

# nRF52833

## Product Specification

v1.5

**NORDIC**<sup>®</sup>  
SEMICONDUCTOR

# Feature list

## Features:

- **Bluetooth® 5.1**, IEEE 802.15.4-2006, 2.4 GHz transceiver
  - -96 dBm sensitivity in 1 Mbps **Bluetooth®** low energy mode
  - -103 dBm sensitivity in 125 kbps **Bluetooth®** low energy mode (long range)
  - -20 to +8 dBm TX power, configurable in 4 dB steps
  - On-air compatible with nRF52, nRF51, nRF24L, and nRF24AP Series
  - Supported data rates:
    - **Bluetooth®** 5.1 – 2 Mbps, 1 Mbps, 500 kbps, and 125 kbps
    - IEEE 802.15.4-2006 – 250 kbps
    - Proprietary 2.4 GHz – 2 Mbps, 1 Mbps
  - Angle-of-arrival (AoA) and angle-of-departure (AoD) direction finding using **Bluetooth®**
  - Single-ended antenna output (on-chip balun)
  - 128-bit AES/ECB/CCM/AAR co-processor (on-the-fly packet encryption)
  - 4.9 mA peak current in TX (0 dBm)
  - 4.6 mA peak current in RX
  - RSSI (1 dB resolution)
- **ARM® Cortex® -M4** 32-bit processor with FPU, 64 MHz
  - 217 EEMBC CoreMark® score running from flash memory
  - 52 µA/MHz running CoreMark from flash memory
  - 38 µA/MHz running CoreMark from RAM
  - Watchpoint and trace debug modules (DWT, ETM, and ITM)
  - Serial wire debug (SWD)
- Rich set of security features
  - Secure boot ready
    - Flash access control list (ACL)
    - Debug control and configuration
    - Access port protection (CTRL-AP)
  - Secure erase
- Flexible power management
  - 1.7 V to 5.5 V supply voltage range
  - On-chip DC/DC and LDO regulators with automated low current modes
  - Automated peripheral power management
  - Fast wake-up using 64 MHz internal oscillator
  - 0.6 µA at 3 V in System OFF mode, no RAM retention
  - 1.5 µA at 3 V in System ON mode, no RAM retention, wake on RTC
- 512 kB flash and 128 kB RAM
- Advanced on-chip interfaces
  - USB 2.0 full speed (12 Mbps) controller
  - High-speed 32 MHz SPI
  - Type 2 near field communication (NFC-A) tag with wake-on field
    - Touch-to-pair support
  - Programmable peripheral interconnect (PPI)
  - 42 general purpose I/O pins
  - EasyDMA automated data transfer between memory and peripherals
- Nordic SoftDevice ready with support for concurrent multiprotocol
- 12-bit, 200 ksp/s ADC – 8 configurable channels with programmable gain
- 64 level comparator
- 15 level low-power comparator with wake-up from System OFF mode
- Temperature sensor
- 4x four channel pulse width modulator (PWM) unit with EasyDMA
- Audio peripherals – I<sup>2</sup>S, digital microphone interface (PDM)
- 5x 32-bit timer with counter mode
- Up to 4x SPI master/3x SPI slave with EasyDMA
- Up to 2x I<sup>2</sup>C compatible two-wire master/slave
- 2x UART (CTS/RTS) with EasyDMA
- Quadrature decoder (QDEC)
- 3x real-time counter (RTC)
- Single crystal operation
- Operating temperature from -40 to 105 °C
- Package variants
  - aQFN™ 73 package, 7 x 7 mm
  - QFN40 package, 5 x 5 mm
  - WLCSP package, 3.175 x 3.175 mm

Applications:

- Advanced computer peripherals and I/O devices
  - Mouse
  - Keyboard
  - Multi-touch trackpad
- Advanced wearables
  - Health/fitness sensor and monitor devices
  - Wireless payment enabled devices
- Internet of things (IoT)
  - Smart home sensors and controllers
  - Industrial IoT sensors and controllers
- Interactive entertainment devices
  - Remote controls
  - Gaming controllers

| 4.3 NVMC — Non-volatile memory controller . . . . .                        | 23        |
| 4.3.1 Writing to flash . . . . .                                           | 23        |
| 4.3.2 Erasing a page in flash . . . . .                                    | 24        |
| 4.3.3 Writing to user information configuration registers (UICR) . . . . . | 24        |
| 4.3.4 Erasing user information configuration registers (UICR) . . . . .    | 24        |
| 4.3.5 Erase all . . . . .                                                  | 24        |
| 4.3.6 Access port protection behavior . . . . .                            | 24        |
| 4.3.7 NVMC power failure protection . . . . .                              | 24        |
| 4.3.8 Partial erase of a page in flash . . . . .                           | 25        |
| 4.3.9 Cache . . . . .                                                      | 25        |
| 4.3.10 Registers . . . . .                                                 | 25        |
| 4.3.11 Electrical specification . . . . .                                  | 30        |
| 4.4 FICR — Factory information configuration registers . . . . .           | 30        |
| 4.4.1 Registers . . . . .                                                  | 30        |
| 4.5 UICR — User information configuration registers . . . . .              | 40        |
| 4.5.1 Registers . . . . .                                                  | 40        |
| 4.6 EasyDMA . . . . .                                                      | 44        |
| 4.6.1 EasyDMA error handling . . . . .                                     | 45        |
| 4.6.2 EasyDMA array list . . . . .                                         | 46        |
| 4.7 AHB multilayer . . . . .                                               | 46        |
| 4.8 Debug and trace . . . . .                                              | 47        |
| 4.8.1 DAP - Debug access port . . . . .                                    | 48        |
| 4.8.2 Access port protection . . . . .                                     | 48        |
| 4.8.3 CTRL-AP - Control access port . . . . .                              | 51        |
| 4.8.4 Debug Interface mode . . . . .                                       | 53        |

|                                                                      |           |
|----------------------------------------------------------------------|-----------|
| 4.8.5 Real-time debug . . . . .                                      | 53        |
| 4.8.6 Trace . . . . .                                                | 53        |
| <b>5 Power and clock management. . . . .</b>                         | <b>55</b> |
| 5.1 Power management unit (PMU) . . . . .                            | 55        |
| 5.2 Current consumption . . . . .                                    | 55        |
| 5.2.1 Electrical specification . . . . .                             | 56        |
| 5.3 POWER — Power supply . . . . .                                   | 61        |
| 5.3.1 Main supply . . . . .                                          | 62        |
| 5.3.2 USB supply . . . . .                                           | 66        |
| 5.3.3 System OFF mode . . . . .                                      | 67        |
| 5.3.4 System ON mode . . . . .                                       | 68        |
| 5.3.5 RAM power control . . . . .                                    | 68        |
| 5.3.6 Reset . . . . .                                                | 69        |
| 5.3.7 Registers . . . . .                                            | 70        |
| 5.3.8 Electrical specification . . . . .                             | 80        |
| 5.4 CLOCK — Clock control . . . . .                                  | 82        |
| 5.4.1 HFCLK controller . . . . .                                     | 82        |
| 5.4.2 LFCLK controller . . . . .                                     | 84        |
| 5.4.3 Registers . . . . .                                            | 87        |
| 5.4.4 Electrical specification . . . . .                             | 95        |
| <b>6 Peripherals. . . . .</b>                                        | <b>98</b> |
| 6.1 Peripheral interface . . . . .                                   | 98        |
| 6.1.1 Peripheral ID . . . . .                                        | 98        |
| 6.1.2 Peripherals with shared ID . . . . .                           | 99        |
| 6.1.3 Peripheral registers . . . . .                                 | 99        |
| 6.1.4 Bit set and clear . . . . .                                    | 99        |
| 6.1.5 Tasks . . . . .                                                | 99        |
| 6.1.6 Events . . . . .                                               | 99        |
| 6.1.7 Shortcuts . . . . .                                            | 100       |
| 6.1.8 Interrupts . . . . .                                           | 100       |
| 6.2 AAR — Accelerated address resolver . . . . .                     | 101       |
| 6.2.1 EasyDMA . . . . .                                              | 101       |
| 6.2.2 Resolving a resolvable address . . . . .                       | 101       |
| 6.2.3 Example . . . . .                                              | 102       |
| 6.2.4 IRK data structure . . . . .                                   | 102       |
| 6.2.5 Registers . . . . .                                            | 102       |
| 6.2.6 Electrical specification . . . . .                             | 106       |
| 6.3 ACL — Access control lists . . . . .                             | 106       |
| 6.3.1 Registers . . . . .                                            | 108       |
| 6.4 CCM — AES CCM mode encryption . . . . .                          | 110       |
| 6.4.1 Keystream generation . . . . .                                 | 110       |
| 6.4.2 Encryption . . . . .                                           | 111       |
| 6.4.3 Decryption . . . . .                                           | 111       |
| 6.4.4 AES CCM and RADIO concurrent operation . . . . .               | 112       |
| 6.4.5 Encrypting packets on-the-fly in radio transmit mode . . . . . | 112       |
| 6.4.6 Decrypting packets on-the-fly in RADIO receive mode . . . . .  | 113       |
| 6.4.7 CCM data structure . . . . .                                   | 114       |
| 6.4.8 EasyDMA and ERROR event . . . . .                              | 115       |
| 6.4.9 Registers . . . . .                                            | 116       |
| 6.4.10 Electrical specification . . . . .                            | 122       |
| 6.5 COMP — Comparator . . . . .                                      | 122       |

|                                                             |     |
|-------------------------------------------------------------|-----|
| 6.5.1 Shared resources . . . . .                            | 124 |
| 6.5.2 Differential mode . . . . .                           | 124 |
| 6.5.3 Single-ended mode . . . . .                           | 125 |
| 6.5.4 Registers . . . . .                                   | 127 |
| 6.5.5 Electrical specification . . . . .                    | 134 |
| 6.6 ECB — AES electronic codebook mode encryption . . . . . | 134 |
| 6.6.1 Shared resources . . . . .                            | 135 |
| 6.6.2 EasyDMA . . . . .                                     | 135 |
| 6.6.3 ECB data structure . . . . .                          | 135 |
| 6.6.4 Registers . . . . .                                   | 135 |

|               |         | <ul style="list-style-type: none"> <li>• <a href="#">Current consumption</a> on page 55 - Added missing compounded currents.</li> <li>• <a href="#">POWER — Power supply</a> on page 61 - Clarified REG0 elspec parameters, by renaming and adding several parameters.</li> <li>• <a href="#">RADIO — 2.4 GHz radio</a> on page 280 - Corrected Sensitivity plot.</li> <li>• <a href="#">SPIM — Serial peripheral interface master with EasyDMA</a> on page 391 - Corrected parameter <math>t_{SPIM,CSK}</math>.</li> <li>• <a href="#">Reference circuitry</a> on page 570 - Added optional 4.7 <math>\Omega</math> resistor to USB supply in configuration 1 for QIAA package.</li> <li>• <a href="#">Recommended operating conditions</a> on page 611 - Added parameter <math>T_J</math> (junction temperature), moved from <a href="#">Absolute maximum ratings</a> on page 612.</li> <li>• <a href="#">Absolute maximum ratings</a> on page 612 - Increased aQFN73 CDM to 750 V. Removed parameter <math>T_J</math> (junction temperature), moved to <a href="#">Recommended operating conditions</a> on page 611. Added footnote regarding supply voltages used in HTOL.</li> <li>• <a href="#">Legal notices</a> on page 619 - Updated copyright date.</li> </ul> |
| January 2020  | 1.1     | Not released                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| November 2019 | 1.0     | First release                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# 2 About this document

This document is organized into chapters that are based on the modules and peripherals available in the IC.

## 2.1 Document status

The document status reflects the level of maturity of the document.

| Document name                         | Description                                                                                                                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Objective Product Specification (OPS) | Applies to document versions up to 1.0.<br><br>This document contains target specifications for product development.                                                                                                                                             |
| Product Specification (PS)            | Applies to document versions 1.0 and higher.<br><br>This document contains final product specifications. Nordic Semiconductor ASA reserves the right to make changes at any time without notice in order to improve design and supply the best possible product. |

Table 1: Defined document names

## 2.2 Peripheral chapters

Every peripheral has a unique capitalized name or an abbreviation of its name, e.g. TIMER, used for identification and reference. This name is used in chapter headings and references, and it will appear in the ARM® Cortex® Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer to identify the peripheral.

The peripheral instance name, which is different from the peripheral name, is constructed using the peripheral name followed by a numbered postfix, starting with 0, for example, TIMER0. A postfix is normally only used if a peripheral can be instantiated more than once. The peripheral instance name is also used in the CMSIS to identify the peripheral instance.

The chapters describing peripherals may include the following information:

- A detailed functional description of the peripheral
- Register configuration for the peripheral
- Electrical specification tables, containing performance data which apply for the operating conditions described in [Recommended operating conditions](#) on page 611.

## 2.3 Register tables

Individual registers are described using register tables. These tables are built up of two sections. The first three colored rows describe the position and size of the different fields in the register. The following rows describe the fields in more detail.

### 2.3.1 Fields and values

The **Id (Field Id)** row specifies the bits that belong to the different fields in the register. If a field has enumerated values, then every value will be identified with a unique value id in the **Value Id** column.

A blank space means that the field is reserved and read as undefined, and it also must be written as 0 to secure forward compatibility. If a register is divided into more than one field, a unique field name is specified for each field in the **Field** column. The **Value Id** may be omitted in the single-bit bit fields when values can be substituted with a Boolean type enumerator range, e.g. true/false, disable(d)/enable(d), on/off, and so on.

Values are usually provided as decimal or hexadecimal. Hexadecimal values have a 0x prefix, decimal values have no prefix.

The **Value** column can be populated in the following ways:

- Individual enumerated values, for example 1, 3, 9.
- Range of values, e.g. [0..4], indicating all values from and including 0 and 4.
- Implicit values. If no values are indicated in the **Value** column, all bit combinations are supported, or alternatively the field's translation and limitations are described in the text instead.

If two or more fields are closely related, the **Value Id**, **Value**, and **Description** may be omitted for all but the first field. Subsequent fields will indicate inheritance with '..'.

A feature marked **Deprecated** should not be used for new designs.

### 2.3.2 Permissions

Different fields in a register might have different access permissions enforced by hardware.

The access permission for each register field is documented in the **Access** column in the following ways:

| Access | Description     | Hardware behavior                                                                                                      |
|--------|-----------------|------------------------------------------------------------------------------------------------------------------------|
| RO     | Read-only       | Field can only be read. A write will be ignored.                                                                       |
| WO     | Write-only      | Field can only be written. A read will return an undefined value.                                                      |
| RW     | Read-write      | Field can be read and written multiple times.                                                                          |
| W1     | Write-once      | Field can only be written once per reset. Any subsequent write will be ignored. A read will return an undefined value. |
| RW1    | Read-write-once | Field can be read multiple times, but only written once per reset. Any subsequent write will be ignored.               |

Table 2: Register field permission schemes

## 2.4 Registers

| Register | Offset | Description                                       |
|----------|--------|---------------------------------------------------|
| DUMMY    | 0x514  | Example of a register controlling a dummy feature |

Table 3: Register overview

### 2.4.1 DUMMY

Address offset: 0x514

Example of a register controlling a dummy feature

|                  |      |         |              |        |       |    |    |    |    |    |    |    |    |    |    |    |                                                                 |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |            |   |   |
|------------------|------|---------|--------------|--------|-------|----|----|----|----|----|----|----|----|----|----|----|-----------------------------------------------------------------|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|------------|---|---|

### 3 Block diagram

This block diagram illustrates the overall system. Arrows with white heads indicate signals that share physical pins with other signals.

Figure 1: Block diagram

# 4 Core components

## 4.1 CPU

The ARM<sup>®</sup> Cortex<sup>®</sup>-M4 processor with floating-point unit (FPU) has a 32-bit instruction set (Thumb<sup>®</sup>-2 technology) that implements a superset of 16- and 32-bit instructions to maximize code density and performance.

This processor implements the following features that enable energy-efficient arithmetic and high-performance signal processing.

- Digital signal processing (DSP) instructions
- Single-cycle multiply and accumulate (MAC) instructions
- Hardware divide
- 8- and 16-bit single instruction multiple data (SIMD) instructions
- Single-precision floating-point unit (FPU)

The ARM<sup>®</sup> Cortex<sup>®</sup> Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer for the ARM<sup>®</sup> Cortex<sup>®</sup> processor series is implemented and available for the M4 CPU.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the nested vectored interrupt controller (NVIC).

Executing code from flash memory will have a wait state penalty on the nRF52 Series. An instruction cache can be enabled to minimize flash wait states when fetching instructions. For more information on cache, see [Cache](#) on page 25. The [Electrical specification](#) on page 19 shows CPU performance parameters including wait states in different modes, CPU current and efficiency, and processing power and efficiency based on the CoreMark<sup>®</sup> benchmark.

The ARM system timer (SysTick) is present on nRF52833. The SysTick's clock will only tick when the CPU is running or when the system is in debug interface mode.

### 4.1.1 Floating point interrupt

The floating point unit (FPU) may generate exceptions when used due to e.g. overflow or underflow, which in turn will trigger the FPU interrupt.

See [Instantiation](#) on page 22 for more information about the exceptions triggering the FPU interrupt.

To clear the IRQ (interrupt request) line when an exception has occurred, the relevant exception bit within the floating-point status and control register (FPSCR) needs to be cleared. For more information about the FPSCR or other FPU registers, see *Cortex-M4 Devices Generic User Guide*.

### 4.1.2 CPU and support module configuration

The ARM<sup>®</sup> Cortex<sup>®</sup>-M4 processor has a number of CPU options and support modules implemented on the IC.

| Option / Module | Description                        | Implemented   |
|-----------------|------------------------------------|---------------|
| Core options    |                                    |               |
| NVIC            | Nested vector interrupt controller | 48 vectors    |
| PRIORITIES      | Priority bits                      | 3             |
| WIC             | Wakeup interrupt controller        | NO            |
| Endianness      | Memory system endianness           | Little endian |
| Bit-banding     | Bit banded memory                  | NO            |
| DWT             | Data watchpoint and trace          | YES           |
| SysTick         | System tick timer                  | YES           |
| Modules         |                                    |               |
| MPU             | Memory protection unit             | YES           |
| FPU             | Floating-point unit                | YES           |
| DAP             | Debug access port                  | YES           |
| ETM             | Embedded trace macrocell           | YES           |
| ITM             | Instrumentation trace macrocell    | YES           |
| TPIU            | Trace port interface unit          | YES           |
| ETB             | Embedded trace buffer              | NO            |
| FPB             | Flash patch and breakpoint unit    | YES           |
| HTM             | AMBA™ AHB trace macrocell          | NO            |

## 4.1.3 Electrical specification

### 4.1.3.1 CPU performance

The CPU clock speed is 64 MHz. Current and efficiency data is taken when in System ON and the CPU is executing the CoreMark® benchmark. It includes power regulator and clock base currents. All other blocks are IDLE.

| Symbol                   | Description                                                          | Min. | Typ. | Max. | Units                   |
|--------------------------|----------------------------------------------------------------------|------|------|------|-------------------------|
| W <sub>FLASH</sub>       | CPU wait states, running CoreMark from flash, cache disabled         |      |      | 2    |                         |
| W <sub>FLASH</sub> CACHE | CPU wait states, running CoreMark from flash, cache enabled          |      |      | 3    |                         |
| W <sub>RAM</sub>         | CPU wait states, running CoreMark from RAM                           |      |      | 0    |                         |
| CM <sub>FLASH</sub>      | CoreMark, running CoreMark from flash, cache enabled                 |      | 217  |      | Core <sup>®</sup>       |
| CM <sub>FLASH</sub> /MHz | CoreMark per MHz, running CoreMark from flash, cache enabled         |      | 3.4  |      | CoreMark/<br>MHz        |
| CM <sub>FLASH</sub> /mA  | CoreMark per mA, running CoreMark from flash, cache enabled, DCDC 3V |      | 65.8 |      | Core <sup>®</sup><br>mA |

## 4.2 Memory

The nRF52833 contains 512 kB of flash memory and 128 kB of RAM that can be used for code and data storage.

The CPU and peripherals with EasyDMA can access memory via the AHB multilayer interconnect. In addition, peripherals are accessed by the CPU via the AHB multilayer interconnect, as shown in the following figure.

Figure 2: Memory layout

See [AHB multilayer](#) on page 46 and [EasyDMA](#) on page 44 for more information about the AHB multilayer interconnect and EasyDMA.

The same physical RAM is mapped to both the Data RAM region and the Code RAM region. It is up to the application to partition the RAM within these regions so that one does not corrupt the other.

### 4.2.1 RAM - Random access memory

The RAM interface is divided into nine RAM AHB slaves.

RAM AHB slaves 0 to 7 are connected to two 4 kB RAM sections each, while RAM AHB slave 8 is connected to two 32 kB sections, as shown in [Memory layout](#) on page 20.

Each RAM section has separate power control for System ON and System OFF mode operation, which is configured via RAM register (see the [POWER — Power supply](#) on page 61).

### 4.2.2 Flash - Non-volatile memory

The CPU can read from flash memory an unlimited number of times, but is restricted in how it writes to flash and the number of writes and erases it can perform.

Writing to flash memory is managed by the non-volatile memory controller (NVMC), see [NVMC — Non-volatile memory controller](#) on page 23.

Flash memory is divided into 128 pages of 4 kB each that can be accessed by the CPU via the ICODE and DCODE buses as shown in [Memory layout](#) on page 20.

### 4.2.3 Memory map

The complete memory map for the nRF52833 is shown in the following figure. As described in [Memory](#) on page 19, Code RAM and Data RAM are the same physical RAM.

Figure 3: Memory map

## 4.2.4 Instantiation

| ID | Base address | Peripheral | Instance  | Description                                                         |
|----|--------------|------------|-----------|---------------------------------------------------------------------|
| 0  | 0x40000000   | APPROTECT  | APPROTECT | APPROTECT control                                                   |
| 0  | 0x40000000   | CLOCK      | CLOCK     | Clock control                                                       |
| 0  | 0x40000000   | POWER      | POWER     | Power control                                                       |
| 0  | 0x50000000   | GPIO       | GPIO      | General purpose input and output <span>Deprecated</span>            |
| 0  | 0x50000000   | GPIO       | P0        | General purpose input and output, port 0                            |

Table 4: Instantiation table

## 4.3 NVMC — Non-volatile memory controller

The non-volatile memory controller (NVMC) is used for writing and erasing of the internal flash memory and the UICR (user information configuration registers).

The [CONFIG](#) on page 26 is used to enable the NVMC for writing (CONFIG.WEN = Wen) and erasing (CONFIG.WEN = Een).

The CPU must be halted before initiating a NVMC operation from the debug system.

### 4.3.1 Writing to flash

When write is enabled, full 32-bit words can be written to word-aligned addresses in flash memory.

As illustrated in [Memory](#) on page 19, the flash is divided into multiple pages. The same 32-bit word in flash memory can only be written  $n_{WRITE}$  number of times before a page erase must be performed.

The NVMC is only able to write 0 to bits in flash memory that are erased (set to 1). It cannot rewrite a bit back to 1. Only full 32-bit words can be written to flash memory using the NVMC interface. To write less than 32 bits, write the data as a full 32-bit word and set all the bits that should remain unchanged in the word to 1. The restriction on the number of writes ( $n_{WRITE}$ ) still applies in this case.

Only word-aligned writes are allowed. Byte or half-word-aligned writes will result in a hard fault.

The time it takes to write a word to flash is specified by  $t_{WRITE}$ . The CPU is halted if the CPU executes code from the flash while the NVMC is writing to the flash.

NVM writing time can be reduced by using READYNEXT. If this status bit is set to 1, code can perform the next data write to the flash. This write will be buffered and will be taken into account as soon as the ongoing write operation is completed.

### 4.3.2 Erasing a page in flash

When erase is enabled, the flash memory can be erased page by page using the [ERASEPAGE](#) on page 27.

After erasing a flash page, all bits in the page are set to 1. The time it takes to erase a page is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is halted if the CPU executes code from the flash while the NVMC is writing to the flash.

See [Partial erase of a page in flash](#) on page 25 for information on dividing the page erase time into shorter chunks.

### 4.3.3 Writing to user information configuration registers (UICR)

User information configuration registers (UICR) are written in the same way as flash. After UICR has been written, the new UICR configuration will only take effect after a reset.

UICR can only be written  $n_{\text{WRITE}}$  number of times before an erase must be performed using [ERASEUICR](#) on page 28 or [ERASEALL](#) on page 27. The time it takes to write a word to UICR is specified by  $t_{\text{WRITE}}$ . The CPU is halted if the CPU executes code from the flash while the NVMC is writing to the UICR.

### 4.3.4 Erasing user information configuration registers (UICR)

When erase is enabled, UICR can be erased using the [ERASEUICR](#) on page 28.

After erasing UICR, all bits in UICR are set to 1. The time it takes to erase UICR is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is halted if the CPU executes code from the flash while the NVMC performs the erase operation.

### 4.3.5 Erase all

When erase is enabled, flash and UICR can be erased completely in one operation by using the [ERASEALL](#) on page 27. This operation will not erase the factory information configuration registers (FICR).

The time it takes to perform an [ERASEALL](#) command is specified by  $t_{\text{ERASEALL}}$ . The CPU is halted if the CPU executes code from the flash while the NVMC performs the erase operation.

### 4.3.6 Access port protection behavior

When access port protection is enabled, parts of the NVMC functionality will be blocked in order to prevent intentional or unintentional erase of UICR.

|                  | CTRL-AP ERASEALL | NVMC ERASEPAGE | NVMC ERASEPAGE PARTIAL | NVMC ERASEALL | NVMC ERASEUICR |
|------------------|------------------|----------------|------------------------|---------------|----------------|
| <b>APPROTECT</b> |                  |                |                        |               |                |
| Disabled         | Allowed          | Allowed        | Allowed                | Allowed       | Allowed        |
| Enabled          | Allowed          | Allowed        | Allowed                | Allowed       | Blocked        |

Table 5: NVMC Protection

### 4.3.7 NVMC power failure protection

NVMC power failure protection is possible through use of power-fail comparator that is monitoring power supply.

If the power-fail comparator is enabled, and the power supply voltage is below  $V_{\text{POF}}$  threshold, the power-fail comparator will prevent the NVMC from performing erase or write operations in non-volatile memory (NVM).

If a power failure warning is present at the start of an NVM erase operation, the NVMC operation will be ignored.

If a power failure warning is present at the start of an NVM write operation, the CPU will hardfault.

### 4.3.8 Partial erase of a page in flash

Partial erase is a feature in the NVMC to split a page erase time into shorter chunks to prevent longer CPU stalls in time-critical applications. Partial erase is only applicable to the code area in flash memory and does not work with UICR.

When erase is enabled, the partial erase of a flash page can be started by writing to [ERASEPAGEPARTIAL](#) on page 28. The duration of a partial erase can be configured in [ERASEPAGEPARTIALCFG](#) on page 28. A flash page is erased when its erase time reaches  $t_{\text{ERASEPAGE}}$ . Use [ERASEPAGEPARTIAL](#) N number of times so that  $N * \text{ERASEPAGEPARTIALCFG} \geq t_{\text{ERASEPAGE}}$ , where  $N * \text{ERASEPAGEPARTIALCFG}$  gives the cumulative (total) erase time. Every time the cumulative erase time reaches  $t_{\text{ERASEPAGE}}$ , it counts as one erase cycle.

After the erase is complete, all bits in the page are set to 1. The CPU is halted if the CPU executes code from the flash while the NVMC performs the partial erase operation.

The bits in the page are undefined if the flash page erase is incomplete, i.e. if a partial erase has started but the total erase time is less than  $t_{\text{ERASEPAGE}}$ .

### 4.3.9 Cache

An instruction cache (I-Cache) can be enabled for the ICODE bus in the NVMC.

A cache hit is an instruction fetch from the cache, and it has a 0 wait-state delay. The number of wait-states for a cache miss, where the instruction is not available in the cache and needs to be fetched from flash, is shown in [CPU](#) on page 18.

Enabling the cache can increase CPU performance and reduce power consumption by reducing the number of wait cycles and the number of flash accesses. This will depend on the cache hit rate. Cache will use some current when enabled. If the reduction in average current due to reduced flash accesses is larger than the cache power requirement, the average current to execute the program code will decrease.

When disabled, the cache does not use current and does not retain its content.

It is possible to enable cache profiling to analyze the performance of the cache for your program using the [ICACHECNF](#) register. When profiling is enabled, the [IHIT](#) and [IMISS](#) registers are incremented for every instruction cache hit or miss, respectively. The hit and miss profiling registers do not wrap around after reaching the maximum value. If the maximum value is reached, consider profiling for a shorter duration to get correct numbers.

### 4.3.10 Registers

| Base address | Peripheral | Instance | Description                    | Configuration |
|--------------|------------|----------|--------------------------------|---------------|

 ## 4.3.11 Electrical specification

### 4.3.11.1 Flash programming

| Symbol                            | Description                                                                                                                                                                  | Min.  | Typ. | Max.              | Units |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|------|-------------------|-------|
| $n_{\text{WRITE}}$                | Number of times a 32-bit word can be written before erase                                                                                                                    |       |      | 2                 |       |
| $n_{\text{ENDURANCE}}$            | Erase cycles per page                                                                                                                                                        | 10000 |      |                   |       |
| $t_{\text{WRITE}}$                | Time to write one 32-bit word                                                                                                                                                |       |      | 42.5 <sup>1</sup> | μs    |
| $t_{\text{ERASEPAGE}}$            | Time to erase one page                                                                                                                                                       |       |      | 87.5 <sup>1</sup> | ms    |
| $t_{\text{ERASEALL}}$             | Time to erase all flash                                                                                                                                                      |       |      | 173 <sup>1</sup>  | ms    |
| $t_{\text{ERASEPAGEPARTIAL,acc}}$ | Accuracy of the partial page erase duration. Total execution time for one partial page erase is defined as<br>$\text{ERASEPAGEPARTIALCFG} * t_{\text{ERASEPAGEPARTIAL,acc}}$ |       |      | 1.09 <sup>1</sup> |       |

### 4.3.11.2 Cache size

| Symbol                | Description       | Min. | Typ. | Max. | Units |
|-----------------------|-------------------|------|------|------|-------|
| Size <sub>ICODE</sub> | I-Code cache size |      | 2048 |      | Bytes |

## 4.4 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory and cannot be erased by the user. These registers contain chip-specific information and configuration.

### 4.4.1 Registers

| Base address | Peripheral | Instance | Description                       | Configuration |
|--------------|------------|----------|-----------------------------------|---------------|
| 0x10000000   | FICR       | FICR     | Factory information configuration |               |

Table 8: Instances

| Register       | Offset | Description             |
|----------------|--------|-------------------------|
| CODEPAGESIZE   | 0x010  | Code memory page size   |
| CODESIZE       | 0x014  | Code memory size        |
| DEVICEID[0]    | 0x060  | Device identifier       |
| DEVICEID[1]    | 0x064  | Device identifier       |
| ER[0]          | 0x080  | Encryption root, word 0 |
| ER[1]          | 0x084  | Encryption root, word 1 |
| ER[2]          | 0x088  | Encryption root, word 2 |
| ER[3]          | 0x08C  | Encryption root, word 3 |
| IR[0]          | 0x090  | Identity Root, word 0   |
| IR[1]          | 0x094  | Identity Root, word 1   |
| IR[2]          | 0x098  | Identity Root, word 2   |
| IR[3]          | 0x09C  | Identity Root, word 3   |
| DEVICEADDRTYPE | 0x0A0  | Device address type     |
| DEVICEADDR[0]  | 0x0A4  | Device address 0        |
| DEVICEADDR[1]  | 0x0A8  | Device address 1        |
| INFO.PART      | 0x100  | Part code               |

<sup>1</sup> Applies when HFXO is used. Timing varies according to HFINT accuracy when HFINT is used.

| Register        | Offset | Description                                                                                                               |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------|
| INFO.VARIANT    | 0x104  | Build code (hardware version and production configuration)                                                                |
| INFO.PACKAGE    | 0x108  | Package option                                                                                                            |
| INFO.RAM        | 0x10C  | RAM variant                                                                                                               |
| INFO.FLASH      | 0x110  | Flash variant                                                                                                             |

    ## 4.5 UICR — User information configuration registers

The user information configuration registers (UICRs) are non-volatile memory (NVM) registers for configuring user-specific settings.

For information on writing UICR registers, see the [NVMC — Non-volatile memory controller](#) on page 23 and [Memory](#) on page 19 chapters.

### 4.5.1 Registers

| Base address | Peripheral | Instance | Description                    | Configuration |
|--------------|------------|----------|--------------------------------|---------------|
| 0x10001000   | UICR       | UICR     | User information configuration |               |

Table 10: Instances

 #### 4.5.1.4 PSELRESET[n] (n=0..1)

Address offset:  $0x200 + (n \times 0x4)$

Mapping of the nRESET function (see POWER chapter for details)

All PSELRESET registers have to contain the same value for a pin mapping to be valid. If values are not the same, there will be no nRESET function exposed on a GPIO. As a result, the device will always start independently of the levels present on any of the GPIOs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | ## 4.6 EasyDMA

EasyDMA is a module implemented by some peripherals to gain direct access to Data RAM.

EasyDMA is an AHB bus master similar to CPU and is connected to the AHB multilayer interconnect for direct access to Data RAM. EasyDMA is not able to access flash.

A peripheral can implement multiple EasyDMA instances to provide dedicated channels. For example, for reading and writing of data between the peripheral and RAM. This concept is illustrated in [EasyDMA example](#) on page 44.

Figure 4: EasyDMA example

An EasyDMA channel is implemented in the following way, but some variations may occur:

```

READERBUFFER_SIZE 5
WRITERBUFFER_SIZE 6

uint8_t readerBuffer[READERBUFFER_SIZE] __at__ 0x20000000;
uint8_t writerBuffer[WRITERBUFFER_SIZE] __at__ 0x20000005;

// Configuring the READER channel
MYPERIPHERAL->READER.MAXCNT = READERBUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &readerBuffer;

// Configure the WRITER channel
MYPERIPHERAL->WRITER.MAXCNT = WRITERBUFFER_SIZE;
MYPERIPHERAL->WRITER.PTR = &writerBuffer;

```

This example shows a peripheral called MYPERIPHERAL that implements two EasyDMA channels - one for reading called READER, and one for writing called WRITER. When the peripheral is started, it is assumed that the peripheral will perform the following tasks:

- Read 5 bytes from the readerBuffer located in RAM at address 0x20000000
- Process the data
- Write no more than 6 bytes back to the writerBuffer located in RAM at address 0x20000005

The memory layout of these buffers is illustrated in [EasyDMA memory layout](#) on page 45.

|            |                 |                 |                 |                 |
|------------|-----------------|-----------------|-----------------|-----------------|
| 0x20000000 | readerBuffer[0] | readerBuffer[1] | readerBuffer[2] | readerBuffer[3] |
| 0x20000004 | readerBuffer[4] | writerBuffer[0] | writerBuffer[1] | writerBuffer[2] |
| 0x20000008 | writerBuffer[3] | writerBuffer[4] | writerBuffer[5] |                 |

Figure 5: EasyDMA memory layout

The WRITER.MAXCNT register should not be specified larger than the actual size of the buffer (writerBuffer). Otherwise, the channel would overflow the writerBuffer.

Once an EasyDMA transfer is completed, the AMOUNT register can be read by the CPU to see how many bytes were transferred. For example, CPU can read MYPERIPHERAL->WRITER.AMOUNT register to see how many bytes WRITER wrote to RAM.

**Note:** The PTR register of a READER or WRITER must point to a valid memory region before use. The reset value of a PTR register is not guaranteed to point to valid memory. See [Memory](#) on page 19 for more information about the different memory regions and EasyDMA connectivity.

### 4.6.1 EasyDMA error handling

Some errors may occur during DMA handling.

If READER.PTR or WRITER.PTR is not pointing to a valid memory region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

If several AHB bus masters try to access the same AHB slave at the same time, AHB bus congestion might occur. An EasyDMA channel is an AHB master. Depending on the peripheral, the peripheral may either stall and wait for access to be granted, or lose data.

### 4.6.2 EasyDMA array list

EasyDMA is able to operate in Array List mode.

The Array List mode is implemented in channels where the LIST register is available.

The array list does not provide a mechanism to explicitly specify where the next item in the list is located. Instead, it assumes that the list is organized as a linear array where items are located one after the other in RAM.

The EasyDMA Array List can be implemented by using the data structure `ArrayList_type` as illustrated in the code example below using a `READER` EasyDMA channel as an example:

```
#define BUFFER_SIZE 4

typedef struct ArrayList
{
    uint8_t buffer[BUFFER_SIZE];
} ArrayList_type;

ArrayList_type ReaderList[3] __at__ 0x20000000;

MYPERIPHERAL->READER.MAXCNT = BUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &ReaderList;
MYPERIPHERAL->READER.LIST = MYPERIPHERAL_READER_LIST_ArrayList;
```

The data structure only includes a buffer with size equal to the size of `READER.MAXCNT` register. EasyDMA uses the `READER.MAXCNT` register to determine when the buffer is full.

Figure 6: EasyDMA array list

## 4.7 AHB multilayer

AHB multilayer enables parallel access paths between multiple masters and slaves in a system. Access is resolved using priorities.

Each bus master is connected to all the slave devices using an interconnection matrix. The bus masters are assigned priorities, which are used to resolve access when two (or more) bus masters request access to the same slave device. When that occurs, the following rules apply:

- If two (or more) bus masters request access to the same slave device, the master with the highest priority is granted the access first.
- Bus masters with lower priority are stalled until the higher priority master has completed its transaction.
- If the higher priority master pauses at any point during its transaction, the lower priority master in queue is temporarily granted access to the slave device until the higher priority master resumes its activity.
- Bus masters that have the same priority are mutually exclusive, thus cannot be used concurrently.

Some peripherals, such as RADIO, do not have a safe stalling mechanism (no internal data buffering, or opportunity to pause incoming data). Being a low priority bus master might cause loss of data for such peripherals upon bus contention. To avoid AHB bus contention when using multiple bus masters, follow these guidelines:

- Avoid situations where more than one bus master is accessing the same slave.
- If more than one bus master is accessing the same slave, make sure that the bus bandwidth is not exhausted.

Below is a list of bus masters in the system and their priorities.

| Bus master name         | Description                          |
|-------------------------|--------------------------------------|
| CPU                     |                                      |
| CTRL-AP                 |                                      |
| USB                     |                                      |
| SPIM1/SPIS1/TWIM1/TWIS1 | Same priority and mutually exclusive |
| RADIO                   |                                      |
| CCM/ECB/AAR             | Same priority and mutually exclusive |
| SAADC                   |                                      |
| UARTE0                  |                                      |
| SPIM0/SPIS0/TWIM0/TWIS0 | Same priority and mutually exclusive |
| SPIM2/SPIS2             | Same priority and mutually exclusive |
| NFCT                    |                                      |
| I2S                     |                                      |
| PDM                     |                                      |
| PWM0                    |                                      |
| PWM1                    |                                      |
| PWM2                    |                                      |
| PWM3                    |                                      |
| UARTE1                  |                                      |
| SPIM3                   |                                      |

Table 12: AHB bus masters (listed from highest to lowest priority)

Defined bus masters are the CPU and peripherals with implemented EasyDMA. The available slaves are RAM AHB slaves. How the bus masters and slaves are connected using the interconnection matrix is illustrated in [Memory](#) on page 19.

## 4.8 Debug and trace

The debug and trace system offers a flexible and powerful mechanism for non-intrusive debugging.

Figure 7: Debug and trace overview

The main features of the debug and trace system are the following:

- Two-pin serial wire debug (SWD) interface
- Flash patch and breakpoint (FPB) unit that supports the following comparators:
  - Two literal comparators
  - Six instruction comparators
- Data watchpoint and trace (DWT) unit with four comparators
- Instrumentation trace macrocell (ITM)
- Embedded trace macrocell (ETM)
- Trace port interface unit (TPIU)
  - 4-bit parallel trace of ITM and ETM trace data
  - Serial wire output (SWO) trace of ITM data

#### 4.8.1 DAP - Debug access port

An external debugger can access the device via the DAP.

The debug access port (DAP) implements a standard ARM® CoreSight™ serial wire debug port (SW-DP), which implements the serial wire debug protocol (SWD). SWD is a two-pin serial interface, see SWDCLK and SWDIO in [Debug and trace overview](#) on page 48.

In addition to the default access port in CPU (AHB-AP), the DAP includes a custom control access port (CTRL-AP). The CTRL-AP is described in more detail in [CTRL-AP - Control access port](#) on page 51.

##### Note:

- The SWDIO line has an internal pull-up resistor.
- The SWDCLK line has an internal pull-down resistor.

#### 4.8.2 Access port protection

Access port protection blocks the debugger from read and write access to all CPU registers and memory-mapped addresses when enabled.

Access port protection is enabled and disabled differently depending on the build code of the device.

## Access port protection controlled by hardware

This information refers to build codes Axx and earlier.

By default, access port protection is disabled.

Access port protection is enabled by writing `UICR.APPROTECT` to `Enabled` and performing any reset. See [Reset](#) on page 69 for more information.

Access port protection is disabled by issuing an ERASEALL command via CTRL-AP. This command will erase the flash, UICR, and RAM, including `UICR.APPROTECT`. Erasing UICR will set `UICR.APPROTECT` value to `Disabled`. CTRL-AP is described in more detail in [CTRL-AP - Control access port](#) on page 51.

## Access port protection controlled by hardware and software

This information refers to build codes Bxx and later.

By default, access port protection is enabled.

Access port protection is disabled by issuing an ERASEALL command via CTRL-AP. Read [CTRL-AP.APPROTECTSTATUS](#) to ensure that access port protection is disabled, and repeat the ERASEALL command if needed. This command will erase the flash, UICR, and RAM. CTRL-AP is described in more detail in [CTRL-AP - Control access port](#) on page 51. Access port protection will remain disabled until one of the following occurs:

- Pin reset
- Power or brownout reset
- Watchdog reset if not in Debug Interface Mode, see [Debug Interface mode](#) on page 53
- Wake from System OFF if not in Emulated System OFF

To keep access port protection disabled, the following actions must be performed:

- Program `UICR.APPROTECT` to `HwDisabled`. This disables the hardware part of the access port protection scheme after the first reset of any type. The hardware part of the access port protection will stay disabled as long as `UICR.APPROTECT` is not overwritten.
- Firmware must write `APPROTECT.DISABLE` to `SwDisable`. This disables the software part of the access port protection scheme.

**Note:** Register `APPROTECT.DISABLE` is reset after pin reset, power or brownout reset, watchdog reset, or wake from System OFF as mentioned above.

The following figure is an example on how a device with access port protection enabled can be erased, programmed, and configured to allow debugging. Operations sent from debugger as well as registers written by firmware will affect the access port state.

Figure 8: Access port unlocking

Access port protection is enabled when the disabling conditions are not present. For additional security, it is recommended to write `Enabled` to `UICR.APPROTECT`, and have firmware write `Force` to `APPROTECT.FORCEPROTECT`. This is illustrated in the following figure.

**Note:** Register `APPROTECT.FORCEPROTECT` is reset after any reset.

Figure 9: Force access port protection

#### 4.8.2.1 Registers

| Base address | Peripheral | Instance  | Description       | Configuration |
|--------------|------------|-----------|-------------------|---------------|
| 0x40000000   | APPROTECT  | APPROTECT | APPROTECT control |               |

Table 13: Instances

| Register                  | Offset | Description                                                 |
|---------------------------|--------|-------------------------------------------------------------|
| <code>FORCEPROTECT</code> | 0x550  | Software force enable APPROTECT mechanism until next reset. |
| <code>DISABLE</code>      | 0x558  | Software disable APPROTECT mechanism                        |

Table 14: Register overview

#### 4.8.2.1.1 FORCEPROTECT

Address offset: 0x550

Software force enable APPROTECT mechanism until next reset.

|                  |                  |  |          |  |       |  |                                               |  |  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

### 4.8.3 CTRL-AP - Control access port

The control access port (CTRL-AP) is a custom access port that enables control of the device when other access ports in the DAP are disabled by the access port protection.

Access port protection is described in more detail in [Access port protection](#) on page 48.

Control access port has the following features:

- Soft reset - see [Reset](#) on page 69 for more information
- Disabling of access port protection - device control is allowed through CTRL-AP even when all other access ports in DAP are disabled by access port protection

#### 4.8.3.1 Registers

| Register        | Offset | Description                                |
|-----------------|--------|--------------------------------------------|
| RESET           | 0x000  | Soft reset triggered through CTRL-AP       |
| ERASEALL        | 0x004  | Erase all                                  |
| ERASEALLSTATUS  | 0x008  | Status register for the ERASEALL operation |
| APPROTECTSTATUS | 0x00C  | Status register for access port protection |
| IDR             | 0x0FC  | CTRL-AP identification register, IDR       |

Table 15: Register overview

### 4.8.3.2 Electrical specification

#### 4.8.3.2.1 Control access port

| Symbol              | Description                                       | Min.  | Typ. | Max. | Units |
|---------------------|---------------------------------------------------|-------|------|------|-------|
| R <sub>pull</sub>   | Internal SWDIO and SWDCLK pull up/down resistance |       | 13   |      | kΩ    |
| f <sub>SWDCLK</sub> | SWDCLK frequency                                  | 0.125 |      | 8    | MHz   |

### 4.8.4 Debug Interface mode

Before an external debugger can access either CPU's access port (AHB-AP) or the control access port (CTRL-AP), the debugger must first request the device to power up via CxxxPWRUPREQ in the SWJ-DP.

If the device is in System OFF when power is requested via CxxxPWRUPREQ, the system will wake up and the DIF flag in [RESETREAS](#) on page 75 will be set. The device is in the Debug Interface mode as long as the debugger is requesting power via CxxxPWRUPREQ. Once the debugger stops requesting power via CxxxPWRUPREQ, the device is back in normal mode. Some peripherals behave differently in Debug Interface mode compared to normal mode. These differences are described in more detail in the chapters of the peripherals that are affected.

When a debug session is over, the external debugger must make sure to put the device back into normal mode since the overall power consumption is higher in Debug Interface mode than in normal mode.

For details on how to use the debug capabilities, read the debug documentation of your IDE.

### 4.8.5 Real-time debug

The nRF52833 supports real-time debugging.

Real-time debugging allows interrupts to execute to completion in real time when breakpoints are set in Thread mode or lower priority interrupts. This enables developers to set breakpoints and single-step through the code without the risk of real-time event-driven threads running at higher priority failing. For example, this enables the device to continue to service the high-priority interrupts of an external controller or sensor without failure or loss of state synchronization while the developer steps through code in a low-priority thread.

### 4.8.6 Trace

The device supports ETM and ITM trace.

Trace data from the ETM and the ITM is sent to an external debugger via a 4-bit wide parallel trace port interface unit (TPIU), see TRACEDATA[0] through TRACEDATA[3] and TRACECLK in [Debug and trace overview](#) on page 48.

In addition to parallel trace, the TPIU supports serial trace via the serial wire output (SWO) trace protocol. Parallel and serial trace cannot be used at the same time. ETM trace is only supported in Parallel Trace mode, while ITM trace is supported in both Parallel and Serial Trace modes.

For details on how to use the trace capabilities, read the debug documentation of your IDE.

TPIU's trace pins are multiplexed with GPIOs. SWO and TRACEDATA[0] use the same GPIO. See [Pin assignments](#) on page 560 for more information.

Trace speed is configured in register [TRACECONFIG](#) on page 95. The speed of the trace pins depends on the DRIVE setting of the GPIOs that the trace pins are multiplexed with. Only S0S1 and H0H1 drives are suitable for debugging. S0S1 is the default DRIVE setting at reset. If parallel or serial trace port signals are not fast enough with the default settings, all GPIOs in use for tracing should be set to high drive (H0H1). The DRIVE setting for these GPIOs should not be overwritten by firmware during the debugging session.

# 5 Power and clock management

## 5.1 Power management unit (PMU)

Power and clock management in nRF52833 is designed to automatically ensure maximum power efficiency.

The core of the power and clock management system is the power management unit (PMU) illustrated in the following figure.

Figure 10: Power management unit

The PMU automatically detects which power and clock resources are required by the different system components at any given time. The PMU will then automatically start/stop and choose operation modes in supply regulators and clock sources, to achieve the lowest power consumption possible.

## 5.2 Current consumption

Because the system is continually being tuned by the [Power management unit \(PMU\)](#) on page 55, estimating an application's current consumption can be challenging when measurements cannot be directly performed on the hardware. To facilitate the estimation process, a set of current consumption scenarios are provided to show the typical current drawn from the VDD supply.

Each scenario specifies a set of operations and conditions applying to the given scenario. The following table shows a set of common conditions used in all scenarios, unless otherwise stated in the description of a given scenario. All scenarios are listed in [Electrical specification](#) on page 56.

| Condition                               | Value                                                                                                                                                                                                                                                                                                                      |

Table 16: Current consumption scenarios, common conditions

## 5.2.1 Electrical specification

### 5.2.1.1 Sleep

| Symbol                           | Description                                                                            | Min. | Typ. | Max. | Units |
|----------------------------------|----------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>ON_RAMOFF_EVENT</sub>     | System ON, no RAM retention, wake on any event                                         |      | 1.1  |      | μA    |
| I <sub>ON_RAMON_EVENT</sub>      | System ON, full 128 kB RAM retention, wake on any event                                |      | 1.8  |      | μA    |
| I <sub>ON_RAMON_POF</sub>        | System ON, full 128 kB RAM retention, wake on any event, power-fail comparator enabled |      | 1.9  |      | μA    |
| I <sub>ON_RAMON_GPIOTE</sub>     | System ON, full 128 kB RAM retention, wake on GPIOTE input (event mode)                |      | 7.4  |      | μA    |
| I <sub>ON_RAMON_GPIOTEPORT</sub> | System ON, full 128 kB RAM retention, wake on GPIOTE PORT event                        |      | 1.8  |      | μA    |
| I <sub>ON_RAMOFF_RTC</sub>       | System ON, no RAM retention, wake on RTC (running from LFRC clock)                     |      | 1.5  |      | μA    |
| I <sub>ON_RAMON_RTC</sub>        | System ON, full 128 kB RAM retention, wake on RTC (running from LFRC clock)            |      | 2.6  |      | μA    |

<sup>2</sup> Applies only when CPU is running from flash memory

<sup>3</sup> Applies only when HFXO is running

| Symbol                              | Description                                                                             | Min. | Typ. | Max. | Units         |
|-------------------------------------|-----------------------------------------------------------------------------------------|------|------|------|---------------|
| $I_{\text{OFF\_RAMOFF\_RESET}}$     | System OFF, no RAM retention, wake on reset                                             |      | 0.6  |      | $\mu\text{A}$ |
| $I_{\text{OFF\_RAMOFF\_LPCOMP}}$    | System OFF, no RAM retention, wake on LPCOMP                                            |      | 0.9  |      | $\mu\text{A}$ |
| $I_{\text{OFF\_RAMON\_RESET}}$      | System OFF, full 128 kB RAM retention, wake on reset                                    |      | 1.3  |      | $\mu\text{A}$ |
| $I_{\text{ON\_RAMOFF\_EVENT\_5V}}$  | System ON, no RAM retention, wake on any event, 5 V supply on VDDH, REG0 output = 3.3 V |      | 1.3  |      | $\mu\text{A}$ |
| $I_{\text{OFF\_RAMOFF\_RESET\_5V}}$ | System OFF, no RAM retention, wake on reset, 5 V supply on VDDH, REG0 output = 3.3 V    |      | 1.0  |      | $\mu\text{A}$ |

Figure 11: System OFF, no RAM retention, wake on reset (typical values)

Figure 12: System ON, no RAM retention, wake on any event (typical values)

### 5.2.1.2 COMP active

| Symbol                 | Description                   | Min. | Typ. | Max. | Units |
|------------------------|-------------------------------|------|------|------|-------|
| $I_{\text{COMP,LP}}$   | COMP enabled, low power mode  |      | 22.7 |      | μA    |
| $I_{\text{COMP,NORM}}$ | COMP enabled, normal mode     |      | 26.4 |      | μA    |
| $I_{\text{COMP,HS}}$   | COMP enabled, high-speed mode |      | 33.0 |      | μA    |

### 5.2.1.3 CPU running

| Symbol            | Description                                                               | Min. | Typ. | Max. | Units |
|-------------------|---------------------------------------------------------------------------|------|------|------|-------|
| $I_{\text{CPU0}}$ | CPU running CoreMark @64 MHz from flash, Clock = HFXO, Regulator = DC/DC  |      | 3.3  |      | mA    |
| $I_{\text{CPU1}}$ | CPU running CoreMark @64 MHz from flash, Clock = HFXO                     |      | 5.6  |      | mA    |
| $I_{\text{CPU2}}$ | CPU running CoreMark @64 MHz from RAM, Clock = HFXO, Regulator = DC/DC    |      | 2.4  |      | mA    |
| $I_{\text{CPU3}}$ | CPU running CoreMark @64 MHz from RAM, Clock = HFXO                       |      | 4.7  |      | mA    |
| $I_{\text{CPU4}}$ | CPU running CoreMark @64 MHz from flash, Clock = HFINT, Regulator = DC/DC |      | 3.1  |      | mA    |

### 5.2.1.4 NFCT active

| Symbol                 | Description                         | Min. | Typ. | Max. | Units |
|------------------------|-------------------------------------|------|------|------|-------|
| $I_{\text{sense}}$     | Current in SENSE STATE <sup>4</sup> |      | 100  |      | nA    |
| $I_{\text{activated}}$ | Current in ACTIVATED STATE          |      | 400  |      | μA    |

<sup>4</sup> This current does not apply when in NFC field

### 5.2.1.5 Radio transmitting/receiving

| Symbol                  | Description                                                                                                                     | Min. | Typ. | Max. | Units |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| $I_{\text{RADIO\_TX0}}$ | Radio transmitting @ 8 dBm output power, 1 Mbps<br><i>Bluetooth</i> ® Low Energy (BLE) mode, Clock = HFXO, Regulator<br>= DC/DC |      | 15.5 |      | mA    |
| $I_{\text{RADIO\_TX1}}$ | Radio transmitting @ 0 dBm output power, 1 Mbps BLE<br>mode, Clock = HFXO, Regulator = DC/DC                                    |      | 6.0  |      | mA    |
| $I_{\text{RADIO\_TX2}}$ | Radio transmitting @ -40 dBm output power, 1 Mbps BLE<br>mode, Clock = HFXO, Regulator = DC/DC                                  |      | 3.5  |      | mA    |
| $I_{\text{RADIO\_TX3}}$ | Radio transmitting @ 0 dBm output power, 1 Mbps BLE<br>mode, Clock = HFXO                                                       |      | 11.0 |      | mA    |
| $I_{\text{RADIO\_TX4}}$ | Radio transmitting @ -40 dBm output power, 1 Mbps BLE<br>mode, Clock = HFXO                                                     |      | 5.4  |      | mA    |
| $I_{\text{RADIO\_TX5}}$ | Radio transmitting @ 0 dBm output power, 250 kbit/s IEE<br>802.15.4-2006 mode, Clock = HFXO, Regulator = DC/DC                  |      | 6.0  |      | mA    |
| $I_{\text{RADIO\_RX0}}$ | Radio receiving @ 1 Mbps BLE mode, Clock = HFXO,<br>Regulator = DC/DC                                                           |      | 6.0  |      | mA    |
| $I_{\text{RADIO\_RX1}}$ | Radio receiving @ 1 Mbps BLE mode, Clock = HFXO                                                                                 |      | 10.5 |      | mA    |
| $I_{\text{RADIO\_RX2}}$ | Radio receiving @ 250 kbit/s IEE 802.15.4-2006 mode, Clock<br>= HFXO, Regulator = DC/DC                                         |      | 6.2  |      | mA    |

Figure 13: Radio transmitting @ 8 dBm output power, 1 Mbps BLE mode, Clock = HFXO, Regulator = DC/DC (typical values)

Figure 14: Radio transmitting @ 0 dBm output power, 1 Mbps BLE mode, Clock = HFXO, Regulator = DC/DC (typical values)

### 5.2.1.6 RNG active

| Symbol            | Description | Min. | Typ. | Max. | Units |
|-------------------|-------------|------|------|------|-------|
| I <sub>RNG0</sub> | RNG running |      | 539  |      | μA    |

### 5.2.1.7 SAADC active

| Symbol                  | Description                                                                         | Min. | Typ. | Max. | Units |
|-------------------------|-------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>SAADC, RUN</sub> | SAADC sampling @ 16 kbps, Acquisition time = 20 μs, Clock = HFXO, Regulator = DC/DC |      | 1.37 |      | mA    |

### 5.2.1.8 TEMP active

| Symbol             | Description  | Min. | Typ. | Max. | Units |
|--------------------|--------------|------|------|------|-------|
| I <sub>TEMP0</sub> | TEMP started |      | 0.92 |      | mA    |

### 5.2.1.9 TIMER running

| Symbol              | Description                                        | Min. | Typ. | Max. | Units |
|---------------------|----------------------------------------------------|------|------|------|-------|
| I <sub>TIMER0</sub> | One TIMER instance running @ 1 MHz, Clock = HFINT  |      | 342  |      | μA    |
| I <sub>TIMER1</sub> | Two TIMER instances running @ 1 MHz, Clock = HFINT |      | 341  |      | μA    |
| I <sub>TIMER2</sub> | One TIMER instance running @ 1 MHz, Clock = HFXO   |      | 573  |      | μA    |
| I <sub>TIMER3</sub> | One TIMER instance running @ 16 MHz, Clock = HFINT |      | 497  |      | μA    |
| I <sub>TIMER4</sub> | One TIMER instance running @ 16 MHz, Clock = HFXO  |      | 729  |      | μA    |

### 5.2.1.10 USB running

| Symbol                 | Description                                                                                                                       | Min. | Typ. | Max. | Units   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------|
| $I_{USB,ACTIVE,VBUS}$  | Current from VBUS supply, USB active                                                                                              |      | 2.4  |      | mA      |
| $I_{USB,SUSPEND,VBUS}$ | Current from VBUS supply, USB suspended, CPU sleeping                                                                             |      | 262  |      | $\mu$ A |
| $I_{USB,ACTIVE,VDD}$   | Current from VDD supply (normal voltage mode), all RAM retained, regulator=LDO, CPU running, USB active                           |      | 7.73 |      | mA      |
| $I_{USB,SUSPEND,VDD}$  | Current from VDD supply (normal voltage mode), all RAM retained, regulator=LDO, CPU sleeping, USB suspended                       |      | 173  |      | $\mu$ A |
| $I_{USB,ACTIVE,VDDH}$  | Current from VDDH supply (high voltage mode), VDD=3 V (REG0 output), all RAM retained, regulator=LDO, CPU running, USB active     |      | 7.46 |      | mA      |
| $I_{USB,SUSPEND,VDDH}$ | Current from VDDH supply (high voltage mode), VDD=3 V (REG0 output), all RAM retained, regulator=LDO, CPU sleeping, USB suspended |      | 178  |      | $\mu$ A |
| $I_{USB,DISABLED,VDD}$ | Current from VDD supply, USB disabled, VBUS supply connected, all RAM retained, regulator=LDO, CPU sleeping                       |      | 7    |      | $\mu$ A |

### 5.2.1.11 WDT active

| Symbol            | Description | Min. | Typ. | Max. | Units   |
|-------------------|-------------|------|------|------|---------|

| $I_{S1}$ | CPU running CoreMark from flash, Radio receiving @ 1 Mbps BLE mode, Clock = HFXO, Regulator = DC/DC                                                        |      | 8.3  |      | mA    |
| $I_{S2}$ | CPU running CoreMark from flash, Radio transmitting @ 0 dBm output power, 1 Mbps BLE mode, Clock = HFXO                                                    |      | 16.7 |      | mA    |
| $I_{S3}$ | CPU running CoreMark from flash, Radio receiving @ 1 Mbps BLE mode, Clock = HFXO                                                                           |      | 16.2 |      | mA    |

## 5.3 POWER — Power supply

The power supply consists of a number of LDO and DC/DC regulators that are utilized to maximize the system's power efficiency.

This device has the following power supply features:

- On-chip LDO and DC/DC regulators
- Global System ON/OFF modes
- Individual RAM section power control for all system modes
- Analog or digital pin wakeup from System OFF
- Supervisor hardware to manage power-on reset, brownout, and power failure
- Auto-controlled refresh modes for LDO and DC/DC regulators to maximize efficiency
- Separate USB supply

### 5.3.1 Main supply

The main supply voltage is connected to the VDD/VDDH pins. The system will enter one of two supply voltage modes, Normal or High Voltage mode, depending on how the supply voltage is connected to these pins.

The system enters Normal Voltage mode when the supply voltage is connected to both the VDD and VDDH pins (pin VDD shorted to pin VDDH). For the supply voltage range to connect to both VDD and VDDH pins, see parameter  $V_{DD}$ .

The system enters High Voltage mode when the supply voltage is only connected to the VDDH pin and the VDD pin is not connected to any voltage supply. For the supply voltage range to connect to the VDDH pin, see parameter  $V_{DDH}$ .

The register [MAINREGSTATUS](#) on page 78 can be used to read the current supply voltage mode.

#### 5.3.1.1 Main voltage regulators

The system contains two main supply regulator stages, REG0 and REG1.

REG1 regulator stage has the regulator type options of Low-dropout regulator (LDO) and Buck regulator (DC/DC). REG0 regulator stage has only the option of Low-dropout regulator (LDO).

In Normal Voltage mode, only the REG1 regulator stage is used, and the REG0 stage is automatically disabled. In High Voltage mode, both regulator stages (REG0 and REG1) are used. The output voltage of REG0 can be configured in register [REGOUT0](#) on page 44. This output voltage is connected to VDD and is the input voltage to REG1.

**Note:** In High Voltage mode, the configured output voltage for REG0 ([REGOUT0](#) on page 44) must not be greater than REG0 input voltage minus the voltage drop in REG0 ( $V_{DDH} - V_{VDDH-VDD}$ ).

By default, the LDO regulators are enabled and the DC/DC regulator is disabled. Register [DCDCEN](#) on page 78 is used to enable the DC/DC regulator for REG1 stage.

When the DC/DC converter is enabled, the corresponding LDO regulator is disabled. External LC filter must be connected for the DC/DC regulator if it is being used. The advantage of using a DC/DC regulator is that the overall power consumption is normally reduced as the efficiency of such a regulator is higher than that of a LDO. The efficiency gained by using a DC/DC regulator is best seen when the regulator voltage drop (difference between input and output voltage) is high. The efficiency of internal regulators vary with the supply voltage and the current drawn from the regulators.

**Note:** Do not enable the DC/DC regulator without an external LC filter being connected as this will inhibit device operation, including debug access, until an LC filter is connected.

#### 5.3.1.2 GPIO levels

The GPIO high reference voltage is equal to the level on the VDD pin.

In Normal Voltage mode, the GPIO high level equals the voltage supplied to the VDD pin. In High Voltage mode, it equals the level specified in register [REGOUT0](#) on page 44.

#### 5.3.1.3 Regulator configuration examples

The voltage regulators can be configured in several ways, depending on the selected supply voltage mode (Normal/High) and the regulator type option for REG1 (LDO or DC/DC).

Four configuration examples are illustrated in the following figures.

Figure 15: Normal Voltage mode, REG1 LDO

Figure 16: Normal Voltage mode, REG1 DC/DC

Figure 17: High Voltage mode, REG1 LDO

Figure 18: High Voltage mode, REG1 DC/DC

### 5.3.1.4 Power supply supervisor

The power supply supervisor enables monitoring of the connected power supply.

The power supply supervisor provides the following functionality:

- Power-on reset - signals the circuit when a supply is connected
- An optional power-fail comparator (POF) - signals the application when the supply voltages drop below a configured threshold
- A fixed brownout reset detector - holds the system in reset when the voltage is too low for safe operation

The power supply supervisor is illustrated in the following figure.

Figure 19: Power supply supervisor

### 5.3.1.5 Power-fail comparator

Using the power-fail comparator (POF) is optional. When enabled, it can provide an early warning to the CPU of an impending power supply failure.

To enable and configure the power-fail comparator, see the register [POFCON](#) on page 77.

When the supply voltage falls below the defined threshold, the power-fail comparator generates an event (POFWARN) that can be used by an application to prepare for power failure. This event is also generated when the supply voltage is already below the threshold at the time the power-fail comparator is enabled, or if the threshold is re-configured to a level above the supply voltage.

Figure 21: USB voltage regulator

To ensure stability, the input and output of the USB regulator need to be decoupled with a suitable decoupling capacitor. See [Reference circuitry](#) on page 570 for the recommended values.

### 5.3.3 System OFF mode

System OFF is the deepest power saving mode the system can enter. In this mode, the system's core functionality is powered down and all ongoing tasks are terminated.

The device can be put into System OFF mode using the register [SYSTEMOFF](#) on page 76. When in System OFF mode, the device can be woken up through one of the following signals:

- The DETECT signal, optionally generated by the GPIO peripheral.
- The ANADETECT signal, optionally generated by the LPCOMP module.
- The SENSE signal, optionally generated by the NFC module to wake-on-field.
- Detecting a [valid USB voltage](#) on the VBUS pin ( $V_{BUS,DETECT}$ ).
- A reset.

The system is reset when it wakes up from System OFF mode.

One or more RAM sections can be retained in System OFF mode, depending on the settings in the RAM[n].POWER registers. RAM[n].POWER are retained registers. These registers are usually overwritten by the start-up code provided with the nRF application examples.

Before entering System OFF mode, all on-going EasyDMA transactions need to have completed. See peripheral specific chapters for more information about how to acquire the status of EasyDMA transactions.

#### 5.3.3.1 Emulated System OFF mode

If the device is in Debug Interface mode, System OFF will be emulated to secure that all required resources needed for debugging are available during System OFF.

Required resources needed for debugging include the following key components:

- [Debug and trace](#) on page 47
- [CLOCK — Clock control](#) on page 82
- [POWER — Power supply](#) on page 61
- [NVMC — Non-volatile memory controller](#) on page 23
- [CPU](#) on page 18
- Flash memory
- RAM

See [Debug and trace](#) on page 47 for more information.

Because the CPU is kept on in an emulated System OFF mode, it is recommended to add an infinite loop directly after entering System OFF, to prevent the CPU from executing code that normally should not be executed.

### 5.3.4 System ON mode

System ON is the default state after power-on reset. In System ON mode, all functional blocks such as the CPU or peripherals can be in IDLE or RUN mode, depending on the configuration set by the software and the state of the application executing.

Register [RESETREAS](#) on page 75 provides information about the source causing the wakeup or reset.

The system can switch the appropriate internal power sources on and off, depending on the amount of power needed at any given time. The power requirement of a peripheral is directly related to its activity level, and the activity level of a peripheral fluctuates when specific tasks are triggered or events are generated.

#### 5.3.4.1 Sub-power modes

In System ON mode, when the CPU and all peripherals are in IDLE mode, the system can reside in one of the two sub-power modes.

The sub-power modes are:

- Constant Latency
- Low-power

In Constant Latency mode, the CPU wakeup latency and the PPI task response are constant and kept at a minimum. This is secured by forcing a set of basic resources to be turned on while in sleep. The cost of constant and predictable latency is increased power consumption. Constant Latency mode is selected by triggering the CONSTLAT task.

In Low-power mode, the automatic power management system described in [System ON mode](#) on page 68 ensures that the most efficient supply option is chosen to save power. The cost of having the lowest possible power consumption is a varying CPU wakeup latency and PPI task response. Low-power mode is selected by triggering the LOWPWR task.

When the system enters System ON mode, it is by default in the sub-power mode Low-power.

### 5.3.5 RAM power control

The RAM power control registers are used for configuring the following:

- The RAM sections to be retained during System OFF
- The RAM sections to be retained and accessible during System ON

In System OFF, retention of a RAM section is configured in the RETENTION field of the corresponding register [RAM\[n\].POWER \(n=0..8\)](#) on page 79.

In System ON, retention and accessibility of a RAM section is configured in the RETENTION and POWER fields of the corresponding register [RAM\[n\].POWER \(n=0..8\)](#) on page 79.

The following table summarizes the behavior of these registers.

| Configuration |                    |                        | RAM section status |          |
|---------------|--------------------|------------------------|--------------------|----------|
| System on/off | RAM[n].POWER.POWER | RAM[n].POWER.RETENTION | Accessible         | Retained |
| Off           | x                  | Off                    | No                 | No       |
| Off           | x                  | On                     | No                 | Yes      |
| On            | Off                | Off                    | No                 | No       |
| On            | Off <sup>5</sup>   | On                     | No                 | Yes      |
| On            | On                 | x                      | Yes                | Yes      |

Table 17: RAM section configuration

The advantage of not retaining RAM contents is that the overall current consumption is reduced.

See [Memory](#) on page 19 for more information on RAM sections.

### 5.3.6 Reset

Several sources may trigger a reset.

After a reset has occurred, register [RESETREAS](#) can be read to determine which source triggered the reset.

#### 5.3.6.1 Power-on reset

The power-on reset generator initializes the system at power-on.

The system is held in reset state until the supply has reached the minimum operating voltage and the internal voltage regulators have started.

#### 5.3.6.2 Pin reset

A pin reset is generated when the physical reset pin on the device is asserted.

Pin reset is configured via both registers [PSELRESET\[n\]](#) ( $n=0..1$ ) on page 42.

#### 5.3.6.3 Wakeup from System OFF mode reset

The device is reset when it wakes up from System OFF mode.

The debug access port (DAP) is not reset following a wake up from System OFF mode if the device is in Debug Interface mode. See chapter [Debug and trace](#) on page 47 for more information.

#### 5.3.6.4 Soft reset

A soft reset is generated when the SYSRESETREQ bit of the application interrupt and reset control register (AIRCRR) in the ARM® core is set.

See [ARM documentation](#) for more details.

A soft reset can also be generated via the register [RESET](#) on page 51 in the CTRL-AP.

#### 5.3.6.5 Watchdog reset

A Watchdog reset is generated when the watchdog times out.

See chapter [WDT — Watchdog timer](#) on page 555 for more information.

<sup>5</sup> Not useful. RAM section power off gives negligible reduction in current consumption when retention is on.

### 5.3.6.6 Brownout reset

The brownout reset generator puts the system in a reset state if VDD drops below the brownout reset (BOR) threshold.

See section [Power fail comparator](#) on page 81 for more information.

### 5.3.6.7 Retained registers

A retained register is one that will retain its value in System OFF mode and through a reset, depending on the reset source. See the individual peripheral chapters for information on which of their registers are retained.

### 5.3.6.8 Reset behavior

The various reset sources and their targets are summarized in the table below.

| Reset source                      | Reset target |             |      |                    |        |                |     |                    |           |
|-----------------------------------|--------------|-------------|------|--------------------|--------|----------------|-----|--------------------|-----------|
|                                   | CPU          | Peripherals | GPIO | Debug <sup>6</sup> | SWJ-DP | RAM            | WDT | Retained registers | RESETREAS |
| CPU lockup <sup>7</sup>           | x            | x           | x    |                    |        |                |     |                    |           |
| Soft reset                        | x            | x           | x    |                    |        |                |     |                    |           |
| Wakeup from System OFF mode reset | x            | x           |      | x <sup>8</sup>     |        | x <sup>9</sup> | x   |                    |           |
| Watchdog reset <sup>10</sup>      | x            | x           | x    | x                  |        | x              | x   | x                  |           |
| Pin reset                         | x            | x           | x    | x                  |        | x              | x   | x                  |           |
| Brownout reset                    | x            | x           | x    | x                  | x      | x              | x   | x                  | x         |
| Power-on reset                    | x            | x           | x    | x                  | x      | x              | x   | x                  | x         |

**Note:** The RAM is never reset, but depending on a reset source the content of RAM may be corrupted.

## 5.3.7 Registers

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40000000   | POWER      | POWER    | Power control |               |

Table 18: Instances

| Register          | Offset | Description                              |
|-------------------|--------|------------------------------------------|
| TASKS_CONSTLAT    | 0x78   | Enable Constant Latency mode             |
| TASKS_LOWPWR      | 0x7C   | Enable Low-power mode (variable latency) |
| EVENTS_POFWARN    | 0x108  | Power failure warning                    |
| EVENTS_SLEEPENTER | 0x114  | CPU entered WFI/WFE sleep                |

<sup>6</sup> All debug components excluding SWJ-DP. See [Debug and trace](#) on page 47 for more information about the different debug components.

<sup>7</sup> Reset from CPU lockup is disabled if the device is in Debug Interface mode. CPU lockup is not possible in System OFF.

<sup>8</sup> The debug components will not be reset if the device is in Debug Interface mode.

<sup>9</sup> RAM is not reset on wakeup from System OFF mode. RAM, or certain parts of RAM, may not be retained after the device has entered System OFF mode, depending on the settings in the RAM registers.

<sup>10</sup> Watchdog reset is not available in System OFF.

| Register          | Offset | Description                           |            |
|-------------------|--------|---------------------------------------|------------|
| EVENTS_SLEEPEXIT  | 0x118  | CPU exited WFI/WFE sleep              |            |
| EVENTS_USBDTECTED | 0x11C  | Voltage supply detected on VBUS       |            |
| EVENTS_USBREMOVED | 0x120  | Voltage supply removed from VBUS      |            |
| EVENTS_USBPWRDY   | 0x124  | USB 3.3 V supply ready                |            |
| INTENSET          | 0x304  | Enable interrupt                      |            |
| INTENCLR          | 0x308  | Disable interrupt                     |            |
| RESETREAS         | 0x400  | Reset reason                          |            |
| RAMSTATUS         | 0x428  | RAM status register                   | Deprecated |
| USBREGSTATUS      | 0x438  | USB supply status                     |            |
| SYSTEMOFF         | 0x500  | System OFF register                   |            |
| POFCON            | 0x510  | Power-fail comparator configuration   |            |
| GPREGRET          | 0x51C  | General purpose retention register    |            |
| GPREGRET2         | 0x520  | General purpose retention register    |            |
| DCDCEN            | 0x578  | Enable DC/DC converter for REG1 stage |            |
| MAINREGSTATUS     | 0x640  | Main supply status                    |            |

### 5.3.7.11 RESETREAS

Address offset: 0x400

Reset reason

Unless cleared, the RESETREAS register will be cumulative. A field is cleared by writing '1' to it. If none of the reset sources are flagged, this indicates that the chip was reset from the on-chip reset generator, which will indicate a power-on-reset or a brownout reset.

### 5.3.7.12 RAMSTATUS ( Deprecated )

Address offset: 0x428

RAM status register

Since this register is deprecated the following substitutions have been made: RAM block 0 is equivalent to a block comprising RAM0.S0 and RAM1.S0. RAM block 1 is equivalent to a block comprising RAM2.S0 and RAM3.S0. RAM block 2 is equivalent to a block comprising RAM4.S0 and RAM5.S0. RAM block 3 is equivalent to a block comprising RAM6.S0 and RAM7.S0. A RAM block field will indicate ON as long as any of the RAM sections associated with a block are on.

| B                | RW         | THRESHOLD              |                                                                                       | Power-fail comparator threshold setting. This setting applies both for normal voltage mode (supply connected to both VDD and VDDH) and high voltage mode (supply connected to VDDH only). Values 0-3 set threshold below 1.7 V and should not be used as brown out detection will be activated before power failure warning on such low voltages. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 5.3.8 Electrical specification

### 5.3.8.1 Regulator operating conditions

| Symbol              | Description                                      | Min. | Typ. | Max. | Units |
|---------------------|--------------------------------------------------|------|------|------|-------|
| V <sub>DD,POR</sub> | VDD supply voltage needed during power-on reset  | 1.75 |      |      | V     |
| V <sub>DD</sub>     | Normal voltage mode operating voltage            | 1.7  | 3.0  | 3.6  | V     |
| V <sub>DDH</sub>    | High voltage mode operating voltage              | 2.5  | 3.7  | 5.5  | V     |
| C <sub>VDD</sub>    | Effective decoupling capacitance on the VDD pin  | 2.7  | 4.7  | 5.5  | μF    |
| C <sub>DEC4</sub>   | Effective decoupling capacitance on the DEC4 pin | 0.7  | 1    | 1.3  | μF    |

### 5.3.8.2 Regulator specifications, REG0 stage

| Symbol                       | Description                                                                                                                             | Min. | Typ. | Max. | Units |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| V <sub>REG0OUT</sub>         | REG0 output voltage                                                                                                                     | 1.8  |      | 3.3  | V     |
| V <sub>REG0OUT,ERR</sub>     | REG0 output voltage error (deviation from setting in <a href="#">REG0OUT</a> on page 44)                                                | -10  |      | 5    | %     |
| V <sub>REG0OUT,ERR,EXT</sub> | REG0 output voltage error (deviation from setting in <a href="#">REG0OUT</a> on page 44), extended temperature range                    | -10  |      | 7    | %     |
| V <sub>VDDH-VDD</sub>        | Required difference between input voltage (VDDH) and output voltage (VDD, configured in <a href="#">REG0OUT</a> on page 44), VDDH > VDD | 0.3  |      |      | V     |

### 5.3.8.3 Device startup times

| Symbol                          | Description                                                                                          | Min. | Typ. | Max. | Units |
|---------------------------------|------------------------------------------------------------------------------------------------------|------|------|------|-------|
| t <sub>POR</sub>                | Time in power-on reset after supply reaches minimum operating voltage, depending on supply rise time |      |      |      |       |
| t <sub>POR,10μs</sub>           | VDD rise time 10 μs <sup>11</sup>                                                                    |      | 1    | 10   | ms    |
| t <sub>POR,10ms</sub>           | VDD rise time 10 ms <sup>11</sup>                                                                    |      | 9    |      | ms    |
| t <sub>POR,60ms</sub>           | VDD rise time 60 ms <sup>11</sup>                                                                    |      | 23   | 110  | ms    |
| t <sub>RISE,REG0OUT</sub>       | REG0 output (VDD) rise time after VDDH reaches minimum VDDH supply voltage <sup>11</sup>             |      |      |      |       |
| t <sub>RISE,REG0OUT,10μs</sub>  | VDDH rise time 10 μs <sup>11</sup>                                                                   |      | 0.22 | 1.55 | ms    |
| t <sub>RISE,REG0OUT,10ms</sub>  | VDDH rise time 10 ms <sup>11</sup>                                                                   |      | 5    |      | ms    |
| t <sub>RISE,REG0OUT,100ms</sub> | VDDH rise time 100 ms <sup>11</sup>                                                                  | 30   | 50   | 80   | ms    |
| t <sub>PINR</sub>               | Reset time when using pin reset, depending on pin capacitance                                        |      |      |      |       |
| t <sub>PINR,500nF</sub>         | 500 nF capacitance at reset pin                                                                      |      |      | 32.5 | ms    |

<sup>11</sup> See [Recommended operating conditions](#) on page 611 for more information.

| Symbol                    | Description                                                           | Min.            | Typ.   | Max. | Units |
|---------------------------|-----------------------------------------------------------------------|-----------------|--------|------|-------|
| t <sub>PINR,10μF</sub>    | 10 μF capacitance at reset pin                                        |                 |        | 650  | ms    |
| t <sub>R2ON</sub>         | Time from power-on reset to System ON                                 |                 |        |      |       |
| t <sub>R2ON,NOTCONF</sub> | If reset pin not configured                                           | tPOR            |        |      | ms    |
| t <sub>R2ON,CONF</sub>    | If reset pin configured                                               | tPOR +<br>tPINR |        |      | ms    |
| t <sub>OFF2ON</sub>       | Time from OFF to CPU execute                                          |                 | 16.5   |      | μs    |
| t <sub>IDLE2CPU</sub>     | Time from IDLE to CPU execute                                         |                 | 3.0    |      | μs    |
| t <sub>EVTSET,CL1</sub>   | Time from HW event to PPI event in Constant Latency<br>System ON mode |                 | 0.0625 |      | μs    |
| t <sub>EVTSET,CL0</sub>   | Time from HW event to PPI event in Low Power System ON<br>mode        |                 | 0.0625 |      | μs    |

### 5.3.8.4 Power fail comparator

| Symbol               | Description                                                                                                                                                                | Min. | Typ. | Max. | Units |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| V <sub>POF,NV</sub>  | Nominal power level warning thresholds (falling supply voltage) in Normal voltage mode (supply on VDD). Levels are configurable between Min. and Max. in 100 mV increments | 1.7  |      | 2.8  | V     |
| V <sub>POF,HV</sub>  | Nominal power level warning thresholds (falling supply voltage) in High voltage mode (supply on VDDH). Levels are configurable in 100 mV increments                        | 2.7  |      | 4.2  | V     |
| V <sub>POFTOL</sub>  | Threshold voltage tolerance (applies in both Normal voltage mode and High voltage mode)                                                                                    | -5   |      | 5    | %     |
| V <sub>POFHYST</sub> | Threshold voltage hysteresis (applies in both Normal voltage mode and High voltage mode)                                                                                   | 40   | 50   | 60   | mV    |
| V <sub>BOR,OFF</sub> | Brownout reset voltage range System OFF mode. Brownout only applies to the voltage on VDD                                                                                  | 1.2  |      | 1.62 | V     |
| V <sub>BOR,ON</sub>  | Brownout reset voltage range System ON mode. Brownout only applies to the voltage on VDD                                                                                   | 1.57 | 1.6  | 1.63 | V     |

### 5.3.8.5 USB operating conditions

| Symbol            | Description                | Min.      | Typ. | Max.            | Units |
|-------------------|----------------------------|-----------|------|-----------------|-------|
| V <sub>BUS</sub>  | Supply voltage on VBUS pin | 4.35      | 5    | 5.5             | V     |
| V <sub>DPDM</sub> | Voltage on D+ and D- lines | VSS - 0.3 |      | VUSB33<br>+ 0.3 | V     |

### 5.3.8.6 USB regulator specifications

| Symbol                       | Description                                                                            | Min. | Typ. | Max. | Units |
|------------------------------|----------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>USB,QUIES</sub>       | USB regulator quiescent current drawn from VBUS (USBD enabled)                         |      | 170  |      | μA    |
| t <sub>USBPWRRDY</sub>       | Time from USB enabled to USBPWRRDY event triggered, V <sub>BUS</sub> supply provided   |      | 1    |      | ms    |
| V <sub>USB33</sub>           | On voltage at the USB regulator output (DECUSB pin)                                    | 3.0  | 3.3  | 3.6  | V     |
| R <sub>SOURCE,VBUS</sub>     | Maximum source resistance on VBUS, including cable, when VDDH is not connected to VBUS |      |      | 6    | Ω     |
| R <sub>SOURCE,VBUSVDDH</sub> | Maximum source resistance on VBUS, including cable, when VDDH is connected to VBUS     |      |      | 3.8  | Ω     |
| C <sub>DECUSB</sub>          | Decoupling capacitor on the DECUSB pin                                                 | 2.35 | 4.7  | 5.5  | μF    |

### 5.3.8.7 VBUS detection specifications

| Symbol                  | Description                                                  | Min. | Typ. | Max. | Units |
|-------------------------|--------------------------------------------------------------|------|------|------|-------|
| V <sub>BUS,DETECT</sub> | Voltage at which rising VBUS gets reported by USBDETECTED    | 3.4  | 4.0  | 4.3  | V     |
| V <sub>BUS,REMOVE</sub> | Voltage at which decreasing VBUS gets reported by USBREMOVED | 3.0  | 3.6  | 3.9  | V     |

## 5.4 CLOCK — Clock control

The clock control system can source the system clocks from a range of internal or external high and low frequency oscillators and distribute them to modules based upon a module's individual requirements. Clock distribution is automated and grouped independently by module to limit current consumption in unused branches of the clock tree.

Listed here are the main features for CLOCK:

- 64 MHz on-chip oscillator
- 64 MHz crystal oscillator, using external 32 MHz crystal
- 32.768 kHz +/-500 ppm RC oscillator
- 32.768 kHz crystal oscillator, using external 32.768 kHz crystal
- 32.768 kHz oscillator synthesized from 64 MHz oscillator
- Firmware (FW) override control of crystal oscillator activity for low latency start up
- Automatic internal oscillator and clock control, and distribution for ultra-low power

Figure 22: Clock control

### 5.4.1 HFCLK controller

The HFCLK controller provides several clock signals in the system.

These are as follows:

- HCLK64M: 64 MHz CPU clock
- PCLK1M: 1 MHz peripheral clock
- PCLK16M: 16 MHz peripheral clock
- PCLK32M: 32 MHz peripheral clock

The HFCLK controller uses the following high frequency clock (HFCLK) sources:

- 64 MHz internal oscillator (HFINT)
- 64 MHz crystal oscillator (HFXO)

For illustration, see [Clock control](#) on page 82.

The HFCLK controller will automatically provide the clock(s) requested by the system. If the system does not request any clocks from the HFCLK controller, the controller will enter a power saving mode.

The HFINT source will be used when HFCLK is requested and HFXO has not been started.

The HFXO is started by triggering the HFCLKSTART task and stopped by triggering the HFCLKSTOP task. When the HFCLKSTART task is triggered, the HFCLKSTARTED event is generated once the HFXO startup time has elapsed. The HFXO startup time is given as the sum of the following:

- HFXO power-up time, as specified in [64 MHz crystal oscillator \(HFXO\)](#) on page 95.
- HFXO debounce time, as specified in register [HFXODEBOUNCE](#) on page 94.

The HFXO must be running to use the RADIO or the calibration mechanism associated with the 32.768 kHz RC oscillator.

#### 5.4.1.1 64 MHz crystal oscillator (HFXO)

The 64 MHz crystal oscillator (HFXO) is controlled by a 32 MHz external crystal.

The crystal oscillator is designed for use with an AT-cut quartz crystal in parallel resonant mode. To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet.

[Circuit diagram of the 64 MHz crystal oscillator](#) on page 83 shows how the 32 MHz crystal is connected to the 64 MHz crystal oscillator.

Figure 23: Circuit diagram of the 64 MHz crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is given by:

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground. For more information, see [Reference circuitry](#) on page 570.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitances on the PCB.  $C_{pin}$  is the pin input capacitance on the XC1 and XC2 pins. See table [64 MHz crystal oscillator \(HFXO\)](#) on page 95. The load capacitors C1 and C2 should have the same value.

For reliable operation, the crystal load capacitance, shunt capacitance, equivalent series resistance, and drive level must comply with the specifications in table [64 MHz crystal oscillator \(HFXO\)](#) on page 95. It is recommended to use a crystal with lower than maximum load capacitance and/or shunt capacitance. A low load capacitance will reduce both start up time and current consumption.

## 5.4.2 LFCLK controller

The system supports several low frequency clock sources.

As illustrated in [Clock control](#) on page 82, the system supports the following low frequency clock sources:

- 32.768 kHz RC oscillator (LFRC)
- 32.768 kHz crystal oscillator (LFXO)
- 32.768 kHz synthesized from HFCLK (LFSYNT)

The LFCLK controller and all of the LFCLK clock sources are always switched off when in System OFF mode.

The LFCLK clock is started by first selecting the preferred clock source in register [LFCLKSRC](#) on page 93 and then triggering the LFCLKSTART task. If the LFXO is selected as the clock source, the LFCLK will initially start running from the 32.768 kHz LFRC while the LFXO is starting up and automatically switch to using the LFXO once this oscillator is running. The LFCLKSTARTED event will be generated when the LFXO has been started.

The register [LFXODEBOUNCE](#) on page 94 is used to configure the LFXO debounce time. The register must be modified if operating in the Extended Operating Conditions temperature range, see [Recommended operating conditions](#) on page 611. The LFXO start up time will be increased as a result.

The LFCLK clock is stopped by triggering the LFCLKSTOP task.

Register [LFCLKSRC](#) on page 93 controls the clock source, and its allowed swing. The truth table for various situations is as follows:

| SRC | EXTERNAL | BYPASS | Comment                                                                    |
|-----|----------|--------|----------------------------------------------------------------------------|
| 0   | 0        | 0      | Normal operation, LFRC is source                                           |
| 0   | 0        | 1      | DO NOT USE                                                                 |

| 1   | 1        | 1      | Apply external full swing signal to XL1, leave XL2 grounded or unconnected |
| 1   | 0        | 1      | DO NOT USE                                                                 |
| 2   | 0        | 0      | Normal operation, LFSYNT is source                                         |
| 2   | 0        | 1      | DO NOT USE                                                                 |
| 2   | 1        | X      | DO NOT USE                                                                 |

Table 20: LFCLKSRC configuration depending on clock source

It is not allowed to write to register **LFCLKSRC** on page 93 when the LFCLK is running.

A LFCLKSTOP task will stop the LFCLK oscillator. However, the LFCLKSTOP task can only be triggered after the STATE field in register **LFCLKSTAT** on page 93 indicates LFCLK running state.

The synthesized 32.768 kHz clock depends on the HFCLK to run. If high accuracy is required for the LFCLK running off the synthesized 32.768 kHz clock, the HFCLK must running from the HFXO source.

#### 5.4.2.1 32.768 kHz RC oscillator (LFRC)

The default source of the low frequency clock (LFCLK) is the 32.768 kHz RC oscillator (LFRC).

The LFRC oscillator does not require additional external components.

The LFRC frequency will be affected by variation in temperature. The LFRC oscillator can be calibrated to improve accuracy by using the HFXO as a reference oscillator during calibration.

#### 5.4.2.2 Calibrating the 32.768 kHz RC oscillator

After the LFRC oscillator is started and running, it can be calibrated by triggering the CAL task.

The LFRC oscillator will then temporarily request the HFCLK to be used as a reference for the calibration. A DONE event will be generated when calibration has finished. The HFCLK crystal oscillator has to be started (by triggering the HFCLKSTART task) in order for the calibration mechanism to work.

It is not allowed to stop the LFRC during an ongoing calibration.

#### 5.4.2.3 Calibration timer

The calibration timer can be used to time the calibration interval of the 32.768 kHz RC oscillator.

The calibration timer is started by triggering the CTSTART task and stopped by triggering the CTSTOP task. The calibration timer will always start counting down from the value specified in **CTIV (Retained)** on page 95 and generate a CTTO event when it reaches 0. The calibration timer will automatically stop when it reaches 0.

Figure 24: Calibration timer

After a CTSTART task has been triggered, the calibration timer will ignore further tasks until it has returned the CTSTARTED event. Likewise, after a CTSTOP task has been triggered, the calibration timer will ignore further tasks until it has returned a CTSTOPPED event. Triggering CTSTART while the calibration timer

is running will immediately return a CTSTARTED event. Triggering CTSTOP when the calibration timer is stopped will immediately return a CTSTOPPED event.

#### 5.4.2.4 32.768 kHz crystal oscillator (LFXO)

For higher LFCLK accuracy (when better than +/- 500 ppm accuracy is required), the low frequency crystal oscillator (LFXO) must be used.

The following external clock sources are supported:

- Low swing clock signal applied to the XL1 pin. The XL2 pin shall then be grounded.
- Rail-to-rail clock signal applied to the XL1 pin. The XL2 pin shall then be grounded or left unconnected.

To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet. [Circuit diagram of the 32.768 kHz crystal oscillator](#) on page 86 shows the LFXO circuitry.

Figure 25: Circuit diagram of the 32.768 kHz crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is given by:

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitances on the PCB.  $C_{pin}$  is the pin input capacitance on the XC1 and XC2 pins (see [Low frequency crystal oscillator \(LFXO\)](#) on page 96). The load capacitors C1 and C2 should have the same value.

For more information, see [Reference circuitry](#) on page 570.

#### 5.4.2.5 32.768 kHz synthesized from HFCLK (LFSYNT)

LFCLK can also be synthesized from the HFCLK clock source. The accuracy of LFCLK will then be the accuracy of the HFCLK.

Using the LFSYNT clock avoids the requirement for a 32.768 kHz crystal, but increases average power consumption as the HFCLK will need to be requested in the system.

## 5.4.3 Registers

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40000000   | CLOCK      | CLOCK    | Clock control |               |

Table 21: Instances

| Register            | Offset | Description                                                                                                                        |          |
|---------------------|--------|------------------------------------------------------------------------------------------------------------------------------------|----------|

### 5.4.3.22 HFXODEBOUNCE

Address offset: 0x528

HFXO debounce time. The HFXO is started by triggering the TASKS\_HFCLKSTART task.

The EVENTS\_HFCLKSTARTED event is generated after the HFXO power up time + the HFXO debounce time has elapsed. It is not allowed to change the value of this register while the HFXO is starting.

<sup>12</sup> Constant temperature within ±0.5 °C, calibration performed at least every 8 seconds, averaging interval > 7.5 ms, defined as 3 sigma

# 6 Peripherals

## 6.1 Peripheral interface

Peripherals are controlled by the CPU by writing to configuration registers and task registers. Peripheral events are indicated to the CPU by event registers and interrupts if they are configured for a given event.

Figure 26: Tasks, events, shortcuts, and interrupts

### 6.1.1 Peripheral ID

Every peripheral is assigned a fixed block of 0x1000 bytes of address space, which is equal to 1024 x 32 bit registers.

See [Instantiation](#) on page 22 for more information about which peripherals are available and where they are located in the address map.

There is a direct relationship between peripheral ID and base address. For example, a peripheral with base address 0x40000000 is assigned ID=0, a peripheral with base address 0x40001000 is assigned ID=1, and a peripheral with base address 0x4001F000 is assigned ID=31.

Peripherals may share the same ID, which may impose one or more of the following limitations:

- Some peripherals share some registers or other common resources.
- Operation is mutually exclusive. Only one of the peripherals can be used at a time.
- Switching from one peripheral to another must follow a specific pattern (disable the first, then enable the second peripheral).

## 6.1.2 Peripherals with shared ID

In general (with the exception of ID 0), peripherals sharing an ID and base address may not be used simultaneously. The user can only enable one peripheral at the time on this specific ID.

When switching between two peripherals sharing an ID, the user should do the following to prevent unwanted behavior:

1. Disable the previously used peripheral.
2. Remove any programmable peripheral interconnect (PPI) connections set up for the peripheral that is being disabled.
3. Clear all bits in the INTEN register, i.e. `INTENCLR = 0xFFFFFFFF`.
4. Explicitly configure the peripheral that you are about to enable and do not rely on configuration values that may be inherited from the peripheral that was disabled.
5. Enable the now configured peripheral.

See which peripherals are sharing ID in [Instantiation](#) on page 22.

## 6.1.3 Peripheral registers

Most peripherals feature an ENABLE register. Unless otherwise specified in the relevant chapter, the peripheral registers (in particular the PSEL registers) must be configured before enabling the peripheral.

The peripheral must be enabled before tasks and events can be used.

## 6.1.4 Bit set and clear

Registers with multiple single-bit bit fields may implement the set-and-clear pattern. This pattern enables firmware to set and clear individual bits in a register without having to perform a read-modify-write operation on the main register.

This pattern is implemented using three consecutive addresses in the register map, where the main register is followed by dedicated SET and CLR registers (in that exact order).

The SET register is used to set individual bits in the main register while the CLR register is used to clear individual bits in the main register. Writing 1 to a bit in SET or CLR register will set or clear the same bit in the main register respectively. Writing 0 to a bit in SET or CLR register has no effect. Reading the SET or CLR register returns the value of the main register.

**Note:** The main register may not be visible and hence not directly accessible in all cases.

## 6.1.5 Tasks

Tasks are used to trigger actions in a peripheral, for example to start a particular behavior. A peripheral can implement multiple tasks with each task having a separate register in that peripheral's task register group.

A task is triggered when firmware writes 1 to the task register, or when the peripheral itself or another peripheral toggles the corresponding task signal. See [Tasks, events, shortcuts, and interrupts](#) on page 98.

## 6.1.6 Events

Events are used to notify peripherals and the CPU about events that have happened, for example a state change in a peripheral. A peripheral may generate multiple events with each event having a separate register in that peripheral's event register group.

An event is generated when the peripheral itself toggles the corresponding event signal, and the event register is updated to reflect that the event has been generated. See [Tasks, events, shortcuts, and interrupts](#) on page 98. An event register is only cleared when firmware writes 0 to it.

Events can be generated by the peripheral even when the event register is set to 1.

### 6.1.7 Shortcuts

A shortcut is a direct connection between an event and a task within the same peripheral. If a shortcut is enabled, the associated task is automatically triggered when its associated event is generated.

Using a shortcut is the equivalent to making the same connection outside the peripheral and through the PPI. However, the propagation delay through the shortcut is usually shorter than the propagation delay through the PPI.

Shortcuts are predefined, which means their connections cannot be configured by firmware. Each shortcut can be individually enabled or disabled through the shortcut register, one bit per shortcut, giving a maximum of 32 shortcuts for each peripheral.

### 6.1.8 Interrupts

All peripherals support interrupts. Interrupts are generated by events.

A peripheral only occupies one interrupt, and the interrupt number follows the peripheral ID. For example, the peripheral with ID=4 is connected to interrupt number 4 in the nested vectored interrupt controller (NVIC).

Using the INTEN, INTENSET, and INTENCLR registers, every event generated by a peripheral can be configured to generate that peripheral's interrupt. Multiple events can be enabled to generate interrupts simultaneously. To resolve the correct interrupt source, the event registers in the event group of peripheral registers will indicate the source.

Some peripherals implement only INTENSET and INTENCLR registers, and the INTEN register is not available on those peripherals. See the individual peripheral chapters for details. In all cases, reading back the INTENSET or INTENCLR register returns the same information as in INTEN.

Each event implemented in the peripheral is associated with a specific bit position in the INTEN, INTENSET, and INTENCLR registers.

The relationship between tasks, events, shortcuts, and interrupts is shown in [Tasks, events, shortcuts, and interrupts](#) on page 98.

### Interrupt clearing

Clearing an interrupt by writing 0 to an event register, or disabling an interrupt using the INTENCLR register, can take up to four CPU clock cycles to take effect. This means that an interrupt may reoccur immediately, even if a new event has not come, if the program exits an interrupt handler after the interrupt is cleared or disabled but before four clock cycles have passed.

**Note:** To avoid an interrupt reoccurring before a new event has come, the program should perform a read from one of the peripheral registers. For example, the event register that has been cleared, or the INTENCLR register that has been used to disable the interrupt. This will cause a one to three-cycle delay and ensure the interrupt is cleared before exiting the interrupt handler.

Care should be taken to ensure the compiler does not remove the read operation as an optimization. If the program can guarantee a four-cycle delay after an event is cleared or an interrupt is disabled, then a read of a register is not required.

## 6.2 AAR — Accelerated address resolver

Accelerated address resolver is a cryptographic support function for implementing the Resolvable Private Address Resolution procedure described in *Bluetooth Core Specification v4.0*. Resolvable Private Address generation should be achieved using ECB and is not supported by AAR.

The procedure allows two devices that share a secret key to generate and resolve a hash based on their device address. The AAR block enables real-time address resolution on incoming packets when configured as described in this chapter. This allows real-time packet filtering (whitelisting) using a list of known shared keys (Identity Resolving Keys (IRK) in *Bluetooth*).

### 6.2.1 EasyDMA

AAR implements EasyDMA for reading and writing to RAM. EasyDMA will have finished accessing RAM when the END, RESOLVED, and NOTRESOLVED events are generated.

If the [IRKPTR](#) on page 106, [ADDRPTR](#) on page 106, and the [SCRATCHPTR](#) on page 106 is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

### 6.2.2 Resolving a resolvable address

A private resolvable address is composed of six bytes according to the *Bluetooth Core Specification*.

Figure 27: Resolvable address

To resolve an address, the register [ADDRPTR](#) on page 106 must point to the start of the packet. The resolver is started by triggering the START task. A RESOLVED event is generated when AAR manages to resolve the address using one of the Identity Resolving Keys (IRK) found in the IRK data structure. AAR will use the IRK specified in the register IRK0 to IRK15 starting from IRK0. The register [NIRK](#) on page 105 specifies how many IRKs should be used. The AAR module will generate a NOTRESOLVED event if it is not able to resolve the address using the specified list of IRKs.

AAR will go through the list of available IRKs in the IRK data structure and for each IRK try to resolve the address according to the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification v4.0* [Vol 3] chapter 10.8.2.3. The time it takes to resolve an address varies due to the location in the list of the resolvable address. The resolution time will also be affected by RAM accesses performed by other peripherals and the CPU. See the [Electrical specifications](#) for more information about resolution time.

AAR only compares the received address to those programmed in the module without checking the address type.

AAR will stop as soon as it has managed to resolve the address, or after trying to resolve the address using NIRK number of IRKs from the IRK data structure. AAR will generate an END event after it has stopped.

Figure 28: Address resolution with packet preloaded into RAM

### 6.2.3 Example

The following example shows how to chain RADIO packet reception with address resolution using AAR.

AAR may be started as soon as the 6 bytes required by AAR have been received by RADIO and stored in RAM. The ADDRPTR pointer must point to the start of packet.

Figure 29: Address resolution with packet loaded into RAM by RADIO

### 6.2.4 IRK data structure

The IRK data structure is located in RAM at the memory location specified by the IRKPTR register.

| Property | Address offset | Description              |
|----------|----------------|--------------------------|
| IRK0     | 0              | IRK number 0 (16 bytes)  |
| IRK1     | 16             | IRK number 1 (16 bytes)  |
| ..       | ..             | ..                       |
| IRK15    | 240            | IRK number 15 (16 bytes) |

Table 23: IRK data structure overview

### 6.2.5 Registers

| Base address | Peripheral | Instance | Description                  | Configuration |
|--------------|------------|----------|------------------------------|---------------|
| 0x4000F000   | AAR        | AAR      | Accelerated address resolver |               |

Table 24: Instances

| Register    | Offset | Description                                                                 |
|-------------|--------|-----------------------------------------------------------------------------|
| TASKS_START | 0x000  | Start resolving addresses based on IRKs specified in the IRK data structure |
| TASKS_STOP  | 0x008  | Stop resolving addresses                                                    |
| EVENTS_END  | 0x100  | Address resolution procedure complete                                       |

| Register           | Offset | Description                                     |
|--------------------|--------|-------------------------------------------------|
| EVENTS_RESOLVED    | 0x104  | Address resolved                                |
| EVENTS_NOTRESOLVED | 0x108  | Address not resolved                            |
| INTENSET           | 0x304  | Enable interrupt                                |
| INTENCLR           | 0x308  | Disable interrupt                               |
| STATUS             | 0x400  | Resolution status                               |
| ENABLE             | 0x500  | Enable AAR                                      |
| NIRK               | 0x504  | Number of IRKs                                  |
| IRKPTR             | 0x508  | Pointer to IRK data structure                   |
| ADDRPTR            | 0x510  | Pointer to the resolvable address               |
| SCRATCHPTR         | 0x514  | Pointer to data area used for temporary storage |

Table 25: Register overview

### 6.2.5.1 TASKS\_START

Address offset: 0x000

Start resolving addresses based on IRKs specified in the IRK data structure

## 6.2.6 Electrical specification

### 6.2.6.1 AAR Electrical Specification

| Symbol      | Description                                                                                                                                                                               | Min. | Typ. | Max. | Units   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------|
| $t_{AAR}$   | Address resolution time per IRK. Total time for several IRKs is given as $(1 \mu s + n * t_{AAR})$ , where n is the number of IRKs. (Given priority to the actual destination RAM block). |      |      | 6    | $\mu s$ |
| $t_{AAR,8}$ | Time for address resolution of 8 IRKs. (Given priority to the actual destination RAM block).                                                                                              |      |      | 49   | $\mu s$ |

## 6.3 ACL — Access control lists

The Access control lists (ACL) peripheral is designed to assign and enforce access permission schemes for different regions of the on-chip flash memory map.

Flash memory regions can be assigned individual ACL permission schemes. The following registers are involved:

- PERM register - configures permission schemes
- ADDR register - defines the flash page start address (word-aligned)
- SIZE register - determines the size of the region where the permission schemes are applied

**Note:** The size of the region is restricted to a multiple of the flash page size, measured in bytes. The maximum region is limited to half the size of the flash page. See [Memory](#) on page 19 for more information.

Figure 30: On-chip flash memory protected regions

There are four defined ACL permission schemes, each with different combinations of read/write permissions, as shown in the following table.

| Read | Write | Protection description                                                     |
|------|-------|----------------------------------------------------------------------------|
| 0    | 0     | No protection. Entire region can be executed, read, written to, or erased. |
| 0    | 1     | Region can be executed and read, but not written to or erased.             |
| 1    | 0     | Region can be written to and erased, but not executed or read.             |
| 1    | 1     | Region is locked for all access until next reset.                          |

Table 26: ACL permission schemes

**Note:** If a permission violation to a protected region is detected by the ACL peripheral, the request is blocked and a Bus Fault exception is triggered.

Access control to a configured region is enforced by the hardware. This goes into effect two CPU clock cycles after the ADDR, SIZE, and PERM registers for an ACL instance are written successfully. There are two dependencies for protection to be enforced. First, a valid start address for the flash page boundary must be written to the ADDR register. Second, the SIZE and PERM registers cannot be zero.

The ADDR, SIZE, and PERM registers can only be written once. All ACL configuration registers are cleared on reset by resetting the device from a reset source. This is the only way of clearing the configuration registers. To ensure that the ACL peripheral always enforces the desired permission schemes, the device boot sequence must perform the necessary configuration.

Debugger read access to a read-protected region will be Read-As-Zero (RAZ), while debugger write access to a write-protected region will be Write-Ignored (WI).

### 6.3.1 Registers

| Base address | Peripheral | Instance | Description          | Configuration |
|--------------|------------|----------|----------------------|---------------|
| 0x4001E000   | ACL        | ACL      | Access control lists |               |

Table 27: Instances

| Register       | Offset | Description                                                                                  |
|----------------|--------|----------------------------------------------------------------------------------------------|
| ACL[0].ADDR    | 0x800  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[0].SIZE    | 0x804  | Size of region to protect counting from address ACL[0].ADDR. Writing a '0' has no effect.    |
| ACL[0].PERM    | 0x808  | Access permissions for region 0 as defined by start address ACL[0].ADDR and size ACL[0].SIZE |
| ACL[0].UNUSED0 | 0x80C  | Reserved                                                                                     |
| ACL[1].ADDR    | 0x810  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[1].SIZE    | 0x814  | Size of region to protect counting from address ACL[1].ADDR. Writing a '0' has no effect.    |
| ACL[1].PERM    | 0x818  | Access permissions for region 1 as defined by start address ACL[1].ADDR and size ACL[1].SIZE |
| ACL[1].UNUSED0 | 0x81C  | Reserved                                                                                     |
| ACL[2].ADDR    | 0x820  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[2].SIZE    | 0x824  | Size of region to protect counting from address ACL[2].ADDR. Writing a '0' has no effect.    |
| ACL[2].PERM    | 0x828  | Access permissions for region 2 as defined by start address ACL[2].ADDR and size ACL[2].SIZE |
| ACL[2].UNUSED0 | 0x82C  | Reserved                                                                                     |
| ACL[3].ADDR    | 0x830  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[3].SIZE    | 0x834  | Size of region to protect counting from address ACL[3].ADDR. Writing a '0' has no effect.    |
| ACL[3].PERM    | 0x838  | Access permissions for region 3 as defined by start address ACL[3].ADDR and size ACL[3].SIZE |
| ACL[3].UNUSED0 | 0x83C  | Reserved                                                                                     |
| ACL[4].ADDR    | 0x840  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[4].SIZE    | 0x844  | Size of region to protect counting from address ACL[4].ADDR. Writing a '0' has no effect.    |
| ACL[4].PERM    | 0x848  | Access permissions for region 4 as defined by start address ACL[4].ADDR and size ACL[4].SIZE |
| ACL[4].UNUSED0 | 0x84C  | Reserved                                                                                     |

| Register       | Offset | Description                                                                                  |
|----------------|--------|----------------------------------------------------------------------------------------------|
| ACL[5].ADDR    | 0x850  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[5].SIZE    | 0x854  | Size of region to protect counting from address ACL[5].ADDR. Writing a '0' has no effect.    |
| ACL[5].PERM    | 0x858  | Access permissions for region 5 as defined by start address ACL[5].ADDR and size ACL[5].SIZE |
| ACL[5].UNUSED0 | 0x85C  | Reserved                                                                                     |
| ACL[6].ADDR    | 0x860  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[6].SIZE    | 0x864  | Size of region to protect counting from address ACL[6].ADDR. Writing a '0' has no effect.    |
| ACL[6].PERM    | 0x868  | Access permissions for region 6 as defined by start address ACL[6].ADDR and size ACL[6].SIZE |
| ACL[6].UNUSED0 | 0x86C  | Reserved                                                                                     |
| ACL[7].ADDR    | 0x870  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[7].SIZE    | 0x874  | Size of region to protect counting from address ACL[7].ADDR. Writing a '0' has no effect.    |
| ACL[7].PERM    | 0x878  | Access permissions for region 7 as defined by start address ACL[7].ADDR and size ACL[7].SIZE |
| ACL[7].UNUSED0 | 0x87C  | Reserved                                                                                     |

Table 28: Register overview

### 6.3.1.1 ACL[n].ADDR (n=0..7)

Address offset:  $0x800 + (n \times 0x10)$

Start address of region to protect. The start address must be word-aligned.

This register can only be written once.

|                  |            |          |       |    |                                                                                         |    |             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| A                | RW1 ADDR   |          |       |    | Start address of flash region n. The start address must point to a flash page boundary. |    |             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

### 6.3.1.2 ACL[n].SIZE (n=0..7)

Address offset:  $0x804 + (n \times 0x10)$

Size of region to protect counting from address ACL[n].ADDR. Writing a '0' has no effect.

This register can only be written once.

|                  |          |       |          |    |       |    |                                                                             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| A                | RW1 SIZE |       |          |    |       |    | Size of flash region n in bytes. Must be a multiple of the flash page size. |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

### 6.3.1.3 ACL[n].PERM (n=0..7)

Address offset:  $0x808 + (n \times 0x10)$

Access permissions for region n as defined by start address ACL[n].ADDR and size ACL[n].SIZE

This register can only be written once.

|                  |      |         |                                                                                       |                                                 |       |                                                                                  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 6.4 CCM — AES CCM mode encryption

Cipher block chaining - message authentication code (CCM) mode is an authenticated encryption algorithm designed to provide both authentication and confidentiality during data transfer. CCM combines counter mode encryption and CBC-MAC authentication. The CCM terminology "Message authentication code (MAC)" is called the "Message integrity check (MIC)" in *Bluetooth* terminology and also in this document.

The CCM block generates an encrypted keystream that is applied to input data using the XOR operation and generates the four byte MIC field in one operation. CCM and RADIO can be configured to work synchronously. CCM will encrypt in time for transmission and decrypt after receiving bytes into memory from the radio. All operations can complete within the packet RX or TX time. CCM on this device is implemented according to *Bluetooth* requirements and the algorithm as defined in IETF [RFC3610](#), and depends on the AES-128 block cipher. A description of the CCM algorithm can also be found in [NIST Special Publication 800-38C](#). The *Bluetooth* specification describes the configuration of counter mode blocks and encryption blocks to implement compliant encryption for Bluetooth Low Energy.

The CCM block uses EasyDMA to load key counter mode blocks (including the nonce required), and to read/write plain text and cipher text.

The AES CCM peripheral supports three operations: keystream generation, packet encryption, and packet decryption. These operations are performed in compliance with the *Bluetooth* AES CCM 128 bit block encryption, see *Bluetooth Core specification Version 4.0*.

The following figure illustrates keystream generation followed by encryption or decryption. The shortcut is optional.

Figure 31: Keystream generation

### 6.4.1 Keystream generation

A new keystream needs to be generated before a new packet encryption or packet decryption operation can start.

A keystream is generated by triggering the KSGEN task. An ENDKSGEN event is generated after the keystream has been generated.

Keystream generation, packet encryption, and packet decryption operations utilize the configuration specified in the data structure pointed to by [CNFPTR](#) on page 120. It is necessary to configure this pointer and its underlying data structure, and register [MODE](#) on page 120 before the KSGEN task is triggered.

The keystream will be stored in the AES CCM peripheral's temporary memory area, specified by the [SCRATCHPTR](#) on page 121, where it will be used in subsequent encryption and decryption operations.

For default length packets ([MODE.LENGTH](#) = Default), the size of the generated keystream is 27 bytes. When using extended length packets ([MODE.LENGTH](#) = Extended), register [MAXPACKETSIZE](#) on page 121 specifies the length of the keystream to be generated. The length of the generated keystream must be greater or equal to the length of the subsequent packet payload to be encrypted or decrypted. The maximum length of the keystream in extended mode is 251 bytes, which means that the maximum packet payload size is 251.

If a shortcut is used between the ENDKSGEN event and CRYPT task, pointer [INPTR](#) on page 120 and the pointers [OUTPTR](#) on page 121 must also be configured before the KSGEN task is triggered.

## 6.4.2 Encryption

The AES CCM peripheral is able to read an unencrypted packet, encrypt it, and append a four byte MIC field to the packet.

During packet encryption, the AES CCM peripheral performs the following:

- Reads the unencrypted packet located in RAM address specified in the [INPTR](#) pointer
- Encrypts the packet
- Appends a four byte long Message Integrity Check (MIC) field to the packet

Encryption is started by triggering the CRYPT task with register [MODE](#) on page 120 set to ENCRYPTION. An ENDCRYPT event is generated when packet encryption is completed.

The AES CCM peripheral will also modify the length field of the packet to adjust for the appended MIC field. It adds four bytes to the length and stores the resulting packet in RAM at the address specified in pointer [OUTPTR](#) on page 121, see [Encryption](#) on page 111.

Empty packets (length field is set to 0) will not be encrypted but instead moved unmodified through the AES CCM peripheral.

AES CCM supports different widths of the LENGTH field in the data structure for encrypted packets. This is configured in register [MODE](#) on page 120.

Figure 32: Encryption

## 6.4.3 Decryption

The AES CCM peripheral is able to read an encrypted packet, decrypt it, authenticate the MIC field, and generate an appropriate MIC status.

During packet decryption, the AES CCM peripheral performs the following:

- Reads the encrypted packet located in RAM at the address specified in the [INPTR](#) pointer
- Decrypts the packet

- Authenticates the packet's MIC field
- Generates the appropriate MIC status

The packet header (S0) and payload are included in the MIC authentication. Bits in the packet header can be masked away by configuring register [HEADERMASK](#) on page 122.

Decryption is started by triggering the CRYPT task with register [MODE](#) on page 120 set to DECRYPTION. An ENDCRYPT event is generated when packet decryption is completed.

The AES CCM peripheral modifies the length field of the packet to adjust for the MIC field. It subtracts four bytes from the length and stores the decrypted packet in RAM at the address specified in the pointer OUTPTR, see [Decryption](#) on page 112.

CCM is only able to decrypt packet payloads that are at least five bytes long (one byte or more encrypted payload (EPL) and four bytes of MIC). CCM will therefore generate a MIC error for packets where the length field is set to 1, 2, 3, or 4.

Empty packets (length field is set to 0) will not be decrypted but instead moved unmodified through the AES CCM peripheral. These packets will always pass the MIC check.

CCM supports different widths of the LENGTH field in the data structure for decrypted packets. This is configured in register [MODE](#) on page 120.

Figure 33: Decryption

#### 6.4.4 AES CCM and RADIO concurrent operation

The CCM peripheral is able to encrypt/decrypt data synchronously to data being transmitted or received on the radio.

In order for CCM to run synchronously with the radio, the data rate setting in register [MODE](#) on page 120 needs to match the radio data rate. The settings in this register apply whenever either the KSGEN or CRYPT tasks are triggered.

The data rate setting of register [MODE](#) on page 120 can also be overridden on-the-fly during an ongoing encrypt/decrypt operation by the contents of register [RATEOVERRIDE](#) on page 122. The data rate setting in this register applies whenever the RATEOVERRIDE task is triggered. This feature can be useful in cases where the radio data rate is changed during an ongoing packet transaction.

#### 6.4.5 Encrypting packets on-the-fly in radio transmit mode

When the AES CCM peripheral encrypts a packet on-the-fly while RADIO is transmitting it, RADIO must read the encrypted packet from the same memory location that the AES CCM peripheral is writing to.

The [OUTPTR](#) on page 121 pointer in the AES CCM must point to the same memory location as the PACKETPTR pointer in the radio, see [Configuration of on-the-fly encryption](#) on page 113.

Figure 34: Configuration of on-the-fly encryption

In order to match RADIO's timing, the KSGEN task must be triggered early enough to allow the keystream generation to complete before packet encryption begins.

For short packets (MODE.LENGTH = Default), the KSGEN task must be triggered before or at the same time as the START task in RADIO is triggered. In addition, the shortcut between the ENDKSGEN event and the CRYPT task must be enabled. This use-case is illustrated in [On-the-fly encryption of short packets \(MODE.LENGTH = Default\) using a PPI connection](#) on page 113. It uses a PPI connection between the READY event in RADIO and the KSGEN task in the AES CCM peripheral.

For long packets (MODE.LENGTH = Extended), the keystream generation needs to start earlier, such as when the TXEN task in RADIO is triggered.

Refer to [Timing specification](#) on page 122 for information about the time needed for generating a keystream.

Figure 35: On-the-fly encryption of short packets (MODE.LENGTH = Default) using a PPI connection

### 6.4.6 Decrypting packets on-the-fly in RADIO receive mode

When the AES CCM peripheral decrypts a packet on-the-fly while RADIO is receiving it, the AES CCM peripheral must read the encrypted packet from the same memory location that RADIO is writing to.

The INPTR on page 120 pointer in the AES CCM must point to the same memory location as the PACKETPTR pointer in RADIO, see [Configuration of on-the-fly decryption](#) on page 114.

Figure 36: Configuration of on-the-fly decryption

In order to match RADIO's timing, the KSGEN task must be triggered early enough to allow the keystream generation to complete before the decryption of the packet shall start.

For short packets (MODE.LENGTH = Default) the KSGEN task must be triggered no later than when the START task in RADIO is triggered. In addition, the CRYPT task must be triggered no earlier than when the ADDRESS event is generated by RADIO.

If the CRYPT task is triggered exactly at the same time as the ADDRESS event is generated by RADIO, the AES CCM peripheral will guarantee that the decryption is completed no later than when the END event in RADIO is generated.

This use-case is illustrated in [On-the-fly decryption of short packets \(MODE.LENGTH = Default\) using a PPI connection](#) on page 114 using a PPI connection between the ADDRESS event in RADIO and the CRYPT task in the AES CCM peripheral. The KSGEN task is triggered from the READY event in RADIO through a PPI connection.

For long packets (MODE.LENGTH = Extended) the keystream generation will need to start even earlier, such as when the RXEN task in RADIO is triggered.

Refer to [Timing specification](#) on page 122 for information about the time needed for generating a keystream.

Figure 37: On-the-fly decryption of short packets (MODE.LENGTH = Default) using a PPI connection

### 6.4.7 CCM data structure

The CCM data structure is located in Data RAM at the memory location specified by the CNFPTR pointer register.

| Property | Address offset | Description                                                                                                                |
|----------|----------------|----------------------------------------------------------------------------------------------------------------------------|
| KEY      | 0              | 16 byte AES key                                                                                                            |
| PKTCTR   | 16             | Octet0 (LSO) of packet counter                                                                                             |
|          | 17             | Octet1 of packet counter                                                                                                   |
|          | 18             | Octet2 of packet counter                                                                                                   |
|          | 19             | Octet3 of packet counter                                                                                                   |
|          | 20             | Bit 6 – Bit 0: Octet4 (7 most significant bits of packet counter, with Bit 6 being the most significant bit) Bit7: Ignored |
|          | 21             | Ignored                                                                                                                    |
|          | 22             | Ignored                                                                                                                    |
|          | 23             | Ignored                                                                                                                    |
|          | 24             | Bit 0: Direction bit Bit 7 – Bit 1: Zero padded                                                                            |
|          | 25             | 8 byte initialization vector (IV) Octet0 (LSO) of IV, Octet1 of IV, ... , Octet7 (MSO) of IV                               |

Table 29: CCM data structure overview

The NONCE vector (as specified by the *Bluetooth* Core Specification) will be generated by hardware based on the information specified in the CCM data structure from [CCM data structure overview](#) on page 115 .

| Property | Address offset | Description                            |
|----------|----------------|----------------------------------------|
| HEADER   | 0              | Packet Header                          |
| LENGTH   | 1              | Number of bytes in unencrypted payload |
| RFU      | 2              | Reserved Future Use                    |
| PAYLOAD  | 3              | Unencrypted payload                    |

Table 30: Data structure for unencrypted packet

| Property | Address offset     | Description                                                                    |
|----------|--------------------|--------------------------------------------------------------------------------|
| HEADER   | 0                  | Packet Header                                                                  |
| LENGTH   | 1                  | Number of bytes in encrypted payload including length of MIC                   |
|          |                    | LENGTH will be 0 for empty packets since the MIC is not added to empty packets |
| RFU      | 2                  | Reserved Future Use                                                            |
| PAYLOAD  | 3                  | Encrypted payload                                                              |
| MIC      | 3 + payload length | ENCRYPT: 4 bytes encrypted MIC                                                 |
|          |                    | MIC is not added to empty packets                                              |

Table 31: Data structure for encrypted packet

## 6.4.8 EasyDMA and ERROR event

CCM implements an EasyDMA mechanism for reading and writing to RAM.

When the CPU and EasyDMA enabled peripherals access the same RAM block at the same time, increased bus collisions might disrupt on-the-fly encryption. This will generate an ERROR event.

EasyDMA stops accessing RAM when the ENDKSGEN and ENDCRYPT events are generated.

If the CNFPTR, SCRATCHPTR, INPTR, and the OUTPTR are not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

## 6.4.9 Registers

| Base address | Peripheral | Instance | Description                                             | Configuration |
|--------------|------------|----------|---------------------------------------------------------|---------------|
| 0x4000F000   | CCM        | CCM      | AES counter with CBC-MAC (CCM) mode<br>block encryption |               |

Table 32: Instances

| Register           | Offset | Description                                                                                                                     |            |
|--------------------|--------|---------------------------------------------------------------------------------------------------------------------------------|------------|
| TASKS_KSGEN        | 0x000  | Start generation of keystream. This operation will stop by itself when completed.                                               |            |
| TASKS_CRYPT        | 0x004  | Start encryption/decryption. This operation will stop by itself when completed.                                                 |            |
| TASKS_STOP         | 0x008  | Stop encryption/decryption                                                                                                      |            |
| TASKS_RATEOVERRIDE | 0x00C  | Override DATARATE setting in MODE register with the contents of the RATEOVERRIDE register for any ongoing encryption/decryption |            |
| EVENTS_ENDKSGEN    | 0x100  | Keystream generation complete                                                                                                   |            |
| EVENTS_ENDCRYPT    | 0x104  | Encrypt/decrypt complete                                                                                                        |            |
| EVENTS_ERROR       | 0x108  | CCM error event                                                                                                                 | Deprecated |
| SHORTS             | 0x200  | Shortcuts between local events and tasks                                                                                        |            |
| INTENSET           | 0x304  | Enable interrupt                                                                                                                |            |
| INTENCLR           | 0x308  | Disable interrupt                                                                                                               |            |

 | A                | RW         | SCRATCHPTR |          |       |    |    |    | Pointer to a scratch data area used for temporary storage |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

The scratch area is used for temporary storage of data during keystream generation and encryption.

When MODE.LENGTH = Default, a space of 43 bytes is required for this temporary storage. When MODE.LENGTH = Extended, a space of (16 + MAXPACKETSIZE) bytes is required.

### 6.4.9.18 MAXPACKETSIZE

Address offset: 0x518

Length of keystream generated when MODE.LENGTH = Extended

|            |  |  |  |  ### 6.4.9.19 RATEOVERRIDE

Address offset: 0x51C

Data rate override setting.

Override value to be used instead of the setting of MODE.DATARATE. This override value applies when the RATEOVERRIDE task is triggered.

## 6.5 COMP — Comparator

The comparator (COMP) compares an input voltage (VIN+) against a second input voltage (VIN-). VIN+ can be derived from an analog input pin (AIN0-AIN7). VIN- can be derived from multiple sources depending on the operation mode of the comparator.

The main features of COMP are the following:

- Input range from 0 V to VDD
- Single-ended mode
  - Fully flexible hysteresis using a 64-level reference ladder
- Differential mode

- Configurable hysteresis
- Reference inputs (VREF):
  - VDD
  - External reference from AIN0 to AIN7 (between 0 V and VDD)
  - Internal references 1.2 V, 1.8 V, and 2.4 V
- Three speed/power consumption modes:
  - Low-power
  - Normal
  - High-speed
- Event generation on output changes
  - UP event on  $V_{IN-} > V_{IN+}$
  - DOWN event on  $V_{IN-} < V_{IN+}$
  - CROSS event on  $V_{IN+}$  and  $V_{IN-}$  crossing
  - READY event on core and internal reference (if used) ready

Figure 38: Comparator overview

Once enabled (using the [ENABLE](#) register), the comparator is started by triggering the START task and stopped by triggering the STOP task. The comparator will generate a READY event to indicate when it is ready for use and the output is correct. The delay between START and READY is  $t_{INT\_REF,START}$  if an internal reference is selected, or  $t_{COMP,START}$  if an external reference is used. When the COMP module is started, events will be generated every time  $V_{IN+}$  crosses  $V_{IN-}$ .

## Operation modes

The comparator can be configured to operate in two main operation modes: differential mode and single-ended mode. See the [MODE](#) register for more information. In both operation modes, the comparator can operate in different speed and power consumption modes (low-power, normal and high-speed). High-speed mode will consume more power compared to low-power mode, and low-power mode will result in slower response time compared to high-speed mode.

Use the [PSEL](#) register to select any of the AIN0-AIN7 pins as VIN+ input, regardless of the operation mode selected for the comparator. The source of VIN- depends on which of the following operation mode are used:

- Differential mode - Derived directly from AIN0 to AIN7
- Single-ended mode - Derived from VREF. VREF can be derived from VDD, AIN0-AIN7 or internal 1.2 V, 1.8 V and 2.4 V references.

The selected analog pins will be acquired by the comparator once it is enabled.

An optional hysteresis on VIN+ and VIN- can be enabled when the module is used in differential mode through the [HYST](#) register. In single-ended mode, VUP and VDOWN thresholds can be set to implement a hysteresis using the reference ladder (see [Comparator in single-ended mode](#) on page 126). This hysteresis is in the order of magnitude of  $V_{DIFFHYST}$ , and shall prevent noise on the signal to create unwanted events. See [Hysteresis example where VIN+ starts below VUP](#) on page 126 for an illustration of the effect of an active hysteresis on a noisy input signal.

An upward crossing will generate an UP event and a downward crossing will generate a DOWN event. The CROSS event will be generated every time there is a crossing, independent of direction.

The immediate value of the comparator can be sampled to [RESULT](#) register by triggering the SAMPLE task.

### 6.5.1 Shared resources

The COMP shares analog resources with other analog peripherals.

While it is possible to use the SAADC at the same time as the COMP, selecting the same analog input pin for both peripherals is not supported.

Additionally, COMP shares registers and other resources with other peripherals that have the same ID as the COMP. See [Peripherals with shared ID](#) on page 99 for more information.

The COMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behavior.

### 6.5.2 Differential mode

In differential mode, the reference input VIN- is derived directly from one of the AINx pins.

Before enabling the comparator via the [ENABLE](#) register, the following registers must be configured for the differential mode:

- [PSEL](#)
- [MODE](#)
- [EXTREFSEL](#)

Figure 39: Comparator in differential mode

**Note:** Depending on the device, not all the analog inputs may be available for each MUX. See definitions for [PSEL](#) and [EXTREFSEL](#) for more information about which analog pins are available on a particular device.

When the [HYST](#) register is turned on during this mode, the output of the comparator and associated events do the following:

- Change from ABOVE to BELOW when  $V_{IN+}$  drops below  $V_{IN-} - (V_{DIFFHYST}/2)$
- Change from BELOW to ABOVE when  $V_{IN+}$  raises above  $V_{IN-} + (V_{DIFFHYST}/2)$

This behavior is illustrated in the following figure.

Figure 40: Hysteresis enabled in differential mode

### 6.5.3 Single-ended mode

In single-ended mode,  $V_{IN-}$  is derived from the reference ladder.

Before enabling the comparator via the [ENABLE](#) register, the following registers must be configured for the single-ended mode:

- [PSEL](#)
- [MODE](#)
- [REFSEL](#)
- [EXTREFSEL](#)
- [TH](#)

The reference ladder uses the reference voltage (VREF) to derive two new voltage references, VUP and VDOWN. VUP and VDOWN are configured using THUP and THDOWN respectively in the TH register. VREF can be derived from any of the available reference sources, configured using the EXTREFSEL and REFSEL registers as shown in the following figure. When AREF is selected in the REFSEL register, the EXTREFSEL register is used to select one of the AIN0-AIN7 analog input pins as reference input. The selected analog pins will be acquired by the comparator once it is enabled.

Figure 41: Comparator in single-ended mode

**Note:** Depending on the device, not all the analog inputs may be available for each MUX. See definitions for PSEL and EXTREFSEL for more information about which analog pins are available on a particular device.

When the comparator core detects that  $VIN+ > VIN-$ , i.e. ABOVE as per the RESULT register,  $VIN-$  will switch to VDOWN. When  $VIN+$  falls below  $VIN-$  again,  $VIN-$  will be switched back to VUP. By specifying VUP larger than VDOWN, a hysteresis can be generated as illustrated in the following figures.

Writing to HYST has no effect in single-ended mode, and the content of this register is ignored.

Figure 42: Hysteresis example where  $VIN+$  starts below VUP

Figure 43: Hysteresis example where VIN+ starts above VUP

## 6.5.4 Registers

| Base address | Peripheral | Instance | Description                | Configuration |

## 6.6 ECB — AES electronic codebook mode encryption

The AES electronic codebook mode encryption (ECB) can be used for a range of cryptographic functions like hash generation, digital signatures, and keystream generation for data encryption/decryption. The ECB encryption block supports 128 bit AES encryption (encryption only, not decryption).

<sup>13</sup> Propagation delay is with 10 mV overdrive.

AES ECB operates with EasyDMA access to system Data RAM for in-place operations on cleartext and ciphertext during encryption. ECB uses the same AES core as the CCM and AAR blocks, and is an asynchronous operation which may not complete if the AES core is busy.

AES ECB features:

- 128 bit AES encryption
- Supports standard AES ECB block encryption
- Memory pointer support
- DMA data transfer

AES ECB performs a 128 bit AES block encrypt. At the STARTECB task, data and key is loaded into the algorithm by EasyDMA. When output data has been written back to memory, the ENDECB event is triggered.

AES ECB can be stopped by triggering the STOPECB task.

### 6.6.1 Shared resources

The ECB, CCM, and AAR share the same AES module. The ECB will always have lowest priority, and if there is a sharing conflict during encryption, the ECB operation will be aborted and an ERRORECB event will be generated.

### 6.6.2 EasyDMA

The ECB implements an EasyDMA mechanism for reading and writing to the Data RAM. This DMA cannot access the program memory or any other parts of the memory area except RAM.

If the ECBDATAPTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

The EasyDMA will have finished accessing the Data RAM when the ENDECB or ERRORECB is generated.

### 6.6.3 ECB data structure

Block encrypt input and output is stored in the same data structure. ECBDATAPTR should point to this data structure before STARTECB is initiated.

| Property   | Address offset | Description                         |
|------------|----------------|-------------------------------------|
| KEY        | 0              | 16 byte AES key                     |
| CLEARTEXT  | 16             | 16 byte AES cleartext input block   |
| CIPHERTEXT | 32             | 16 byte AES ciphertext output block |

Table 36: ECB data structure overview

### 6.6.4 Registers

| Base address | Peripheral | Instance | Description                                          | Configuration |
|--------------|------------|----------|------------------------------------------------------|---------------|
| 0x4000E000   | ECB        | ECB      | AES electronic code book (ECB) mode block encryption |               |

Table 37: Instances

#### 6.6.4.1 TASKS\_STARTTECB

Start ECB block encrypt

If a crypto operation is already running in the AES core, the STARTECB task will not start a new encryption and an ERRORECB event will be triggered.

## 6.6.5 Electrical specification

### 6.6.5.1 ECB Electrical Specification

| Symbol           | Description                             | Min. | Typ. | Max. | Units |
|------------------|-----------------------------------------|------|------|------|-------|
| t <sub>ECB</sub> | Run time per 16 byte block in all modes |      |      | 7.2  | µs    |

## 6.7 EGU — Event generator unit

Event generator unit (EGU) provides support for interlayer signaling. This means providing support for atomic triggering of both CPU execution and hardware tasks, from both firmware (by CPU) and hardware (by PPI). This feature can be used for triggering CPU execution at a lower priority execution from a higher priority execution, or to handle a peripheral's interrupt service routine (ISR) execution at a lower priority for some of its events. However, triggering any priority from any priority is possible.

Listed here are the main EGU features:

- Software-enabled interrupt triggering
- Separate interrupt vectors for every EGU instance
- Up to 16 separate event flags per interrupt for multiplexing

Each instance of EGU implements a set of tasks which can individually be triggered to generate the corresponding event. For example, the corresponding event for TASKS\_TRIGGER[n] is EVENTS\_TRIGGERED[n]. See [Instances](#) on page 139 for a list of EGU instances.

## 6.7.1 Registers

| Base address | Peripheral | Instance | Description            | Configuration |
|--------------|------------|----------|------------------------|---------------|
| 0x40014000   | EGU        | EGU0     | Event generator unit 0 |               |
| 0x40015000   | EGU        | EGU1     | Event generator unit 1 |               |
| 0x40016000   | EGU        | EGU2     | Event generator unit 2 |               |
| 0x40017000   | EGU        | EGU3     | Event generator unit 3 |               |
| 0x40018000   | EGU        | EGU4     | Event generator unit 4 |               |
| 0x40019000   | EGU        | EGU5     | Event generator unit 5 |               |

Table 39: Instances

| Register             | Offset | Description                                                                |
|----------------------|--------|----------------------------------------------------------------------------|
| TASKS_TRIGGER[0]     | 0x000  | Trigger 0 for triggering the corresponding TRIGGERED[0] event              |
| TASKS_TRIGGER[1]     | 0x004  | Trigger 1 for triggering the corresponding TRIGGERED[1] event              |
| TASKS_TRIGGER[2]     | 0x008  | Trigger 2 for triggering the corresponding TRIGGERED[2] event              |
| TASKS_TRIGGER[3]     | 0x00C  | Trigger 3 for triggering the corresponding TRIGGERED[3] event              |
| TASKS_TRIGGER[4]     | 0x010  | Trigger 4 for triggering the corresponding TRIGGERED[4] event              |
| TASKS_TRIGGER[5]     | 0x014  | Trigger 5 for triggering the corresponding TRIGGERED[5] event              |
| TASKS_TRIGGER[6]     | 0x018  | Trigger 6 for triggering the corresponding TRIGGERED[6] event              |
| TASKS_TRIGGER[7]     | 0x01C  | Trigger 7 for triggering the corresponding TRIGGERED[7] event              |
| TASKS_TRIGGER[8]     | 0x020  | Trigger 8 for triggering the corresponding TRIGGERED[8] event              |
| TASKS_TRIGGER[9]     | 0x024  | Trigger 9 for triggering the corresponding TRIGGERED[9] event              |
| TASKS_TRIGGER[10]    | 0x028  | Trigger 10 for triggering the corresponding TRIGGERED[10] event            |
| TASKS_TRIGGER[11]    | 0x02C  | Trigger 11 for triggering the corresponding TRIGGERED[11] event            |
| TASKS_TRIGGER[12]    | 0x030  | Trigger 12 for triggering the corresponding TRIGGERED[12] event            |
| TASKS_TRIGGER[13]    | 0x034  | Trigger 13 for triggering the corresponding TRIGGERED[13] event            |
| TASKS_TRIGGER[14]    | 0x038  | Trigger 14 for triggering the corresponding TRIGGERED[14] event            |
| TASKS_TRIGGER[15]    | 0x03C  | Trigger 15 for triggering the corresponding TRIGGERED[15] event            |
| EVENTS_TRIGGERED[0]  | 0x100  | Event number 0 generated by triggering the corresponding TRIGGER[0] task   |
| EVENTS_TRIGGERED[1]  | 0x104  | Event number 1 generated by triggering the corresponding TRIGGER[1] task   |
| EVENTS_TRIGGERED[2]  | 0x108  | Event number 2 generated by triggering the corresponding TRIGGER[2] task   |
| EVENTS_TRIGGERED[3]  | 0x10C  | Event number 3 generated by triggering the corresponding TRIGGER[3] task   |
| EVENTS_TRIGGERED[4]  | 0x110  | Event number 4 generated by triggering the corresponding TRIGGER[4] task   |
| EVENTS_TRIGGERED[5]  | 0x114  | Event number 5 generated by triggering the corresponding TRIGGER[5] task   |
| EVENTS_TRIGGERED[6]  | 0x118  | Event number 6 generated by triggering the corresponding TRIGGER[6] task   |
| EVENTS_TRIGGERED[7]  | 0x11C  | Event number 7 generated by triggering the corresponding TRIGGER[7] task   |
| EVENTS_TRIGGERED[8]  | 0x120  | Event number 8 generated by triggering the corresponding TRIGGER[8] task   |
| EVENTS_TRIGGERED[9]  | 0x124  | Event number 9 generated by triggering the corresponding TRIGGER[9] task   |
| EVENTS_TRIGGERED[10] | 0x128  | Event number 10 generated by triggering the corresponding TRIGGER[10] task |
| EVENTS_TRIGGERED[11] | 0x12C  | Event number 11 generated by triggering the corresponding TRIGGER[11] task |
| EVENTS_TRIGGERED[12] | 0x130  | Event number 12 generated by triggering the corresponding TRIGGER[12] task |
| EVENTS_TRIGGERED[13] | 0x134  | Event number 13 generated by triggering the corresponding TRIGGER[13] task |
| EVENTS_TRIGGERED[14] | 0x138  | Event number 14 generated by triggering the corresponding TRIGGER[14] task |
| EVENTS_TRIGGERED[15] | 0x13C  | Event number 15 generated by triggering the corresponding TRIGGER[15] task |
| INTEN                | 0x300  | Enable or disable interrupt                                                |
| INTENSET             | 0x304  | Enable interrupt                                                           |

## 6.8 GPIO — General purpose input/output

The general purpose input/output pins (GPIOs) are grouped as one or more ports, with each port having up to 32 GPIOs.

The number of ports and GPIOs per port varies with product variant and package. Refer to [Registers](#) on page 144 and [Pin assignments](#) on page 560 for more information about the number of GPIOs that are supported.

GPIO has the following user-configurable features:

- Up to 32 GPIO pins per GPIO port
- Output drive strength
- Internal pull-up and pull-down resistors
- Wake-up from high or low level triggers on all pins
- Trigger interrupt on state changes on any pin
- All pins can be used by the PPI task/event system
- One or more GPIO outputs can be controlled through the PPI and GPIOTE channels
- Any pin can be mapped to a peripheral for layout flexibility
- GPIO state changes captured on the SENSE signal can be stored by the LATCH register

The GPIO port peripheral implements up to 32 pins,  $\text{PIN}_0$  through  $\text{PIN}_{31}$ . Each of these pins can be individually configured in the  $\text{PIN\_CNF}[n]$  registers ( $n=0..31$ ).

The following parameters can be configured through these registers:

- Direction
- Drive strength
- Enabling of pull-up and pull-down resistors
- Pin sensing
- Input buffer disconnect

- Analog input (for selected pins)

The PIN\_CNF registers are retained registers. See [POWER — Power supply](#) on page 61 for more information about retained registers.

### 6.8.1 Pin configuration

Pins can be individually configured through the SENSE field in the PIN\_CNF[n] register to detect either a high or low level input.

When the correct level is detected on a configured pin, the sense mechanism will set the DETECT signal high. Each pin has a separate DETECT signal. Default behavior, defined by the DETECTMODE register, combines all DETECT signals from the pins in the GPIO port into one common DETECT signal and routes it through the system to be utilized by other peripherals. This mechanism is functional in both System ON and System OFF mode. See [GPIO port and the GPIO pin details](#) on page 142.

The following figure illustrates the GPIO port containing 32 individual pins, where PIN0 is shown in more detail for reference. All signals on the left side of the illustration are used by other peripherals in the system and therefore not directly available to the CPU.

Figure 44: GPIO port and the GPIO pin details

Pins should be in a level that cannot trigger the sense mechanism before being enabled. If the SENSE condition configured in the PIN\_CNF registers is met when the sense mechanism is enabled, the DETECT signal will immediately go high. A PORT event is triggered if the DETECT signal was low before enabling the sense mechanism. See [GPIOTE — GPIO tasks and events](#) on page 149.

See the following peripherals for more information about how the DETECT signal is used:

- [POWER — Power supply](#) on page 61 - uses the DETECT signal to exit from System OFF mode.
- [GPIOTE — GPIO tasks and events](#) on page 149 - uses the DETECT signal to generate the PORT event.

When a pin's PINx.DETECT signal goes high, a flag is set in the LATCH register. For example, when the PIN0.DETECT signal goes high, bit 0 in the LATCH register is set to 1. If the CPU performs a clear operation on a bit in the LATCH register when the associated PINx.DETECT signal is high, the bit in the LATCH register will not be cleared. The LATCH register will only be cleared if the CPU explicitly clears it by writing a 1 to the bit that shall be cleared, i.e. the LATCH register will not be affected by a PINx.DETECT signal being set low.

The LDETECT signal will be set high when one or more bits in the LATCH register are 1. The LDETECT signal will be set low when all bits in the LATCH register are successfully cleared to 0.

If one or more bits in the LATCH register are 1 after the CPU has performed a clear operation on the LATCH register, a rising edge will be generated on the LDETECT signal. This is illustrated in [DETECT signal behavior](#) on page 143.

**Note:** The CPU can read the LATCH register at any time to check if a SENSE condition has been met on any of the GPIO pins. This is still valid if that condition is no longer met at the time the CPU queries the LATCH register. This mechanism will work even if the LDETECT signal is not used as the DETECT signal.

The LDETECT signal is by default not connected to the GPIO port's DETECT signal, but via the DETECTMODE register. It is possible to change from default behavior to the DETECT signal that is derived directly from the LDETECT signal. See [GPIO port and the GPIO pin details](#) on page 142. The following figure illustrates the DETECT signal behavior for these two alternatives.

Figure 45: DETECT signal behavior

A GPIO pin input buffer can be disconnected from the pin to enable power savings when the pin is not used as an input, see [GPIO port and the GPIO pin details](#) on page 142. Input buffers must be connected to get a valid input value in the IN register, and for the sense mechanism to get access to the pin.

Other peripherals in the system can connect to GPIO pins and override their output value and configuration, or read their analog or digital input value. See [GPIO port and the GPIO pin details](#) on page 142.

Selected pins also support analog input signals, see ANAIN in [GPIO port and the GPIO pin details](#) on page 142. The assignment of the analog pins can be found in [Pin assignments](#) on page 560.

**Note:** When a pin is configured as digital input, increased current consumption occurs when the input voltage is between  $V_{IL}$  and  $V_{IH}$ . It is good practice to ensure that the external circuitry does not drive that pin to levels between  $V_{IL}$  and  $V_{IH}$  for a long period of time.

## 6.8.2 Registers

| Base address | Peripheral | Instance | Description                              | Configuration              |
|--------------|------------|----------|------------------------------------------|----------------------------|
| 0x50000000   | GPIO       | GPIO     | General purpose input and output         | Deprecated                 |
| 0x50000000   | GPIO       | P0       | General purpose input and output, port 0 | P0.00 to P0.31 implemented |
| 0x50000300   | GPIO       | P1       | General purpose input and output, port 1 | P1.00 to P1.09 implemented |

Table 41: Instances

| Register    | Offset | Description                                                                                               |
|-------------|--------|-----------------------------------------------------------------------------------------------------------|
| OUT         | 0x504  | Write GPIO port                                                                                           |
| OUTSET      | 0x508  | Set individual bits in GPIO port                                                                          |
| OUTCLR      | 0x50C  | Clear individual bits in GPIO port                                                                        |
| IN          | 0x510  | Read GPIO port                                                                                            |
| DIR         | 0x514  | Direction of GPIO pins                                                                                    |
| DIRSET      | 0x518  | DIR set register                                                                                          |
| DIRCLR      | 0x51C  | DIR clear register                                                                                        |
| LATCH       | 0x520  | Latch register indicating what GPIO pins that have met the criteria set in the PIN_CNF[n].SENSE registers |
| DETECTMODE  | 0x524  | Select between default DETECT signal behavior and LDETECT mode                                            |
| PIN_CNF[0]  | 0x700  | Configuration of GPIO pins                                                                                |
| PIN_CNF[1]  | 0x704  | Configuration of GPIO pins                                                                                |
| PIN_CNF[2]  | 0x708  | Configuration of GPIO pins                                                                                |
| PIN_CNF[3]  | 0x70C  | Configuration of GPIO pins                                                                                |
| PIN_CNF[4]  | 0x710  | Configuration of GPIO pins                                                                                |
| PIN_CNF[5]  | 0x714  | Configuration of GPIO pins                                                                                |
| PIN_CNF[6]  | 0x718  | Configuration of GPIO pins                                                                                |
| PIN_CNF[7]  | 0x71C  | Configuration of GPIO pins                                                                                |
| PIN_CNF[8]  | 0x720  | Configuration of GPIO pins                                                                                |
| PIN_CNF[9]  | 0x724  | Configuration of GPIO pins                                                                                |
| PIN_CNF[10] | 0x728  | Configuration of GPIO pins                                                                                |
| PIN_CNF[11] | 0x72C  | Configuration of GPIO pins                                                                                |
| PIN_CNF[12] | 0x730  | Configuration of GPIO pins                                                                                |
| PIN_CNF[13] | 0x734  | Configuration of GPIO pins                                                                                |
| PIN_CNF[14] | 0x738  | Configuration of GPIO pins                                                                                |
| PIN_CNF[15] | 0x73C  | Configuration of GPIO pins                                                                                |
| PIN_CNF[16] | 0x740  | Configuration of GPIO pins                                                                                |
| PIN_CNF[17] | 0x744  | Configuration of GPIO pins                                                                                |
| PIN_CNF[18] | 0x748  | Configuration of GPIO pins                                                                                |
| PIN_CNF[19] | 0x74C  | Configuration of GPIO pins                                                                                |

## 6.8.3 Electrical specification

### 6.8.3.1 GPIO Electrical Specification

| Symbol       | Description                                                           | Min.      | Typ. | Max.      | Units |
|--------------|-----------------------------------------------------------------------|-----------|------|-----------|-------|
| $V_{IH}$     | Input high voltage                                                    | 0.7 x VDD |      | VDD       | V     |
| $V_{IL}$     | Input low voltage                                                     | VSS       |      | 0.3 x VDD | V     |
| $V_{OH,SD}$  | Output high voltage, standard drive, 0.5 mA, VDD $\geq$ 1.7           | VDD - 0.4 |      | VDD       | V     |
| $V_{OH,HDL}$ | Output high voltage, high drive, 5 mA, VDD $\geq$ 2.7 V               | VDD - 0.4 |      | VDD       | V     |
| $V_{OH,HDL}$ | Output high voltage, high drive, 3 mA, VDD $\geq$ 1.7 V               | VDD - 0.4 |      | VDD       | V     |
| $V_{OL,SD}$  | Output low voltage, standard drive, 0.5 mA, VDD $\geq$ 1.7            | VSS       |      | VSS + 0.4 | V     |
| $V_{OL,HDL}$ | Output low voltage, high drive, 5 mA, VDD $\geq$ 2.7 V                | VSS       |      | VSS + 0.4 | V     |
| $V_{OL,HDL}$ | Output low voltage, high drive, 3 mA, VDD $\geq$ 1.7 V                | VSS       |      | VSS + 0.4 | V     |
| $I_{OL,SD}$  | Current at VSS+0.4 V, output set low, standard drive, VDD $\geq$ 1.7  | 1         | 2    | 4         | mA    |
| $I_{OL,HDL}$ | Current at VSS+0.4 V, output set low, high drive, VDD $\geq$ 2.7 V    | 6         | 10   | 15        | mA    |
| $I_{OL,HDL}$ | Current at VSS+0.4 V, output set low, high drive, VDD $\geq$ 1.7 V    | 3         |      |           | mA    |
| $I_{OH,SD}$  | Current at VDD-0.4 V, output set high, standard drive, VDD $\geq$ 1.7 | 1         | 2    | 4         | mA    |
| $I_{OH,HDL}$ | Current at VDD-0.4 V, output set high, high drive, VDD $\geq$ 2.7 V   | 6         | 9    | 14        | mA    |
| $I_{OH,HDL}$ | Current at VDD-0.4 V, output set high, high drive, VDD $\geq$ 1.7 V   | 3         |      |           | mA    |

| Symbol         | Description                                                           | Min. | Typ. | Max. | Units      |
|----------------|-----------------------------------------------------------------------|------|------|------|------------|
| $t_{RF,15pF}$  | Rise/fall time, standard drive mode, 10-90%, 15 pF load <sup>14</sup> |      | 9    |      | ns         |
| $t_{RF,25pF}$  | Rise/fall time, standard drive mode, 10-90%, 25 pF load <sup>14</sup> |      | 13   |      | ns         |
| $t_{RF,50pF}$  | Rise/fall time, standard drive mode, 10-90%, 50 pF load <sup>14</sup> |      | 25   |      | ns         |
| $t_{HRF,15pF}$ | Rise/Fall time, high drive mode, 10-90%, 15 pF load <sup>14</sup>     |      | 4    |      | ns         |
| $t_{HRF,25pF}$ | Rise/Fall time, high drive mode, 10-90%, 25 pF load <sup>14</sup>     |      | 5    |      | ns         |
| $t_{HRF,50pF}$ | Rise/Fall time, high drive mode, 10-90%, 50 pF load <sup>14</sup>     |      | 8    |      | ns         |
| $R_{PU}$       | Pull-up resistance                                                    | 11   | 13   | 16   | k $\Omega$ |
| $R_{PD}$       | Pull-down resistance                                                  | 11   | 13   | 16   | k $\Omega$ |
| $C_{PAD}$      | Pad capacitance                                                       |      | 3    |      | pF         |

### 6.8.3.2 NFC Pads Electrical Specification

| Symbol               | Description                                                                                  | Min. | Typ. | Max. | Units   |
|----------------------|----------------------------------------------------------------------------------------------|------|------|------|---------|
| $C_{PAD\_NFC}$       | Pad capacitance on NFC pads                                                                  |      | 4    |      | pF      |
| $I_{NFC\_LEAK}$      | Leakage current between NFC pads when driven to different states                             |      | 1    | 10   | $\mu$ A |
| $I_{NFC\_LEAK\_EXT}$ | Leakage current between NFC pads when driven to different states, extended temperature range |      | 1    | 15   | $\mu$ A |

## 6.9 GPIOTE — GPIO tasks and events

The GPIO tasks and events (GPIOTE) module provides functionality for accessing GPIO pins using tasks and events. Each GPIOTE channel can be assigned to one pin.

A GPIOTE block enables GPIOs to generate events on pin state change which can be used to carry out tasks through the PPI system. A GPIO can also be driven to change state on system events using the PPI system. Tasks and events are briefly introduced in [Peripheral interface](#) on page 98, and GPIO is described in more detail in [GPIO — General purpose input/output](#) on page 141.

Low power detection of pin state changes is possible when in System ON or System OFF.

| Instance | Number of GPIOTE channels |
|----------|---------------------------|
| GPIOTE   | 8                         |

Table 43: GPIOTE properties

Up to three tasks can be used in each GPIOTE channel for performing write operations to a pin. Two tasks are fixed (SET and CLR), and one (OUT) is configurable to perform following operations:

- Set
- Clear
- Toggle

An event can be generated in each GPIOTE channel from one of the following input conditions:

- Rising edge
- Falling edge
- Any change

<sup>14</sup> Rise and fall times based on simulations

## 6.9.1 Pin events and tasks

The GPIOTE module has a number of tasks and events that can be configured to operate on individual GPIO pins.

The tasks SET[n], CLR[n], and OUT[n] can write to individual pins, and events IN[n] can be generated from input changes of individual pins.

The SET task will set the pin selected in GPIOTE.CONFIG[n].PSEL to high. The CLR task will set the pin low.

The effect of the OUT task on the pin is configurable in CONFIG[n].POLARITY. It can set the pin high, set it low, or toggle it.

Tasks and events are configured using the CONFIG[n] registers. One CONFIG[n] register is associated with a set of SET[n], CLR[n], and OUT[n] tasks and IN[n] events.

As long as a SET[n], CLR[n], and OUT[n] task or an IN[n] event is configured to control pin **n**, the pin's output value will only be updated by the GPIOTE module. The pin's output value, as specified in the GPIO, will be ignored as long as the pin is controlled by GPIOTE. Attempting to write to the pin as a normal GPIO pin will have no effect. When the GPIOTE is disconnected from a pin, the associated pin gets the output and configuration values specified in the GPIO module, see MODE field in CONFIG[n] register.

When conflicting tasks are triggered simultaneously (i.e. during the same clock cycle) in one channel, the priority of the tasks is as described in the following table.

| Priority | Task |
|----------|------|
| 1        | OUT  |
| 2        | CLR  |
| 3        | SET  |

Table 44: Task priorities

When setting the CONFIG[n] registers, MODE=Disabled does not have the same effect as MODE=Task and POLARITY=None. In the latter case, a CLR or SET task occurring at the exact same time as OUT will end up with no change on the pin, based on the priorities described in the table above.

When a GPIOTE channel is configured to operate on a pin as a task, the initial value of that pin is configured in the OUTINIT field of CONFIG[n].

## 6.9.2 Port event

PORT is an event that can be generated from multiple input pins using the GPIO DETECT signal.

The event will be generated on the rising edge of the DETECT signal. See [GPIO — General purpose input/output](#) on page 141 for more information about the DETECT signal.

The GPIO DETECT signal will not wake the system up again if the system is put into System ON IDLE while the DETECT signal is high. Clear all DETECT sources before entering sleep. If the LATCH register is used as a source, a new rising edge will be generated on DETECT if any bit in LATCH is still high after clearing all or part of the register. This could occur if one of the PINx.DETECT signals is still high, for example. See [Pin configuration](#) on page 142 for more information.

Setting the system to System OFF while DETECT is high will cause a wakeup from System OFF reset.

This feature is always enabled even if the peripheral itself appears to be IDLE, meaning no clocks or other power intensive infrastructure have to be requested to keep this feature enabled. This feature can therefore be used to wake up the CPU from a WFI or WFE type sleep in System ON when all peripherals and the CPU are idle, meaning the lowest power consumption in System ON mode.

In order to prevent spurious interrupts from the PORT event while configuring the sources, the following must be performed:

1. Disable interrupts on the PORT event (through INTENCLR.PORT).
2. Configure the sources (PIN\_CNF[n].SENSE).
3. Clear any potential event that could have occurred during configuration (write '0' to EVENTS\_PORT).
4. Enable interrupts (through INTENSET.PORT).

### 6.9.3 Tasks and events pin configuration

Each GPIOTE channel is associated with one physical GPIO pin through the CONFIG.PSEL field.

When Event mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an input, overriding the DIR setting in GPIO. Similarly, when Task mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an output overriding the DIR setting and OUT value in GPIO. When Disabled is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will use its configuration from the PIN[n].CNF registers in GPIO.

**Note:** A pin can only be assigned to one GPIOTE channel at a time. Failing to do so may result in unpredictable behavior.

### 6.9.4 Registers

| Base address | Peripheral | Instance | Description           | Configuration |
|--------------|------------|----------|-----------------------|---------------|
| 0x40006000   | GPIOTE     | GPIOTE   | GPIO tasks and events |               |

Table 45: Instances

| Register     | Offset | Description                                                                                             |
|--------------|--------|---------------------------------------------------------------------------------------------------------|
| TASKS_OUT[0] | 0x000  | Task for writing to pin specified in CONFIG[0].PSEL. Action on pin is configured in CONFIG[0].POLARITY. |
| TASKS_OUT[1] | 0x004  | Task for writing to pin specified in CONFIG[1].PSEL. Action on pin is configured in CONFIG[1].POLARITY. |
| TASKS_OUT[2] | 0x008  | Task for writing to pin specified in CONFIG[2].PSEL. Action on pin is configured in CONFIG[2].POLARITY. |
| TASKS_OUT[3] | 0x00C  | Task for writing to pin specified in CONFIG[3].PSEL. Action on pin is configured in CONFIG[3].POLARITY. |
| TASKS_OUT[4] | 0x010  | Task for writing to pin specified in CONFIG[4].PSEL. Action on pin is configured in CONFIG[4].POLARITY. |
| TASKS_OUT[5] | 0x014  | Task for writing to pin specified in CONFIG[5].PSEL. Action on pin is configured in CONFIG[5].POLARITY. |
| TASKS_OUT[6] | 0x018  | Task for writing to pin specified in CONFIG[6].PSEL. Action on pin is configured in CONFIG[6].POLARITY. |
| TASKS_OUT[7] | 0x01C  | Task for writing to pin specified in CONFIG[7].PSEL. Action on pin is configured in CONFIG[7].POLARITY. |
| TASKS_SET[0] | 0x030  | Task for writing to pin specified in CONFIG[0].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[1] | 0x034  | Task for writing to pin specified in CONFIG[1].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[2] | 0x038  | Task for writing to pin specified in CONFIG[2].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[3] | 0x03C  | Task for writing to pin specified in CONFIG[3].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[4] | 0x040  | Task for writing to pin specified in CONFIG[4].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[5] | 0x044  | Task for writing to pin specified in CONFIG[5].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[6] | 0x048  | Task for writing to pin specified in CONFIG[6].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[7] | 0x04C  | Task for writing to pin specified in CONFIG[7].PSEL. Action on pin is to set it high.                   |
| TASKS_CLR[0] | 0x060  | Task for writing to pin specified in CONFIG[0].PSEL. Action on pin is to set it low.                    |
| TASKS_CLR[1] | 0x064  | Task for writing to pin specified in CONFIG[1].PSEL. Action on pin is to set it low.                    |
| TASKS_CLR[2] | 0x068  | Task for writing to pin specified in CONFIG[2].PSEL. Action on pin is to set it low.                    |

| Register     | Offset | Description                                                                          |
|--------------|--------|--------------------------------------------------------------------------------------|
| TASKS_CLR[3] | 0x06C  | Task for writing to pin specified in CONFIG[3].PSEL. Action on pin is to set it low. |
| TASKS_CLR[4] | 0x070  | Task for writing to pin specified in CONFIG[4].PSEL. Action on pin is to set it low. |
| TASKS_CLR[5] | 0x074  | Task for writing to pin specified in CONFIG[5].PSEL. Action on pin is to set it low. |
| TASKS_CLR[6] | 0x078  | Task for writing to pin specified in CONFIG[6].PSEL. Action on pin is to set it low. |
| TASKS_CLR[7] | 0x07C  | Task for writing to pin specified in CONFIG[7].PSEL. Action on pin is to set it low. |

 Event mode: Generate IN[n] event when falling edge on pin.                                                                                                                                                                                                                         |  |  |  |  |  |  |  |  |  |  |  |  |  |     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|                  |      |          | Toggle                                                                                | 3       | Task mode: Toggle pin from OUT[n]. Event mode: Generate IN[n] when any change on pin.                                                                                                                                                                                                                                     |  |  |  |  |  |  |  |  |  |  |  |  |  |     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| E                | RW   | OUTINIT  |                                                                                       |         | When in task mode: Initial value of the output when the GPIOTE channel is configured. When in event mode: No effect.                                                                                                                                                                                                      |  |  |  |  |  |  |  |  |  |  |  |  |  |     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|                  |      |          | Low                                                                                   | 0       | Task mode: Initial value of pin before task triggering is low                                                                                                                                                                                                                                                             |  |  |  |  |  |  |  |  |  |  |  |  |  |     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|                  |      |          | High                                                                                  | 1       | Task mode: Initial value of pin before task triggering is high                                                                                                                                                                                                                                                            |  |  |  |  |  |  |  |  |  |  |  |  |  |     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 6.9.5 Electrical specification

## 6.10 I<sup>2</sup>S — Inter-IC sound interface

The I<sup>2</sup>S (Inter-IC Sound) module, supports the original two-channel I<sup>2</sup>S format, and left or right-aligned formats. It implements EasyDMA for sample transfer directly to and from RAM without CPU intervention.

The I<sup>2</sup>S peripheral has the following main features:

- Master and Slave mode
- Simultaneous bi-directional (TX and RX) audio streaming
- Original I<sup>2</sup>S and left- or right-aligned format
- 8, 16 and 24-bit sample width
- Low-jitter Master Clock generator
- Various sample rates

Figure 46: I<sup>2</sup>S master

### 6.10.1 Mode

The I<sup>2</sup>S protocol specification defines two modes of operation, Master and Slave.

The I<sup>2</sup>S mode decides which of the two sides (Master or Slave) shall provide the clock signals LRCK and SCK, and these signals are always supplied by the Master to the Slave.

### 6.10.2 Transmitting and receiving

The I<sup>2</sup>S module supports both transmission (TX) and reception (RX) of serial data. In both cases the serial data is shifted synchronously to the clock signals SCK and LRCK.

TX data is written to the SDOUT pin on the falling edge of SCK, and RX data is read from the SDIN pin on the rising edge of SCK. The most significant bit (MSB) is always transmitted first.

TX and RX are available in both Master and Slave modes and can be enabled/disabled independently in the [CONFIG.TXEN](#) on page 169 and [CONFIG.RXEN](#) on page 169.

Transmission and/or reception is started by triggering the START task. When started and transmission is enabled (in [CONFIG.TXEN](#) on page 169), the TXPTRUPD event will be generated for every [RXTXD.MAXCNT](#) on page 172 number of transmitted data words (containing one or more samples). Similarly, when started and reception is enabled (in [CONFIG.RXEN](#) on page 169), the RXPTRUPD event will be generated for every [RXTXD.MAXCNT](#) on page 172 received data words.

Figure 47: Transmitting and receiving. *CONFIG.FORMAT = Aligned, CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo, RXTXD.MAXCNT = 1.*

### 6.10.3 Left right clock (LRCK)

The Left Right Clock (LRCK), often referred to as "word clock", "sample clock" or "word select" in I<sup>2</sup>S context, is the clock defining the frames in the serial bit streams sent and received on SDOUT and SDIN, respectively.

In I2S mode, each frame contains one left and right sample pair, with the left sample being transferred during the low half period of LRCK followed by the right sample being transferred during the high period of LRCK.

In Aligned mode, each frame contains one left and right sample pair, with the left sample being transferred during the high half period of LRCK followed by the right sample being transferred during the low period of LRCK.

Consequently, the LRCK frequency is equivalent to the audio sample rate.

When operating in Master mode, the LRCK is generated from the MCK, and the frequency of LRCK is then given as:

$$\text{LRCK} = \text{MCK} / \text{CONFIG.RATIO}$$

LRCK always toggles around the falling edge of the serial clock SCK.

### 6.10.4 Serial clock (SCK)

The serial clock (SCK), often referred to as the serial bit clock, pulses once for each data bit being transferred on the serial data lines SDIN and SDOUT.

When operating in Master mode the SCK is generated from the MCK, and the frequency of SCK is then given as:

$$\text{SCK} = 2 * \text{LRCK} * \text{CONFIG.SWIDTH}$$

The falling edge of the SCK falls on the toggling edge of LRCK.

When operating in Slave mode SCK is provided by the external I<sup>2</sup>S master.

### 6.10.5 Master clock (MCK)

The master clock (MCK) is the clock from which LRCK and SCK are derived when operating in Master mode.

The MCK is generated by an internal MCK generator. This generator always needs to be enabled when in Master mode, but the generator can also be enabled when in Slave mode. Enabling the generator when in slave mode can be useful in the case where the external Master is not able to generate its own master clock.

The MCK generator is enabled/disabled in the register [CONFIG.MCKEN](#) on page 169, and the generator is started or stopped by the START or STOP tasks.

In Master mode the LRCK and the SCK frequencies are closely related, as both are derived from MCK and set indirectly through [CONFIG.RATIO](#) on page 170 and [CONFIG.SWIDTH](#) on page 171.

When configuring these registers, the user is responsible for fulfilling the following requirements:

1. SCK frequency can never exceed the MCK frequency, which can be formulated as:

$$\text{CONFIG.RATIO} \geq 2 * \text{CONFIG.SWIDTH}$$

2. The MCK/LRCK ratio shall be a multiple of  $2 * \text{CONFIG.SWIDTH}$ , which can be formulated as:

$$\text{Integer} = (\text{CONFIG.RATIO} / (2 * \text{CONFIG.SWIDTH}))$$

The MCK signal can be routed to an output pin (specified in PSEL.MCK) to supply external I<sup>2</sup>S devices that require the MCK to be supplied from the outside.

When operating in Slave mode, the I<sup>2</sup>S module does not use the MCK and the MCK generator does not need to be enabled.

Figure 48: Relation between RATIO, MCK and LRCK.

| Desired LRCK [Hz] | CONFIG.SWIDTH | CONFIG.RATIO | CONFIG.MCKF | MCK [Hz]  | LRCK [Hz] | LRCK error [%] |
|-------------------|---------------|--------------|-------------|-----------|-----------|----------------|
| 16000             | 16Bit         | 32X          | 32MDIV63    | 507936.5  | 15873.0   | -0.8           |
| 16000             | 16Bit         | 64X          | 32MDIV31    | 1032258.1 | 16129.0   | 0.8            |
| 16000             | 16Bit         | 256X         | 32MDIV8     | 4000000.0 | 15625.0   | -2.3           |
| 32000             | 16Bit         | 32X          | 32MDIV31    | 1032258.1 | 32258.1   | 0.8            |
| 32000             | 16Bit         | 64X          | 32MDIV16    | 2000000.0 | 31250.0   | -2.3           |
| 44100             | 16Bit         | 32X          | 32MDIV23    | 1391304.3 | 43478.3   | -1.4           |
| 44100             | 16Bit         | 64X          | 32MDIV11    | 2909090.9 | 45454.5   | 3.1            |

Table 47: Configuration examples

### 6.10.6 Width, alignment and format

The CONFIG.SWIDTH register primarily defines the sample width of the data written to memory. In master mode, it then also sets the amount of bits per frame. In Slave mode it controls padding/trimming if required. Left, right, transmitted, and received samples always have the same width. The CONFIG.FORMAT

register specifies the position of the data frames with respect to the LRCK edges in both Master and Slave modes.

When using  $I^2S$  format, the first bit in a half-frame (containing one left or right sample) gets sampled on the second rising edge of the SCK after a LRCK edge. When using Aligned mode, the first bit in a half-frame gets sampled on the first rising edge of SCK following a LRCK edge.

For data being received on SDIN the sample value can be either right or left-aligned inside a half-frame, as specified in [CONFIG.ALIGN](#) on page 171. [CONFIG.ALIGN](#) on page 171 affects only the decoding of the incoming samples (SDIN), while the outgoing samples (SDOUT) are always left-aligned (or justified).

When using left-alignment, each half-frame starts with the MSB of the sample value (both for data being sent on SDOUT and received on SDIN).

When using right-alignment, each half-frame of data being received on SDIN ends with the LSB of the sample value, while each half-frame of data being sent on SDOUT starts with the MSB of the sample value (same as for left-alignment).

In Master mode, the size of a half-frame (in number of SCK periods) equals the sample width (in number of bits), and in this case the alignment setting does not care as each half-frame in any case will start with the MSB and end with the LSB of the sample value.

In slave mode, however, the sample width does not need to equal the frame size. This means you might have extra or fewer SCK pulses per half-frame than what the sample width specified in [CONFIG.SWIDTH](#) requires.

In the case where we use **left-alignment** and the number of SCK pulses per half-frame is **higher** than the sample width, the following will apply:

- For data received on SDIN, all bits after the LSB of the sample value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the sample value will be 0.

In the case where we use **left-alignment** and the number of SCK pulses per frame is **lower** than the sample width, the following will apply:

- Data sent and received on SDOUT and SDIN will be truncated with the LSBs being removed first.

In the case where we use **right-alignment** and the number of SCK pulses per frame is **higher** than the sample width, the following will apply:

- For data received on SDIN, all bits before the MSB of the sample value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the sample value will be 0 (same behavior as for left-alignment).

In the case where we use **right-alignment** and the number of SCK pulses per frame is **lower** than the sample width, the following will apply:

- Data received on SDIN will be sign-extended to "sample width" number of bits before being written to memory.
- Data sent on SDOUT will be truncated with the LSBs being removed first (same behavior as for left-alignment).

Figure 49:  $I^2S$  format. [CONFIG.SWIDTH](#) equalling half-frame size.

Figure 50: Aligned format. *CONFIG.SWIDTH* equalling half-frame size.

### 6.10.7 EasyDMA

The I<sup>2</sup>S module implements EasyDMA for accessing internal Data RAM without CPU intervention.

The source and destination pointers for the TX and RX data are configured in [TXD.PTR](#) on page 172 and [RXD.PTR](#) on page 172. The memory pointed to by these pointers will only be read or written when TX or RX are enabled in [CONFIG.TXEN](#) on page 169 and [CONFIG.RXEN](#) on page 169.

The addresses written to the pointer registers [TXD.PTR](#) on page 172 and [RXD.PTR](#) on page 172 are double-buffered in hardware, and these double buffers are updated for every [RXTXD.MAXCNT](#) on page 172 words (containing one or more samples) read/written from/to memory. The events TXPTRUPD and RXPTRUPD are generated whenever the TXD.PTR and RXD.PTR are transferred to these double buffers.

If [TXD.PTR](#) on page 172 is not pointing to the Data RAM region when transmission is enabled, or [RXD.PTR](#) on page 172 is not pointing to the Data RAM region when reception is enabled, an EasyDMA transfer may result in a HardFault and/or memory corruption. See [Memory](#) on page 19 for more information about the different memory regions.

Due to the nature of I<sup>2</sup>S, where the number of transmitted samples always equals the number of received samples (at least when both TX and RX are enabled), one common register [RXTXD.MAXCNT](#) on page 172 is used for specifying the sizes of these two memory buffers. The size of the buffers is specified in a number of 32-bit words. Such a 32-bit memory word can either contain four 8-bit samples, two 16-bit samples or one right-aligned 24-bit sample sign extended to 32 bit.

In stereo mode ([CONFIG.CHANNELS](#)=Stereo), the samples are stored as "left and right sample pairs" in memory. Figure [Memory mapping for 8 bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.](#) on page 161, [Memory mapping for 16 bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.](#) on page 161 and [Memory mapping for 24 bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.](#) on page 162 show how the samples are mapped to memory in this mode. The mapping is valid for both RX and TX.

In mono mode ([CONFIG.CHANNELS](#)=Left or Right), RX sample from only one channel in the frame is stored in memory, the other channel sample is ignored. Illustrations [Memory mapping for 8 bit mono. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.](#) on page 161, [Memory mapping for 16 bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.](#) on page 161 and [Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.](#) on page 162 show how RX samples are mapped to memory in this mode.

For TX, the same outgoing sample read from memory is transmitted on both left and right in a frame, resulting in a mono output stream.

Figure 51: Memory mapping for 8 bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.

Figure 52: Memory mapping for 8 bit mono. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.

Figure 53: Memory mapping for 16 bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.

Figure 54: Memory mapping for 16 bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.

Figure 55: Memory mapping for 24 bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.

Figure 56: Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.

### 6.10.8 Module operation

Described here is a typical operating procedure for the I<sup>2</sup>S module.

## 1. Configure the I<sup>2</sup>S module using the CONFIG registers

```
// Enable reception
NRF_I2S->CONFIG.RXEN = (I2S_CONFIG_RXEN_RXEN_Enabled <<
                        I2S_CONFIG_RXEN_RXEN_Pos);

// Enable transmission
NRF_I2S->CONFIG.TXEN = (I2S_CONFIG_TXEN_TXEN_Enabled <<
                        I2S_CONFIG_TXEN_TXEN_Pos);

// Enable MCK generator
NRF_I2S->CONFIG.MCKEN = (I2S_CONFIG_MCKEN_MCKEN_Enabled <<
                        I2S_CONFIG_MCKEN_MCKEN_Pos);

// MCKFREQ = 4 MHz
NRF_I2S->CONFIG.MCKFREQ = I2S_CONFIG_MCKFREQ_MCKFREQ_32MDIV8 <<
                        I2S_CONFIG_MCKFREQ_MCKFREQ_Pos;

// Ratio = 256
NRF_I2S->CONFIG.RATIO = I2S_CONFIG_RATIO_RATIO_256X <<
                        I2S_CONFIG_RATIO_RATIO_Pos;

// MCKFREQ = 4 MHz and Ratio = 256 gives sample rate = 15.625 ks/s
// Sample width = 16 bit
NRF_I2S->CONFIG.SWIDTH = I2S_CONFIG_SWIDTH_SWIDTH_16Bit <<
                        I2S_CONFIG_SWIDTH_SWIDTH_Pos;

// Alignment = Left
NRF_I2S->CONFIG.ALIGN = I2S_CONFIG_ALIGN_ALIGN_Left <<
                        I2S_CONFIG_ALIGN_ALIGN_Pos;

// Format = I2S
NRF_I2S->CONFIG.FORMAT = I2S_CONFIG_FORMAT_FORMAT_I2S <<
                        I2S_CONFIG_FORMAT_FORMAT_Pos;

// Use stereo
NRF_I2S->CONFIG.CHANNELS = I2S_CONFIG_CHANNELS_CHANNELS_Stereo <<
                        I2S_CONFIG_CHANNELS_CHANNELS_Pos;
```

## 2. Map IO pins using the PINSEL registers

```
// MCK routed to pin 0
NRF_I2S->PSEL.MCK = (0 << I2S_PSEL_MCK_PIN_Pos) |
                    (I2S_PSEL_MCK_CONNECT_Connected <<
                     I2S_PSEL_MCK_CONNECT_Pos);

// SCK routed to pin 1
NRF_I2S->PSEL.SCK = (1 << I2S_PSEL_SCK_PIN_Pos) |
                    (I2S_PSEL_SCK_CONNECT_Connected <<
                     I2S_PSEL_SCK_CONNECT_Pos);

// LRCK routed to pin 2
NRF_I2S->PSEL.LRCK = (2 << I2S_PSEL_LRCK_PIN_Pos) |
                     (I2S_PSEL_LRCK_CONNECT_Connected <<
                      I2S_PSEL_LRCK_CONNECT_Pos);

// SDOUT routed to pin 3
NRF_I2S->PSEL.SDOUT = (3 << I2S_PSEL_SDOUT_PIN_Pos) |
                      (I2S_PSEL_SDOUT_CONNECT_Connected <<
                       I2S_PSEL_SDOUT_CONNECT_Pos);

// SDIN routed on pin 4
NRF_I2S->PSEL.SDIN = (4 << I2S_PSEL_SDIN_PIN_Pos) |
                     (I2S_PSEL_SDIN_CONNECT_Connected <<
                      I2S_PSEL_SDIN_CONNECT_Pos);
```

### 3. Configure TX and RX data pointers using the TXD, RXD and RXTXD registers

```
NRF_I2S->TXD.PTR = my_tx_buf;
NRF_I2S->RXD.PTR = my_rx_buf;
NRF_I2S->TXD.MAXCNT = MY_BUF_SIZE;
```

### 4. Enable the I<sup>2</sup>S module using the ENABLE register

```
NRF_I2S->ENABLE = 1;
```

### 5. Start audio streaming using the START task

```
NRF_I2S->TASKS_START = 1;
```

### 6. Handle received and transmitted data when receiving the TXPTRUPD and RXPTRUPD events

```
if (NRF_I2S->EVENTS_TXPTRUPD != 0)
{
    NRF_I2S->TXD.PTR = my_next_tx_buf;
    NRF_I2S->EVENTS_TXPTRUPD = 0;
}

if (NRF_I2S->EVENTS_RXPTRUPD != 0)
{
    NRF_I2S->RXD.PTR = my_next_rx_buf;
    NRF_I2S->EVENTS_RXPTRUPD = 0;
}
```

## 6.10.9 Pin configuration

The MCK, SCK, LRCK, SDIN and SDOUT signals associated with the I<sup>2</sup>S module are mapped to physical pins according to the pin numbers specified in the PSEL.x registers.

These pins are acquired whenever the I<sup>2</sup>S module is enabled through the register [ENABLE](#) on page 168.

When a pin is acquired by the I<sup>2</sup>S module, the direction of the pin (input or output) will be configured automatically, and any pin direction setting done in the GPIO module will be overridden. The directions for the various I<sup>2</sup>S pins are shown below in [GPIO configuration before enabling peripheral \(master mode\)](#) on page 164 and [GPIO configuration before enabling peripheral \(slave mode\)](#) on page 165.

To secure correct signal levels on the pins when the system is in OFF mode, and when the I<sup>2</sup>S module is disabled, these pins must be configured in the GPIO peripheral directly.

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Output    | 0              |         |
| SCK                     | As specified in PSEL.SCK   | Output    | 0              |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 48: GPIO configuration before enabling peripheral (master mode)

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Input     | Not applicable |         |
| SCK                     | As specified in PSEL.SCK   | Input     | Not applicable |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 49: GPIO configuration before enabling peripheral (slave mode)

## 6.10.10 Registers

| Base address | Peripheral | Instance | Description              | Configuration |
|--------------|------------|----------|--------------------------|---------------|
| 0x40025000   | I2S        | I2S      | Inter-IC sound interface |               |

Table 50: Instances

| Register        | Offset | Description                                                                                                                                                                                                     |
|-----------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_START     | 0x000  | Starts continuous I2S transfer. Also starts MCK generator when this is enabled.                                                                                                                                 |
| TASKS_STOP      | 0x004  | Stops I2S transfer. Also stops MCK generator. Triggering this task will cause the STOPPED event to be generated.                                                                                                |
| EVENTS_RXPTRUPD | 0x104  | The RXD.PTR register has been copied to internal double-buffers. When the I2S module is started and RX is enabled, this event will be generated for every RXTXD.MAXCNT words that are received on the SDIN pin. |
| EVENTS_STOPPED  | 0x108  | I2S transfer stopped.                                                                                                                                                                                           |
| EVENTS_TXPTRUPD | 0x114  | The TDX.PTR register has been copied to internal double-buffers. When the I2S module is started and TX is enabled, this event will be generated for every RXTXD.MAXCNT words that are sent on the SDOUT pin.    |
| INTEN           | 0x300  | Enable or disable interrupt                                                                                                                                                                                     |
| INTENSET        | 0x304  | Enable interrupt                                                                                                                                                                                                |
| INTENCLR        | 0x308  | Disable interrupt                                                                                                                                                                                               |
| ENABLE          | 0x500  | Enable I2S module.                                                                                                                                                                                              |

### 6.10.10.2 TASKS\_STOP

Address offset: 0x004

Stops I2S transfer. Also stops MCK generator. Triggering this task will cause the STOPPED event to be generated.

### 6.10.10.3 EVENTS\_RXPTRUPD

Address offset: 0x104

The RXD.PTR register has been copied to internal double-buffers. When the I2S module is started and RX is enabled, this event will be generated for every RXTXD.MAXCNT words that are received on the SDIN pin.

## 6.10.11 Electrical specification

### 6.10.11.1 I2S timing specification

| Symbol          | Description                        | Min. | Typ. | Max. | Units |
|-----------------|------------------------------------|------|------|------|-------|
| $t_{S\_SDIN}$   | SDIN setup time before SCK rising  | 20   |      |      | ns    |
| $t_{H\_SDIN}$   | SDIN hold time after SCK rising    | 15   |      |      | ns    |
| $t_{S\_SDOUT}$  | SDOUT setup time after SCK falling | 40   |      |      | ns    |
| $t_{H\_SDOUT}$  | SDOUT hold time before SCK falling | 6    |      |      | ns    |
| $t_{SCK\_LRCK}$ | SCLK falling to LRCK edge          | -5   | 0    | 5    | ns    |
| $f_{MCK}$       | MCK frequency                      |      |      | 4000 | kHz   |
| $f_{LRCK}$      | LRCK frequency                     |      |      | 48   | kHz   |
| $f_{SCK}$       | SCK frequency                      |      |      | 2000 | kHz   |
| $DC_{CK}$       | Clock duty cycle (MCK, LRCK, SCK)  | 45   |      | 55   | %     |

Figure 57: I2S timing diagram

## 6.11 LPCOMP — Low-power comparator

Low-power comparator (LPCOMP) compares an input voltage against a reference voltage.

Listed here are the main features of LPCOMP:

- 0 - VDD input range
- Ultra-low power
- Eight input options (**AIN0** to **AIN7**)
- Reference voltage options:
  - Two external analog reference inputs, or
  - 15-level internal reference ladder ( $VDD/16$ )
- Optional hysteresis enable on input
- Can be used as a wakeup source from System OFF mode

In System ON, the LPCOMP can generate separate events on rising and falling edges of a signal, or sample the current state of the pin as being above or below the selected reference. The block can be configured to use any of the analog inputs on the device. Additionally, the low-power comparator can be used as an analog wakeup source from System OFF or System ON. The comparator threshold can be programmed to a range of fractions of the supply voltage.

**Note:** LPCOMP cannot be used (STARTed) at the same time as COMP. Only one comparator can be used at a time.

Figure 58: Low-power comparator

The wakeup comparator (LPCOMP) compares an input voltage ( $VIN+$ ), which comes from an analog input pin selected via the **PSEL** register, against a reference voltage ( $VIN-$ ) selected via registers **REFSEL** on page 181 and **EXTREFSEL**.

The **PSEL**, **REFSEL**, and **EXTREFSEL** registers must be configured before the LPCOMP is enabled through the **ENABLE** register.

The **HYST** register allows enabling an optional hysteresis in the comparator core. This hysteresis shall prevent noise on the signal to create unwanted events. Figure below illustrates the effect of an active hysteresis on a noisy input signal. It is disabled by default, and shall be configured before enabling LPCOMP as well.

Figure 59: Effect of hysteresis on a noisy input signal

The LPCOMP is started by triggering the START task. After a startup time of  $t_{\text{LPCOMP,STARTUP}}$ , the LPCOMP will generate a READY event to indicate that the comparator is ready to use and the output of the LPCOMP is correct. The LPCOMP will generate events every time  $V_{IN+}$  crosses  $V_{IN-}$ . More specifically, every time  $V_{IN+}$  rises above  $V_{IN-}$  (upward crossing) an UP event is generated along with a CROSS event. Every time  $V_{IN+}$  falls below  $V_{IN-}$  (downward crossing), a DOWN event is generated along with a CROSS event. When hysteresis is enabled, the upward crossing level becomes  $(V_{IN-} + VHYST/2)$ , and the downward crossing level becomes  $(V_{IN-} - VHYST/2)$ .

The LPCOMP is stopped by triggering the STOP task.

LPCOMP will be operational in both System ON and System OFF mode when it is enabled through the ENABLE register. See [POWER — Power supply](#) on page 61 for more information about power modes. Note that it is not allowed to go to System OFF when a READY event is pending to be generated.

All LPCOMP registers, including [ENABLE](#), are classified as retained registers when the LPCOMP is enabled. However, when the device wakes up from System OFF, all LPCOMP registers will be reset.

The LPCOMP can wake up the system from System OFF by asserting the ANADETECT signal. The ANADETECT signal can be derived from any of the event sources that generate the UP, DOWN and CROSS events. In case of wakeup from System OFF, no events will be generated, only the ANADETECT signal. See the ANADETECT register ([ANADETECT](#) on page 182) for more information on how to configure the ANADETECT signal.

The immediate value of the LPCOMP can be sampled to [RESULT](#) on page 180 by triggering the SAMPLE task.

See [RESETREAS](#) on page 75 for more information on how to detect a wakeup from LPCOMP.

### 6.11.1 Shared resources

The LPCOMP shares analog resources with SAADC. While it is possible to use the SAADC at the same time as the LPCOMP, selecting the same analog input pin for both modules is not supported.

Additionally, LPCOMP shares registers and other resources with other peripherals that have the same ID as the LPCOMP. See [Peripherals with shared ID](#) on page 99 for more information.

The LPCOMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behavior.

### 6.11.2 Pin configuration

You can use the LPCOMP.PSEL register to select one of the analog input pins, **AIN0** through **AIN7**, as the analog input pin for the LPCOMP.

See [GPIO — General purpose input/output](#) on page 141 for more information about the pins. Similarly, you can use [EXTRESEL](#) on page 182 to select one of the analog reference input pins, **AIN0** and **AIN1**,

as input for AREF in case AREF is selected in [EXTREFSEL](#) on page 182. The selected analog pins will be acquired by the LPCOMP when it is enabled through [ENABLE](#) on page 181.

### 6.11.3 Registers

| Base address | Peripheral | Instance | Description          | Configuration |
|--------------|------------|----------|----------------------|---------------|
| 0x40013000   | LPCOMP     | LPCOMP   | Low power comparator |               |

Table 52: Instances

| Register     | Offset | Description                              |
|--------------|--------|------------------------------------------|
| TASKS_START  | 0x000  | Start comparator                         |
| TASKS_STOP   | 0x004  | Stop comparator                          |
| TASKS_SAMPLE | 0x008  | Sample comparator value                  |
| EVENTS_READY | 0x100  | LPCOMP is ready and output is valid      |
| EVENTS_DOWN  | 0x104  | Downward crossing                        |
| EVENTS_UP    | 0x108  | Upward crossing                          |
| EVENTS_CROSS | 0x10C  | Downward or upward crossing              |
| SHORTS       | 0x200  | Shortcuts between local events and tasks |

## 6.11.4 Electrical specification

### 6.11.4.1 LPCOMP Electrical Specification

| Symbol                 | Description                                                                    | Min. | Typ. | Max. | Units |
|------------------------|--------------------------------------------------------------------------------|------|------|------|-------|
| t <sub>LPCANADET</sub> | Time from VIN crossing (>=50 mV above threshold) to ANADETECT signal generated |      | 5    |      | µs    |
| V <sub>INPOFFSET</sub> | Input offset including reference ladder error                                  | -40  |      | 40   | mV    |
| V <sub>HYST</sub>      | Optional hysteresis                                                            |      | 35   |      | mV    |
| t <sub>STARTUP</sub>   | Startup time for LPCOMP                                                        |      | 140  |      | µs    |

## 6.12 MWU — Memory watch unit

The Memory watch unit (MWU) can be used to generate events when a memory region is accessed by the CPU. The MWU can be configured to trigger events for access to Data RAM and Peripheral memory segments. The MWU allows an application developer to generate memory access events during development for debugging or during production execution for failure detection and recovery.

Listed here are the main features for MWU:

- Six memory regions, four user-configurable and two fixed regions in peripheral address space
- Flexible configuration of regions with START and END addresses
- Generate events on CPU read and/or write to a defined region of Data RAM or peripheral memory address space
- Programmable maskable or non-maskable (NMI) interrupt on events
- Peripheral interfaces can be watched for read and write access using subregions of the two fixed memory regions

| Memory region | START address | END address  |
|---------------|---------------|--------------|
| REGION[0..3]  | Configurable  | Configurable |
| PREGION[0]    | 0x40000000    | 0x4001FFFF   |
| PREGION[1]    | 0x40020000    | 0x4003FFFF   |

Table 54: Memory regions

Each MWU region is defined by a start address and an end address, configured by the START and END registers respectively. These addresses are byte aligned and inclusive. The END register value has to be greater or equal to the START register value. Each region is associated with a pair of events that indicate that either a write access or a read access from the CPU has been detected inside the region.

For regions containing subregions (see below), a set of status registers PERREGION[0..1].SUBSTATWA and PERREGION[0..1].SUBSTATRA indicate which subregion(s) caused the EVENT\_PREGION[0..1].WA and EVENT\_PREGION[0..1].RA respectively.

The MWU is only able to detect memory accesses in the Data RAM and Peripheral memory segments from the CPU, see [Memory](#) on page 19 for more information about the different memory segments. EasyDMA

accesses are not monitored by the MWU. The MWU requires two HCLK cycles to detect and generate the event.

The peripheral regions, PREGION[0..1], are divided into 32 equally sized subregions, SR[0..31]. All subregions are excluded in the main region by default, and any can be included by specifying them in the SUBS register. When a subregion is excluded from the main region, the memory watch mechanism will not trigger any events when that subregion is accessed.

Subregions in PREGION[0..1] cannot be individually configured for read or write access watch. Watch configuration is only possible for a region as a whole. The PRGNiRA and PRGNiWA (i=0..1) fields in the REGIONEN register control watching read and write access.

REGION[0..3] can be individually enabled for read and/or write access watching through their respective RGNiRA and RGNiWA (i=0..3) fields in the REGIONEN register.

REGIONENSET and REGIONENCLR allow respectively enabling and disabling one or multiple REGIONS or PREGIONS watching in a single write access.

### 6.12.1 Registers

| Base address | Peripheral | Instance | Description       | Configuration |
|--------------|------------|----------|-------------------|---------------|
| 0x40020000   | MWU        | MWU      | Memory watch unit |               |

Table 55: Instances

| Register               | Offset | Description                                                                                                         |
|------------------------|--------|---------------------------------------------------------------------------------------------------------------------|
| EVENTS_REGION[0].WA    | 0x100  | Write access to region 0 detected                                                                                   |
| EVENTS_REGION[0].RA    | 0x104  | Read access to region 0 detected                                                                                    |
| EVENTS_REGION[1].WA    | 0x108  | Write access to region 1 detected                                                                                   |
| EVENTS_REGION[1].RA    | 0x10C  | Read access to region 1 detected                                                                                    |
| EVENTS_REGION[2].WA    | 0x110  | Write access to region 2 detected                                                                                   |
| EVENTS_REGION[2].RA    | 0x114  | Read access to region 2 detected                                                                                    |
| EVENTS_REGION[3].WA    | 0x118  | Write access to region 3 detected                                                                                   |
| EVENTS_REGION[3].RA    | 0x11C  | Read access to region 3 detected                                                                                    |
| EVENTS_PREGION[0].WA   | 0x160  | Write access to peripheral region 0 detected                                                                        |
| EVENTS_PREGION[0].RA   | 0x164  | Read access to peripheral region 0 detected                                                                         |
| EVENTS_PREGION[1].WA   | 0x168  | Write access to peripheral region 1 detected                                                                        |
| EVENTS_PREGION[1].RA   | 0x16C  | Read access to peripheral region 1 detected                                                                         |
| INTEN                  | 0x300  | Enable or disable interrupt                                                                                         |
| INTENSET               | 0x304  | Enable interrupt                                                                                                    |
| INTENCLR               | 0x308  | Disable interrupt                                                                                                   |
| NMIEN                  | 0x320  | Enable or disable interrupt                                                                                         |
| NMIENSET               | 0x324  | Enable interrupt                                                                                                    |
| NMIENCLR               | 0x328  | Disable interrupt                                                                                                   |
| PERREGION[0].SUBSTATWA | 0x400  | Source of event/interrupt in region 0, write access detected while corresponding subregion was enabled for watching |
| PERREGION[0].SUBSTATRA | 0x404  | Source of event/interrupt in region 0, read access detected while corresponding subregion was enabled for watching  |
| PERREGION[1].SUBSTATWA | 0x408  | Source of event/interrupt in region 1, write access detected while corresponding subregion was enabled for watching |
| PERREGION[1].SUBSTATRA | 0x40C  | Source of event/interrupt in region 1, read access detected while corresponding subregion was enabled for watching  |
| REGIONEN               | 0x510  | Enable/disable regions watch                                                                                        |
| REGIONENSET            | 0x514  | Enable regions watch                                                                                                |
| REGIONENCLR            | 0x518  | Disable regions watch                                                                                               |

| Register         | Offset | Description                |
|------------------|--------|----------------------------|
| REGION[0].START  | 0x600  | Start address for region 0 |

## 6.13 NFCT — Near field communication tag

The NFCT peripheral is an implementation of an NFC Forum compliant listening device NFC-A.

With appropriate software, the NFCT peripheral can be used as the listening device NFC-A as specified by the [NFC Forum](#).

Listed here are the main features for the NFCT peripheral:

- NFC-A listen mode operation
  - 13.56 MHz input frequency
  - Bit rate 106 kbps
- Wake-on-field low power field detection (SENSE) mode
- Frame assemble and disassemble for the NFC-A frames specified by the NFC Forum
- Programmable frame timing controller
- Integrated automatic collision resolution, cyclic redundancy check (CRC), and parity functions

Figure 60: NFCT block diagram

### 6.13.1 Overview

The NFCT peripheral contains a 13.56 MHz AM receiver and a 13.56 MHz load modulator with 106 kbps data rate as defined by the NFC Forum.

Figure 61: NFCT overview

When transmitting, the frame data will be transferred directly from RAM and transmitted with configurable frame type and delay timing. The system will be notified by an event whenever a complete frame is received or sent. The received frames will be automatically disassembled and the data part of the frame transferred to RAM.

The NFCT peripheral also supports the collision detection and resolution ("anticollision") as defined by the NFC Forum.

Wake-on-field is supported in SENSE mode while the device is either in System OFF or System ON mode. When the antenna enters an NFC field, an event will be triggered notifying the system to activate the NFCT functionality for incoming frames. In System ON, if the energy detected at the antenna increases beyond a threshold value, the module will generate a **FIELDDETECTED** event. When the strength of the field no longer supports NFC communication, the module will generate a **FIELDLOST** event. For the Low Power Field Detect threshold values, refer to **NFCT Electrical Specification** on page 227.

In System OFF, the NFCT Low Power Field Detect function can wake the system up through a reset. See **RESETREAS** on page 75 for more information on how to detect a wakeup from NFCT.

If the system is put into System OFF mode while a field is already present, the NFCT Low Power Field Detect function will wake the system up right away and generate a reset.

**Important:** As a consequence of a reset, NFCT is disabled, and therefore the reset handler will have to activate NFCT again and set it up properly.

The HFXO must be running before the NFCT peripheral goes into ACTIVATED state. Note that the NFCT peripheral calibration is automatically done on **ACTIVATE** task. The HFXO can be turned off when the NFCT peripheral goes into SENSE mode. The shortcut **FIELDDETECTED\_ACTIVATE** can be used when the HFXO is already running while in SENSE mode.

Outgoing data will be collected from RAM with the EasyDMA function and assembled according to the **TXD.FRAMECONFIG** on page 222 register. Incoming data will be disassembled according to the **RXD.FRAMECONFIG** register and the data section in the frame will be written to RAM via the EasyDMA function.

The NFCT peripheral includes a frame timing controller that can be used to accurately control the inter-frame delay between the incoming frame and a corresponding outgoing frame. It also includes optional CRC functionality.

### 6.13.2 Operating states

Tasks and events are used to control the operating state of the peripheral. The module can change state by triggering a task, or when specific operations are finalized. Events and tasks allow software to keep track of and change the current state.

See [NFCT block diagram](#) on page 198 and [NFCT state diagram, automatic collision resolution enabled](#) on page 200 for more information. See *NFC Forum, NFC Activity Technical Specification* for description on NFCT operating states.

Figure 62: NFCT state diagram, automatic collision resolution enabled

Figure 63: NFCT state diagram, automatic collision resolution disabled

**Important:**

- FIELDLOST event is not generated in SENSE mode.
- Sending SENSE task while field is still present does not generate **FIELDDETECTED** event.
- If the FIELDDETECTED event is cleared before sending the **ACTIVATE** task, then the FIELDDETECTED event shows up again after sending the ACTIVATE task. The shortcut FIELDDETECTED\_ACTIVATE can be used to avoid this condition.

### 6.13.3 Pin configuration

NFCT uses two pins to connect the antenna and these pins are shared with GPIOs.

The PROTECT field in the NFCPINS register in UICR defines the usage of these pins and their protection level against excessive voltages. The content of the NFCPINS register is reloaded at every reset. See [Pin assignments](#) on page 560 for the pins used by the NFCT peripheral.

When NFCPINS.PROTECT=NFC, a protection circuit will be enabled on the dedicated pins, preventing the chip from being damaged in the presence of a strong NFC field. The protection circuit will short the two pins together if voltage difference exceeds approximately 2V. The GPIO function on those pins will also be disabled.

When NFCPINS.PROTECT=Disabled, the device will not be protected against strong NFC field damages caught by a connected NFCT antenna, and the NFCT peripheral will not operate as expected, as it will never leave the DISABLE state.

The pins dedicated to the NFCT antenna function will have some limitation when the pins are configured for normal GPIO operation. The pin capacitance will be higher on those (refer to  $C_{PAD\_NFC}$  in the Electrical Specification of [GPIO — General purpose input/output](#) on page 141), and some increased leakage current between the two pins is to be expected if they are used in GPIO mode, and are driven to different logical values. To save power, the two pins should always be set to the same logical value whenever entering one of the device power saving modes. For details, refer to  $I_{NFC\_LEAK}$  in the Electrical Specification of [GPIO — General purpose input/output](#) on page 141.

### 6.13.4 EasyDMA

The NFCT peripheral implements EasyDMA for reading and writing of data packets from and to the Data RAM.

The NFCT EasyDMA utilizes a pointer called [PACKETPTR](#) on page 222 for receiving and transmitting packets.

The NFCT peripheral uses EasyDMA to read or write RAM, but not both at the same time. The event [RXFRAMESTART](#) indicates that the EasyDMA has started writing to the RAM for a receive frame and the event [RXFRAMEEND](#) indicates that the EasyDMA has completed writing to the RAM. Similarly, the event [TXFRAMESTART](#) indicates that the EasyDMA has started reading from the RAM for a transmit frame and the event [TXFRAMEEND](#) indicates that the EasyDMA has completed reading from the RAM. If a transmit and a receive operation is issued at the same time, the transmit operation would be prioritized.

Starting a transmit operation while the EasyDMA is writing a receive frame to the RAM will result in unpredictable behavior. Starting an EasyDMA operation when there is an ongoing EasyDMA operation may result in unpredictable behavior. It is recommended to wait for the TXFRAMEEND or RXFRAMEEND event for the ongoing transmit or receive before starting a new receive or transmit operation.

The [MAXLEN](#) on page 222 register determines the maximum number of bytes that can be read from or written to the RAM. This feature can be used to ensure that the NFCT peripheral does not overwrite, or read beyond, the RAM assigned to a packet. Note that if the [RXD.AMOUNT](#) or [TXD.AMOUNT](#) register indicates longer data packets than set in MAXLEN, the frames sent to or received from the physical layer

will be incomplete. In that situation, in RX, the **OVERRUN** bit in the **FRAMESTATUS.RX** register will be set and an **RXERROR** event will be triggered.

**Important:** The **RXD.AMOUNT** and **TXD.AMOUNT** define a frame length in bytes and bits excluding start of frame (SoF), end of frame (EoF), and parity, but including CRC for **RXD.AMOUNT** only. Make sure to take potential additional bits into account when setting **MAXLEN**.

Only sending task **ENABLERXDATA** ensures that a new value in **PACKETPTR** pointing to the RX buffer in Data RAM is taken into account.

If **PACKETPTR** is not pointing to the Data RAM region, an EasyDMA transfer may result in a hard fault or RAM corruption. For more information about the different memory regions, see Chapter **Memory** on page 19.

The NFCT peripherals normally do alternative receive and transmit frames. Therefore, to prepare for the next frame, the **PACKETPTR**, **MAXLEN**, **TXD.FRAMECONFIG** and **TXD.AMOUNT** can be updated while the receive is in progress, and, similarly, the **PACKETPTR**, **MAXLEN** and **RXD.FRAMECONFIG** can be updated while the transmit is in progress. They can be updated and prepared for the next NFC frame immediately after the **STARTED** event of the current frame has been received. Updating the **TXD.FRAMECONFIG** and **TXD.AMOUNT** during the current transmit frame or updating **RXD.FRAMECONFIG** during current receive frame may cause unpredictable behaviour.

In accordance with *NFC Forum, NFC Digital Protocol Technical Specification*, the least significant bit (LSB) from the least significant byte (LSByte) is sent on air first. The bytes are stored in increasing order, starting at the lowest address in the EasyDMA buffer in RAM.

### 6.13.5 Frame assembler

The NFCT peripheral implements a frame assembler in hardware.

When the NFCT peripheral is in the **ACTIVE\_A** state, the software can decide to enter RX or TX mode. For RX, see **Frame disassembler** on page 203. For TX, the software must indicate the address of the source buffer in Data RAM and its size through programming the **PACKETPTR** and **MAXLEN** registers respectively, then issuing a **STARTTX** task.

**MAXLEN** must be set so that it matches the size of the frame to be sent.

The **STARTED** event indicates that the **PACKETPTR** and **MAXLEN** registers have been captured by the frame assembler EasyDMA.

When asserting the **STARTTX** task, the frame assembler module will start reading **TXD.AMOUNT.TXDATABYTES** bytes (plus one additional byte if **TXD.AMOUNT.TXDATABITS > 0**) from the RAM position set by the **PACKETPTR**.

The NFCT peripheral transmits the data as read from RAM, adding framing and the CRC calculated on the fly if set in **TXD.FRAMECONFIG**. The NFCT peripheral will take  $(8 * \text{TXD.AMOUNT.TXDATABYTES} + \text{TXD.AMOUNT.TXDATABITS})$  bits and assemble a frame according to the settings in **TXD.FRAMECONFIG**. Both short frames, standard frames, and bit-oriented SDD frames as specified in the *NFC Forum, NFC Digital Protocol Technical Specification* can be assembled by the correct setting of the **TXD.FRAMECONFIG** register.

The bytes will be transmitted on air in the same order as they are read from RAM with a rising bit order within each byte, least significant bit (LSB) first. That is, b0 will be transmitted on air before b1, and so on. The bits read from RAM will be coded into symbols as defined in the *NFC Forum, NFC Digital Protocol Technical Specification*.

**Important:** Some NFC Forum documents, such as *NFC Forum*, *NFC Digital Protocol Technical Specification*, define bit numbering in a byte from b1 (LSB) to b8 (most significant bit (MSB)), while most other technical documents from the NFC Forum, and also the Nordic Semiconductor documentation, traditionally number them from b0 to b7. The present document uses the b0–b7 numbering scheme. Be aware of this when comparing the *NFC Forum*, *NFC Digital Protocol Technical Specification* to others.

The frame assembler can be configured in TXD.FRAMECONFIG to add SoF symbol, calculate and add parity bits, and calculate and add CRC to the data read from RAM when assembling the frame. The total frame will then be longer than what is defined by TXD.AMOUNT.TXDATABYTES. TXDATABITS. DISCARDMODE will select if the first bits in the first byte read from RAM or the last bits in the last byte read from RAM will be discarded if TXD.AMOUNT.TXDATABITS are not equal to zero. Note that if TXD.FRAMECONFIG.PARITY = Parity and TXD.FRAMECONFIG.DISCARDMODE=DiscardStart, a parity bit will be included after the non-complete first byte. No parity will be added after a non-complete last byte.

The frame assemble operation is illustrated in [Frame assemble illustration](#) on page 203 for different settings in TXD.FRAMECONFIG. All shaded bit fields are added by the frame assembler. Some of these bits are optional and appearances are configured in TXD.FRAMECONFIG. Note that the frames illustrated do not necessarily comply with the NFC specification. The figure is only to illustrate the behavior of the NFCT peripheral.

#### Data from RAM

#### Frame on air

PARITY = Parity  
TXDATABITS = 0  
CRCMODETX = CRC16TX

PARITY = Parity  
TXDATABITS = 4  
CRCMODETX = NoCRCTX  
DISCARDMODE = DiscardStart

PARITY = Parity  
TXDATABITS = 0  
CRCMODETX = NoCRCTX

Figure 64: Frame assemble illustration

The accurate timing for transmitting the frame on air is set using the frame timing controller settings.

### 6.13.6 Frame disassembler

The NFCT peripheral implements a frame disassembler in hardware.

When the NFCT peripheral is in the ACTIVE\_A state, the software can decide to enter RX or TX mode. For TX, see [Frame assembler](#) on page 202. For RX, the software must indicate the address and size of the destination buffer in Data RAM through programming the [PACKETPTR](#) and [MAXLEN](#) registers before issuing an [ENABLERXDATA](#) task.

The [STARTED](#) event indicates that the [PACKETPTR](#) and [MAXLEN](#) registers have been captured by the frame disassembler EasyDMA.

When an incoming frame starts, the [RXFRAMESTART](#) event will get issued and data will be written to the buffer in Data RAM. The frame disassembler will verify and remove any parity bits, start of frame (SoF) and

end of frame (EoF) symbols on the fly based on [RXD.FRAMECONFIG](#) register configuration. It will, however, verify and transfer the CRC bytes into RAM, if the CRC is enabled through [RXD.FRAMECONFIG](#).

When an EoF symbol is detected, the NFCT peripheral will assert the [RXFRAMEEND](#) event and write the [RXD.AMOUNT](#) register to indicate numbers of received bytes and bits in the data packet. The module does not interpret the content of the data received from the remote NFC device, except for SoF, EoF, parity, and CRC checking, as described above. The frame disassemble operation is illustrated below.

#### Frame on air

PARITY = Parity  
RXDATABITS = 0  
CRCMODERX = CRC16RX

PARITY = Parity  
CRCMODERX = NoCRCTR  
RXDATABITS = 4

PARITY = NoParity  
CRCMODERX = NoCRCRX  
RXDATABITS = 0

#### Data to RAM

Figure 65: Frame disassemble illustration

Per NFC specification, the time between EoF to the next SoF can be as short as 86  $\mu$ s, and therefore care must be taken that PACKETPTR and MAXLEN are ready and ENABLERXDATA is issued on time after the end of previous frame. The use of a PPI shortcut from [TXFRAMEEND](#) to ENABLERXDATA is recommended.

### 6.13.7 Frame timing controller

The NFCT peripheral includes a frame timing controller that continuously keeps track of the number of the 13.56 MHz RF carrier clock periods since the end of the EoF of the last received frame.

The NFCT peripheral can be programmed to send a responding frame within a time window or at an exact count of RF carrier periods. In case of [FRAMEDELAYMODE](#) = Window, a [STARTTX](#) task triggered before the frame timing controller counter is equal to [FRAMEDELAYMIN](#) will force the transmission to halt until the counter is equal to [FRAMEDELAYMIN](#). If the counter is within [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) when the [STARTTX](#) task is triggered, the NFCT peripheral will start the transmission straight away. In case of [FRAMEDELAYMODE](#) = ExactVal, a [STARTTX](#) task triggered before the frame delay counter is equal to [FRAMEDELAYMAX](#) will halt the actual transmission start until the counter is equal to [FRAMEDELAYMAX](#).

In case of [FRAMEDELAYMODE](#) = WindowGrid, the behaviour is similar to the [FRAMEDELAYMODE](#) = Window, but the actual transmission between [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) starts on a bit grid as defined for NFC-A Listen frames (slot duration of 128 RF carrier periods).

An [ERROR](#) event (with [FRAMEDELAYTIMEOUT](#) cause in [ERRORSTATUS](#)) will be asserted if the frame timing controller counter reaches [FRAMEDELAYMAX](#) without any [STARTTX](#) task triggered. This may happen even when the response is not required as per *NFC Forum, NFC Digital Protocol Technical Specification*. Any commands handled by the automatic collision resolution that don't involve a response being generated may also result in an [ERROR](#) event (with [FRAMEDELAYTIMEOUT](#) cause in [ERRORSTATUS](#)). The [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) values shall only be updated before the [STARTTX](#) task is triggered. Failing to do so may cause unpredictable behaviour.

The frame timing controller operation is illustrated in [Frame timing controller \(FRAMEDELAYMODE=Window\)](#) on page 205. The frame timing controller automatically adjusts the frame timing counter based on the last received data bit according to NFC-A technology in the *NFC Forum, NFC Digital Protocol Technical Specification*.

Figure 66: Frame timing controller (FRAMEDELAYMODE=Window)

### 6.13.8 Collision resolution

The NFCT peripheral implements an automatic collision resolution function as defined by the NFC Forum.

Automatic collision resolution is enabled by default, and it is recommended that the feature is used since it is power efficient and reduces the complexity of software handling the collision resolution sequence. This feature can be disabled through the MODE field in the [AUTOCOLRESCONFIG](#) register. When the automatic collision resolution is disabled, all commands will be sent over EasyDMA as defined in frame disassembler.

The [SENSRES](#) and [SELRES](#) registers need to be programmed upfront in order for the collision resolution to behave correctly. Depending on the NFCIDSIZE field in SENSRES, the following registers also need to be programmed upfront:

- NFCID1\_LAST if NFCID1SIZE=NFCID1Single (ID = 4 bytes);
- NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Double (ID = 7 bytes);
- NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Triple (ID = 10 bytes);

A pre-defined set of registers, NFC.TAGHEADER0..3, containing a valid NFCID1 value, is available in FICR and can be used by software to populate the NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST, and NFCID1\_LAST registers.

[NFCID1 byte allocation \(top sent first on air\)](#) on page 206 explains the position of the ID bytes in NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST, and NFCID1\_LAST, depending on the ID size, and as compared to the definition used in the *NFC Forum, NFC Digital Protocol Technical Specification*.

|          | ID = 4 bytes        | ID = 7 bytes        | ID = 10 bytes       |
|----------|---------------------|---------------------|---------------------|
| NFCID1_Q |                     |                     | nfcid1 <sub>0</sub> |
| NFCID1_R |                     |                     | nfcid1 <sub>1</sub> |
| NFCID1_S |                     |                     | nfcid1 <sub>2</sub> |
| NFCID1_T |                     | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> |
| NFCID1_U |                     | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> |
| NFCID1_V |                     | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> |
| NFCID1_W | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> | nfcid1 <sub>6</sub> |
| NFCID1_X | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> | nfcid1 <sub>7</sub> |
| NFCID1_Y | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> | nfcid1 <sub>8</sub> |
| NFCID1_Z | nfcid1 <sub>3</sub> | nfcid1 <sub>6</sub> | nfcid1 <sub>9</sub> |

Table 57: NFCID1 byte allocation (top sent first on air)

The hardware implementation can handle the states from IDLE to ACTIVE\_A automatically as defined in the *NFC Forum, NFC Activity Technical Specification*, and the other states are to be handled by software. The software keeps track of the state through events. The collision resolution will trigger an **AUTOCOLRESSTARTED** event when it has started. Reaching the ACTIVE\_A state is indicated by the **SELECTED** event.

If collision resolution fails, a **COLLISION** event is triggered. Note that errors occurring during automatic collision resolution may also cause **ERROR** and/or **RXERROR** events to be generated. Other events may also get generated. It is recommended that the software ignores any event except COLLISION, SELECTED and FIELDLOST during automatic collision resolution. Software shall also make sure that any unwanted SHORT or PPI shortcut is disabled during automatic collision resolution.

The automatic collision resolution will be restarted, if the packets are received with CRC or parity errors while in ACTIVE\_A state. The automatic collision resolution feature can be disabled while in ACTIVE\_A state to avoid this.

The SLP\_REQ is automatically handled by the NFCT peripheral when the automatic collision resolution is enabled. However, this results in an ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS) since the SLP\_REQ has no response. This error must be ignored until the SELECTED event is triggered and this error should be cleared by the software when the SELECTED event is triggered.

### 6.13.9 Antenna interface

In ACTIVATED state, an amplitude regulator will adjust the voltage swing on the antenna pins to a value that is within the  $V_{\text{swing}}$  limit.

Refer to [NFCT Electrical Specification](#) on page 227.

### 6.13.10 NFCT antenna recommendations

The NFCT antenna coil must be connected differential between **NFC1** and **NFC2** pins of the device.

Two external capacitors should be used to tune the resonance of the antenna circuit to 13.56 MHz.

Figure 67: NFCT antenna recommendations

The required tuning capacitor value is given by the below equations:

$$C'_{tune} = \frac{1}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} \quad \text{where } C'_{tune} = \frac{1}{2} \cdot (C_p + C_{int} + C_{tune})$$

$$\text{and } C_{tune1} = C_{tune2} = C_{tune} \quad C_{p1} = C_{p2} = C_p \quad C_{int1} = C_{int2} = C_{int}$$

$$C_{tune} = \frac{2}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} - C_p - C_{int}$$

An antenna inductance of  $L_{ant} = 2 \mu\text{H}$  will give tuning capacitors in the range of 130 pF on each pin. The total capacitance on **NFC1** and **NFC2** must be matched.

### 6.13.11 Battery protection

If the antenna is exposed to a strong NFC field, current may flow in the opposite direction on the supply due to parasitic diodes and ESD structures.

If the battery used does not tolerate return current, a series diode must be placed between the battery and the device in order to protect the battery.

### 6.13.12 Digital Modulation Signal

Support for external analog frontends or antenna architectures is possible by optionally outputting the digital modulation signal to a GPIO.

The NFCT peripheral is designed to connect directly to a loop antenna, receive a modulated signal from an NFC Reader with its internal analog frontend and transmit data back by changing the input resistance that is then seen as modulated load by the NFC Reader.

In addition, the peripheral has an option to output the digital modulation signal to a GPIO. Reception still occurs through the internal analog frontend, whereas transmission can be done by one of the following:

- The internal analog frontend through the loop antenna (default)
- An external frontend using the digital modulation signal
- The combination of both above

There are two registers that allow configuration of the modulation signal (i.e. of the response from NFCT to the NFC Reader), [MODULATIONCTRL](#) and [MODULATIONPSEL](#). The registers need to be programmed before NFCT sends a response to a request from a reader. Ideally, this configuration is performed during startup and whenever the NFCT peripheral is powered up.

The selected GPIO needs to be configured as output in the corresponding GPIO configuration register. It is recommended to set an output value in the corresponding GPIO.OUT register – this value will be driven whenever the NFCT peripheral is disabled.

NFCT drives the pin low when there is no modulation, and drives it with On-Off Keying (OOK) modulation of an 847 kHz subcarrier (derived from the carrier frequency) when it responds to commands from an NFC Reader.

| ERRORSTATUS      | 0x404  | NFC Error Status register                                                                                           |
| FRAMESTATUS.RX   | 0x40C  | Result of last incoming frame                                                                                       |
| NFCTAGSTATE      | 0x410  | NfcTag state register                                                                                               |
| SLEEPSTATE       | 0x420  | Sleep state during automatic collision resolution                                                                   |
| FIELDPRESENT     | 0x43C  | Indicates the presence or not of a valid field                                                                      |
| FRAMEDELAYMIN    | 0x504  | Minimum frame delay                                                                                                 |
| FRAMEDELAYMAX    | 0x508  | Maximum frame delay                                                                                                 |
| FRAMEDELAYMODE   | 0x50C  | Configuration register for the Frame Delay Timer                                                                    |
| PACKETPTR        | 0x510  | Packet pointer for TXD and RXD data storage in Data RAM                                                             |
| MAXLEN           | 0x514  | Size of the RAM buffer allocated to TXD and RXD data storage each                                                   |
| TXD.FRAMECONFIG  | 0x518  | Configuration of outgoing frames                                                                                    |
| TXD.AMOUNT       | 0x51C  | Size of outgoing frame                                                                                              |
| RXD.FRAMECONFIG  | 0x520  | Configuration of incoming frames                                                                                    |
| RXD.AMOUNT       | 0x524  | Size of last incoming frame                                                                                         |
| MODULATIONCTRL   | 0x52C  | Enables the modulation output to a GPIO pin which can be connected to a second external antenna.                    |
| MODULATIONPSEL   | 0x538  | Pin select for Modulation control.                                                                                  |
| NFCID1_LAST      | 0x590  | Last NFCID1 part (4, 7 or 10 bytes ID)                                                                              |
| NFCID1_2ND_LAST  | 0x594  | Second last NFCID1 part (7 or 10 bytes ID)                                                                          |
| NFCID1_3RD_LAST  | 0x598  | Third last NFCID1 part (10 bytes ID)                                                                                |
| AUTOCOLRESCONFIG | 0x59C  | Controls the auto collision resolution function. This setting must be done before the NFCT peripheral is activated. |
| SENSRES          | 0x5A0  | NFC-A SENS_RES auto-response settings                                                                               |
| SELRES           | 0x5A4  | NFC-A SEL_RES auto-response settings                                                                                |

Table 59: Register overview

### 6.13.14.1 TASKS\_ACTIVATE

Address offset: 0x000

Activate NFCT peripheral for incoming and outgoing frames, change state to activated

|                  |            |                |       |                                                                                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

    #### 6.13.14.41 MODULATIONCTRL

Address offset: 0x52C

Enables the modulation output to a GPIO pin which can be connected to a second external antenna.

See [MODULATIONPSEL](#) for GPIO configuration.
