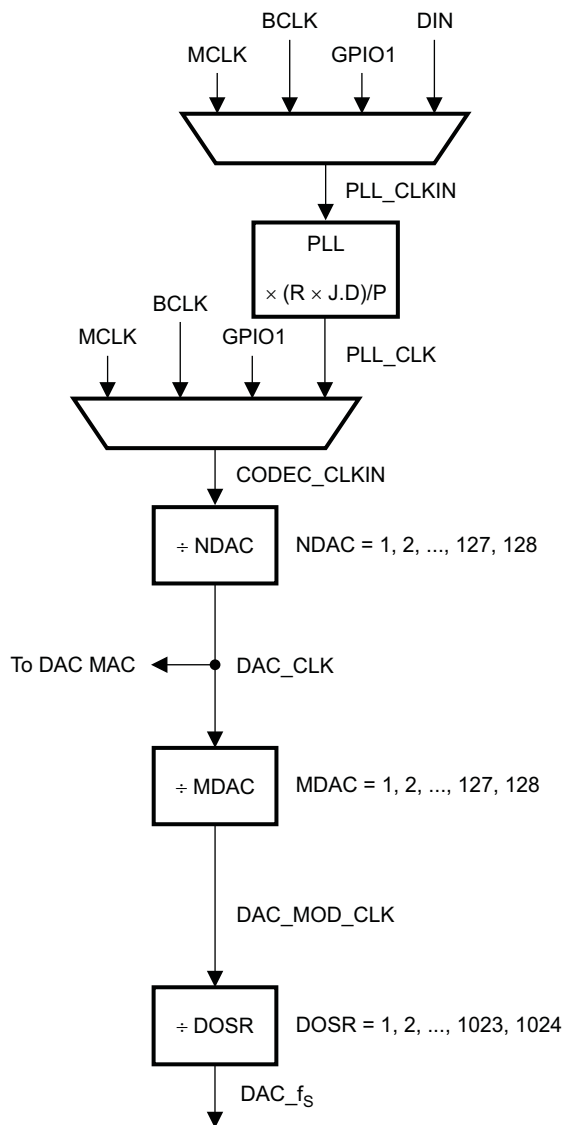

```
#
# DOSR = 128, DOSR(9:8) = 0, DOSR(7:0) = 128
w 30 0D 00 80
#
# (f) Program I2S word length if required (16, 20, 24, 32 bits)
# and master mode (BCLK and WCLK are outputs)
#
# mode is i2s, wordlength is 16, slave mode
w 30 1B 00
# (g) Program the processing block to be used
#
# Select Processing Block PRB_P11
w 30 3C 0B
w 30 00 08
w 30 01 04
w 30 00 00
#
# (h) Miscellaneous page 0 controls
#
# DAC => volume control thru pin disable
w 30 74 00
# 3. Program analog blocks
#
# (a) Set register page to 1
#
w 30 00 01
#
# (b) Program common-mode voltage (defalut = 1.35 V)
#
w 30 1F 04
#
# (c) Program headphone-specific depop settings (in case headphone driver is used)
#
# De-pop, Power on = 800 ms, Step time = 4 ms
w 30 21 4E
#
# (d) Program routing of DAC output to the output amplifier (headphone/lineout or speaker)
#
# LDAC routed to HPL out, RDAC routed to HPR out
w 30 23 44
#
# (e) Unmute and set gain of output driver
#
# Unmute HPL, set gain = 0 db
w 30 28 06
# Unmute HPR, set gain = 0 dB
w 30 29 06
# Unmute Class-D, set gain = 18 dB
w 30 2A 1C
#
# (f) Power up output drivers
#
# HPL and HPR powered up
w 30 1F C2
# Power-up Class-D driver

# Enable HPL output analog volume, set = -9 dB
w 30 24 92
# Enable HPR output analog volume, set = -9 dB
w 30 25 92
# Enable Class-D output analog volume, set = -9 dB
w 30 26 92
#
# 4. Apply waiting time determined by the de-pop settings and the soft-stepping settings
# of the driver gain or poll page 1 / register 63
#
# 5. Power up DAC
# (a) Set register page to 0
#
w 30 00 00
#
# (b) Power up DAC channels and set digital gain
#
```

```
# Powerup DAC left and right channels (soft step enabled)
w 30 3F D4
#
# DAC Left gain = -22 dB
w 30 41 D4
# DAC Right gain = -22 dB
w 30 42 D4
#
# (c) Unmute digital volume control
#
# Unmute DAC left and right channels
w 30 40 00
```

## 5.6 CLOCK Generation and PLL

The TLV320DAC3100-Q1 supports a wide range of options for generating clocks for the DAC section as well as interface and other control blocks, as shown in [Figure 5-20](#). The clocks for the DAC require a source reference clock. This clock can be provided on variety of device pins, such as the MCLK, BCLK, or GPIO1 pins. The source reference clock for the codec can be chosen by programming the CODEC\_CLKIN value on page 0 / register 4, bits D1–D0. CODEC\_CLKIN can then be routed through highly-flexible clock dividers, shown in [Figure 5-20](#), to generate the various clocks required for the DAC. In the event that the desired audio clocks cannot be generated from the reference clocks on MCLK, BCLK, or GPIO1, the TLV320DAC3100-Q1 also provides the option of using the on-chip PLL, which supports a wide range of fractional multiplication values to generate the required clocks. Starting from CODEC\_CLKIN, the TLV320DAC3100-Q1 provides several programmable clock dividers to help achieve a variety of sampling rates for the DAC.

B0357-04

**Figure 5-20. Clock Distribution Tree**

$$\text{DAC\_MOD\_CLK} = \frac{\text{CODEC\_CLKIN}}{\text{NDAC} \times \text{MDAC}}$$

$$\text{DAC\_f}_s = \frac{\text{CODEC\_CLKIN}}{\text{NDAC} \times \text{MDAC} \times \text{DOSR}}$$

(5)

**Table 5-26. CODEC CLKIN Clock Dividers**

| Divider | Bits  |
|---------|---|
| NDAC    | Page 0 / register 11, bits D6–D0                                      |
| MDAC    | Page 0 / register 12, bits D6–D0                                      |
| DOSR    | Page 0 / register 13, bits D1–D0 and page 0 / register 14, bits D7–D0 |

The DAC modulator is clocked by DAC\_MOD\_CLK. For proper power-up operation of the DAC channel, DAC\_MOD\_CLK must be enabled by configuring the NDAC and MDAC clock dividers (page 0 / register 11, bit D7 = 1 and page 0 / register 12, bit D7 = 1). When the DAC channel is powered down, the device internally initiates a power-down sequence for proper shutdown. During this shutdown sequence, the NDAC and MDAC dividers must not be powered down, or else a proper low-power shutdown may not take place. The user can read back the power-status flag at page 0 / register 37, bit D7 and page 0 / register 37, bit D3. When both the flags indicate power-down, the MDAC divider may be powered down, followed by the NDAC divider.

In general, for proper operation, all the root clock dividers should be powered down only after the child clock dividers have been powered down.

The TLV320DAC3100-Q1 also has options for routing some of the internal clocks to the GPIO1 pin to be used as general-purpose clocks in the system. The feature is shown in [Figure 5-22](#).

B0362-01

**Figure 5-21. BCLK Output Options**

In the mode when the TLV320DAC3100-Q1 is configured to drive the BCLK pin (page 0 / register 27, bit D3 = 1), it can be driven as the divided value of BDIV\_CLKIN. The division value can be programmed in page 0 / register 30, bits D6–D0 from 1 to 128. BDIV\_CLKIN can itself be configured to be one of DAC\_CLK (DAC processing clock), DAC\_MOD\_CLK by configuring the BDIV\_CLKIN multiplexer in page 0 / register 29, bits D1–D0. Additionally, a general-purpose clock can be driven out on GPIO1.

This clock can be a divided-down version of CDIV\_CLKIN. The value of this clock divider can be programmed from 1 to 128 by writing to page 0 / register 26, bits D6–D0. CDIV\_CLKIN can itself be programmed as one of the clocks among the list shown in [Figure 5-22](#). This can be controlled by programming the multiplexer in page 0 / register 25, bits D2–D0.

B0363-01

**Figure 5-22. General-Purpose Clock Output Options**

**Table 5-27. Maximum TLV320DAC3100-Q1 Clock Frequencies**

| Clock                          | DVDD ≥ 1.65 V   |
|--------------------------------|---|
| CODEC_CLKIN                    | ≤ 110 MHz   |
| DAC_CLK (DAC processing clock) | ≤ 49.152 MHz  |
| DAC_MAC_CLK                    | ≤ 49.152 MHz with DRC disabled<br>≤ 48 MHz with DRC enabled |
| DAC_MOD_CLK                    | 6.758 MHz   |
| DAC <sub>fs</sub>              | 0.192 MHz   |
| BDIV_CLKIN                     | 55 MHz  |
| CDIV_CLKIN                     | 100 MHz when M is odd<br>110 MHz when M is even             |

### 5.6.1 PLL

For lower power consumption, it is best to derive the internal audio processing clocks using the simple dividers. When the input MCLK or other source clock is not an integer multiple of the audio processing clocks, then it is necessary to use the onboard PLL. The TLV320DAC3100-Q1 fractional PLL can be used to generate an internal *master clock* used to produce the processing clocks needed by the DAC. The programmability of this PLL allows operation from a wide variety of clocks that may be available in the system.

The PLL input supports clocks varying from 512 kHz to 20 MHz and is register-programmable to enable generation of the required sampling rates with fine resolution. The PLL can be turned on by writing to page 0 / register 5, bit D7. When the PLL is enabled, the PLL output clock, PLL\_CLK, is given by the following equation:

$$\text{PLL\_CLK} = \frac{\text{PLL\_CLKIN} \times R \times J \cdot D}{P} \quad (6)$$

where

R = 1, 2, 3, ..., 16 (page 0 / register 5, default value = 1)

J = 1, 2, 3, ..., 63, (page 0 / register 6, default value = 4)

D = 0, 1, 2, ..., 9999 (page 0 / register 7 and page 0 / register 8, default value = 0)

P = 1, 2, 3, ..., 8 (page 0 / register 5, default value = 1)

The PLL can be turned on via page 0 / register 5, bit D7. The variable P can be programmed via page 0 / register 5, bits D6–D4. The variable R can be programmed via page 0 / register 5, bits D3–D0. The variable J can be programmed via page 0 / register 6, bits D5–D0. The variable D is 14 bits and is programmed into two registers. The MSB portion can be programmed via page 0 / register 7, bits D5–D0, and the LSB portion is programmed via page 0 / register 8, bits D7–D0. For proper update of the D divider value, page 0 / register 7 must be programmed first, followed immediately by page 0 / register 8. Unless the write to page 0 / register 8 is completed, the new value of D does not take effect.

When the PLL is enabled, the following conditions must be satisfied:

- When the PLL is enabled and D = 0, the following conditions must be satisfied for PLL\_CLKIN:

$$512 \text{ kHz} \leq \frac{\text{PLL\_CLKIN}}{P} \leq 20 \text{ MHz}$$

$$80 \text{ MHz} \leq (\text{PLL\_CLKIN} \times J.D \times R/P) \leq 110 \text{ MHz}$$

$$4 \leq R \times J \leq 259$$

(7)

- When the PLL is enabled and D ≠ 0, the following conditions must be satisfied for PLL\_CLKIN:

$$10 \text{ MHz} \leq \frac{\text{PLL\_CLKIN}}{P} \leq 20 \text{ MHz}$$

$$80 \text{ MHz} \leq \text{PLL\_CLKIN} \times J.D \times R/P \leq 110 \text{ MHz}$$

$$R = 1$$

(8)

The PLL can be powered up independently from the DAC block, and can also be used as a general-purpose PLL by routing its output to the GPIO output. After powering up the PLL, PLL\_CLK is available typically after 10 ms.

The clock for the codec and various signal processing blocks, CODEC\_CLKIN, can be generated from the MCLK input, BCLK input, GPIO input, or PLL\_CLK (page 0 / register 4, bits D1–D0).

If CODEC\_CLKIN is derived from the PLL, then the PLL must be powered up first and powered down last.

Table 5-28 lists several example cases of typical PLL\_CLKIN rates and how to program the PLL to achieve a sample rate  $f_s$  of either 44.1 kHz or 48 kHz.

**Table 5-28. PLL Example Configurations**

| PLL_CLKIN (MHz)                            | PLL P | PLL R | PLL J | PLL D | MDAC | NDAC | DOSR |
|--|-------|-------|-------|-------|------|------|------|
| <b><math>f_s = 44.1 \text{ kHz}</math></b> |       |       |       |       |      |      |      |
| 2.8224                                     | 1     | 3     | 10    | 0     | 3    | 5    | 128  |
| 5.6448                                     | 1     | 3     | 5     | 0     | 3    | 5    | 128  |
| 12   | 1     | 1     | 7     | 560   | 3    | 5    | 128  |
| 13   | 1     | 1     | 6     | 3504  | 6    | 3    | 104  |
| 16   | 1     | 1     | 5     | 2920  | 3    | 5    | 128  |
| 19.2                                       | 1     | 1     | 4     | 4100  | 3    | 5    | 128  |
| 48   | 4     | 1     | 7     | 560   | 3    | 5    | 128  |
| <b><math>f_s = 48 \text{ kHz}</math></b>   |       |       |       |       |      |      |      |
| 2.048                                      | 1     | 3     | 14    | 0     | 7    | 2    | 128  |
| 3.072                                      | 1     | 4     | 7     | 0     | 7    | 2    | 128  |
| 4.096                                      | 1     | 3     | 7     | 0     | 7    | 2    | 128  |
| 6.144                                      | 1     | 2     | 7     | 0     | 7    | 2    | 128  |
| 8.192                                      | 1     | 4     | 3     | 0     | 4    | 4    | 128  |
| 12   | 1     | 1     | 7     | 1680  | 7    | 2    | 128  |
| 16   | 1     | 1     | 5     | 3760  | 7    | 2    | 128  |
| 19.2                                       | 1     | 1     | 4     | 4800  | 7    | 2    | 128  |

Table 5-28. PLL Example Configurations (continued)

| PLL_CLKIN (MHz)          | PLL_P | PLL_R | PLL_J | PLL_D | MDAC | NDAC | DOSR |
|--------------------------|-------|-------|-------|-------|------|------|------|
| $f_s = 44.1 \text{ kHz}$ |       |       |       |       |      |      |      |
| 48                       | 4     | 1     | 7     | 1680  | 7    | 2    | 128  |

## 5.6.2 Timer

The internal clock runs nominally at 8.2 MHz. This is used for various internal timing intervals, de-bounce logics and interrupts. The MCLK divider must be set such a way that the divider output is ~1 MHz for the timers to be closer to the programmed value.

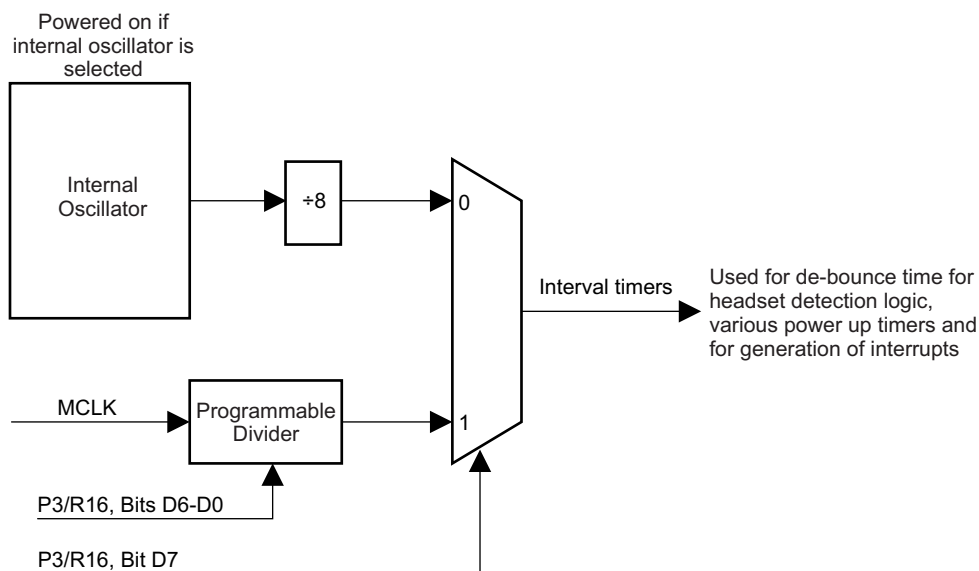

Figure 5-23. Interval Timer Clock Selection

## 5.7 Digital Audio and Control Interface

### 5.7.1 Digital Audio Interface

Audio data is transferred between the host processor and the TLV320DAC3100-Q1 via the digital audio data serial interface, or audio bus. The audio bus on this device is very flexible, including left- or right-justified data options, support for I<sup>2</sup>S or PCM protocols, programmable data-length options, a TDM mode for multichannel operation, very flexible master/slave configurability for each bus-clock line, and the ability to communicate directly with multiple devices within a system.

The audio bus of the TLV320DAC3100-Q1 can be configured for left- or right-justified, I<sup>2</sup>S, DSP, or TDM modes of operation, where communication with standard telephony PCM interfaces is supported within the TDM mode. These modes are all MSB-first, with data width programmable as 16, 20, 24, or 32 bits by configuring page 0 / register 27, bits D5–D4. In addition, the word clock and bit clock can be independently configured in either master or slave mode for flexible connectivity to a wide variety of processors. The word clock is used to define the beginning of a frame, and may be programmed as either a pulse or a square-wave signal. The frequency of this clock corresponds to the DAC sampling frequency.

The bit clock is used to clock in and clock out the digital audio data across the serial bus. When in master mode, this signal can be programmed to generate variable clock pulses by controlling the bit-clock divider in page 0 / register 30 (see Figure 5-20). The number of bit-clock pulses in a frame may need adjustment to accommodate various word lengths, as well as to support the case when multiple TLV320DAC3100-Q1s may share the same audio bus.

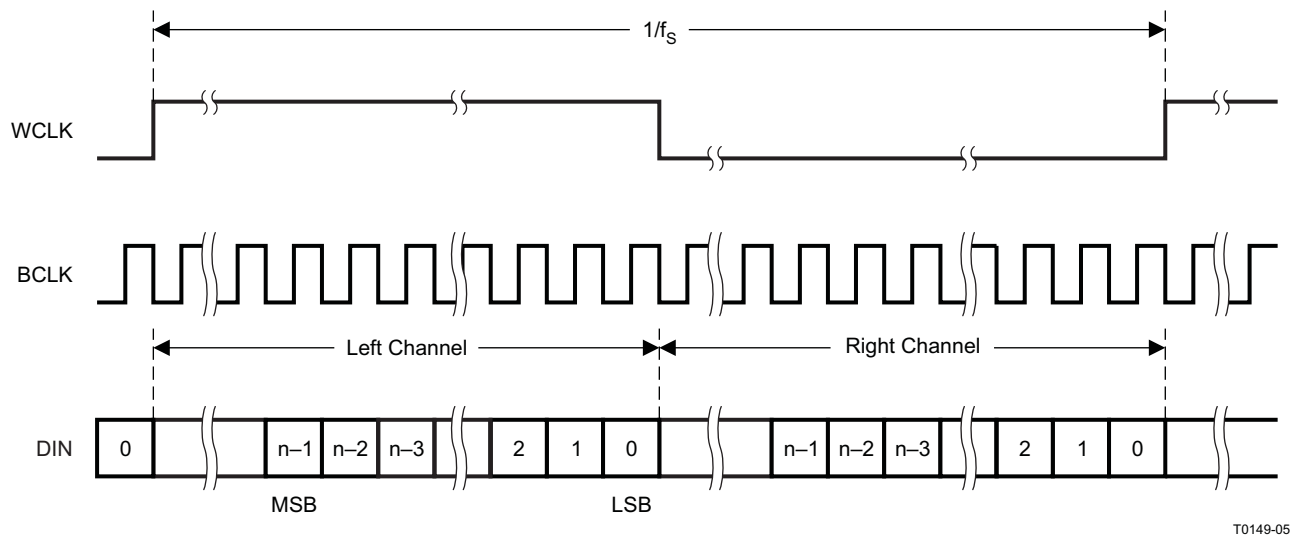

The TLV320DAC3100-Q1 also includes a feature to offset the position of start-of-data-transfer with respect to the word clock. This offset can be controlled in terms of number of bit clocks and can be programmed in page 0 / register 28.

The TLV320DAC3100-Q1 also has the feature of inverting the polarity of the bit clock used for transferring the audio data as compared to the default clock polarity used. This feature can be used independently of the mode of audio interface chosen. This can be configured via page 0 / register 29, bit D3.

By default, when the word clocks and bit clocks are generated by the TLV320DAC3100-Q1, these clocks are active only when the DAC is powered up within the device. This is done to save power. However, it also supports a feature whereby both the word clocks and bit clocks can be active even when the codec in the device is powered down. This is useful when using the TDM mode with multiple codecs on the same bus, or when word clocks or bit clocks are used in the system as general-purpose clocks.

### 5.7.1.1 Right-Justified Mode

The audio interface of the TLV320DAC3100-Q1 can be put into the right-justified mode by programming page 0 / register 27, bits D7–D6 = 10. In right-justified mode, the LSB of the left channel is valid on the rising edge of the bit clock preceding the falling edge of the word clock. Similarly, the LSB of the right channel is valid on the rising edge of the bit clock preceding the rising edge of the word clock.

**Figure 5-24. Timing Diagram for Right-Justified Mode**

For the right-justified mode, the number of bit clocks per frame should be greater than or equal to twice the programmed word length of the data.

### 5.7.1.2 Left-Justified Mode

The audio interface of the TLV320DAC3100-Q1 can be put into left-justified mode by programming page 0 / register 27, bits D7–D6 = 11. In left-justified mode, the MSB of the right channel is valid on the rising edge of the bit clock following the falling edge of the word clock. Similarly, the MSB of the left channel is valid on the rising edge of the bit clock following the rising edge of the word clock.

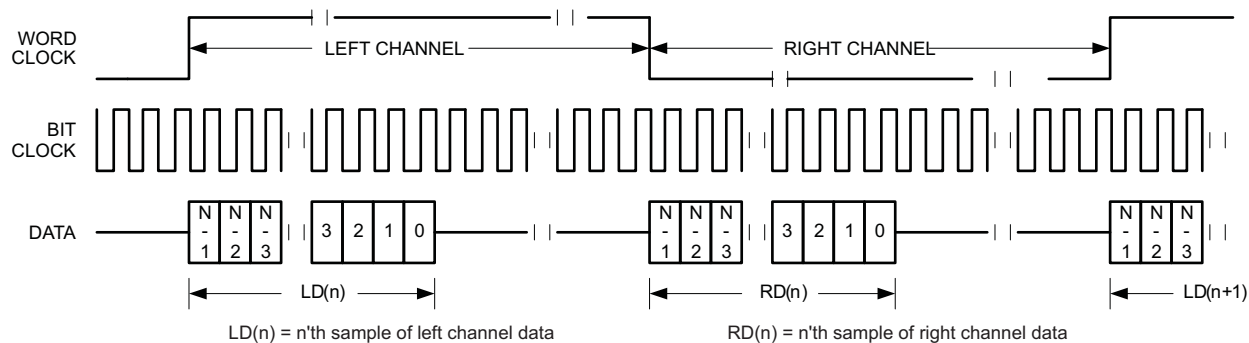

Figure 5-25. Timing Diagram for Left-Justified Mode

Figure 5-26. Timing Diagram for Left-Justified Mode With Offset = 1

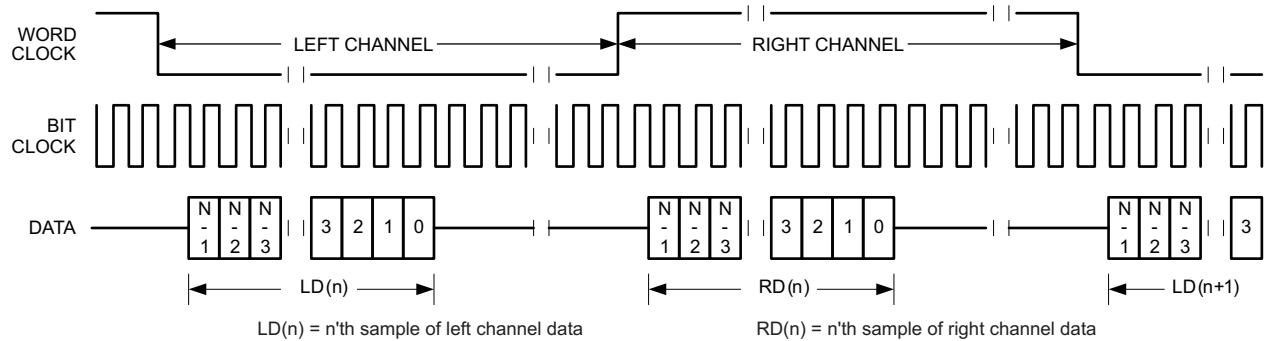

Figure 5-27. Timing Diagram for Left-Justified Mode With Offset = 0 and Inverted Bit Clock

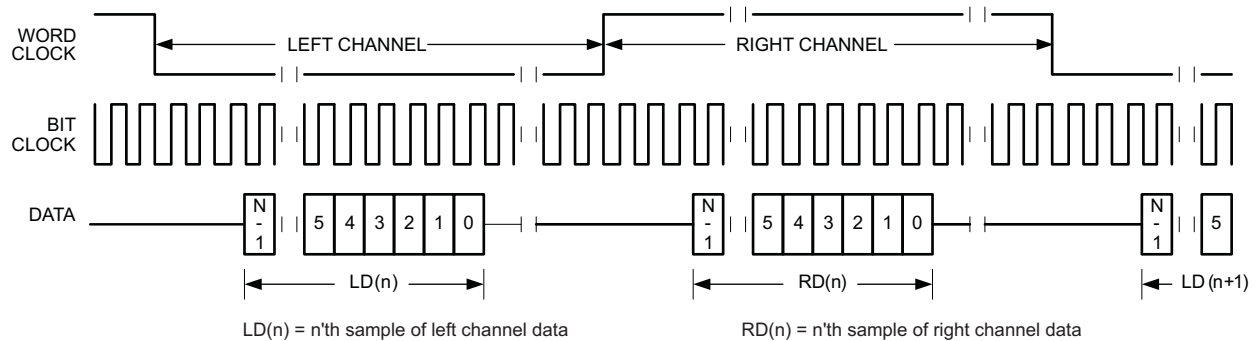

For the left-justified mode, the number of bit clocks per frame should be greater than or equal to twice the programmed word length of the data. Also, the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

### 5.7.1.3 I<sup>2</sup>S Mode

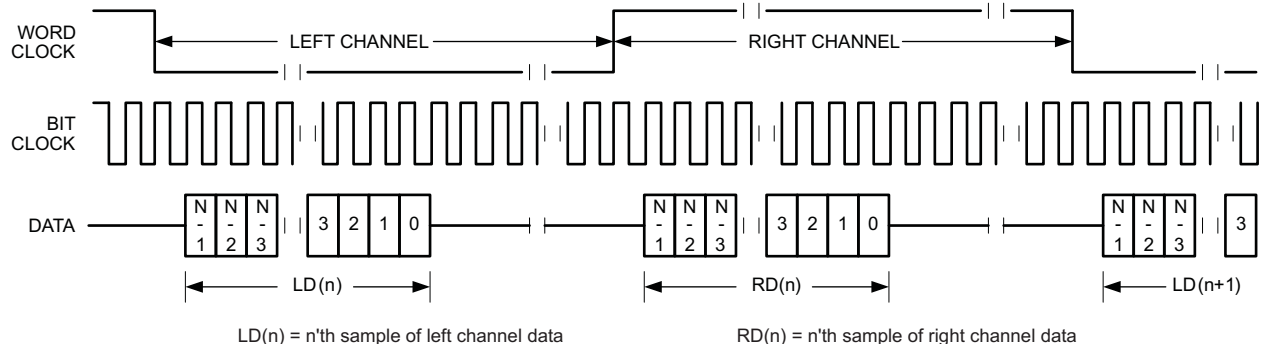

The audio interface of the TLV320DAC3100-Q1 can be put into I<sup>2</sup>S mode by programming page 0 / register 27, bits D7–D6 = 00. In I<sup>2</sup>S mode, the MSB of the left channel is valid on the second rising edge of the bit clock after the falling edge of the word clock. Similarly, the MSB of the right channel is valid on the second rising edge of the bit clock after the rising edge of the word clock.

**Figure 5-28. Timing Diagram for I²S Mode**

**Figure 5-29. Timing Diagram for I²S Mode With Offset = 2**

**Figure 5-30. Timing Diagram for I²S Mode With Offset = 0 and Bit Clock Inverted**

For I²S mode, the number of bit clocks per channel should be greater than or equal to the programmed word length of the data. Also, the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

### 5.7.1.4 DSP Mode

The audio interface of the TLV320DAC3100-Q1 can be put into DSP mode by programming page 0 / register 27, bits D7–D6 = 01. In DSP mode, the falling edge of the word clock starts the data transfer with the left-channel data first and immediately followed by the right-channel data. Each data bit is valid on the falling edge of the bit clock.

Figure 5-31. Timing Diagram for DSP Mode

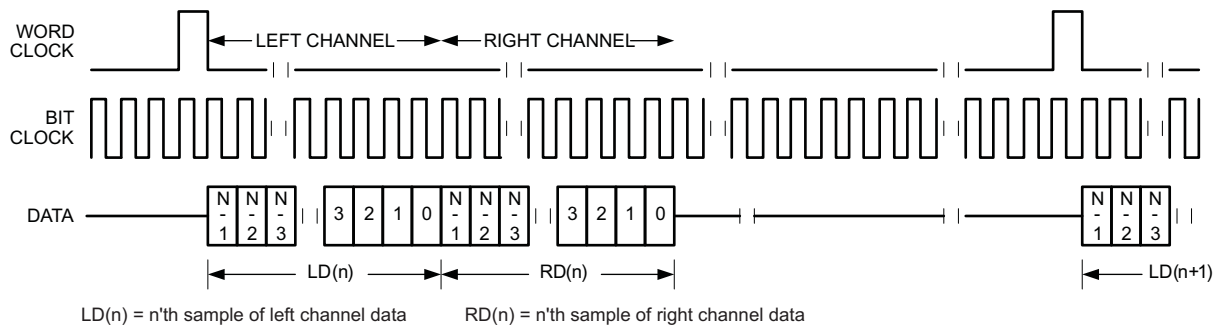

Figure 5-32. Timing Diagram for DSP Mode With Offset = 1

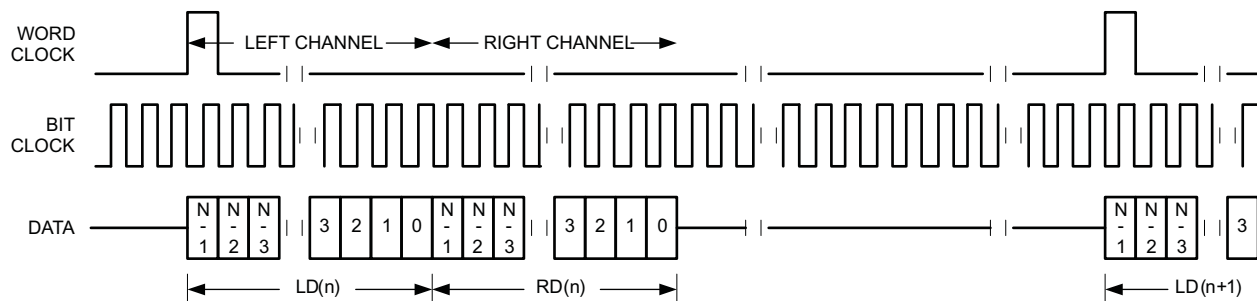

Figure 5-33. Timing Diagram for DSP Mode With Offset = 0 and Bit Clock Inverted

For the DSP mode, the number of bit clocks per frame should be greater than or equal to twice the programmed word length of the data. Also, the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

### 5.7.2 Primary and Secondary Digital Audio Interface Selection

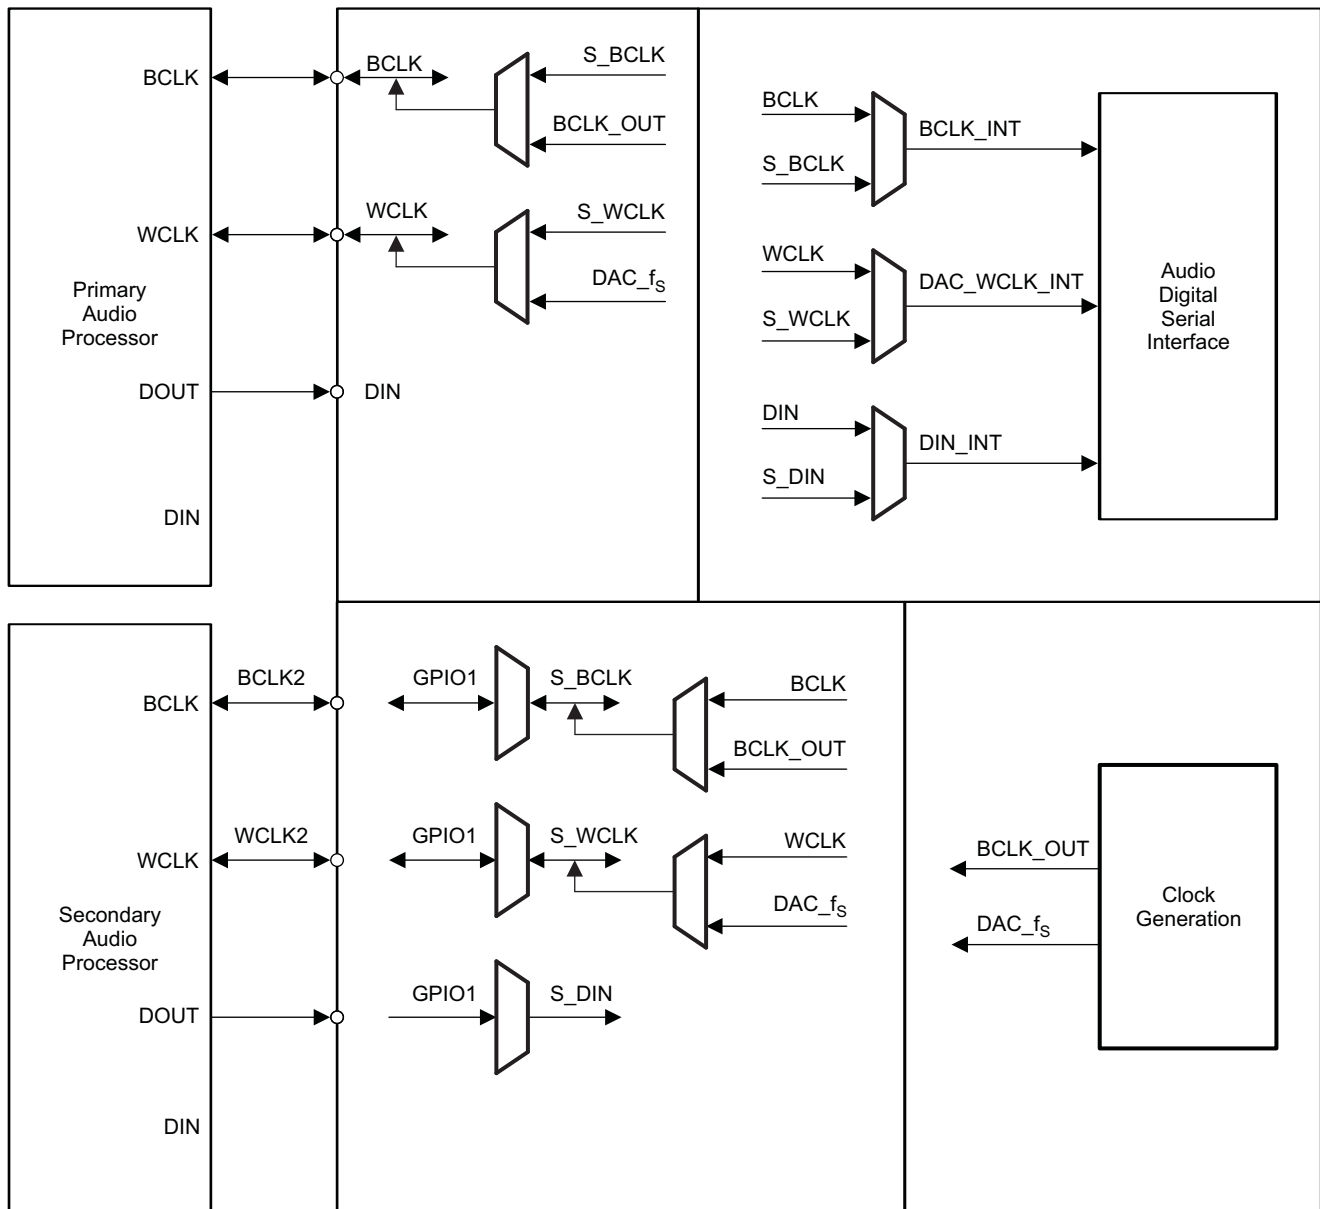

The audio serial interface on the TLV320DAC3100-Q1 has extensive I/O control to allow communication with two independent processors for audio data. The processors can communicate with the device one at a time. This feature is enabled by register programming of the various pin selections. Table 5-29 shows the primary and secondary audio interface selection and registers. Figure 5-34 is a high-level diagram showing the general signal flow and multiplexing for the primary and secondary audio interfaces.

Table 5-29. Primary and Secondary Audio Interface Selection

| Desired Pin Function | Possible Pins | Page 0 Registers | Comment  |
|----------------------|---------------|------------------|--|
| Primary WCLK (OUT)   | WCLK          | R27/D2 = 1       | Primary WCLK is output from codec                        |
|                      |               | R33/D5–D4        | Select source of primary WCLK (DAC_fs or secondary WCLK) |

**Table 5-29. Primary and Secondary Audio Interface Selection (continued)**

| Desired Pin Function | Possible Pins | Page 0 Registers | Comment   |
|----------------------|---------------|------------------|---|
| Primary WCLK (IN)    | WCLK          | R27/D2 = 0       | Primary WCLK is input to codec  |
| Primary BCLK (OUT)   | BCLK          | R27/D3 = 1       | Primary BCLK is output from codec                                     |
|                      |               | R33/D7           | Select source of primary WCLK (internal BCLK or secondary BCLK)       |
| Primary BCLK (IN)    | BCLK          | R27/D3 = 0       | Primary BCLK is input to codec  |
| Primary DIN (IN)     | DIN           | R32/D0           | Select DIN to internal interface (0 = primary DIN; 1 = secondary DIN) |
| Secondary WCLK (OUT) | GPIO1         | R31/D4–D2 = 000  | Secondary WCLK obtained from GPIO1 pin                                |
|                      |               | R51/D5–D2 = 1001 | GPIO1 = secondary WCLK output   |
|                      |               | R33/D3–D2        | Select source of secondary WCLK (DAC_fs, or primary WCLK)             |
| Secondary WCLK (IN)  | GPIO1         | R31/D4–D2 = 000  | Secondary WCLK obtained from GPIO1 pin                                |
|                      |               | R51/D5–D2 = 0001 | GPIO1 enabled as secondary input                                      |
| Secondary BCLK (OUT) | GPIO1         | R31/D7–D5 = 000  | Secondary BCLK obtained from GPIO1 pin                                |
|                      |               | R51/D5–D2 = 1000 | GPIO1 = secondary BCLK output   |
|                      |               | R33/D6           | Select source of secondary BCLK (primary BCLK or internal BCLK)       |
| Secondary BCLK (IN)  | GPIO1         | R31/D7–D5 = 000  | Secondary BCLK obtained from GPIO1 pin                                |
|                      |               | R51/D5–D2 = 0001 | GPIO1 enabled as secondary input                                      |
| Secondary DIN (IN)   | GPIO1         | R31/D1–D0 = 00   | Secondary DIN obtained from GPIO1 pin                                 |
|                      |               | R51/D5–D2 = 0001 | GPIO1 enabled as secondary input                                      |

### 5.7.3 Control Interface

The TLV320DAC3100-Q1 control interface supports the I<sup>2</sup>C communication protocol.

#### 5.7.3.1 I<sup>2</sup>C Control Mode

The TLV320DAC3100-Q1 supports the I<sup>2</sup>C control protocol and responds to the I<sup>2</sup>C address of 0011 000. I<sup>2</sup>C is a two-wire, open-drain interface supporting multiple devices and masters on a single bus. Devices on the I<sup>2</sup>C bus only drive the bus lines LOW by connecting them to ground; they never drive the bus lines HIGH. Instead, the bus wires are pulled HIGH by pullup resistors, so the bus wires are HIGH when no device is driving them LOW. This way, two devices cannot conflict; if two devices drive the bus simultaneously, there is no driver contention.

Communication on the I<sup>2</sup>C bus always takes place between two devices, one acting as the master and the other acting as the slave. Both masters and slaves can read and write, but slaves can only do so under the direction of the master. Some I<sup>2</sup>C devices can act as masters or slaves, but the TLV320DAC3100-Q1 can only act as a slave device.

An I<sup>2</sup>C bus consists of two lines, SDA and SCL. SDA carries data, and the SCL signal provides the clock. All data is transmitted across the I<sup>2</sup>C bus in groups of eight bits. To send a bit on the I<sup>2</sup>C bus, the SDA line is driven to the appropriate level while SCL is LOW (a LOW on SDA indicates the bit is 0, whereas a HIGH indicates the bit is 1).

Once the SDA line has settled, the SCL line is brought HIGH, then LOW. This pulse on the SCL line clocks the SDA bit into the receiver shift register.

The I<sup>2</sup>C bus is bidirectional: the SDA line is used both for transmitting and receiving data. When a master reads from a slave, the slave drives the data line; when a master sends to a slave, the master drives the data line.

Most of the time the bus is idle, no communication is taking place, and both lines are HIGH. When communication is taking place, the bus is active. Only master devices can start communication on the bus. Normally, the data line is only allowed to change state while the clock line is LOW. If the data line changes state while the clock line is HIGH, it is either a START condition or its counterpart, a STOP condition. A START condition is when the clock line is HIGH and the data line goes from HIGH to LOW. A STOP condition is when the clock line is HIGH and the data line goes from LOW to HIGH.

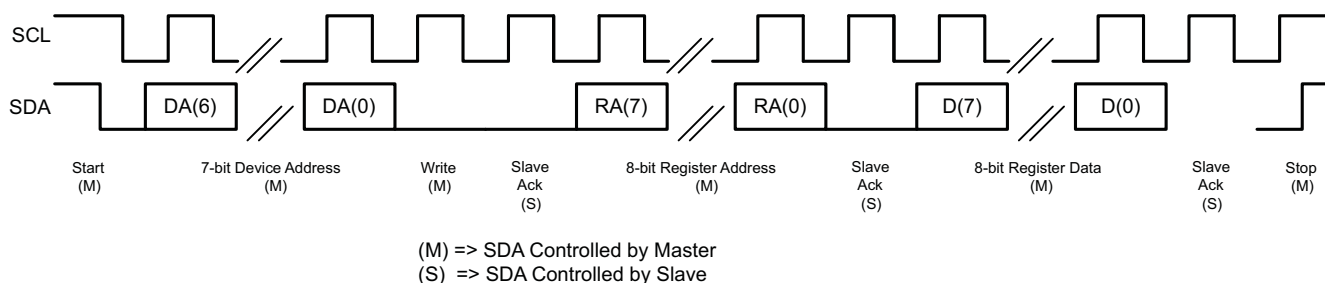

After the master issues a START condition, it sends a byte that selects the slave device for communication. This byte is called the address byte. Each device on an I<sup>2</sup>C bus has a unique 7-bit address to which it responds. (Slaves can also have 10-bit addresses; see the I<sup>2</sup>C specification for details.) The master sends an address in the address byte, together with a bit that indicates whether it is to read from or write to the slave device.

Every byte transmitted on the I<sup>2</sup>C bus, whether it is address or data, is acknowledged with an acknowledge bit. When a master has finished sending a byte (eight data bits) to a slave, it stops driving SDA and waits for the slave to acknowledge the byte. The slave acknowledges the byte by pulling SDA LOW. The master then sends a clock pulse to clock the acknowledge bit. Similarly, a master finishes reading a byte, then pulls SDA LOW to acknowledge this to the slave, then finally sends a clock pulse to clock the bit. (Remember that the master always drives the clock line.)

A not-acknowledge is performed simply by leaving SDA HIGH during an acknowledge cycle. If a device is not present on the bus and the master attempts to address it, it receives a not-acknowledge because no device is present at that address to pull the line LOW.

When a master has finished communicating with a slave, it may issue a STOP condition. When a STOP condition is issued, the bus becomes idle again. A master may also issue another START condition. When a START condition is issued while the bus is active, it is called a repeated START condition.

The TLV320DAC3100-Q1 can also respond to and acknowledge a general call, which consists of the master issuing a command with a slave address byte of 00h. This feature is disabled by default, but can be enabled via page 0 / register 34, bit D5.

**Figure 5-35. I<sup>2</sup>C Write**

**Figure 5-36. I<sup>2</sup>C Read**

In the case of an I<sup>2</sup>C register write, if the master does not issue a STOP condition, then the device enters auto-increment mode. So in the next eight clocks, the data on SDA is treated as data for the next incremental register.

Similarly, in the case of an I<sup>2</sup>C register read, after the device has sent out the 8-bit data from the addressed register, if the master issues a ACKNOWLEDGE, the slave takes over control of the SDA bus and transmits for the next eight clocks the data of the next incremental register.

## 6 REGISTER MAP

### 6.1 TLV320DAC3100-Q1 Register Map

All features on this device are addressed using the I<sup>2</sup>C bus. All of the writable registers can be read back. However, some registers contain status information or data, and are available for reading only.

The TLV320DAC3100-Q1 contains several pages of 8-bit registers, and each page can contain up to 128 registers. The register pages are divided up based on functional blocks for this device. The pages defined for the TLV320DAC3100-Q1 are 0, 1, 3, 8–9, 12–13 (DAC coefficient pages). Page 0 is the default home page after RESET. Page control is done by writing a new page value into register 0 of the current page.

The control registers for the TLV320DAC3100-Q1 are described in detail as follows. All registers are 8 bits in width, with D7 referring to the most-significant bit of each register, and D0 referring to the least-significant bit.

Pages 0, 1, 3, 8–9, and 12–13 are available for use; however, all other pages and registers are reserved. Do not read from or write to reserved pages and registers. Also, do not write other than the reset values for the reserved bits and read-only bits of non-reserved registers; otherwise, device functionality failure can occur.

**Note that the page and register numbers are shown in decimal format. For use in microcode, these decimal values may require conversion to hexadecimal format. For convenience, the register numbers are shown in both formats, whereas the page numbers are shown only in decimal format.**

**Table 6-1. Summary of Register Map**

| Page Number | Description   |
|-------------|---|
| 0           | Page 0 is the default page on power up. Configuration for serial interface, digital I/O, and other circuitry.                 |
| 1           | Configuration for DAC, output drivers, volume controls, and other circuitry.  |
| 3           | Register 16 controls the MCLK divider that controls the interrupt pulse duration, debounce timing, and detection-block clock. |
| 8–9         | DAC filter and DRC coefficients (buffer A)  |
| 12–13       | DAC filter and DRC coefficients (buffer B)  |

**6.4 Control Registers, Page 3: MCLK Divider for Programmable Delay Timer**

Default values shown for this page only become valid 100  $\mu$ s following a hardware or software reset.

**Page 3 / Register 0 (0x00): Page Control Register**

| BIT   | READ/<br>WRITE | RESET<br>VALUE | DESCRIPTION   |
|-------|----------------|----------------|---|
| D7–D0 | R/W            | 0000 0000      | 0000 0000: Page 0 selected<br>0000 0001: Page 1 selected<br>...<br>1111 1110: Page 254 selected<br>1111 1111: Page 255 selected |

The only register used in page 3 is register 16. The remaining page-3 registers are reserved and should not be written to.

**Page 3 / Register 16 (0x10): Timer Clock MCLK Divider**

| BIT   | READ/<br>WRITE | RESET<br>VALUE | DESCRIPTION  |
|-------|----------------|----------------|--|
| D7    | R/W            | 1              | 0: Internal oscillator is used for programmable delay timer.<br>1: External MCLK <sup>(1)</sup> is used for programmable delay timer.  |
| D6–D0 | R/W            | 000 0001       | MCLK Divider to Generate 1-MHz Clock for the Programmable Delay Timer<br>000 0000: MCLK divider = 128<br>000 0001: MCLK divider = 1<br>000 0010: MCLK divider = 2<br>...<br>111 1110: MCLK divider = 126<br>111 1111: MCLK divider = 127 |

(1) External clock is used only to control the delay programmed between the conversions and not used for doing the actual conversion. This feature is provided in case a more accurate delay is desired, because the internal oscillator frequency varies from device to device.

**6.5 Control Registers, Page 8: DAC Programmable Coefficients RAM Buffer A (1:63)**

Default values shown for this page only become valid 100  $\mu$ s following a hardware or software reset.

**Page 8 / Register 1 (0x01): DAC Coefficient RAM Control**

| BIT   | READ/<br>WRITE | RESET<br>VALUE | DESCRIPTION   |
|-------|----------------|----------------|---|
| D7–D3 | R/W            | 0000 0         | Reserved. Write only the reset value.   |
| D2    | R/W            | 0              | DAC Adaptive Filtering Control<br>0: Adaptive filtering disabled in DAC processing block<br>1: Adaptive filtering enabled in DAC processing block   |
| D1    | R              | 0              | DAC Adaptive Filter Buffer Control Flag<br>0: In adaptive filter mode, DAC processing block accesses DAC coefficient buffer A, and the external control interface accesses DAC coefficient buffer B.<br>1: In adaptive filter mode, DAC processing block accesses DAC coefficient buffer B, and the external control interface accesses DAC coefficient buffer A. |
| D0    | R/W            | 0              | DAC Adaptive Filter Buffer Switch Control<br>0: DAC coefficient buffers are not switched at the next frame boundary.<br>1: DAC coefficient buffers are switched at the next frame boundary, if adaptive filtering mode is enabled. This bit self-clears on switching.   |

The remaining page-8 registers are either reserved registers or are used for setting coefficients for the various filters in the TLV320DAC3100-Q1. Reserved registers should not be written to.

The filter coefficient registers are arranged in pairs, with two adjacent 8-bit registers containing the 16-bit coefficient for a single filter. The 16-bit integer contained in the MSB and LSB registers for a coefficient is interpreted as a 2s-complement integer, with possible values ranging from –32,768 to 32,767. When programming any coefficient value for a filter, the MSB register should always be written first, immediately followed by the LSB register. Even if only the MSB or LSB portion of the coefficient changes, both registers should be written in this sequence. [Table 6-2](#) is a list of the page-8 registers, excepting the previously described register 0 and register 1.

**Table 6-2. Page 8 DAC Buffer A Registers**

| REGISTER<br>NUMBER | RESET VALUE | REGISTER NAME   |
|--------------------|-------------|---|
| 2 (0x02)           | 0111 1111   | Coefficient N0(15:8) for left DAC-programmable biquad A |
| 3 (0x03)           | 1111 1111   | Coefficient N0(7:0) for left DAC-programmable biquad A  |

## 6.6 Control Registers, Page 9: DAC Programmable Coefficients RAM Buffer A (65:127)

Default values shown for this page only become valid 100  $\mu$ s following a hardware or software reset.

**Page 9 / Register 0 (0x00): Page Control Register**

| BIT   | READ/<br>WRITE | RESET<br>VALUE | DESCRIPTION   |
|-------|----------------|----------------|---|
| D7–D0 | R/W            | 0000 0000      | 0000 0000: Page 0 selected<br>0000 0001: Page 1 selected<br>...<br>1111 1110: Page 254 selected<br>1111 1111: Page 255 selected |

The remaining page-9 registers are either reserved registers or are used for setting coefficients for the various filters in the TLV320DAC3100-Q1. Reserved registers should not be written to.

The filter-coefficient registers are arranged in pairs, with two adjacent 8-bit registers containing the 16-bit coefficient for a single filter. The 16-bit integer contained in the MSB and LSB registers for a coefficient is interpreted as a 2s-complement integer, with possible values ranging from –32,768 to 32,767. When programming any coefficient value for a filter, the MSB register should always be written first, immediately followed by the LSB register. Even if only the MSB or LSB portion of the coefficient changes, both registers should be written in this sequence. [Table 6-3](#) is a list of the page-9 registers, excepting the previously described register 0.

**Table 6-3. Page 9 DAC Buffer A Registers**

| REGISTER<br>NUMBER | RESET VALUE | REGISTER NAME   |
|--------------------|-------------|---|
| 1 (0x01)           | XXXX XXXX   | Reserved. Do not write to this register.                        |
| 2 (0x02)           | 0111 1111   | Coefficient N0(15:8) for left DAC-programmable first-order IIR  |

## 6.7 Control Registers, Page 12: DAC Programmable Coefficients RAM Buffer B (1:63)

**Table 6-4. Page 12 / Register 0 (0x00): Page Control Register**

| BIT   | READ/<br>WRITE | RESET<br>VALUE | DESCRIPTION   |
|-------|----------------|----------------|---|
| D7–D0 | R/W            | 0000 0000      | 0000 0000: Page 0 selected<br>0000 0001: Page 1 selected<br>...<br>1111 1110: Page 254 selected<br>1111 1111: Page 255 selected |

The remaining page-12 registers are either reserved registers or are used for setting coefficients for the various filters in the TLV320DAC3100-Q1. Reserved registers should not be written to.

The filter-coefficient registers are arranged in pairs, with two adjacent 8-bit registers containing the 16-bit coefficient for a single filter. The 16-bit integer contained in the MSB and LSB registers for a coefficient is interpreted as a 2s-complement integer, with possible values ranging from –32,768 to 32,767. When programming any coefficient value for a filter, the MSB register should always be written first, immediately followed by the LSB register. Even if only the MSB or LSB portion of the coefficient changes, both registers should be written in this sequence. [Table 6-5](#) is a list of the page-12 registers, excepting the previously described register 0.

**Table 6-5. Page-12 DAC Buffer B Registers**

| REGISTER<br>NUMBER | RESET VALUE | REGISTER NAME   |
|--------------------|-------------|---|
| 1 (0x01)           | 0000 0000   | Reserved. Do not write to this register.                |
| 2 (0x02)           | 0111 1111   | Coefficient N0(15:8) for left DAC-programmable biquad A |
| 3 (0x03)           | 1111 1111   | Coefficient N0(7:0) for left DAC-programmable biquad A  |
| 4 (0x04)           | 0000 0000   | Coefficient N1(15:8) for left DAC-programmable biquad A |
| 5 (0x05)           | 0000 0000   | Coefficient N1(7:0) for left DAC-programmable biquad A  |
| 6 (0x06)           | 0000 0000   | Coefficient N2(15:8) for left DAC-programmable biquad A |
| 7 (0x07)           | 0000 0000   | Coefficient N2(7:0) for left DAC-programmable biquad A  |
| 8 (0x08)           | 0000 0000   | Coefficient D1(15:8) for left DAC-programmable biquad A |
| 9 (0x09)           | 0000 0000   | Coefficient D1(7:0) for left DAC-programmable biquad A  |
| 10 (0x0A)          | 0000 0000   | Coefficient D2(15:8) for left DAC-programmable biquad A |
| 11 (0x0B)          | 0000 0000   | Coefficient D2(7:0) for left DAC-programmable biquad A  |

## 6.8 Control Registers, Page 13: DAC Programmable Coefficients RAM Buffer B (65:127)

**Table 6-6. Page 13 / Register 0 (0x00): Page Control Register**

| BIT   | READ/ WRITE | RESET VALUE | DESCRIPTION   |
|-------|-------------|-------------|---|
| D7–D0 | R/W         | 0000 0000   | 0000 0000: Page 0 selected<br>0000 0001: Page 1 selected<br>...<br>1111 1110: Page 254 selected<br>1111 1111: Page 255 selected |

The remaining page-13 registers are either reserved registers or are used for setting coefficients for the various filters in the TLV320DAC3100-Q1. Reserved registers should not be written to.

The filter-coefficient registers are arranged in pairs, with two adjacent 8-bit registers containing the 16-bit coefficient for a single filter. The 16-bit integer contained in the MSB and LSB registers for a coefficient is interpreted as a 2s-complement integer, with possible values ranging from –32,768 to 32,767. When programming any coefficient value for a filter, the MSB register should always be written first, immediately followed by the LSB register. Even if only the MSB or LSB portion of the coefficient changes, both registers should be written in this sequence. [Table 6-7](#) is a list of the page-13 registers, excepting the previously described register 0.

**Table 6-7. Page 13 DAC Buffer B Registers**

| REGISTER NUMBER | RESET VALUE | REGISTER NAME   |
|-----------------|-------------|---|
| 1               | 0000 0000   | Reserved. Do not write to this register.                        |
| 2 (0x02)        | 0111 1111   | Coefficient N0(15:8) for left DAC-programmable first-order IIR  |
| 3 (0x03)        | 1111 1111   | Coefficient N0(7:0) for left DAC-programmable first-order IIR   |
| 4 (0x04)        | 0000 0000   | Coefficient N1(15:8) for left DAC-programmable first-order IIR  |
| 5 (0x05)        | 0000 0000   | Coefficient N1(7:0) for left DAC-programmable first-order IIR   |
| 6 (0x06)        | 0000 0000   | Coefficient D1(15:8) for left DAC-programmable first-order IIR  |
| 7 (0x07)        | 0000 0000   | Coefficient D1(7:0) for left DAC-programmable first-order IIR   |
| 8 (0x08)        | 0111 1111   | Coefficient N0(15:8) for right DAC-programmable first-order IIR |
| 9 (0x09)        | 1111 1111   | Coefficient N0(7:0) for right DAC-programmable first-order IIR  |

## Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Original (July 2013) to Revision A  | Page               |
|--|--------------------|
| • Changed AEC temperature grade from 2 to 3 to include max ambient temp change from 105 to 85 .....  | <a href="#">1</a>  |
| • Changed maximum Ambient temperature range from 105 to 85 in <i>Absolute Maximum Ratings</i> table .....  | <a href="#">5</a>  |
| • Changed maximum operating free-air temperature value from 105 to 85. ....  | <a href="#">6</a>  |
| • Changed condition statement in <i>Electrical Characteristics</i> table by removing T <sub>A</sub> temperature range .....  | <a href="#">6</a>  |
| • Changed condition statement in <i>Electrical Characteristics</i> table by removing T <sub>A</sub> temperature range .....  | <a href="#">7</a>  |
| • Added <i>Power-Supply Sequence</i> section to <i>Device Initialization</i> section .....   | <a href="#">17</a> |
| • Changed register 36 to register 35 in section <a href="#">Section 5.4.2</a> .....  | <a href="#">22</a> |
| • Changed <a href="#">Section 5.5.1.2</a> diagrams for PRB_P2/5/8/10/13/15/18/21/24/25 to reflect that the DRC_HPF filter cannot be bypassed when the DRC is turned off .....                                  | <a href="#">24</a> |
| • Changed HPF and LPF cutoff values from 0.0016 to 0.000083 and 0.00033 to 0.000165 in the <i>Dynamic Range Compression</i> section .....  | <a href="#">34</a> |
| • Deleted dec2hex from MATLAB script in <i>Key-Click Functionality With Digital Sine-Wave Generator (PRB_P25)</i> section .....  | <a href="#">38</a> |
| • Changed note 1. of MATLAB script in <i>Key-Click Functionality With Digital Sine-Wave Generator (PRB_P25)</i> section from Fin less than Fs / 4 to less than 0.5*Fs and not equal to 0 or 0.25*Fs .....      | <a href="#">38</a> |
| • Added sequence for inserting a beep in the middle of an already-playing signal and note text following script in the <i>Key-Click Functionality With Digital Sine-Wave Generator (PRB_P25)</i> section ..... | <a href="#">39</a> |
| • Deleted Analog Volume Control for Headphone and Speaker Outputs (for D7=0) table and added table note to D7=1 table. ....  | <a href="#">42</a> |
| • Added D6–D0 to the Register Value column heading and changed Analog Attenuation to Analog Gain. ....   | <a href="#">42</a> |
| • Changed page 0 to page 1 in section <a href="#">Section 5.5.12.1</a> .....   | <a href="#">43</a> |
| • Changed PRB_Rx to PRB_Px in <i>DAC Setup</i> section .....   | <a href="#">45</a> |
| • Added $80\text{ MHz} \leq (\text{PLL\_CLKIN} \times \text{J.D} \times \text{R/P}) \leq 110\text{ MHz}$ and $4 \leq \text{R} \times \text{J} \leq 259$ under equation 7. ....                                 | <a href="#">52</a> |
| • Added $80\text{ MHz} \leq \text{PLL\_CLKIN} \times \text{J.D} \times \text{R/P} \leq 110\text{ MHz}$ and $\text{R} = 1$ under equation 8. ....   | <a href="#">52</a> |
| • Added Timer section and image after PLL section. ....  | <a href="#">53</a> |
| • Changed part number from TLV320DAC3101 to TLV320DAC3100. ....  | <a href="#">62</a> |
| • Deleted reference to Dig_Mic_In in Page 0 / Register 54 table for bits D2-D1 .....   | <a href="#">70</a> |
| • Added table note to Page 0 / Register 64 (0x40): DAC VOLUME CONTROL. ....  | <a href="#">71</a> |
| • Changed values in <i>Page 0 / Register 69 (0x45): DRC Control 2</i> .....  | <a href="#">73</a> |
| • Changed Page 0, Register 70, bit D3-D0 decay rate value for 0000 from $\text{DR} = 1.5625\text{e}^{-3}$ to $\text{DR} = 0.015625$ .....  | <a href="#">74</a> |
| • Changed D0=1 to Reserved in Page 1 / Register 33. ....   | <a href="#">78</a> |
| • Removed extraneous cross-references for deleted table. ....  | <a href="#">79</a> |
| • Added table note to Page 1 / Register 40 (0x28): HPL Driver. ....  | <a href="#">80</a> |
| • Added table note to Page 1 / Register 41 (0x29): HPR Driver. ....  | <a href="#">80</a> |

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## PACKAGE OUTLINE

### VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4223442/B 08/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

**RHB0032E**

## SOLDER MASK DETAILS

4223442/B 08/2019

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sl原因271](http://www.ti.com/lit/sl原因271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
