|                  |  |  |   ### 6.13.14.46 AUTOCOLRESCONFIG

Address offset: 0x59C

Controls the auto collision resolution function. This setting must be done before the NFCT peripheral is activated.

When modifying this register bit 1 must be written to '1'.

### 6.13.15.2 NFCT Timing Parameters

| Symbol                | Description                                                                                 | Min. | Typ. | Max. | Units |
|-----------------------|---------------------------------------------------------------------------------------------|------|------|------|-------|
| t <sub>activate</sub> | Time from task_ACTIVATE in SENSE or DISABLE state to ACTIVATE_A or IDLE state <sup>16</sup> |      |      | 500  | μs    |
| t <sub>sense</sub>    | Time from remote field is present in SENSE mode to FIELDDETECTED event is asserted          |      |      | 20   | μs    |

Figure 68: NFCT timing parameters (Shortcuts for FIELDDETECTED and FIELDLOST are disabled)

## 6.14 PDM — Pulse density modulation interface

The pulse density modulation (PDM) module enables input of pulse density modulated signals from external audio frontends, for example, digital microphones. The PDM module generates the PDM clock

<sup>15</sup> Input is high impedance in sense mode

<sup>16</sup> Does not account for voltage supply and oscillator startup times

and supports single-channel or dual-channel (left and right) data input. Data is transferred directly to RAM buffers using EasyDMA.

Listed here are the main features for PDM:

- Up to two PDM microphones configured as a left/right pair using the same data input
- 16 kHz output sample rate, 16-bit samples
- EasyDMA support for sample buffering
- HW decimation filters
- Selectable ratio of 64 or 80 between PDM\_CLK and output sample rate

The PDM module illustrated below is interfacing up to two digital microphones with the PDM interface. EasyDMA is implemented to relieve the real-time requirements associated with controlling of the PDM slave from a low priority CPU execution context. It also includes all the necessary digital filter elements to produce pulse code modulation (PCM) samples. The PDM module allows continuous audio streaming.

Figure 69: PDM module

### 6.14.1 Master clock generator

The master clock generator's PDMCLKCTRL register allows adjusting the PDM clock's frequency.

The master clock generator does not add any jitter to the HFCLK source chosen. It is recommended (but not mandatory) to use the Xtal as HFCLK source.

### 6.14.2 Module operation

By default, bits from the left PDM microphone are sampled on PDM\_CLK falling edge, and bits for the right are sampled on the rising edge of PDM\_CLK, resulting in two bitstreams. Each bitstream is fed into a digital filter which converts the PDM stream into 16-bit PCM samples, then filters and down-samples them to reach the appropriate sample rate.

The EDGE field in the MODE register allows swapping left and right, so that left will be sampled on rising edge, and right on falling.

The PDM module uses EasyDMA to store the samples coming out from the filters into one buffer in RAM. Depending on the mode chosen in the OPERATION field in the MODE register, memory either contains alternating left and right 16-bit samples (Stereo), or only left 16-bit samples (Mono). To ensure continuous PDM sampling, it is up to the application to update the EasyDMA destination address pointer as the previous buffer is filled.

The continuous transfer can be started or stopped by sending the START and STOP tasks. STOP becomes effective after the current frame has finished transferring, which will generate the STOPPED event. The STOPPED event indicates that all activity in the module is finished, and that the data is available in RAM (EasyDMA has finished transferring as well). Attempting to restart before receiving the STOPPED event may result in unpredictable behavior.

### 6.14.3 Decimation filter

In order to convert the incoming data stream into PCM audio samples, a decimation filter is included in the PDM interface module.

The input of the filter is the two-channel PDM serial stream (with left channel on clock high, right channel on clock low). Depending on the **RATIO** selected, its output is  $2 \times 16$ -bit PCM samples at a sample rate either 64 times or 80 times (depending on the **RATIO** register) lower than the PDM clock rate.

The filter stage of each channel is followed by a digital volume control, to attenuate or amplify the output samples in a range of -20 dB to +20 dB around the default (reset) setting, defined by  $G_{PDM, default}$ . The gain is controlled by the **GAINL** and **GAINR** registers.

As an example, if the goal is to achieve 2500 RMS output samples (16-bit) with a 1 kHz 90 dBA signal into a -26 dBFS sensitivity PDM microphone, do the following:

- Sum the PDM module's default gain ( $G_{PDM, default}$ ) and the gain introduced by the microphone and acoustic path of his implementation (an attenuation would translate into a negative gain)
- Adjust **GAINL** and **GAINR** by the above summed amount. Assuming that only the PDM module influences the gain, **GAINL** and **GAINR** must be set to  $-G_{PDM, default}$  dB to achieve the requirement.

With  $G_{PDM, default}=3.2$  dB, and as **GAINL** and **GAINR** are expressed in 0.5 dB steps, the closest value to program would be 3.0 dB, which can be calculated as:

$$GAINL = GAINR = (DefaultGain - (2 * 3))$$

Remember to check that the resulting values programmed into **GAINL** and **GAINR** fall within **MinGain** and **MaxGain**.

### 6.14.4 EasyDMA

Samples will be written directly to RAM, and EasyDMA must be configured accordingly.

The address pointer for the EasyDMA channel is set in **SAMPLE.PTR** register. If the destination address set in **SAMPLE.PTR** is not pointing to the Data RAM region, an EasyDMA transfer may result in a **HardFault** or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

DMA supports Stereo (Left+Right 16-bit samples) and Mono (Left only) data transfer, depending on the setting in the **OPERATION** field in the **MODE** register. The samples are stored little endian.

| MODE.OPERATION | Bits per sample | Result stored per RAM word | Physical RAM allocated (32-bit words) | Result boundary indexes in RAM | Note    |
|----------------|-----------------|----------------------------|---------------------------------------|--------------------------------|---------|
| Stereo         | 32 (2x16)       | L+R                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | $R0=[31:16]; L0=[15:0]$        | Default |
| Mono           | 16              | 2xL                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | $L1=[31:16]; L0=[15:0]$        |         |

Table 60: DMA sample storage

The destination buffer in RAM consists of one block, the size of which is set in **SAMPLE.MAXCNT** register. Format is number of 16-bit samples. The physical RAM allocated is always:

$$(\text{RAM allocation, in bytes}) = \text{SAMPLE.MAXCNT} * 2;$$

(but the mapping of the samples depends on **MODE.OPERATION**).

If **OPERATION**=Stereo, RAM will contain a succession of left and right samples.

If **OPERATION**=Mono, RAM will contain a succession of left only samples.

For a given value of `SAMPLE.MAXCNT`, the buffer in RAM can contain half the stereo sampling time as compared to the mono sampling time.

The PDM acquisition can be started by the `START` task, after the `SAMPLE.PTR` and `SAMPLE.MAXCNT` registers have been written. When starting the module, it will take some time for the filters to start outputting valid data. Transients from the PDM microphone itself may also occur. The first few samples (typically around 50) might hence contain invalid values or transients. It is therefore advised to discard the first few samples after a PDM start.

As soon as the `STARTED` event is received, the firmware can write the next `SAMPLE.PTR` value (this register is double-buffered), to ensure continuous operation.

When the buffer in RAM is filled with samples, an `END` event is triggered. The firmware can start processing the data in the buffer. Meanwhile, the PDM module starts acquiring data into the new buffer pointed to by `SAMPLE.PTR`, and sends a new `STARTED` event, so that the firmware can update `SAMPLE.PTR` to the next buffer address.

### 6.14.5 Hardware example

PDM can be configured with a single microphone (mono), or with two microphones.

When a single microphone is used, connect the microphone clock to `CLK`, and data to `DIN`.

Figure 70: Example of a single PDM microphone, wired as left

Figure 71: Example of a single PDM microphone, wired as right

Note that in a single-microphone (mono) configuration, depending on the microphone's implementation, either the left or the right channel (sampled at falling or rising CLK edge respectively) will contain reliable data.

If two microphones are used, one of them has to be set as left, the other as right (L/R pin tied high or to GND on the respective microphone). It is strongly recommended to use two microphones of exactly the same brand and type so that their timings in left and right operation match.

Figure 72: Example of two PDM microphones

### 6.14.6 Pin configuration

The CLK and DIN signals associated to the PDM module are mapped to physical pins according to the configuration specified in the PSEL.CLK and PSEL.DIN registers respectively. If the CONNECT field in any PSEL register is set to Disconnected, the associated PDM module signal will not be connected to the required physical pins, and will not operate properly.

The PSEL.CLK and PSEL.DIN registers and their configurations are only used as long as the PDM module is enabled, and retained only as long as the device is in System ON mode. See [POWER — Power supply](#) on page 61 for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To ensure correct behavior in the PDM module, the pins used by the PDM module must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 231 before enabling the PDM module. This is to ensure that the pins used by the PDM module are driven correctly if the PDM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the PDM module is supposed to be connected to an external PDM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| PDM signal | PDM pin                  | Direction | Output value   | Comment |
|------------|--------------------------|-----------|----------------|---------|
| CLK        | As specified in PSEL.CLK | Output    | 0              |         |
| DIN        | As specified in PSEL.DIN | Input     | Not applicable |         |

Table 61: GPIO configuration before enabling peripheral

### 6.14.7 Registers

| Base address | Peripheral | Instance | Description                                             | Configuration |
|--------------|------------|----------|---------------------------------------------------------|---------------|

## 6.14.8 Electrical specification

### 6.14.8.1 PDM Electrical Specification

| Symbol            | Description                                                                                             | Min. | Typ.  | Max. | Units |
|-------------------|---------------------------------------------------------------------------------------------------------|------|-------|------|-------|
| $f_{PDM,CLK,64}$  | PDM clock speed. PDMCLKCTRL = Default (Setting needed for 16 MHz sample frequency @ $RATIO = Ratio64$ ) |      | 1.032 |      | MHz   |
| $f_{PDM,CLK,80}$  | PDM clock speed. PDMCLKCTRL = 1280K (Setting needed for 16 MHz sample frequency @ $RATIO = Ratio80$ )   |      | 1.280 |      | MHz   |
| $t_{PDM,JITTER}$  | Jitter in PDM clock output                                                                              |      |       | 20   | ns    |
| $T_{dPDM,CLK}$    | PDM clock duty cycle                                                                                    | 40   | 50    | 60   | %     |
| $t_{PDM,DATA}$    | Decimation filter delay                                                                                 |      |       | 5    | ms    |
| $t_{PDM,cv}$      | Allowed clock edge to data valid                                                                        |      |       | 125  | ns    |
| $t_{PDM,ci}$      | Allowed (other) clock edge to data invalid                                                              | 0    |       |      | ns    |
| $t_{PDM,s}$       | Data setup time at $f_{PDM,CLK}=1.024$ MHz or 1.280 MHz                                                 | 65   |       |      | ns    |
| $t_{PDM,h}$       | Data hold time at $f_{PDM,CLK}=1.024$ MHz or 1.280 MHz                                                  | 0    |       |      | ns    |
| $G_{PDM,default}$ | Default (reset) absolute gain of the PDM module                                                         |      | 3.2   |      | dB    |

Figure 73: PDM timing diagram

## 6.15 PPI — Programmable peripheral interconnect

The programmable peripheral interconnect (PPI) enables peripherals to interact autonomously with each other using tasks and events independent of the CPU. The PPI allows precise synchronization between peripherals when real-time application constraints exist and eliminates the need for CPU activity to implement behavior which can be predefined using PPI.

Figure 74: PPI block diagram

The PPI system has, in addition to the fully programmable peripheral interconnections, a set of channels where the event end point (EEP) and task end points (TEP) are fixed in hardware. These fixed channels can be individually enabled, disabled, or added to PPI channel groups (see CHG[n] registers), in the same way as ordinary PPI channels.

| Instance    | Channel | Number of channels |
|-------------|---------|--------------------|
| PPI         | 0-19    | 20                 |
| PPI (fixed) | 20-31   | 12                 |

Table 64: Configurable and fixed PPI channels

The PPI provides a mechanism to automatically trigger a task in one peripheral as a result of an event occurring in another peripheral. A task is connected to an event through a PPI channel. The PPI channel is composed of three end point registers, one EEP, and two TEPs. A peripheral task is connected to a TEP using the address of the task register associated with the task. Similarly, a peripheral event is connected to an EEP using the address of the event register associated with the event.

On each PPI channel, the signals are synchronized to the 16 MHz clock to avoid any internal violation of setup and hold timings. As a consequence, events that are synchronous to the 16 MHz clock will be delayed by one clock period, while other asynchronous events will be delayed by up to one 16 MHz clock period.

**Note:** Shortcuts (as defined in the SHORTS register in each peripheral) are not affected by this 16 MHz synchronization, and are therefore not delayed.

Each TEP implements a fork mechanism that enables a second task to be triggered at the same time as the task specified in the TEP is triggered. This second task is configured in the task end point register in the FORK registers groups, e.g. FORK.TEP[0] is associated with PPI channel CH[0].

There are two ways of enabling and disabling PPI channels:

- Enable or disable PPI channels individually using the CHEN, CHENSET, and CHENCLR registers.
- Enable or disable PPI channels in PPI channel groups through the groups' ENABLE and DISABLE tasks. Prior to these tasks being triggered, the PPI channel group must be configured to define which PPI channels belong to which groups.

**Note:** When a channel belongs to two groups m and n, and the tasks CHG[m].EN and CHG[n].DIS occur simultaneously (m and n can be equal or different), the CHG[m].EN on that channel has priority.

PPI tasks (for example, CHG[0].EN) can be triggered through the PPI like any other task, which means they can be hooked to a PPI channel as a TEP. One event can trigger multiple tasks by using multiple channels and one task can be triggered by multiple events in the same way.

### 6.15.1 Pre-programmed channels

Some of the PPI channels are pre-programmed. These channels cannot be configured by the CPU, but can be added to groups and enabled and disabled like the general purpose PPI channels. The FORK TEP for these channels are still programmable and can be used by the application.

For a list of pre-programmed PPI channels, see the following table.

| Channel | EEP                       | TEP                      |
|---------|---------------------------|--------------------------|
| 20      | TIMER0->EVENTS_COMPARE[0] | RADIO->TASKS_TXEN        |
| 21      | TIMER0->EVENTS_COMPARE[0] | RADIO->TASKS_RXEN        |
| 22      | TIMER0->EVENTS_COMPARE[1] | RADIO->TASKS_DISABLE     |
| 23      | RADIO->EVENTS_BCMATCH     | AAR->TASKS_START         |
| 24      | RADIO->EVENTS_READY       | CCM->TASKS_KSGEN         |
| 25      | RADIO->EVENTS_ADDRESS     | CCM->TASKS_CRYPT         |
| 26      | RADIO->EVENTS_ADDRESS     | TIMER0->TASKS_CAPTURE[1] |
| 27      | RADIO->EVENTS_END         | TIMER0->TASKS_CAPTURE[2] |
| 28      | RTC0->EVENTS_COMPARE[0]   | RADIO->TASKS_TXEN        |
| 29      | RTC0->EVENTS_COMPARE[0]   | RADIO->TASKS_RXEN        |
| 30      | RTC0->EVENTS_COMPARE[0]   | TIMER0->TASKS_CLEAR      |
| 31      | RTC0->EVENTS_COMPARE[0]   | TIMER0->TASKS_START      |

Table 65: Pre-programmed channels

### 6.15.2 Registers

| Base address | Peripheral | Instance | Description                          | Configuration |
|--------------|------------|----------|--------------------------------------|---------------|
| 0x4001F000   | PPI        | PPI      | Programmable peripheral interconnect |               |

Table 66: Instances

| Register         | Offset | Description             |
|------------------|--------|-------------------------|
| TASKS_CHG[0].EN  | 0x000  | Enable channel group 0  |
| TASKS_CHG[0].DIS | 0x004  | Disable channel group 0 |

## 6.16 PWM — Pulse width modulation

The pulse with modulation (PWM) module enables the generation of pulse width modulated signals on GPIO. The module implements an up or up-and-down counter with four PWM channels that drive assigned GPIOs.

The following are the main features of a PWM module:

- Programmable PWM frequency
- Up to four PWM channels with individual polarity and duty cycle values
- Edge or center-aligned pulses across PWM channels
- Multiple duty cycle arrays (sequences) defined in RAM
- Autonomous and glitch-free update of duty cycle values directly from memory through EasyDMA (no CPU involvement)
- Change of polarity, duty cycle, and base frequency possibly on every PWM period
- RAM sequences can be repeated or connected into loops

Figure 75: PWM module

### 6.16.1 Wave counter

The wave counter is responsible for generating the pulses at a duty cycle that depends on the compare values, and at a frequency that depends on COUNTERTOP.

There is one common 15-bit counter with four compare channels. Thus, all four channels will share the same period (PWM frequency), but can have individual duty cycle and polarity. The polarity is set by a value read from RAM (see figure [Decoder memory access modes](#) on page 249). Whether the counter counts up, or up and down, is controlled by the MODE register.

The timer top value is controlled by the COUNTERTOP register. This register value, in conjunction with the selected PRESCALER of the PWM\_CLK, will result in a given PWM period. A COUNTERTOP value smaller than the compare setting will result in a state where no PWM edges are generated. OUT[n] is held high, given that the polarity is set to FallingEdge. All compare registers are internal and can only be configured through decoder presented later. COUNTERTOP can be safely written at any time.

Sampling follows the START task. If DECODER.LOAD=WaveForm, the register value is ignored and taken from RAM instead (see section [Decoder with EasyDMA](#) on page 249 for more details). If DECODER.LOAD is anything else than the WaveForm, it is sampled following a STARTSEQ[n] task and when loading a new value from RAM during a sequence playback.

The following figure shows the counter operating in up mode (MODE=PWM\_MODE\_Up), with three PWM channels with the same frequency but different duty cycle:

Figure 76: PWM counter in up mode example - FallingEdge polarity

The counter is automatically reset to zero when COUNTERTOP is reached and OUT[n] will invert. OUT[n] is held low if the compare value is 0 and held high if set to COUNTERTOP, given that the polarity is set to FallingEdge. Counter running in up mode results in pulse widths that are edge-aligned. The following is the code for the counter in up mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t) (pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up mode, the following formula can be used to compute the PWM period and the step size:

PWM period:  $T_{PWM(Up)} = T_{PWM\_CLK} * COUNTERTOP$

Step width/Resolution:  $T_{\text{steps}} = T_{\text{PWM\_CLK}}$

The following figure shows the counter operating in up-and-down mode (MODE=PWM\_MODE\_UpAndDown), with two PWM channels with the same frequency but different duty cycle and output polarity:

Figure 77: PWM counter in up-and-down mode example

The counter starts decrementing to zero when COUNTERTOP is reached and will invert the OUT[n] when compare value is hit for the second time. This results in a set of pulses that are center-aligned. The following is the code for the counter in up-and-down mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_UpAndDown << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t) (pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up-and-down mode, the following formula can be used to compute the PWM period and the step size:

$$T_{\text{PWM(Up And Down)}} = T_{\text{PWM\_CLK}} * 2 * \text{COUNTERTOP}$$

$$\text{Step width/Resolution: } T_{\text{steps}} = T_{\text{PWM\_CLK}} * 2$$

## 6.16.2 Decoder with EasyDMA

The decoder uses EasyDMA to take PWM parameters stored in RAM and update the internal compare registers of the wave counter, based on the mode of operation.

PWM parameters are organized into a sequence containing at least one half word (16 bit). Its most significant bit[15] denotes the polarity of the OUT[n] while bit[14:0] is the 15-bit compare value.

|                  |    |          |             |                                                                                       |                                             |                                                                |  |  |  |  |  |  |  |  |  |  |  |  |  |                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

The DECODER register controls how the RAM content is interpreted and loaded into the internal compare registers. The LOAD field controls if the RAM values are loaded to all compare channels, or to update a group or all channels with individual values. The following figure illustrates how parameters stored in RAM are organized and routed to various compare channels in different modes:

Figure 78: Decoder memory access modes

A special mode of operation is available when DECODER.LOAD is set to WaveForm. In this mode, up to three PWM channels can be enabled - OUT[0] to OUT[2]. In RAM, four values are loaded at a time: the first, second and third location are used to load the values, and the fourth RAM location is used to load

the COUNTERTOP register. This way one can have up to three PWM channels with a frequency base that changes on a per PWM period basis. This mode of operation is useful for arbitrary wave form generation in applications, such as LED lighting.

The register SEQ[n].REFRESH=N (one per sequence n=0 or 1) will instruct a new RAM stored pulse width value on every (N+1)<sup>th</sup> PWM period. Setting the register to zero will result in a new duty cycle update every PWM period, as long as the minimum PWM period is observed.

Note that registers SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored when DECODER.MODE=NextStep. The next value is loaded upon every received NEXTSTEP task.

SEQ[n].PTR is the pointer used to fetch COMPARE values from RAM. If the SEQ[n].PTR is not pointing to a RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions. After the SEQ[n].PTR is set to the desired RAM location, the SEQ[n].CNT register must be set to number of 16-bit half words in the sequence. It is important to observe that the Grouped mode requires one half word per group, while the Single mode requires one half word per channel, thus increasing the RAM size occupation. If PWM generation is not running when the SEQSTART[n] task is triggered, the task will load the first value from RAM and then start the PWM generation. A SEQSTARTED[n] event is generated as soon as the EasyDMA has read the first PWM parameter from RAM and the wave counter has started executing it. When LOOP.CNT=0, sequence n=0 or 1 is played back once. After the last value in the sequence has been loaded and started executing, a SEQEND[n] event is generated. The PWM generation will then continue with the last loaded value. The following figure illustrates an example of such simple playback:

Figure 79: Simple sequence example

Figure depicts the source code used for configuration and timing details in a sequence where only sequence 0 is used and only run once with a new PWM duty cycle for each period.

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

To completely stop the PWM generation and force the associated pins to a defined state, a STOP task can be triggered at any time. A STOPPED event is generated when the PWM generation has stopped at the end of currently running PWM period, and the pins go into their idle state as defined in GPIO OUT register. PWM generation can then only be restarted through a SEQSTART[n] task. SEQSTART[n] will resume PWM generation after having loaded the first value from the RAM buffer defined in the SEQ[n].PTR register.

The table below indicates when specific registers get sampled by the hardware. Care should be taken when updating these registers to avoid that values are applied earlier than expected.

| Register        | Taken into account by hardware                                                                                                               | Recommended (safe) update                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEQ[n].PTR      | When sending the SEQSTART[n] task                                                                                                            | After having received the SEQSTARTED[n] event                                                                                                                                                |
| SEQ[n].CNT      | When sending the SEQSTART[n] task                                                                                                            | After having received the SEQSTARTED[n] event                                                                                                                                                |
| SEQ[0].ENDDELAY | When sending the SEQSTART[0] task                                                                                                            | Before starting sequence [0] through a SEQSTART[0] task                                                                                                                                      |
|                 | Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | When no more value from sequence [0] gets loaded from RAM (indicated by the SEQEND[0] event)<br><br>At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated) |
| SEQ[1].ENDDELAY | When sending the SEQSTART[1] task                                                                                                            | Before starting sequence [1] through a SEQSTART[1] task                                                                                                                                      |

| PSEL.OUT[n]     | Immediately                                                                                                                                  | Before enabling the PWM instance through the ENABLE register                                                                                                                                 |

Table 68: When to safely update PWM registers

**Note:** SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored at the end of a complex sequence, indicated by a LOOPSDONE event. The reason for this is that the last value loaded from RAM is maintained until further action from software (restarting a new sequence, or stopping PWM generation).

A more complex example, where LOOP.CNT>0, is shown in the following figure:

Figure 80: Example using two sequences

In this case, an automated playback takes place, consisting of SEQ[0], delay 0, SEQ[1], delay 1, then again SEQ[0], etc. The user can choose to start a complex playback with SEQ[0] or SEQ[1] through sending the SEQSTART[0] or SEQSTART[1] task. The complex playback always ends with delay 1.

The two sequences 0 and 1 are defined by the addresses of value tables in RAM (pointed to by SEQ[n].PTR) and the buffer size (SEQ[n].CNT). The rate at which a new value is loaded is defined individually for each sequence by SEQ[n].REFRESH. The chaining of sequence 1 following the sequence 0 is implicit, the LOOP.CNT register allows the chaining of sequence 1 to sequence 0 for a determined number of times. In other words, it allows to repeat a complex sequence a number of times in a fully automated way.

In the following code example, sequence 0 is defined with SEQ[0].REFRESH set to 1, meaning that a new PWM duty cycle is pushed every second PWM period. This complex sequence is started with the SEQSTART[0] task, so SEQ[0] is played first. Since SEQ[0].ENDDelay=1 there will be one PWM period delay between last period on sequence 0 and the first period on sequence 1. Since SEQ[1].ENDDelay=0 there is no delay 1, so SEQ[0] would be started immediately after the end of SEQ[1]. However, as LOOP.CNT is

1, the playback stops after having played SEQ[1] only once, and both SEQEND[1] and LOOPSDONE are generated (their order is not guaranteed in this case).

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 1;
NRF_PWM0->SEQ[0].ENDDELAY = 1;
NRF_PWM0->SEQ[1].PTR  = ((uint32_t)(seq1_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT  = ((sizeof(seq1_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

The decoder can also be configured to asynchronously load new PWM duty cycle. If the DECODER.MODE register is set to NextStep, then the NEXTSTEP task will cause an update of internal compare registers on the next PWM period.

The following figures provide an overview of each part of an arbitrary sequence, in various modes (LOOP.CNT=0 and LOOP.CNT>0). In particular, the following are represented:

- Initial and final duty cycle on the PWM output(s)
- Chaining of SEQ[0] and SEQ[1] if LOOP.CNT>0
- Influence of registers on the sequence
- Events generated during a sequence
- DMA activity (loading of next value and applying it to the output(s))

The diagram illustrates the timing of the SEQEND event across multiple loops. The top section shows the loop counter (LOOP.CNT) and the sequence counter (SEQ[0].CNT, SEQ[1].CNT). The middle section shows the duty cycle, which is a staircase function that increases from 0% to 100% and then decreases back to 0%. The bottom section shows the sequence counter pulse, which occurs during the duty cycle. The diagram is divided into three main sections: 'Loop counter', '(LOOP.CNT - 1) ...', and '1'. The 'Loop counter' section shows the first sequence counter pulse. The middle section shows the sequence counter pulse for the previous loop. The '1' section shows the sequence counter pulse for the current loop. The duty cycle is maintained at 100% during the sequence counter pulse.

Figure 83: Complex sequence ( $LOOP.CNT > 0$ ) starting with  $SEQ[1]$

**Note:** If a sequence is in use in a simple or complex sequence, it must have a length of  $SEQ[n].CNT > 0$ .

### 6.16.3 Limitations

Previous compare value is repeated if the PWM period is shorter than the time it takes for the EasyDMA to retrieve from RAM and update the internal compare registers. This is to ensure a glitch-free operation even for very short PWM periods.

### 6.16.4 Pin configuration

The  $OUT[n]$  ( $n=0..3$ ) signals associated with each PWM channel are mapped to physical pins according to the configuration of  $PSEL.OUT[n]$  registers. If  $PSEL.OUT[n].CONNECT$  is set to Disconnected, the associated PWM module signal will not be connected to any physical pins.

The  $PSEL.OUT[n]$  registers and their configurations are used as long as the PWM module is enabled and the PWM generation active (wave counter started). They are retained only as long as the device is in System ON mode (see section [POWER](#) for more information about power modes).

To ensure correct behavior in the PWM module, the pins that are used must be configured in the GPIO peripheral in the following way before the PWM module is enabled:

| PWM signal | PWM pin                                       | Direction | Output value | Comment                                 |
|------------|-----------------------------------------------|-----------|--------------|-----------------------------------------|
| $OUT[n]$   | As specified in $PSEL.OUT[n]$<br>( $n=0..3$ ) | Output    | 0            | Idle state defined in GPIO OUT register |

Table 69: Recommended GPIO configuration before starting PWM generation

The idle state of a pin is defined by the OUT register in the GPIO module, to ensure that the pins used by the PWM module are driven correctly. If PWM generation is stopped by triggering a STOP task, the PWM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected pins (I/Os) for as long as the PWM module is supposed to be connected to an external PWM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

## 6.16.5 Registers

| Base address | Peripheral | Instance | Description                   | Configuration |
|--------------|------------|----------|-------------------------------|---------------|
| 0x4001C000   | PWM        | PWM0     | Pulse width modulation unit 0 |               |
| 0x40021000   | PWM        | PWM1     | Pulse width modulation unit 1 |               |
| 0x40022000   | PWM        | PWM2     | Pulse width modulation unit 2 |               |
| 0x4002D000   | PWM        | PWM3     | Pulse width modulation unit 3 |               |

Table 70: Instances

| Register             | Offset | Description                                                                                                                                                                                                  |
|----------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_STOP           | 0x004  | Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback                                                                                                     |
| TASKS_SEQSTART[0]    | 0x008  | Loads the first PWM value on all enabled channels from sequence 0, and starts playing that sequence at the rate defined in SEQ[0]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |
| TASKS_SEQSTART[1]    | 0x00C  | Loads the first PWM value on all enabled channels from sequence 1, and starts playing that sequence at the rate defined in SEQ[1]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |
| TASKS_NEXTSTEP       | 0x010  | Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running.                                                          |
| EVENTS_STOPPED       | 0x104  | Response to STOP task, emitted when PWM pulses are no longer generated                                                                                                                                       |
| EVENTS_SEQSTARTED[0] | 0x108  | First PWM period started on sequence 0                                                                                                                                                                       |
| EVENTS_SEQSTARTED[1] | 0x10C  | First PWM period started on sequence 1                                                                                                                                                                       |
| EVENTS_SEQEND[0]     | 0x110  | Emitted at end of every sequence 0, when last value from RAM has been applied to wave counter                                                                                                                |
| EVENTS_SEQEND[1]     | 0x114  | Emitted at end of every sequence 1, when last value from RAM has been applied to wave counter                                                                                                                |
| EVENTS_PWMPERIODEND  | 0x118  | Emitted at the end of each PWM period                                                                                                                                                                        |
| EVENTS_LOOPSDONE     | 0x11C  | Concatenated sequences have been played the amount of times defined in LOOP.CNT                                                                                                                              |
| SHORTS               | 0x200  | Shortcuts between local events and tasks                                                                                                                                                                     |
| INTEN                | 0x300  | Enable or disable interrupt                                                                                                                                                                                  |
| INTENSET             | 0x304  | Enable interrupt                                                                                                                                                                                             |
| INTENCLR             | 0x308  | Disable interrupt                                                                                                                                                                                            |
| ENABLE               | 0x500  | PWM module enable register                                                                                                                                                                                   |
| MODE                 | 0x504  | Selects operating mode of the wave counter                                                                                                                                                                   |
| COUNTERTOP           | 0x508  | Value up to which the pulse generator counter counts                                                                                                                                                         |
| PRESCALER            | 0x50C  | Configuration for PWM_CLK                                                                                                                                                                                    |
| DECODER              | 0x510  | Configuration of the decoder                                                                                                                                                                                 |
| LOOP                 | 0x514  | Number of playbacks of a loop                                                                                                                                                                                |
| SEQ[0].PTR           | 0x520  | Beginning address in RAM of this sequence                                                                                                                                                                    |
| SEQ[0].CNT           | 0x524  | Number of values (duty cycles) in this sequence                                                                                                                                                              |
| SEQ[0].REFRESH       | 0x528  | Number of additional PWM periods between samples loaded into compare register                                                                                                                                |
| SEQ[0].ENDDelay      | 0x52C  | Time added after the sequence                                                                                                                                                                                |
| SEQ[1].PTR           | 0x540  | Beginning address in RAM of this sequence                                                                                                                                                                    |

| Register        | Offset | Description                                                                   |
|-----------------|--------|-------------------------------------------------------------------------------|
| SEQ[1].CNT      | 0x544  | Number of values (duty cycles) in this sequence                               |
| SEQ[1].REFRESH  | 0x548  | Number of additional PWM periods between samples loaded into compare register |
| SEQ[1].ENDDelay | 0x54C  | Time added after the sequence                                                 |
| PSEL.OUT[0]     | 0x560  | Output pin select for PWM channel 0                                           |
| PSEL.OUT[1]     | 0x564  | Output pin select for PWM channel 1                                           |
| PSEL.OUT[2]     | 0x568  | Output pin select for PWM channel 2                                           |
| PSEL.OUT[3]     | 0x56C  | Output pin select for PWM channel 3                                           |

Table 71: Register overview

### 6.16.5.1 TASKS\_STOP

Address offset: 0x004

Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback

### 6.16.5.2 TASKS\_SEQSTART[n] (n=0..1)

Address offset: 0x008 + (n × 0x4)

Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running.

|                  |      |                |         |    |       |                                                                                                                                                                                                              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |

| A                | W    | TASKS_SEQSTART |         |    |       | Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |
|                  |      |                | Trigger | 1  |       | Trigger task                                                                                                                                                                                                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |

### 6.16.5.3 TASKS\_NEXTSTEP

Address offset: 0x010

Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running.

|                  |            |                |       |    |                                                                                                                                                     |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

   Output pin select for PWM channel n

## 6.17 QDEC — Quadrature decoder

265

The sample period and accumulation are configurable to match application requirements. The QDEC provides the following:

- Digital waveform decoding from off-chip quadrature encoder
- Sample accumulation eliminating hard real-time requirements to be enforced on application
- Optional input de-bounce filters.
- Optional LED output signal for optical encoders

Figure 84: Quadrature decoder configuration

### 6.17.1 Sampling and decoding

The QDEC decodes the output from an incremental motion encoder by sampling the QDEC phase input pins (A and B).

The off-chip quadrature encoder is an incremental motion encoder outputting two waveforms, phase A and phase B. The two output waveforms are always 90 degrees out of phase, meaning that one always changes level before the other. The direction of movement is indicated by the waveform that changes level first. Invalid transitions may occur, meaning the two waveforms simultaneously switch. This may occur if the wheel rotates too fast relative to the sample rate set for the decoder.

The QDEC decodes the output from the off-chip encoder by sampling the QDEC phase input pins (A and B) at a fixed rate as specified in the **SAMPLEPER** register.

If the **SAMPLEPER** value needs to be changed, the QDEC shall be stopped using the **STOP** task. **SAMPLEPER** can be then changed upon receiving the **STOPPED** event, and QDEC can be restarted using the **START** task. Failing to do so may result in unpredictable behavior.

It is good practice to only change registers LEDPOL, REPORTPER, DBFEN, and LEDPRE when the QDEC is stopped.

When started, the decoder continuously samples the two input waveforms and decodes these by comparing the current sample pair (n) with the previous sample pair (n-1).

The decoding of the sample pairs is described in the table below.

| Previous sample pair(n-1) |   | Current samples pair(n) |   | SAMPLE register | ACC operation | ACCDBL operation | Description                    |
|---------------------------|---|-------------------------|---|-----------------|---------------|------------------|--------------------------------|
| A                         | B | A                       | B |                 |               |                  |                                |
| 0                         | 0 | 0                       | 0 | 0               | No change     | No change        | No movement                    |

Table 72: Sampled value encoding

### 6.17.2 LED output

The LED output follows the sample period. The LED is switched on for a set period before sampling and then switched off immediately after. The period the LED is switched on before sampling is given in the LEDPRE register.

The LED output pin polarity is specified in the LEDPOL register.

When using off-chip mechanical encoders not requiring an LED, the LED output can be disabled by writing value 'Disconnected' to the CONNECT field of the PSEL.LED register. In this case, the QDEC will not acquire access to a pin for the LED output.

### 6.17.3 Debounce filters

Each of the two-phase inputs have digital debounce filters.

When enabled through the DBFEN register, the filter inputs are sampled at a fixed 1 MHz frequency during the entire sample period (which is specified in the SAMPLEPER register). The filters require all of the samples within this sample period to equal before the input signal is accepted and transferred to the output of the filter.

As a result, only input signal with a steady state longer than twice the period specified in SAMPLEPER are guaranteed to pass through the filter. Any signal with a steady state shorter than SAMPLEPER will always be suppressed by the filter. It is assumed that the frequency during the debounce period never exceeds 500 kHz (as required by the Nyquist theorem when using a 1 MHz sample frequency).

The LED will always be ON when the debounce filters are enabled, as the inputs in this case will be sampled continuously.

When the debounce filters are enabled, displacements reported by the QDEC peripheral are delayed by one SAMPLEPER period.

### 6.17.4 Accumulators

The quadrature decoder contains two accumulator registers, ACC and ACCDBL. These registers accumulate valid motion sample values and the number of detected invalid samples (double transitions), respectively.

The ACC register accumulates all valid values (1/-1) written to the SAMPLE register. This can be useful for preventing hard real-time requirements from being enforced on the application. When using the ACC register, the application can fetch data when necessary instead of reading all SAMPLE register output. The ACC register holds the relative movement of the external mechanical device from the previous clearing of the ACC register. Sample values indicating a double transition (2) will not be accumulated in the ACC register.

An ACCOF event is generated if the ACC receives a SAMPLE value that would cause the register to overflow or underflow. Any SAMPLE value that would cause an ACC overflow or underflow will be discarded, but any samples that do not cause the ACC to overflow or underflow will still be accepted.

The accumulator ACCDBL accumulates the number of detected double transitions since the previous clearing of the ACCDBL register.

The ACC and ACCDBL registers can be cleared by the READCLRACC and subsequently read using the ACCREAD and ACCDBLREAD registers.

The ACC register can be separately cleared by the RDCLRACC and subsequently read using the ACCREAD registers.

The ACCDBL register can be separately cleared by the RDCLRDBL and subsequently read using the ACCDBLREAD registers.

The REPORTPER register allows automated capture of multiple samples before sending an event. When a non-null displacement is captured and accumulated, a REPORTRDY event is sent. When one or more double-displacements are captured and accumulated, a DBLRDY event is sent. The REPORTPER field in this register determines how many samples must be accumulated before the contents are evaluated and a REPORTRDY or DBLRDY event is sent.

Using the RDCLRACC task (manually sent upon receiving the event, or using the DBLRDY\_RDCLRACC shortcut), ACCREAD can then be read.

When a double transition has been captured and accumulated, a DBLRDY event is sent. Using the RDCLRDBL task (manually sent upon receiving the event, or using the DBLRDY\_RDCLRDBL shortcut), ACCDBLREAD can then be read.

### 6.17.5 Output/input pins

The QDEC uses a three-pin interface to the off-chip quadrature encoder.

These pins are acquired when the QDEC is enabled in the ENABLE register. The pins acquired by the QDEC cannot be written by the CPU, but they can still be read by the CPU.

The pin numbers used for the QDEC are selected using the PSEL.n registers.

### 6.17.6 Pin configuration

The Phase A, Phase B, and LED signals are mapped to physical pins according to the configuration specified in the PSEL.A, PSEL.B, and PSEL.LED registers respectively.

If the CONNECT field value 'Disconnected' is specified in any of these registers, the associated signal will not be connected to any physical pin. The PSEL.A, PSEL.B, and PSEL.LED registers and their configurations are only used as long as the QDEC is enabled, and retained only as long as the device is in ON mode.

When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To secure correct behavior in the QDEC, the pins used by the QDEC must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 269 before enabling the QDEC. This configuration must be retained in the GPIO for the selected I/Os as long as the QDEC is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| QDEC signal | QDEC pin                 | Direction | Output value   | Comment |
|-------------|--------------------------|-----------|----------------|---------|
| Phase A     | As specified in PSEL.A   | Input     | Not applicable |         |
| Phase B     | As specified in PSEL.B   | Input     | Not applicable |         |
| LED         | As specified in PSEL.LED | Input     | Not applicable |         |

### 6.17.7.7 EVENTS\_REPORTRDY

Address offset: 0x104

### Non-null report ready

Event generated when REPORTPER number of samples has been accumulated in the ACC register and the content of the ACC register is not equal to 0. (Thus, this event is only generated if a motion is detected since the previous clearing of the ACC register).

### 6.17.7.9 EVENTS\_DBLRDY

Address offset: 0x10C

Double displacement(s) detected

Event generated when REPORTPER number of samples has been accumulated and the content of the ACCDBL register is not equal to 0. (Thus, this event is only generated if a double transition is detected since the previous clearing of the ACCDBL register).

  ## 6.18 RADIO — 2.4 GHz radio

The 2.4 GHz radio transceiver is compatible with multiple radio standards such as 1 Mbps and 2 Mbps *Bluetooth*<sup>®</sup> Low Energy modes, Long Range (125 kbps and 500 kbps) *Bluetooth*<sup>®</sup> Low Energy modes, IEEE 802.15.4 250 kbps mode, as well as Nordic's proprietary 1 Mbps and 2 Mbps modes.

Listed here are main features for the RADIO:

- Multidomain 2.4 GHz radio transceiver
  - 1 Mbps and 2 Mbps *Bluetooth*<sup>®</sup> Low Energy modes
  - Long Range (125 kbps and 500 kbps) *Bluetooth*<sup>®</sup> Low Energy modes
  - Angle-of-arrival (AoA) and angle-of-departure (AoD) direction finding using *Bluetooth*<sup>®</sup> Low Energy
  - IEEE 802.15.4 250 kbps mode
  - 1 Mbps and 2 Mbps Nordic proprietary modes
- Best in class link budget and low power operation
- Efficient data interface with EasyDMA support
- Automatic address filtering and pattern matching

EasyDMA, in combination with an automated packet assembler, packet disassembler, automated CRC generator and CRC checker, makes it easy to configure and use the RADIO. See the following figure for details.

Figure 85: RADIO block diagram

The RADIO includes a device address match unit and an interframe spacing control unit that can be utilized to simplify address whitelisting and interframe spacing respectively in *Bluetooth*® low energy and similar applications.

The RADIO also includes a received signal strength indicator (RSSI) and a bit counter. The bit counter generates events when a preconfigured number of bits are sent or received by the RADIO.

### 6.18.1 Packet configuration

A RADIO packet contains the fields PREAMBLE, ADDRESS, S0, LENGTH, S1, PAYLOAD, and CRC. For Long Range (125 kbps and 500 kbps) *Bluetooth*® Low Energy modes, fields CI, TERM1, and TERM2 are also included.

The content of a RADIO packet is illustrated in the figures below. The RADIO sends the fields in the packet according to the order illustrated in the figures, starting on the left.

Figure 86: On-air packet layout

Figure 87: On-air packet layout for Long Range (125 kbps and 500 kbps) *Bluetooth*® Low Energy modes

Not shown in the figures is the static payload add-on (the length of which is defined in `PCNF1.STATLEN`, and which is 0 bytes in a standard BLE packet). The static payload add-on is sent between PAYLOAD and CRC fields. The RADIO sends the different fields in the packet in the order they are illustrated above, from left to right.

PREAMBLE is sent with least significant bit first on air. The size of the PREAMBLE depends on the mode selected in the `MODE` register:

- The PREAMBLE is one byte for `MODE = Ble_1Mbit` as well as all Nordic proprietary operating modes (`MODE = Nrf_1Mbit` and `MODE = Nrf_2Mbit`), and `PCNF0.PLEN` has to be set accordingly. If the first bit of the ADDRESS is 0, the preamble will be set to 0xAA. Otherwise the PREAMBLE will be set to 0x55.

- For **MODE** = Ble\_2Mbit, the PREAMBLE must be set to 2 bytes through **PCNF0.PLEN**. If the first bit of the ADDRESS is 0, the preamble will be set to 0xAAAA. Otherwise the PREAMBLE will be set to 0x5555.
- For **MODE** = Ble\_LR125Kbit and **MODE** = Ble\_LR500Kbit, the PREAMBLE is 10 repetitions of 0x3C.
- For **MODE** = leee802154\_250Kbit, the PREAMBLE is 4 bytes and set to all zeros.

Radio packets are stored in memory inside instances of a RADIO packet data structure as illustrated below. The PREAMBLE, ADDRESS, CI, TERM1, TERM2, and CRC fields are omitted in this data structure. Fields S0, LENGTH, and S1 are optional.

Figure 88: Representation of a RADIO packet in RAM

The byte ordering on air is always least significant byte first for the ADDRESS and PAYLOAD fields, and most significant byte first for the CRC field. The ADDRESS fields are always transmitted and received least significant bit first. The CRC field is always transmitted and received most significant bit first. The endianness, i.e. the order in which the bits are sent and received, of the S0, LENGTH, S1, and PAYLOAD fields can be configured via **PCNF1.ENDIAN**.

The sizes of the S0, LENGTH, and S1 fields can be individually configured via **S0LEN**, **LFLen**, and **S1LEN** in **PCNF0** respectively. If any of these fields are configured to be less than 8 bits, the least significant bits of the fields are used.

If S0, LENGTH, or S1 are specified with zero length, their fields will be omitted in memory. Otherwise each field will be represented as a separate byte, regardless of the number of bits in their on-air counterpart.

Independent of the configuration of **PCNF1.MAXLEN**, the combined length of S0, LENGTH, S1, and PAYLOAD cannot exceed 258 bytes.

## 6.18.2 Address configuration

The on-air radio ADDRESS field is composed of two parts, the base address field and the address prefix field.

The size of the base address field is configurable via **PCNF1.BALEN**. The base address is truncated from the least significant byte if the **PCNF1.BALEN** is less than 4. See [Definition of logical addresses](#) on page 282.

The on-air addresses are defined in the **BASE0/BASE1** and **PREFIX0/PREFIX1** registers. It is only when writing these registers that the user must relate to the actual on-air addresses. For other radio address registers, such as the **TXADDRESS**, **RXADDRESSES**, and **RXMATCH** registers, logical radio addresses ranging from 0 to 7 are being used. The relationship between the on-air radio addresses and the logical addresses is described in the following table.

| Logical address | Base address | Prefix byte |
|-----------------|--------------|-------------|
| 0               | BASE0        | PREFIX0.AP0 |
| 1               | BASE1        | PREFIX0.AP1 |
| 2               | BASE1        | PREFIX0.AP2 |
| 3               | BASE1        | PREFIX0.AP3 |
| 4               | BASE1        | PREFIX1.AP4 |
| 5               | BASE1        | PREFIX1.AP5 |
| 6               | BASE1        | PREFIX1.AP6 |
| 7               | BASE1        | PREFIX1.AP7 |

Table 76: Definition of logical addresses

### 6.18.3 Data whitening

The RADIO is able to do packet whitening and de-whitening, enabled in [PCNF1.WHITEEN](#). When enabled, whitening and de-whitening will be handled by the RADIO automatically as packets are sent and received.

The whitening word is generated using polynomial  $g(D) = D^7 + D^4 + 1$ , which then is XORed with the data packet that is to be whitened, or de-whitened. The linear feedback shift register is initialized via [DATAWHITEIV](#). See the following figure.

Figure 89: Data whitening and de-whitening

Whitening and de-whitening will be performed over the whole packet except for the preamble and the address fields.

### 6.18.4 CRC

The CRC generator in RADIO calculates the CRC over the whole packet excluding the preamble. If desirable, the address field can be excluded from the CRC calculation as well.

See [CRCCNF](#) register for more information.

The CRC polynomial is configurable as illustrated in the following figure, where bit 0 in the [CRCPOLY](#) register corresponds to  $X^0$  and bit 1 corresponds to  $X^1$  etc. See [CRCPOLY](#) on page 328 for more information.

Figure 90: CRC generation of an  $n$  bit CRC

The figure shows that the CRC is calculated by feeding the packet serially through the CRC generator. Before the packet is clocked through the CRC generator, the CRC generator's latches  $b_0$  through  $b_n$  will be initialized with a predefined value specified in the [CRCINIT](#) register. After the whole packet has been clocked through the CRC generator,  $b_0$  through  $b_n$  will hold the resulting CRC. This value will be used by the RADIO during both transmission and reception. Latches  $b_0$  through  $b_n$  are not available to be read by the CPU at any time. However, a received CRC can be read by the CPU via the [RXCRC](#) register.

The length ( $n$ ) of the CRC is configurable, see [CRCCNF](#) for more information.

Once the entire packet, including the CRC, has been received and no errors were detected, RADIO generates a [CRCOK](#) event. If CRC errors were detected, a [CRCERROR](#) event is generated.

The status of the CRC check can be read from the [CRCSTATUS](#) register after a packet has been received.

## 6.18.5 Radio states

Tasks and events are used to control the operating state of RADIO.

RADIO can enter the states described in the following table.

| State     | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| DISABLED  | No operations are going on inside the RADIO and the power consumption is at a minimum                |
| RXRU      | RADIO is ramping up and preparing for reception                                                      |
| RXIDLE    | RADIO is ready for reception to start                                                                |
| RX        | Reception has been started and the addresses enabled in the RXADDRESSES register are being monitored |
| TXRU      | RADIO is ramping up and preparing for transmission                                                   |
| TXIDLE    | RADIO is ready for transmission to start                                                             |
| TX        | RADIO is transmitting a packet                                                                       |
| RXDISABLE | RADIO is disabling the receiver                                                                      |
| TXDISABLE | RADIO is disabling the transmitter                                                                   |

Table 77: RADIO state diagram

A state diagram showing an overview of RADIO is shown in the following figure.

Figure 91: Radio states

This figure shows how the tasks and events relate to the RADIO's operation. The RADIO does not prevent a task from being triggered from the wrong state. If a task is triggered from the wrong state, for example if the **TXEN** task is triggered from the **RXDISABLE** state, this may lead to incorrect behavior. The **PAYLOAD** event is always generated even if the payload is zero.

The END to START shortcut should not be used with IEEE 802.15.4 250 kbps mode. Use the PHYEND to START shortcut instead.

The END to START shortcut should not be used with Long Range (125 kbps and 500 kbps) **Bluetooth**® Low Energy modes. Use the PHYEND to START shortcut instead.

## 6.18.6 Transmit sequence

Before the RADIO is able to transmit a packet, it must first ramp-up in TX mode. See **TXRU** in [Radio states](#) on page 284 and [Transmit sequence](#) on page 285. A **TXRU** ramp-up sequence is initiated when the **TXEN** task is triggered. After the RADIO has successfully ramped up it will generate the **READY** event

indicating that a packet transmission can be initiated. A packet transmission is initiated by triggering the **START** task. The **START** task can first be triggered after the RADIO has entered into the TXIDLE state.

The following figure illustrates a single packet transmission where the CPU manually triggers the different tasks needed to control the flow of the RADIO, i.e. no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between **READY** and **START**, and between **END** and **DISABLE**. As illustrated in [Transmit sequence](#) on page 285 the RADIO will by default transmit 1s between **READY** and **START**, and between **END** and **DISABLE**. What is transmitted can be programmed through the DTX field in the **MODECNF0** register.

Figure 92: Transmit sequence

The following figure shows a slightly modified version of the transmit sequence where RADIO is configured to use shortcuts between **READY** and **START**, and between **END** and **DISABLE**, which means that no delay is introduced.

Figure 93: Transmit sequence using shortcuts to avoid delays

RADIO is able to send multiple packets one after the other without having to disable and re-enable the RADIO between packets, as illustrated in the following figure.

Figure 94: Transmission of multiple packets

### 6.18.7 Receive sequence

Before RADIO is able to receive a packet, it must first ramp up in RX mode. See RXRU in [Radio states](#) on page 284 and [Receive sequence](#) on page 286 for more information.

An RXRU ramp up sequence is initiated when the [RXEN](#) task is triggered. After RADIO has successfully ramped up it will generate the [READY](#) event indicating that a packet reception can be initiated. A packet reception is initiated by triggering the [START](#) task. As illustrated in [Radio states](#) on page 284, the [START](#) task can first be triggered after RADIO has entered into the RXIDLE state.

The following figure shows a single packet reception where the CPU manually triggers the different tasks needed to control the flow of RADIO, i.e. no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between [READY](#) and [START](#), and between [END](#) and [DISABLE](#). RADIO will be listening and possibly receiving undefined data, represented with an 'X', from [START](#) and until a packet with valid preamble (P) is received.

Figure 95: Receive sequence

The following figure shows a modified version of the receive sequence, where RADIO is configured to use shortcuts between [READY](#) and [START](#), and between [END](#) and [DISABLE](#), which means that no delay is introduced.

Figure 96: Receive sequence using shortcuts to avoid delays

RADIO is able to receive consecutive packets without having to disable and re-enable RADIO between packets, as illustrated in the following figure.

Figure 97: Reception of multiple packets

### 6.18.8 Received signal strength indicator (RSSI)

RADIO implements a mechanism for measuring the power in the received signal. This feature is called received signal strength indicator (RSSI).

The RSSI is measured continuously and the value filtered using a single-pole IIR filter. After a signal level change, the RSSI will settle after approximately `RSSISETTLE`.

Sampling of the received signal strength is started by using the `RSSISTART` task. The sample can be read from the `RSSISAMPLE` register.

The sample period of the RSSI is defined by `RSSIPERIOD`. The `RSSISAMPLE` will hold the filtered received signal strength after this sample period.

For the RSSI sample to be valid, the RADIO has to be enabled in receive mode (`RXEN` task) and the reception has to be started (`READY` event followed by `START` task).

### 6.18.9 Interframe spacing (IFS)

Interframe spacing (IFS) is defined as the time, in microseconds, between two consecutive packets, starting from when the end of the last bit of the previous packet is received, to the beginning of the first bit of the subsequent packet that is transmitted. The RADIO is able to enforce this interval, as specified in the `TIFS` register, as long as the `TIFS` is not specified to be shorter than the RADIO's turnaround time, i.e.

the time needed to switch off the receiver, and then switch the transmitter back on. The **TIFS** register can be written any time before the last bit on air is received.

This timing is illustrated in the figure below.

Figure 98: IFS timing detail

The TIFS duration starts after the last bit on air (just before the **END** event), and elapses with first bit being transmitted on air (just after **READY** event).

TIFS is only enforced if the shortcuts **END** to **DISABLE** and **DISABLED** to **TXEN** or **END** to **DISABLE** and **DISABLED** to **RXEN** are enabled.

TIFS is qualified for use in IEEE 802.15.4 250kbps mode, Long Range (125 kbps and 500 kbps) **Bluetooth**® Low Energy modes, and 1 Mbps and 2 Mbps **Bluetooth**® Low Energy modes, using the default ramp-up mode.

**SHORTS** and **TIFS** registers are not double-buffered, and can be updated at any point before the last bit on air is received. The **MODE** register is double-buffered and sampled at the **TXEN** or **RXEN** task.

### 6.18.10 Device address match

The device address match feature is tailored for address whitelisting in **Bluetooth**® low energy and similar implementations.

This feature enables on-the-fly device address matching while receiving a packet on air. This feature only works in receive mode and when the RADIO is configured for little endian, see **PCNF1.ENDIAN**.

The device address match unit assumes that the first 48 bits of the payload are the device address and that bit number 6 in S0 is the TxAdd bit. See the **Bluetooth**® Core Specification for more information about device addresses, TxAdd, and whitelisting.

The RADIO is able to listen for eight different device addresses at the same time. These addresses are specified in a DAB/DAP register pair, one pair per address, in addition to a TxAdd bit configured in the DACNF register. The DAB register specifies the 32 least significant bits of the device address, while the DAP register specifies the 16 most significant bits of the device address.

Each of the device addresses can be individually included or excluded from the matching mechanism. This is configured in the **DACNF** register.

### 6.18.11 Bit counter

The RADIO implements a simple counter that can be configured to generate an event after a specific number of bits have been transmitted or received.

By using shortcuts, this counter can be started from different events generated by the RADIO and count relative to these.

The bit counter is started by triggering the **BCSTART** task, and stopped by triggering the **BCSTOP** task. A **BCMATCH** event will be generated when the bit counter has counted the number of bits specified in the **BCC** register. The bit counter will continue to count bits until the **DISABLED** event is generated or until the **BCSTOP** task is triggered. After a **BCMATCH** event, the CPU can reconfigure the **BCC** value for new **BCMATCH** events within the same packet.

The bit counter can only be started after the RADIO has received the **ADDRESS** event.

The bit counter will stop and reset on either the **BCSTOP**, **STOP**, or **DISABLE** task, or the **END** event.

The following figure shows how the bit counter can be used to generate a **BCMATCH** event in the beginning of the packet payload, and again generate a second **BCMATCH** event after sending 2 bytes (16 bits) of the payload.

Figure 99: Bit counter example

### 6.18.12 Direction finding

The RADIO implements the Angle-of-Arrival (AoA) and Angle-of-Departure (AoD) Bluetooth Low Energy feature, which can be used to determine the direction of a peer device. The feature is available for the BLE 1 Mbps and BLE 2 Mbps modes.

When using this feature, the transmitter sends a packet with a continuous tone extension (CTE) appended to the packet, after the CRC. During the CTE, the receiver can take IQ samples of the incoming signal.

An antenna array is employed at the transmitter (AoD) or at the receiver (AoA). The AoD transmitter, or AoA receiver, switches between the antennas, in order to collect IQ samples from the different antenna pairs. The IQ samples can be used to calculate the relative path lengths between the antenna pairs, which can be used to estimate the direction of the transmitter.

#### 6.18.12.1 CTE format

The CTE is from 16  $\mu$ s to 160  $\mu$ s and consists of an unwhitened sequence of 1's, equivalent to a continuous tone nominally offset from the carrier by +250 kHz for the 1 Mbps PHY and +500 kHz for the 2 Mbps BLE PHYs. The format of the CTE, when switching and/or sampling, is shown in the following figure.

Figure 100: Constant tone extension (CTE) structure

Antenna switching is performed during switch slots and the guard period. The AoA/AoD feature requires that one IQ sample is taken for each microsecond within the reference period, and once for each sample slot. Oversampling is possible by changing the sample spacing as described in [IQ sampling](#) on page 293. The switch slot and sample slot durations are either 1 or 2  $\mu\text{s}$ , but must be equal. The format of the CTE and switching and sampling procedures may be configured prior to, or during, packet transmission and reception. Alternatively, during packet reception, these operations can be configured by reading specific fields of the packet contents.

### 6.18.12.2 Mode

Depending on the [DFEMODE](#), the device performs the procedures shown in the following table.

|                   |                                           | DFEMODE |    |     |    |
|-------------------|-------------------------------------------|---------|----|-----|----|
|                   |                                           | AOA     |    | AOD |    |
|                   |                                           | TX      | RX | TX  | RX |
| AoA/AoD Procedure | Generating and transmitting CTE           | x       |    | x   |    |
|                   | Receiving, interpreting, and sampling CTE |         | x  |     | x  |
|                   | Antenna switching                         |         | x  | x   |    |

Table 78: AoA/AoD Procedures performed as a function of DFEMODE and TX/RX mode

### 6.18.12.3 Inline configuration

When inline configuration is enabled during RX, further configuration of the AoA/AoD procedures is performed based on the values of the CP bit and the CTEInfo octet within the packet. This is enabled by setting [CTEINLINECONF.CTEINLINECTRLIN](#). The CTEInfo octet is present only if the CP bit is set. The position of the CP bit and CTEInfo octet depends on whether the packet has a *Data Channel PDU* ([CTEINLINECONF.CTEINFOINS1=InS1](#)), or an *Advertising Channel PDU* ([CTEINLINECONF.CTEINFOINS1=NotInS1](#)).

#### Data channel PDU

For Data Channel PDUs, [PCNF0.SOLEN](#) must be 1 byte, and [PCNF0.LFLEN](#) must be 8 bits. To determine if S1 is present, the registers [CTEINLINECONF.SOMASK](#) and [CTEINLINECONF.SOCONF](#) forms a bitwise mask-and-test for the S0 field. If the bitwise AND between S0 and SOMASK equals SOCONF, then S1 is determined to be present. When present, the value of [PCNF0.S1LEN](#) will be ignored, as this is decided by the CP bit in the the following figure.

Figure 101: Data channel PDU header

When encrypting and decrypting BLE packets using the [CCM](#) peripheral, it is also required to set [PCNF0.S1INCL=1](#). The CCM mode must be configured to use an 8-bit length field. The value of the CP bit is included in the calculation of the MIC, while the S1 field is ignored by the CCM calculation.

## Advertising channel PDU

For advertising channel PDUs, the CTEInfo Flag replaces the CP bit. The CTEInfo Flag is within the extended header flag field in some of the advertising PDUs that employ the common extended advertising payload format (i.e. AUX\_SYNC\_IND, AUX\_CHAIN\_IND). The format of such packets is shown in the following figure.

Figure 102: Advertising channel PDU header

The [CTEINLINECONF.SOCONF](#) and [CTEINLINECONF.SOMASK](#) fields can be configured to accept only certain advertising PDU Types. If the extended header length is non-zero, the CTEInfo extended header flag is checked to determine whether CTEInfo is present. If a bit before the CTEInfo flag within the extended header flags is set, then the CTEInfo position is postponed 6 octets.

## CTEInfo parsing

The CTEInfo field is shown in the following figure.

Figure 103: CTEInfo field

The CTETIME field defines the length of the CTE in 8  $\mu$ s units. The valid upper bound of values can be adjusted using [CTEINLINECONF.CTETIMEVALIDRANGE](#), including allowing use of the RFU bit within this field. If the CTETIME field is an invalid value of either 0 or 1, the CTE is assumed to be the minimum valid length of 16  $\mu$ s. The slot duration is determined by the CTEType field. In RX this determines whether the sample spacing as defined in [CTEINLINECONF.CTEINLINERXMODE1US](#) or [CTEINLINECONF.CTEINLINERXMODE2US](#) is used.

| CTEType | Description             | TX switch spacing | RX sample spacing during reference period | Sample spacing RX during reference period |
|---------|-------------------------|-------------------|-------------------------------------------|-------------------------------------------|
| 0       | AoA, no switching       | -                 | TSAMPLESPACING1                           | TSAMPLESPACING2                           |
| 1       | AoD, 1 $\mu$ s slots    | 2 $\mu$ s         | TSAMPLESPACING1                           | CTEINLINERXMODE1US                        |
| 2       | AoD, 2 $\mu$ s slots    | 4 $\mu$ s         | TSAMPLESPACING1                           | CTEINLINERXMODE2US                        |
| 3       | Reserved for future use |                   |                                           |                                           |

Table 79: Switching and sampling spacing based on CTEType

### 6.18.12.4 Manual configuration

If [CTEINLINECONF.CTEINLINECTRL1](#) is not set, then the packet is not parsed to determine the CTE parameters, and the antenna switching and sampling is controlled by other registers, see [Antenna switching](#) on page 292. The length of the CTE is given in 8  $\mu$ s units by [DFECTRL1.NUMBEROF8US](#). The start of the antenna switching and/or sampling (denoted as an AoA/AoD procedure), can be configured to start at some trigger with an additional offset. Using [DFECTRL1.DFEINEXTENSION](#), the trigger can be configured to be the end of the CRC, or alternatively, the ADDRESS event. The additional offset for antenna switching is configured using [DFECTRL2.TSWITCHOFFSET](#). Similarly, the additional offset for antenna sampling is configured using [DFECTRL2.TSAMPLEOFFSET](#).

### 6.18.12.5 Receive- and transmit sequences

The addition of the CTE to the transmitted packet is illustrated in the following figure.

Figure 104: Transmit sequence with DFE

The presence of CTE within a received packet is signalled by the **CTEPRESENT** event illustrated in the figure below.

Figure 105: Receive sequence with DFE

### 6.18.12.6 Antenna switching

The RADIO can control up to 8 GPIO pins in order to control external antenna switches used in direction finding.

#### Pin configuration

The eight antenna selection signals are mapped to physical pins according to the pin numbers specified in the PSEL.DFEGPIO[n] registers. Only pins that have the PSEL.DFEGPIO[n].CONNECTED field set to *Connected* will be controlled by the RADIO. Pins that are *Disconnected* will be controlled by GPIO.

During transmission in AoD TX mode or reception in AoA RX mode, the RADIO automatically acquires the pins as needed. At times when the RADIO does not use the pin, the pin is released to its default state and controlled by the **GPIO** configuration. Thus, the pin must be configured using the **GPIO** peripheral.

| Pin acquired by RADIO | Direction                         | Value                                      | Comment                                                                                |
|-----------------------|-----------------------------------|--------------------------------------------|----------------------------------------------------------------------------------------|
| Yes                   | Output                            | Specified in <a href="#">SWITCHPATTERN</a> | Pin acquired by RADIO, and in use for DFE.                                             |
| No                    | Specified by <a href="#">GPIO</a> | Specified by <a href="#">GPIO</a>          | DFE not in progress. Pin has not been acquired by RADIO, but is available for DFE use. |

Table 80: Pin configuration matrix for a connected and enabled pin [n]

## Switch pattern configuration

The values of the GPIOs while switching during the CTE are configured by writing successively to the [SWITCHPATTERN](#) register. The first write to [SWITCHPATTERN](#) is the GPIO pattern applied from the call of [TASKS\\_TXEN](#) or [TASKS\\_RXEN](#) until the first antenna switch is triggered. The second write sets the pattern for the reference period and is applied at the start of the guard period. The following writes set the pattern for the remaining switch slots and are applied at the start of each switch slot. If writing beyond the total number of antenna slots, the pattern will wrap to [SWITCHPATTERN\[2\]](#) and start over again. During operation, when the end of the [SWITCHPATTERN](#) buffer is reached, the RADIO cycles back to [SWITCHPATTERN\[2\]](#). At the end of the AoA/AoD procedure, [SWITCHPATTERN\[0\]](#) is applied to [DFECTRL1.TSWITCHSPACING](#) after the previous antenna switch. The [SWITCHPATTERN](#) buffer can be erased/cleared using [CLEARPATTERN](#).

A minimum number of three patterns must be written to the [SWITCHPATTERN](#) register.

If [CTEINLINECONF.CTEINLINECTRLLEN](#) is not set, then the antenna switch spacing is determined by [DFECTRL1.TSWITCHSPACING](#) (otherwise described by [Switching and sampling spacing based on CTEType](#) on page 291). [DFECTRL2.TSWITCHOFFSET](#) determines the position of the first switch compared to the configurable start of CTE (see [DFECTRL1.DFEINEXTENSION](#)).

### 6.18.12.7 IQ sampling

The RADIO uses DMA to write IQ samples recorded during the CTE to RAM. Alternatively, the magnitude and phase of the samples can be recorded using the [DFECTRL1.SAMPLETYPE](#) field. The samples are written to the location in RAM specified by [DFEPACKET.PTR](#). The maximum number of samples to transfer are specified by [DFEPACKET.MAXCNT](#) and the number of samples transferred are given in [DFEPACKET.AMOUNT](#). The IQ samples are recorded with respect to the RX carrier frequency. The format of the samples is provided in the following table.

| SAMPLETYPE       | Field     | Bits  | Description                                                                                             |
|------------------|-----------|-------|---------------------------------------------------------------------------------------------------------|
| 0: I_Q (default) | Q         | 31:16 | 12 bits signed, sign extended to 16 bits. Out of range samples are saturated at value -32768.           |
|                  | I         | 15:0  |                                                                                                         |
| 1: MagPhase      | reserved  | 31:29 | Always zero                                                                                             |
|                  | magnitude | 28:16 | 13 bits unsigned. Equals $1.646756 \cdot \sqrt{I^2 + Q^2}$ .                                            |
|                  | phase     | 15:0  | 9 bits signed, sign extended to 16 bits. Equals $64 \cdot \text{atan2}(Q, I)$ in the range [-201, 201]. |

Table 81: Format of samples

Oversampling is configured separately for the reference period and for the time after the reference period. During the reference period, the sample spacing is determined by [DFECTRL1.TSAMPLESPACINGREF](#). [DFECTRL2.TSAMPLEOFFSET](#) determines the position of the first sample relative to the end of the last bit of the CRC.

For the time after the reference period, if [CTEINLINECONF.CTEINLINECTRLLEN](#) is disabled, the sample spacing is set in [DFECTRL1.TSAMPLESPACING](#). However, when [CTEINLINECONF.CTEINLINECTRLLEN](#) is enabled, the sample spacing is determined by two different registers, depending on whether the device is in AoA or AoD RX-mode.

For AoD RX mode, the sample spacing after the reference period is determined by the CTEType in the packet, as listed in the following table.

Table 82: Sample spacing when CTEINLINECONF.CTEINLINELTRLEN is set and the device is in AoD RX mode

| DFECTR1.TSWITCHSPACING | Sample spacing                   |
|------------------------|----------------------------------|
| 2 $\mu$ s              | CTEINLINECONF.CTEINLINERXMODE1US |
| 4 $\mu$ s              | CTEINLINECONF.CTEINLINERXMODE2US |
| Other                  | DFECTR1.TSAMPLESPACING           |

For the reference and switching periods, `DFECTR1.TSAMPLESPACINGREF` and `DFECTR1.TSAMPLESPACING` can be used to achieve oversampling.

With the `MODE=ieee802154_250kbit` the RADIO will comply with the IEEE 802.15.4-2006 standard implementing its 250 kbps, 2450 MHz, O-QPSK PHY.

The main features of the IEEE 802.15.4 mode are:

- Ultra-low power 250 kbps, 2450 MHz, IEEE 802.15.4-2006 compliant link
- Clear channel assessment
- Energy detection scan
- CRC generation

The IEEE 802.15.4 standard defines an on-the-air frame/packet that is different from what is used in BLE mode.

| PHY protocol data unit (PPDU)         |               |
|---------------------------------------|---------------|
| Preamble sequence                     | SFD           |
| 5 octets synchronization header (SHR) | 1 octet (PHR) |
| Maximum 127 octets (PSDU)             |               |
| MAC protocol data unit (MPDU)         |               |

The standard uses the term *octet* for an 8-bit storage unit within the PPDU. For timing, the value *symbol* is used, and it has a duration of 16  $\mu$ s.

4452 021 v1.5

The preamble sequence consists of four octets that are all zero, and are used for synchronizing the RADIO's receiver. Following the preamble is the single octet *start of frame delimiter (SFD)*, with a fixed value of 0xA7. An alternate SFD can be programmed through the [SFD](#) register, providing an initial level of frame filtering for those who choose non-standard compliance. It is a valuable feature when operating in a congested or private network. The preamble sequence and the SFD are generated by the RADIO, and are not programmed by the user into the frame buffer.

Following the five octet *synchronization header (SHR)* is the single octet *phy header (PHR)*. The least significant seven bits of PHR denote the frame length of the following PSDU. The most significant bit is reserved and is set to zero for frames that are standard compliant. The RADIO reports all eight bits which can be used to carry additional information. The PHR is the first byte written to the frame data memory pointed to by [PACKETPTR](#). Frames with zero length are discarded, and the [FRAMESTART](#) event is not generated in this case.

The next N octets carry the data of the PHY packet, where N equals the value of the PHR. For an implementation also using the IEEE 802.15.4 MAC layer, the PHY data is a MAC frame of N-2 octets, since two octets occupy a CRC field.

An IEEE 802.15.4 MAC layer frame consists of the following:

- A header:
  - The frame control field (FCF)
  - The sequence number
  - Addressing fields
- A payload
- The 16-bit frame control sequence (FCS)

Figure 107: IEEE 802.15.4 frame format (MPDU)

The two FCF octets contain information about the frame type, addressing, and other control flags. This field is decoded when using the assisted operating modes offered by the RADIO.

The sequence number is a single octet in size and is unique for a frame. It is used in the associated acknowledgement frame sent upon successful frame reception.

The addressing field can be zero (acknowledgement frame) or up to 20 octets in size. The field is used to direct packets to the correct recipient and denote its origin. IEEE 802.15.4 bases its addressing on networks being organized in PANs with 16-bit identifier and nodes having a 16-bit or 64-bit address. In the assisted receive mode, these parameters are analyzed for address matching and acknowledgement.

The MAC payload carries the data of the next higher layer, or in the case of a MAC command frame, information used by the MAC layer itself.

The two last octets contain the 16-bit ITU-T CRC. The FCS is calculated over the MAC header (MHR) and MAC payload (MSDU) parts of the frame. This field is calculated automatically when sending a frame, or indicated in the [CRCSTATUS](#) register when a frame is received. If configured, this feature is taken care of autonomously by the CRC module.

### 6.18.13.2 Operating frequencies

The IEEE 802.15.4 standard defines 16 channels, 11 - 26, of 5 MHz each, in the 2450 MHz frequency band.

To choose the correct channel center frequency, the [FREQUENCY](#) register must be programmed according to the table below.

| IEEE 802.15.4 channel | Center frequency (MHz) | FREQUENCY setting |
|-----------------------|------------------------|-------------------|
| Channel 11            | 2405                   | 5                 |
| Channel 12            | 2410                   | 10                |
| Channel 13            | 2415                   | 15                |
| Channel 14            | 2420                   | 20                |
| Channel 15            | 2425                   | 25                |
| Channel 16            | 2430                   | 30                |
| Channel 17            | 2435                   | 35                |
| Channel 18            | 2440                   | 40                |
| Channel 19            | 2445                   | 45                |
| Channel 20            | 2450                   | 50                |
| Channel 21            | 2455                   | 55                |
| Channel 22            | 2460                   | 60                |
| Channel 23            | 2465                   | 65                |
| Channel 24            | 2470                   | 70                |
| Channel 25            | 2475                   | 75                |
| Channel 26            | 2480                   | 80                |

Table 84: IEEE 802.15.4 center frequency definition

### 6.18.13.3 Energy detection (ED)

As required by the IEEE 802.15.4 standard, it must be possible to sample the received signal power within the bandwidth of a channel, for the purpose of determining presence of activity.

To prevent the channel signal from being decoded, the shortcut between the [READY](#) event and the [START](#) task should be disabled before putting the RADIO in receive mode. The energy detection (ED) measurement time, where RSSI samples are averaged, is 8 symbol periods, corresponding to 128  $\mu$ s. The standard further specifies the measurement to be a number between 0 and 255, where 0 shall indicate received power less than 10 dB above the selected receiver sensitivity. The power range of the ED values must be at least a 40 dB linear mapping with accuracy of  $\pm 6$  dB. See section 6.9.7 *Receiver ED* in the IEEE 802.15.4 standard for further details.

The following example shows how to perform a single energy detection measurement and convert to IEEE 802.15.4 scale.

**IEEE 802.15.4 ED measurement example**

```

#define ED_RSSISCALE 4 // From electrical specifications
uint8_t sample_ed(void)
{
    int val;
    NRF_RADIO->TASKS_EDSTART = 1; // Start
    while (NRF_RADIO->EVENTS_EDEND != 1) {
        // CPU can sleep here or do something else
        // Use of interrupts are encouraged
    }
    val = NRF_RADIO->EDSAMPLE * ED_RSSISCALE; // Read level
    return (uint8_t)(val>255 ? 255 : val);    // Convert to IEEE 802.15.4
    scale
}

```

For scaling between hardware value and dBm, see equation [Conversion between hardware value and dBm](#) on page 299.

The mlme-scan.req primitive of the MAC layer uses the ED measurement to detect channels where there might be wireless activity. To assist this primitive, a tailored mode of operation is available where the ED measurement runs for a defined number of iterations keeping track of the maximum ED level. This is engaged by writing the [EDCNT](#) register to a value different from 0, where it will run the specified number of iterations and report the maximum energy measurement in the [EDSAMPLE](#) register. The scan is started with [EDSTART](#) task and its end indicated with the [EDEND](#) event. This significantly reduces the interrupt frequency and therefore power consumption. The following figure shows how the ED measurement will operate depending on the [EDCNT](#) register.

[EDCNT](#) = 0

[EDCNT](#) = N-1

Figure 108: Energy detection measurement examples

The scan is stopped by writing the [EDSTOP](#) task. It will be followed by the [EDSTOPPED](#) event when the module has terminated.

#### 6.18.13.4 Clear channel assessment (CCA)

IEEE 802.15.4 implements a listen-before-talk channel access method to avoid collisions when transmitting, known as *carrier sense multiple access with collision avoidance (CSMA-CA)*. The key part of this is measuring if the wireless medium is busy or not.

The following clear channel assesment modes are supported:

- **CCA Mode 1** (energy above threshold) - The medium is reported busy upon detecting any energy above the ED threshold.
- **CCA Mode 2** (carrier sense only) - The medium is reported busy upon detection of a signal compliant with the IEEE 802.15.4 standard with the same modulation and spreading characteristics.
- **CCA Mode 3** (carrier sense with energy above threshold) - The medium is reported busy using a logical combination (AND/OR) between the results from CCA Mode 1 and CCA Mode 2.

The clear channel assessment should survey a period equal to 8 symbols or 128  $\mu$ s.

The RADIO must be in receive mode and be able to receive correct packets when performing the CCA. The shortcut between **READY** and **START** must be disabled if baseband processing is not to be performed while the measurement is running.

## CCA Mode 1

**CCA Mode 1** is enabled by first configuring the field **CCACTRL.CCAMODE**=EdMode and writing the **CCACTRL.CCAEDTHRES** field to a chosen value. Once the **CCASTART** task is written, the RADIO will perform a ED measurement for 8 symbols and compare the measured level with that found in the **CCACTRL.CCAEDTHRES** field. If the measured value is higher than or equal to this threshold, the **CCABUSY** event is generated. If the measured level is less than the threshold, the **CCAIDLE** event is generated.

## CCA Mode 2

**CCA Mode 2** is enabled by configuring **CCACTRL.CCAMODE**=CarrierMode. The RADIO will sample to see if a valid SFD is found during the 8 symbols. If a valid SFD is detected, the **CCABUSY** event is generated and the device should not send any data. The **CCABUSY** event is also generated if the scan was performed during an ongoing frame reception. In the case where the measurement period completes with no SFD detection, the **CCAIDLE** event is generated. When **CCACTRL.CCACORRCNT** is not zero, the algorithm will look at the correlator output in addition to the SFD detection signal. If a SFD is reported during the scan period, it will terminate immediately indicating busy medium. Similarly, if the number of peaks above **CCACTRL.CCACORRTHRES** crosses the **CCACTRL.CCACORRCNT**, the **CCACTRL.CCABUSY** event is generated. If less than **CCACORRCOUNT** crossings are found and no SFD is reported, the **CCAIDLE** event will be generated and the device can send data.

## CCA Mode 3

**CCA Mode 3** is enabled by configuring **CCACTRL.CCAMODE**=CarrierAndEdMode or **CCACTRL.CCAMODE**=CarrierOrEdMode, performing the required logical combination of the result from CCA Mode 1 and 2. The **CCABUSY** or **CCAIDLE** events are generated by ANDing or ORing the *energy above threshold* and *carrier detection* scans.

## Shortcuts

An ongoing CCA can always be stopped by issuing the **CCASTOP** task. This will trigger the associated **CCASTOPPED** event.

For CCA mode automation, a number of shortcuts are available.

- To automatically switch between RX (when performing the CCA) and to TX where the packet is sent, the shortcut between **CCAIDLE** and **TXEN**, in conjunction with the short between **CCAIDLE** and **STOP** muse be used.

- To automatically disable the RADIO whenever the CCA reports a busy medium, the shortcut between **CCABUSY** and **DISABLE** can be used.
- To immediately start a CCA after ramping up into RX mode, the shortcut between **RXREADY** and **CCASTART** can be used.

## Conversion

The conversion from a CCAEDTHRES, LQI, or EDSAMPLE value to dBm can be done with the following equation, where  $VAL_{HARDWARE}$  is either CCAEDTHRES, LQI, or EDSAMPLE. LQI and EDSAMPLE are hardware-reported values, while CCAEDTHRES is set by software. Constants ED\_RSSISCALE and ED\_RSSIOFFS are from electrical specifications.

$$P_{RF}[dBm] = ED\_RSSIOFFS + VAL_{HARDWARE}$$

Figure 109: Conversion between hardware value and dBm

The ED\_RSSISCALE constant is used to calculate power in 802.15.4 units (0-255):

$$P_{RF}[802.15.4 \text{ units}] = \text{MIN}(ED\_RSSISCALE \times VAL_{HARDWARE}, 255)$$

Figure 110: Conversion between hardware value and 802.15.4 units (0-255)

### 6.18.13.5 Cyclic redundancy check (CRC)

IEEE 802.15.4 uses a 16-bit ITU-T cyclic redundancy check (CRC) calculated over the MAC header (MHR) and MAC service data unit (MSDU).

The standard defines the following generator polynomial:

$$G(x) = x^{16} + x^{12} + x^5 + 1$$

In receive mode the RADIO will trigger the CRC module when the first octet after the frame length (PHR) is received. The CRC will then update on each consecutive octet received. When a complete frame is received the **CRCSTATUS** register will be updated accordingly and the **CRCOK** or **CRCERROR** events generated. When the CRC module is enabled it will not write the two last octets (CRC) to the frame Data RAM. When transmitting, the CRC will be computed on the fly, starting with the first octet after PHR, and inserted as the two last octets in the frame. The EasyDMA will fetch frame length minus 2 octets from RAM and insert the CRC octets insitu.

The following code shows how to configure the CRC module for correct operation when in IEEE 802.15.4 mode. The **CRC CNF** is written to 16-bit CRC and the **CRC POLY** is written to 0x11021. The start value used by IEEE 802.15.4 is zero and **CRC INIT** is configured to reflect this.

```
/* 16-bit CRC with ITU-T polynomial with 0 as start condition*/
NRF_RADIO->CRCCNF = ((RADIO_CRCCNF_SKIPADDR_Ieee802154 << RADIO_CRCCNF_SKIPADDR_Pos) |
                    (RADIO_CRCCNF_LEN_Two << RADIO_CRCCNF_LEN_Pos));
NRF_RADIO->CRCPOLY = 0x11021;
NRF_RADIO->CRCINIT = 0;
```

The ENDIANESS subregister must be set to little-endian since the FCS field is transmitted from left bit to right.

### 6.18.13.6 Transmit sequence

The transmission is started by first putting the RADIO in receive mode and triggering the **RXEN** task.

An outline of the IEEE 802.15.4 transmission is illustrated in the following figure.

Figure 111: IEEE 802.15.4 transmit sequence

The receiver will ramp up and enter the RXIDLE state where the **READY** event is generated. Upon receiving the ready event, the CCA is started by triggering the **CCASTART** task. The chosen mode of assessment (**CCCTRL.CCAMODE** register) will be performed and signal the **CCAIDLE** or **CCABUSY** event 128  $\mu$ s later. If the **CCABUSY** event is received, the RADIO will have to retry the CCA after a specific back-off period. This is outlined in the *IEEE 802.15.4 standard, Figure 69 in section 7.5.1.4 The CSMA-CA algorithm*.

If the **CCAIDLE** event is generated, a write to the **TXEN** task register enters the RADIO in TXRU state. The **READY** event will be generated when the RADIO is in TXIDLE state and ready to transmit. With the **PACKETPTR** pointing to the length (PHR) field of the frame, the **START** task can be written. The RADIO will send the four octet preamble sequence followed by the start of frame delimiter (**SFD** register). The first byte read from the Data RAM is the length field (PHR) followed by the transmission of the number of bytes indicated as the frame length. If the CRC module is configured it will run for PHR-2 octets. The last two octets will be substituted with the results from running the CRC. The necessary CRC parameters are sampled on the **START** task. The FCS field of the frame is little endian.

In addition to the already available shortcuts, one is provided between **READY** event and **CCASTART** task so that a CCA can automatically start when the receiver is ready. A second shortcut has been added between **CCAIDLE** event and the **TXEN** task, so that upon detecting a clear channel the RADIO can immediately enter transmit mode.

#### 6.18.13.7 Receive sequence

The reception is started by first putting the RADIO in receive mode. After writing to the **RXEN** task, the RADIO will start ramping up and enter the RXRU state.

When the **READY** event is generated, the RADIO enters the RXIDLE mode. For the baseband processing to be enabled, the **START** task must be written. An outline of the IEEE 802.15.4 reception can be found in the following figure.

Figure 112: IEEE 802.15.4 receive sequence

When a valid SHR is received, the RADIO will start storing future octets (starting with PHR) to the data memory pointed to by [PACKETPTR](#). After the SFD octet is received, the [FRAMESTART](#) event is generated. If the CRC module is enabled it will start updating with the second byte received (first byte in payload) and run for the full frame length. The two last bytes in the frame are not written to RAM when CRC is configured. However, if the result of the CRC after running the full frame is zero, the [CRCOK](#) event will be generated. The [END](#) event is generated when the last octet has been received and is available in data memory.

When a packet is received, a link quality indicator (LQI) is also generated and appended immediately after the last received octet. When using an IEEE 802.15.4 compliant frame, this will be just after the MSDU since the FCS is not reported. In the case of a non-compliant frame, it will be appended after the full frame. The LQI reported by hardware must be converted to IEEE 802.15.4 range by an 8-bit saturating multiplication of 4, as shown in [IEEE 802.15.4 ED measurement example](#) on page 297. The LQI is only valid for frames equal to or longer than three octets. When receiving a frame, the RSSI (reported as negative dB) will be measured at three points during the reception. These three values will be sorted and the middle one selected (median 3) to be remapped within the LQI range. The following figure illustrates the LQI measurement and how the data is arranged in data memory.

Figure 113: IEEE 802.15.4 frame in data memory

A shortcut has been added between the **FRAMESTART** event and the **BCSTART** task. This can be used to trigger a **BCMATCH** event after N bits, such as when inspecting the MAC addressing fields.

#### 6.18.13.8 Interframe spacing (IFS)

The IEEE 802.15.4 standard defines a specific time that is allotted for the MAC sublayer to process received data. Interframe spacing (IFS) is used to prevent two frames from being transmitted too close together. If the transmission is requesting an acknowledgement, the space before the second frame shall be at least one IFS period.

The IFS is determined to be one of the following:

- IFS equals `macMinSIFSPeriod` (12 symbols) if the MPDU is less than or equal to `aMaxSIFSFrameSize` (18 octets) octets
- IFS equals `macMinLIFSPeriod` (40 symbols) if the MPDU is larger than `aMaxSIFSFrameSize`

Using the efficient assisted modes in the RADIO, the **TIFS** will be programmed with the correct value based on the frame being transmitted. If the assisted modes are not in use, the **TIFS** register must be updated manually. The following figure provides details on what IFS period is valid in both acknowledged and unacknowledged transmissions.

Figure 114: Interframe spacing examples

### 6.18.14 EasyDMA

The RADIO uses EasyDMA to read and write packets to RAM without CPU involvement.

As illustrated in [RADIO block diagram](#) on page 281, the RADIO's EasyDMA utilizes the same [PACKETPTR](#) for receiving and transmitting packets. This pointer should be reconfigured by the CPU each time before RADIO is started by the [START](#) task. The [PACKETPTR](#) register is double-buffered, meaning that it can be updated and prepared for the next transmission.

The [END](#) event indicates that the last bit has been processed by the RADIO. The [DISABLED](#) event is issued to acknowledge that a [DISABLE](#) task is done.

The structure of a packet is described in detail in [Packet configuration](#) on page 281. The data that is stored in Data RAM and transported by EasyDMA consists of the following fields:

- S0
- LENGTH
- S1
- PAYLOAD

In addition, a static add-on is sent immediately after the payload.

The size of each of the above fields in the frame is configurable (see [Packet configuration](#) on page 281), and the space occupied in RAM depends on these settings. The size of the field can be zero, as long as the resulting frame complies with the chosen RF protocol.

All fields are extended in size to align with a byte boundary in RAM. For instance, a 3-bit long field on air will occupy 1 byte in RAM while a 9-bit long field will be extended to 2 bytes.

The packet's elements can be configured as follows:

- CI, TERM1, and TERM2 fields are only present in *Bluetooth*<sup>®</sup> Low Energy Long Range mode
- S0 is configured through the [PCNF0.SOLEN](#) field
- LENGTH is configured through the [PCNF0.LFLEN](#) field
- S1 is configured through the [PCNF0.S1LEN](#) field
- Payload size is configured through the value in RAM corresponding to the LENGTH field
- Static add-on size is configured through the [PCNF1.STATLEN](#) field

The [PCNF1.MAXLEN](#) field configures the maximum packet payload plus add-on size in number of bytes that can be transmitted or received by the RADIO. This feature can be used to ensure that the RADIO does not overwrite, or read beyond, the RAM assigned to the packet payload. This means that if the LENGTH field of the packet payload exceeds [PCNF1.STATLEN](#), and the LENGTH field in the packet specifies a packet larger than configured in [PCNF1.MAXLEN](#), the payload will be truncated to the length specified in [PCNF1.MAXLEN](#).

**Note:** The `PCNF1.MAXLEN` field includes the payload and the add-on, but excludes the size occupied by the `S0`, `LENGTH`, and `S1` fields. This has to be taken into account when allocating RAM.

If the payload and add-on length is specified larger than `PCNF1.MAXLEN`, the RADIO will still transmit or receive in the same way as before, except the payload is now truncated to `PCNF1.MAXLEN`. The packet's `LENGTH` field will not be altered when the payload is truncated. The RADIO will calculate CRC as if the packet length is equal to `PCNF1.MAXLEN`.

**Note:** If `PACKETPTR` is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

The `END` event indicates that the last bit has been processed by the RADIO. The `DISABLED` event is issued to acknowledge that an `DISABLE` task is done.

## 6.18.15 Registers

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40001000   | RADIO      | RADIO    | 2.4 GHz radio |               |

Table 85: Instances

| Register                       | Offset | Description                                                                                                                |
|--------------------------------|--------|----------------------------------------------------------------------------------------------------------------------------|
| <code>TASKS_TXEN</code>        | 0x000  | Enable RADIO in TX mode                                                                                                    |
| <code>TASKS_RXEN</code>        | 0x004  | Enable RADIO in RX mode                                                                                                    |
| <code>TASKS_START</code>       | 0x008  | Start RADIO                                                                                                                |
| <code>TASKS_STOP</code>        | 0x00C  | Stop RADIO                                                                                                                 |
| <code>TASKS_DISABLE</code>     | 0x010  | Disable RADIO                                                                                                              |
| <code>TASKS_RSSISTART</code>   | 0x014  | Start the RSSI and take one single sample of the receive signal strength                                                   |
| <code>TASKS_RSSISTOP</code>    | 0x018  | Stop the RSSI measurement                                                                                                  |
| <code>TASKS_BCSTART</code>     | 0x01C  | Start the bit counter                                                                                                      |
| <code>TASKS_BCSTOP</code>      | 0x020  | Stop the bit counter                                                                                                       |
| <code>TASKS_EDSTART</code>     | 0x024  | Start the energy detect measurement used in IEEE 802.15.4 mode                                                             |
| <code>TASKS_EDSTOP</code>      | 0x028  | Stop the energy detect measurement                                                                                         |
| <code>TASKS_CCASTART</code>    | 0x02C  | Start the clear channel assessment used in IEEE 802.15.4 mode                                                              |
| <code>TASKS_CCACSTOP</code>    | 0x030  | Stop the clear channel assessment                                                                                          |
| <code>EVENTS_READY</code>      | 0x100  | RADIO has ramped up and is ready to be started                                                                             |
| <code>EVENTS_ADDRESS</code>    | 0x104  | Address sent or received                                                                                                   |
| <code>EVENTS_PAYLOAD</code>    | 0x108  | Packet payload sent or received                                                                                            |
| <code>EVENTS_END</code>        | 0x10C  | Packet sent or received                                                                                                    |
| <code>EVENTS_DISABLED</code>   | 0x110  | RADIO has been disabled                                                                                                    |
| <code>EVENTS_DEVMATCH</code>   | 0x114  | A device address match occurred on the last received packet                                                                |
| <code>EVENTS_DEVMISS</code>    | 0x118  | No device address match occurred on the last received packet                                                               |
| <code>EVENTS_RSSIEND</code>    | 0x11C  | Sampling of receive signal strength complete                                                                               |
| <code>EVENTS_BCMATCH</code>    | 0x128  | Bit counter reached bit count value                                                                                        |
| <code>EVENTS_CRCOK</code>      | 0x130  | Packet received with CRC ok                                                                                                |
| <code>EVENTS_CRCERROR</code>   | 0x134  | Packet received with CRC error                                                                                             |
| <code>EVENTS_FRAMESTART</code> | 0x138  | IEEE 802.15.4 length field received                                                                                        |
| <code>EVENTS_EDEND</code>      | 0x13C  | Sampling of energy detection complete. A new ED sample is ready for readout from the <code>RADIO.EDSAMPLE</code> register. |
| <code>EVENTS_EDSTOPPED</code>  | 0x140  | The sampling of energy detection has stopped                                                                               |
| <code>EVENTS_CCAIDLE</code>    | 0x144  | Wireless medium in idle - clear to send                                                                                    |
| <code>EVENTS_CCABUSY</code>    | 0x148  | Wireless medium busy - do not send                                                                                         |

| Register          | Offset | Description                                                                            |
|-------------------|--------|----------------------------------------------------------------------------------------|
| EVENTS_CCASTOPPED | 0x14C  | The CCA has stopped                                                                    |
| EVENTS_RATEBOOST  | 0x150  | Ble_LR CI field received, receive mode is changed from Ble_LR125Kbit to Ble_LR500Kbit. |
| EVENTS_TXREADY    | 0x154  | RADIO has ramped up and is ready to be started TX path                                 |
| EVENTS_RXREADY    | 0x158  | RADIO has ramped up and is ready to be started RX path                                 |
| EVENTS_MHRMATCH   | 0x15C  | MAC header match found                                                                 |
| EVENTS_SYNC       | 0x168  | Preamble indicator                                                                     |
| EVENTS_PHYEND     | 0x16C  | Generated when last bit is sent on air, or received from air                           |
| EVENTS_CTEPRESENT | 0x170  | CTE is present (early warning right after receiving CTEInfo byte)                      |
| SHORTS            | 0x200  | Shortcuts between local events and tasks                                               |
| INTENSET          | 0x304  | Enable interrupt                                                                       |
| INTENCLR          | 0x308  | Disable interrupt                                                                      |

| PREFIX0           | 0x524  | Prefixes bytes for logical addresses 0-3                                               |
| PREFIX1           | 0x528  | Prefixes bytes for logical addresses 4-7                                               |
| TXADDRESS         | 0x52C  | Transmit address select                                                                |
| RXADDRESSES       | 0x530  | Receive address select                                                                 |
| CRC CNF           | 0x534  | CRC configuration                                                                      |
| CRC POLY          | 0x538  | CRC polynomial                                                                         |
| CRC INIT          | 0x53C  | CRC initial value                                                                      |
| TIFS              | 0x544  | Interframe spacing in $\mu$ s                                                          |
| RSSISAMPLE        | 0x548  | RSSI sample                                                                            |
| STATE             | 0x550  | Current radio state                                                                    |
| DATAWHITEIV       | 0x554  | Data whitening initial value                                                           |
| BCC               | 0x560  | Bit counter compare                                                                    |
| DAB[n]            | 0x600  | Device address base segment n                                                          |
| DAP[n]            | 0x620  | Device address prefix n                                                                |
| DACNF             | 0x640  | Device address match configuration                                                     |
| MHRMATCHCONF      | 0x644  | Search pattern configuration                                                           |
| MHRMATCHMAS       | 0x648  | Pattern mask                                                                           |
| MODECNF0          | 0x650  | Radio mode configuration register 0                                                    |
| SFD               | 0x660  | IEEE 802.15.4 start of frame delimiter                                                 |
| EDCNT             | 0x664  | IEEE 802.15.4 energy detect loop count                                                 |
| EDSAMPLE          | 0x668  | IEEE 802.15.4 energy detect level                                                      |
| CCACTRL           | 0x66C  | IEEE 802.15.4 clear channel assessment control                                         |
| DFEMODE           | 0x900  | Whether to use Angle-of-Arrival (AOA) or Angle-of-Departure (AOD)                      |
| CTEINLINECONF     | 0x904  | Configuration for CTE inline mode                                                      |
| DFECTRL1          | 0x910  | Various configuration for Direction finding                                            |
| DFECTRL2          | 0x914  | Start offset for Direction finding                                                     |
| SWITCHPATTERN     | 0x928  | GPIO patterns to be used for each antenna                                              |

| Register         | Offset | Description                                           |
|------------------|--------|-------------------------------------------------------|
| CLEARPATTERN     | 0x92C  | Clear the GPIO pattern array for antenna control      |
| PSEL.DFEGPIO[0]  | 0x930  | Pin select for DFE pin 0                              |
| PSEL.DFEGPIO[1]  | 0x934  | Pin select for DFE pin 1                              |
| PSEL.DFEGPIO[2]  | 0x938  | Pin select for DFE pin 2                              |
| PSEL.DFEGPIO[3]  | 0x93C  | Pin select for DFE pin 3                              |
| PSEL.DFEGPIO[4]  | 0x940  | Pin select for DFE pin 4                              |
| PSEL.DFEGPIO[5]  | 0x944  | Pin select for DFE pin 5                              |
| PSEL.DFEGPIO[6]  | 0x948  | Pin select for DFE pin 6                              |
| PSEL.DFEGPIO[7]  | 0x94C  | Pin select for DFE pin 7                              |
| DFEPACKET.PTR    | 0x950  | Data pointer                                          |
| DFEPACKET.MAXCNT | 0x954  | Maximum number of buffer words to transfer            |
| DFEPACKET.AMOUNT | 0x958  | Number of samples transferred in the last transaction |
| POWER            | 0xFFC  | Peripheral power control                              |

### 6.18.15.35 EVENTS\_SYNC

Address offset: 0x168

Preamble indicator

A possible preamble has been received in Ble\_LR125Kbit, Ble\_LR500Kbit, or leee802154\_250Kbit modes during an RX transaction. False triggering of the event is possible.

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | | A  | RW         | CRCPOLY  |       | <p>CRC polynomial</p> <p>Each term in the CRC polynomial is mapped to a bit in this register which index corresponds to the term's exponent. The least significant term/bit is hardwired internally to 1, and bit number 0 of the register content is ignored by the hardware. The following example is for an 8 bit CRC polynomial: <math>x^8 + x^7 + x^3 + x^2 + 1 = 1\ 1000\ 1101</math>.</p> |

 ### 6.18.15.82 SWITCHPATTERN

Address offset: 0x928

GPIO patterns to be used for each antenna

Maximum 8 GPIOs can be controlled. To secure correct signal levels on the pins, the pins must be configured in the GPIO peripheral as described in Pin configuration.

If, during switching, the total number of antenna slots is bigger than the number of written patterns, the RADIO loops back to the pattern used after the reference pattern.

A minimum number of three patterns must be written.

### 6.18.16.5 Receiver operation

| Symbol                          | Description                                                                                 | Min. | Typ. | Max. | Units |
|---------------------------------|---------------------------------------------------------------------------------------------|------|------|------|-------|
| P <sub>RX,MAX</sub>             | Maximum received signal strength at < 0.1% PER                                              |      | 0    |      | dBm   |
| P <sub>SENS,IT,1M</sub>         | Sensitivity, 1 Mbps nRF mode ideal transmitter <sup>17</sup>                                |      | -93  |      | dBm   |
| P <sub>SENS,IT,2M</sub>         | Sensitivity, 2 Mbps nRF mode ideal transmitter <sup>17</sup>                                |      | -89  |      | dBm   |
| P <sub>SENS,IT,SP,1M,BLE</sub>  | Sensitivity, 1 Mbps BLE ideal transmitter, packet length ≤ 37 bytes BER=1E-3 <sup>18</sup>  |      | -96  |      | dBm   |
| P <sub>SENS,IT,LP,1M,BLE</sub>  | Sensitivity, 1 Mbps BLE ideal transmitter, packet length ≥ 128 bytes BER=1E-4 <sup>19</sup> |      | -94  |      | dBm   |
| P <sub>SENS,IT,SP,2M,BLE</sub>  | Sensitivity, 2 Mbps BLE ideal transmitter, packet length ≤ 37 bytes                         |      | -92  |      | dBm   |
| P <sub>SENS,IT,BLE LE125k</sub> | Sensitivity, 125 kbps BLE mode                                                              |      | -103 |      | dBm   |
| P <sub>SENS,IT,BLE LE500k</sub> | Sensitivity, 500 kbps BLE mode                                                              |      | -98  |      | dBm   |
| P <sub>SENS,IEEE 802.15.4</sub> | Sensitivity in IEEE 802.15.4 mode                                                           |      | -100 |      | dBm   |

<sup>17</sup> Typical sensitivity applies when ADDR0 is used for receiver address correlation. When ADDR[1...7] are used for receiver address correlation, the typical sensitivity for this mode is degraded by 3 dB.

<sup>18</sup> As defined in the *Bluetooth Core Specification v4.0 Volume 6: Core System Package (Low Energy Controller Volume)*.

<sup>19</sup> Equivalent BER limit < 10E-04.

Figure 117: Sensitivity, 1 Mbps Bluetooth low energy mode, Regulator = LDO (typical values)

#### 6.18.16.6 RX selectivity

RX selectivity with equal modulation on interfering signal<sup>20</sup>

| Symbol                          | Description                                              | Min. | Typ. | Max. | Units |
|---------------------------------|----------------------------------------------------------|------|------|------|-------|
| C/I <sub>1M,co-channel</sub>    | 1 Mbps mode, co-channel interference                     |      | 10   |      | dB    |
| C/I <sub>1M,-1MHz</sub>         | 1 Mbps mode, Adjacent (-1 MHz) interference              |      | -5   |      | dB    |

### 6.18.16.7 RX intermodulation

RX intermodulation. Desired signal level at PIN = -64 dBm. Two interferers with equal input power are used. The interferer closest in frequency is not modulated, the other interferer is modulated equal with the desired signal. The input power of the interferers where the sensitivity equals BER = 0.1% is presented.

| Symbol                      | Description                                                               | Min. | Typ. | Max. | Units |
|-----------------------------|---------------------------------------------------------------------------|------|------|------|-------|
| P <sub>IMD,5TH,1M</sub>     | IMD performance, 1 Mbps, 5th offset channel, packet length ≤ 37 bytes     |      | -34  |      | dBm   |
| P <sub>IMD,5TH,1M,BLE</sub> | IMD performance, BLE 1 Mbps, 5th offset channel, packet length ≤ 37 bytes |      | -32  |      | dBm   |
| P <sub>IMD,5TH,2M</sub>     | IMD performance, 2 Mbps, 5th offset channel, packet length ≤ 37 bytes     |      | -33  |      | dBm   |
| P <sub>IMD,5TH,2M,BLE</sub> | IMD performance, BLE 2 Mbps, 5th offset channel, packet length ≤ 37 bytes |      | -32  |      | dBm   |

### 6.18.16.8 Radio timing

| Symbol                        | Description                                                                                                              | Min. | Typ. | Max. | Units |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| t <sub>TXEN,BLE,1M</sub>      | Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE and 150 μs TIFS)                   | 140  |      | 140  | μs    |
| t <sub>TXEN,FAST,BLE,1M</sub> | Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE with fast ramp-up and 150 μs TIFS) | 40   |      | 40   | μs    |
| t <sub>TXDIS,BLE,1M</sub>     | When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit                      | 6    |      | 6    | μs    |
| t <sub>RXEN,BLE,1M</sub>      | Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE)                               | 140  |      | 140  | μs    |
| t <sub>RXEN,FAST,BLE,1M</sub> | Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE with fast ramp-up)             | 40   |      | 40   | μs    |

| Symbol                               | Description                                                                                                          | Min. | Typ. | Max. | Units |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| t <sub>RXDIS,BLE,1M</sub>            | When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit                  | 0    |      | 0    | µs    |

| t <sub>DISABLEDJITTER</sub> | Jitter on DISABLED event relative to END event when shortcut between END and DISABLE is enabled |      | 0.25 |      | µs    |
| t <sub>READYJITTER</sub>    | Jitter on READY event relative to TXEN and RXEN task                                            |      | 0.25 |      | µs    |

### 6.18.16.11 IEEE 802.15.4 mode energy detection constants

| Symbol       | Description                                                           | Min. | Typ. | Max. | Units |
|--------------|-----------------------------------------------------------------------|------|------|------|-------|
| ED_RSSISCALE | Scaling value when converting between hardware-reported value and dBm |      | 5    |      |       |
| ED_RSSIOFFS  | Offset value when converting between hardware-reported value and dBm  |      | -93  |      |       |

<sup>21</sup> Valid range -90 to -30 dBm

## 6.19 RNG — Random number generator

The Random number generator (RNG) generates true non-deterministic random numbers based on internal thermal noise that are suitable for cryptographic purposes. The RNG does not require a seed value.

Figure 118: Random number generator

The RNG is started by triggering the START task and stopped by triggering the STOP task. When started, new random numbers are generated continuously and written to the VALUE register when ready. A VALRDY event is generated for every new random number that is written to the VALUE register. This means that after a VALRDY event is generated, the CPU has the time until the next VALRDY event to read out the random number from the VALUE register before it is overwritten by a new random number.

### 6.19.1 Bias correction

A bias correction algorithm is employed on the internal bit stream to remove any bias toward 1 or 0. The bits are then queued into an eight-bit register for parallel readout from the VALUE register.

It is possible to enable bias correction in the CONFIG register. This will result in slower value generation, but will ensure a statistically uniform distribution of the random values.

### 6.19.2 Speed

The time needed to generate one random byte of data is unpredictable, and may vary from one byte to the next. This is especially true when bias correction is enabled.

### 6.19.3 Registers

| Base address | Peripheral | Instance | Description             | Configuration |
|--------------|------------|----------|-------------------------|---------------|
| 0x4000D000   | RNG        | RNG      | Random number generator |               |

Table 87: Instances

| Register      | Offset | Description                                                                     |
|---------------|--------|---------------------------------------------------------------------------------|
| TASKS_START   | 0x000  | Task starting the random number generator                                       |
| TASKS_STOP    | 0x004  | Task stopping the random number generator                                       |
| EVENTS_VALRDY | 0x100  | Event being generated for every new random number written to the VALUE register |
| SHORTS        | 0x200  | Shortcuts between local events and tasks                                        |
| INTENSET      | 0x304  | Enable interrupt                                                                |
| INTENCLR      | 0x308  | Disable interrupt                                                               |
| CONFIG        | 0x504  | Configuration register                                                          |
| VALUE         | 0x508  | Output random number                                                            |

## 6.19.4 Electrical specification

### 6.19.4.1 RNG Electrical Specification

| Symbol                 | Description                                                                                                                            | Min. | Typ. | Max. | Units         |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------------|
| $t_{\text{RNG,START}}$ | Time from setting the START task to generation begins.<br>This is a one-time delay on START signal and does not apply between samples. |      | 128  |      | $\mu\text{s}$ |
| $t_{\text{RNG,RAW}}$   | Run time per byte without bias correction. Uniform distribution of 0 and 1 is not guaranteed.                                          |      | 30   |      | $\mu\text{s}$ |
| $t_{\text{RNG,BC}}$    | Run time per byte with bias correction. Uniform distribution of 0 and 1 is guaranteed. Time to generate a byte cannot be guaranteed.   |      | 120  |      | $\mu\text{s}$ |

## 6.20 RTC — Real-time counter

The Real-time counter (RTC) module provides a generic, low power timer on the low-frequency clock source (LFCLK).

Figure 119: RTC block schematic

The RTC module features a 24-bit COUNTER, a 12-bit (1/X) prescaler, capture/compare registers, and a tick event generator for low power, tickless RTOS implementation.

### 6.20.1 Clock source

The RTC runs off the LFCLK.

The COUNTER resolution is 30.517  $\mu\text{s}$ . Depending on the source, the RTC is able to run while the HFCLK is OFF and PCLK16M is not available.

The software has to explicitly start LFCLK before using the RTC.

See [CLOCK — Clock control](#) on page 82 for more information about clock sources.

### 6.20.2 Resolution versus overflow and the PRESCALER

Counter increment frequency:

$$f_{\text{RTC}} [\text{kHz}] = 32.768 / (\text{PRESCALER} + 1)$$

The PRESCALER register is read/write when the RTC is stopped. The PRESCALER register is read-only once the RTC is STARTed. Writing to the PRESCALER register when the RTC is started has no effect.

The PRESCALER is restarted on START, CLEAR, and TRIGOVFLW, meaning the prescaler value is latched to an internal register (<<PRESC>>) on these tasks.

Examples of different frequency configurations are as following:

- Desired COUNTER frequency 100 Hz (10 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 100 \text{ Hz}) - 1 = 327$$

$$f_{\text{RTC}} = 99.9 \text{ Hz}$$

$$10009.576 \mu\text{s counter period}$$

- Desired COUNTER frequency 8 Hz (125 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 8 \text{ Hz}) - 1 = 4095$$

$$f_{\text{RTC}} = 8 \text{ Hz}$$

$$125 \text{ ms counter period}$$

| Prescaler    | Counter resolution   | Overflow       |
|--------------|----------------------|----------------|
| 0            | 30.517 $\mu\text{s}$ | 512 seconds    |
| $2^8 - 1$    | 7812.5 $\mu\text{s}$ | 131072 seconds |
| $2^{12} - 1$ | 125 ms               | 582.542 hours  |

Table 89: RTC resolution versus overflow

### 6.20.3 COUNTER register

The COUNTER increments on LFCLK when the internal PRESCALER register (<<PRESC>>) is 0x00. <<PRESC>> is reloaded from the PRESCALER register. If enabled, the TICK event occurs on each increment of the COUNTER. The TICK event is disabled by default.

Figure 120: Timing diagram - COUNTER\_PRESCALER\_0

Figure 121: Timing diagram - COUNTER\_PRESCALER\_1

## 6.20.4 Overflow features

The TRIGOVFLW task sets the COUNTER value to 0xFFFFF0 to allow SW test of the overflow condition.

OVRFLW occurs when COUNTER overflows from 0xFFFFF to 0.

**Note:** The OVRFLW event is disabled by default.

## 6.20.5 TICK event

The TICK event enables low power tickless RTOS implementation as it optionally provides a regular interrupt source for a RTOS without the need to use the ARM<sup>®</sup> SysTick feature.

Using the RTC TICK event rather than the SysTick allows the CPU to be powered down while still keeping RTOS scheduling active.

**Note:** The TICK event is disabled by default.

## 6.20.6 Event control feature

To optimize RTC power consumption, events in the RTC can be individually disabled to prevent PCLK16M and HFCLK being requested when those events are triggered. This is managed using the EVTEN register.

For example, if the TICK event is not required for an application, this event should be disabled as it is frequently occurring and may increase power consumption if HFCLK otherwise could be powered down for long durations.

This means that the RTC implements a slightly different task and event system compared to the standard system described in [Peripheral interface](#) on page 98. The RTC task and event system is illustrated in [Tasks, events, and interrupts in the RTC](#) on page 351.

Figure 122: Tasks, events, and interrupts in the RTC

### 6.20.7 Compare feature

There are a number of Compare registers.

For more information, see [Registers](#) on page 356.

When setting a compare register, the following behavior of the RTC compare event should be noted:

- If a CC register value is 0 when a CLEAR task is set, this will not trigger a COMPARE event.

Figure 123: Timing diagram - COMPARE\_CLEAR

- If a CC register is N and the COUNTER value is N when the START task is set, this will not trigger a COMPARE event.

- COMPARE occurs when a CC register is N and the COUNTER value transitions from N-1 to N.

- If the COUNTER is N, writing N+2 to a CC register is guaranteed to trigger a COMPARE event at N+2.

- If the COUNTER is N, writing N or N+1 to a CC register may not trigger a COMPARE event.

Figure 127: Timing diagram - COMPARE\_N+1

- If the COUNTER is N and the current CC register value is N+1 or N+2 when a new CC value is written, a match may trigger on the previous CC value before the new value takes effect. If the current CC value is greater than N+2 when the new value is written, there will be no event due to the old value.

Figure 128: Timing diagram - COMPARE\_N-1

### 6.20.8 TASK and EVENT jitter/delay

Jitter or delay in the RTC is due to the peripheral clock being a low frequency clock (LFCLK) which is not synchronous to the faster PCLK16M.

Registers in the peripheral interface, part of the PCLK16M domain, have a set of mirrored registers in the LFCLK domain. For example, the COUNTER value accessible from the CPU is in the PCLK16M domain and is latched on read from an internal register called COUNTER in the LFCLK domain. COUNTER is the register which is actually modified each time the RTC ticks. These registers must be synchronised between clock domains (PCLK16M and LFCLK).

The following is a summary of the jitter introduced on tasks and events.

| Task                            | Delay             |
|---------------------------------|-------------------|
| CLEAR, STOP, START, TRIGOVRFLOW | +15 to 46 $\mu$ s |

Table 90: RTC jitter magnitudes on tasks

| Operation/Function               | Jitter         |
|----------------------------------|----------------|
| START to COUNTER increment       | +/- 15 $\mu$ s |
| COMPARE to COMPARE <sup>22</sup> | +/- 62.5 ns    |

Table 91: RTC jitter magnitudes on events

**Note:** 32.768 kHz clock jitter is additional to the numbers provided above.

CLEAR and STOP (and TRIGOVFLW; not shown) will be delayed as long as it takes for the peripheral to clock a falling edge and rising of the LFCLK. This is between 15.2585  $\mu$ s and 45.7755  $\mu$ s – rounded to 15  $\mu$ s and 46  $\mu$ s for the remainder of the section.

Figure 129: Timing diagram - DELAY\_CLEAR

Figure 130: Timing diagram - DELAY\_STOP

The START task will start the RTC. Assuming that the LFCLK was previously running and stable, the first increment of COUNTER (and instance of TICK event) will be typically after 30.5  $\mu$ s +/- 15  $\mu$ s. In some cases, in particular if the RTC is STARTed before the LFCLK is running, that timing can be up to  $\sim 250 \mu$ s. The software should therefore wait for the first TICK if it has to make sure the RTC is running. Sending a TRIGOVFLW task sets the COUNTER to a value close to overflow. However, since the update of COUNTER relies on a stable LFCLK, sending this task while LFCLK is not running will start LFCLK, but the update will then be delayed by the same amount of time of up to  $\sim 250 \mu$ s. The figures show the shortest and longest delays on the START task which appears as a +/- 15  $\mu$ s jitter on the first COUNTER increment.

<sup>22</sup> Assumes RTC runs continuously between these events.

Figure 131: Timing diagram - JITTER\_START-

Figure 132: Timing diagram - JITTER\_START+

### 6.20.9 Reading the COUNTER register

To read the COUNTER register, the internal <<COUNTER>> value is sampled.

To ensure that the <<COUNTER>> is safely sampled (considering an LFCLK transition may occur during a read), the CPU and core memory bus are halted for three cycles by lowering the core PREADY signal. The Read takes the CPU 2 cycles in addition resulting in the COUNTER register read taking a fixed five PCLK16M clock cycles.

Figure 133: Timing diagram - COUNTER\_READ

## 6.20.10 Registers

| Base address | Peripheral | Instance | Description         | Configuration                               |
|--------------|------------|----------|---------------------|---------------------------------------------|
| 0x4000B000   | RTC        | RTC0     | Real-time counter 0 | CC[0..2] implemented, CC[3] not implemented |
| 0x40011000   | RTC        | RTC1     | Real-time counter 1 | CC[0..3] implemented                        |
| 0x40024000   | RTC        | RTC2     | Real-time counter 2 | CC[0..3] implemented                        |

Table 92: Instances

| Register          | Offset | Description                                                                                        |
|-------------------|--------|----------------------------------------------------------------------------------------------------|
| TASKS_START       | 0x000  | Start RTC COUNTER                                                                                  |
| TASKS_STOP        | 0x004  | Stop RTC COUNTER                                                                                   |
| TASKS_CLEAR       | 0x008  | Clear RTC COUNTER                                                                                  |

### 6.20.11 Electrical specification

## 6.21 SAADC — Successive approximation analog-to-digital converter

The SAADC is a differential successive approximation register (SAR) analog-to-digital converter. It supports up to eight external analog input channels, depending on package variant.

The following lists the main features of the SAADC:

- Multiple input channels
  - Each channel can use pins AIN0 through AIN7, the VDD pin, or the VDDH pin as input
  - Eight channels for single-ended inputs and four channels for differential inputs
- Full scale input range
- Individual reference selection for each channel
  - VDD
  - Internal reference
- Continuous sampling
- Output samples are automatically written to RAM using EasyDMA
- Samples are stored as 16-bit 2's complement values
- 8/10/12-bit resolution, 14-bit resolution with oversampling

Figure 134: Block diagram

An input channel is enabled and connected to an analog input pin using the registers [CH\[n\].PSELP \(n=0..7\)](#) on page 378 and [CH\[n\].PSELN \(n=0..7\)](#) on page 378.

Before any sampling can take place, the length and the location of the memory buffer in RAM where output values shall be written need to be configured, and the START task has to be triggered to apply the configuration. See [EasyDMA](#) on page 364 for details on memory configuration and how the results are placed in memory.

Sampling of all enabled channels is started by triggering the SAMPLE task, and the sample results are automatically written to memory using EasyDMA.

When multiple channels are enabled, they are sampled successively in a sequence starting with the lowest channel number. The time it takes to sample all enabled channels is given as follows:

$$\text{Total time} < \text{Sum}(\text{CH}[x].t_{\text{ACQ}} + t_{\text{CONV}}), \text{ x is the number of enabled channels}$$

A DONE event is generated for every single completed conversion, and an END event is generated when multiple samples, as specified in [RESULT.MAXCNT](#) on page 381, have been written to memory.

### 6.21.1 Input configuration

Each SAADC channel can be configured to use either single-ended or differential input mode.

The configuration is done using the registers [CH\[n\].CONFIG \(n=0..7\)](#) on page 379. In single-ended mode, the negative channel input is shorted to ground internally and the setting in the corresponding register [CH\[n\].PSELN \(n=0..7\)](#) on page 378 will not apply. The assumption in single-ended mode is that the internal ground of the SAADC is the same as the external ground that the measured voltage is referred to. The SAADC is thus sensitive to ground bounce on the PCB in single-ended mode. If this is a concern, using differential measurement is recommended. In differential mode, both positive and negative input has to be configured in registers [CH\[n\].PSELP \(n=0..7\)](#) on page 378 and [CH\[n\].PSELN \(n=0..7\)](#) on page 378 respectively.

#### 6.21.1.1 Acquisition time

To sample input voltage, the SAADC connects a capacitor to the input.

This is illustrated in the following figure:

Figure 135: Simplified SAADC sample network

The acquisition time indicates how long the capacitor is connected, see TACQ field in CH[n].CONFIG register. The required acquisition time depends on the source resistance ( $R_{source}$ ). For high source resistance the acquisition time should be increased:

| TACQ [ $\mu$ s] | Maximum source resistance [k $\Omega$ ] |
|-----------------|-----------------------------------------|
| 3               | 10                                      |
| 5               | 40                                      |
| 10              | 100                                     |
| 15              | 200                                     |
| 20              | 400                                     |
| 40              | 800                                     |

Table 94: Acquisition time

When using VDDHDI5 as input, the acquisition time needs to be 10  $\mu$ s or higher.

#### 6.21.1.2 Internal resistor string (resistor ladder)

The SAADC has an internal resistor string for positive and negative input. The resistors are controlled in registers CH[n].CONFIG.RESP and CH[n].CONFIG.RESN.

The following figure illustrates the resistor ladder for positive (and negative) input:

Figure 136: Resistor ladder for positive input (negative input is equivalent, using RESN instead of RESP)

## 6.21.2 Reference voltage and gain settings

Each SAADC channel can have individual reference and gain settings.

This is configured in registers [CH\[n\].CONFIG \(n=0..7\)](#) on page 379. Available configuration options are:

- VDD/4 or internal 0.6 V reference
- Gain ranging from 1/6 to 4

The gain setting can be used to control the effective input range of the SAADC:

$$\text{Input range} = (\pm 0.6 \text{ V or } \pm \text{VDD}/4) / \text{gain}$$

For example, selecting VDD as reference, single-ended input (grounded negative input), and a gain of 1/4 will result in the following input range:

$$\text{Input range} = (\text{VDD}/4) / (1/4) = \text{VDD}$$

With internal reference, single-ended input (grounded negative input) and a gain of 1/6, the input range will be:

$$\text{Input range} = (0.6 \text{ V}) / (1/6) = 3.6 \text{ V}$$

Inputs AIN0 through AIN7 cannot exceed VDD or be lower than VSS.

## 6.21.3 Digital output

The digital output value from the SAADC is calculated using a formula.

$$\text{RESULT} = (V(P) - V(N)) * (\text{GAIN}/\text{REFERENCE}) * 2^{(\text{RESOLUTION} - m)}$$

where

**V(P)**

is the voltage at input P

**V(N)**

is the voltage at input N

**GAIN**

is the selected gain

**REFERENCE**

is the selected reference voltage

**RESOLUTION**

is output resolution in bits, as configured in register [RESOLUTION](#) on page 380

**m**

is 0 for single-ended channels

is 1 for differential channels

Results are sign extended to 16 bits and stored as little-endian byte order in RAM.

## 6.21.4 EasyDMA

The SAADC resources are started by triggering the START task. The SAADC is using EasyDMA to store results in a result buffer in RAM.

Registers [RESULT.PTR](#) on page 381 and [RESULT.MAXCNT](#) on page 381 must be configured before SAADC is started.

The result buffer is located at the address specified in register [RESULT.PTR](#) on page 381. This register is double-buffered, and it can be updated and prepared for the next START task immediately after the STARTED event is generated. The size of the result buffer is specified in register [RESULT.MAXCNT](#) on page 381, and the SAADC will generate an END event when it has filled up the result buffer, as illustrated in the following figure:

Figure 137: SAADC

The following figure shows how results are placed in RAM when multiple channels are enabled, and value in [RESULT.MAXCNT](#) on page 381 is an even number:

|                                  |                              |    |                              |   |
|----------------------------------|------------------------------|----|------------------------------|---|
|                                  | 31                           | 16 | 15                           | 0 |
| RESULT.PTR                       | CH[2] 1 <sup>st</sup> result |    | CH[1] 1 <sup>st</sup> result |   |
| RESULT.PTR + 4                   | CH[1] 2 <sup>nd</sup> result |    | CH[5] 1 <sup>st</sup> result |   |
| RESULT.PTR + 8                   | CH[5] 2 <sup>nd</sup> result |    | CH[2] 2 <sup>nd</sup> result |   |
|                                  | (...)                        |    |                              |   |
| RESULT.PTR + 2*RESULT.MAXCNT – 4 | CH[5] last result            |    | CH[2] last result            |   |

Figure 138: Example of RAM placement: [RESULT.MAXCNT](#) even number, channels 1, 2 and 5 enabled

The following figure shows how results are placed in RAM when multiple channels are enabled and value in [RESULT.MAXCNT](#) on page 381 is an odd number:

|                                  |                              |    |                              |   |
|----------------------------------|------------------------------|----|------------------------------|---|
|                                  | 31                           | 16 | 15                           | 0 |
| RESULT.PTR                       | CH[2] 1 <sup>st</sup> result |    | CH[1] 1 <sup>st</sup> result |   |
| RESULT.PTR + 4                   | CH[1] 2 <sup>nd</sup> result |    | CH[5] 1 <sup>st</sup> result |   |
| RESULT.PTR + 8                   | CH[5] 2 <sup>nd</sup> result |    | CH[2] 2 <sup>nd</sup> result |   |
|                                  | (…)                          |    |                              |   |
| RESULT.PTR + 2*RESULT.MAXCNT – 2 |                              |    | CH[5] last result            |   |

Figure 139: Example of RAM placement: [RESULT.MAXCNT](#) odd number, channels 1, 2 and 5 enabled

The last 32-bit word is populated only with one 16-bit result. In both examples, channels 1, 2 and 5 are enabled, and all others are disabled.

See [Memory](#) on page 19 for more information about the different memory regions.

EasyDMA is finished with accessing RAM when events END or STOPPED are generated. The register [RESULT.AMOUNT](#) on page 382 can then be read, to see how many results have been transferred to the result buffer in RAM since the START task was triggered.

### 6.21.5 Continuous sampling

When using continuous sampling, new samples are automatically taken at a fixed sample rate.

Continuous sampling of both single and multiple channels can be implemented using a general purpose timer connecting a timer event to SAADC's SAMPLE task via PPI.

Alternatively, continuous sampling can be implemented by using the internal timer in the SAADC by setting the MODE field in register [SAMPLERATE](#) on page 381 to `Timers`. The sample rate (frequency at which the SAMPLE task is triggered) is configured in the same register. The internal timer and the continuous sampling are started by triggering the START task and stopped using the STOP task.

**Note:** Note that the internal timer can only be used when a single input channel is enabled.

For continuous sampling, ensure that the sample rate fulfills the following criteria:

$$f_{\text{SAMPLE}} < 1 / [t_{\text{ACQ}} + t_{\text{conv}}]$$

### 6.21.6 Oversampling

An accumulator in the SAADC can be used to find the average of several analog input samples. In general, oversampling improves the signal-to-noise ratio (SNR). Oversampling does not improve the integral non-linearity (INL) or differential non-linearity (DNL).

The accumulator is controlled in the [OVERSAMPLE](#) register. When using oversampling,  $2^{\text{OVERSAMPLE}}$  input samples are averaged before the sample result is transferred to memory. Hence, the SAMPLE task must be triggered  $2^{\text{OVERSAMPLE}}$  times for each output value. The following events are relevant:

- DONE event is generated for every input sample taken
- RESULTDONE event is generated for every averaged value ready to be transferred into RAM
- END event is generated when averaged values defined in [RESULT.MAXCNT](#) on page 381 have been written to memory. END event is generated every  $2^{\text{OVERSAMPLE}}$  time the DONE event is generated.

If value in [OVERSAMPLE](#) is set to 0, the DONE and RESULTDONE events will be generated at the same rate.

**Note:** Oversampling should only be used when a single input channel is enabled, as averaging is performed over all enabled channels.

### 6.21.7 Event monitoring using limits

A channel can be event monitored by using limits.

Limits are configured in [CH\[n\].LIMIT](#) register, with high limit and low limit.

**Note:** High limit shall always be higher than or equal to low limit.

Appropriate events are generated whenever the conversion results (sampled input signals) are outside of the two defined limits. It is not possible to generate an event when the input signal is inside a defined range by swapping high and low limits. An example of event monitoring using limits is illustrated in the following figure:

Figure 140: Example: Event monitoring on channel  $n$  using limits

The comparison to limits always takes place, it does not need to be specifically enabled. If comparison is not required on a channel, the software ignores the related events. In that situation, the value of the limits defined in register is irrelevant, i.e. it does not matter if the low limit is lower than the high limit or not.

### 6.21.8 Calibration

The SAADC has a temperature dependent offset.

Therefore, it is recommended to calibrate the SAADC at least once before use, and to re-run calibration every time the ambient temperature has changed by more than 10 °C.

Offset calibration is started by triggering the CALIBRATEOFFSET task, and the CALIBRATEDONE event is generated when calibration is done.

### 6.21.9 Registers

| Base address | Peripheral | Instance | Description                 | Configuration |
|--------------|------------|----------|-----------------------------|---------------|
| 0x40007000   | SAADC      | SAADC    | Analog to digital converter |               |

Table 95: Instances

| Register              | Offset | Description                                                                                                                                       |
|-----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_START           | 0x000  | Starts the SAADC and prepares the result buffer in RAM                                                                                            |
| TASKS_SAMPLE          | 0x004  | Takes one SAADC sample                                                                                                                            |
| TASKS_STOP            | 0x008  | Stops the SAADC and terminates all on-going conversions                                                                                           |
| TASKS_CALIBRATEOFFSET | 0x00C  | Starts offset auto-calibration                                                                                                                    |
| EVENTS_STARTED        | 0x100  | The SAADC has started                                                                                                                             |
| EVENTS_END            | 0x104  | The SAADC has filled up the result buffer                                                                                                         |
| EVENTS_DONE           | 0x108  | A conversion task has been completed. Depending on the configuration, multiple conversions might be needed for a result to be transferred to RAM. |
| EVENTS_RESULTDONE     | 0x10C  | Result ready for transfer to RAM                                                                                                                  |

| Register             | Offset | Description                                       |
|----------------------|--------|---------------------------------------------------|
| EVENTS_CALIBRATEDONE | 0x110  | Calibration is complete                           |
| EVENTS_STOPPED       | 0x114  | The SAADC has stopped                             |
| EVENTS_CH[0].LIMITH  | 0x118  | Last result is equal or above CH[0].LIMIT.HIGH    |
| EVENTS_CH[0].LIMITL  | 0x11C  | Last result is equal or below CH[0].LIMIT.LOW     |
| EVENTS_CH[1].LIMITH  | 0x120  | Last result is equal or above CH[1].LIMIT.HIGH    |
| EVENTS_CH[1].LIMITL  | 0x124  | Last result is equal or below CH[1].LIMIT.LOW     |

| Register      | Offset | Description                                                                                                                          |
|---------------|--------|--------------------------------------------------------------------------------------------------------------------------------------|
| CH[7].CONFIG  | 0x588  | Input configuration for CH[7]                                                                                                        |
| CH[7].LIMIT   | 0x58C  | High/low limits for event monitoring of a channel                                                                                    |
| RESOLUTION    | 0x5F0  | Resolution configuration                                                                                                             |
| OVERSAMPLE    | 0x5F4  | Oversampling configuration. The RESOLUTION is applied before averaging, thus for high OVERSAMPLE a higher RESOLUTION should be used. |
| SAMPLERATE    | 0x5F8  | Controls normal or continuous sample rate                                                                                            |
| RESULT.PTR    | 0x62C  | Data pointer                                                                                                                         |
| RESULT.MAXCNT | 0x630  | Maximum number of 16-bit samples to be written to output RAM buffer                                                                  |
| RESULT.AMOUNT | 0x634  | Number of 16-bit samples written to output RAM buffer since the previous START task                                                  |

Table 96: Register overview

### 6.21.9.1 TASKS\_START

Address offset: 0x000

Starts the SAADC and prepares the result buffer in RAM

|                  |            |             |       |                                                                                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

   ### 6.21.9.23 OVERSAMPLE

Address offset: 0x5F4

Oversampling configuration. The RESOLUTION is applied before averaging, thus for high OVERSAMPLE a higher RESOLUTION should be used.

    ## 6.22 SPI — Serial peripheral interface master

The SPI master provides a simple CPU interface which includes a TXD register for sending data and an RXD register for receiving data. This section is added for legacy support for now.

Figure 141: SPI master

RXD-1 and TXD+1 illustrate the double buffered version of RXD and TXD respectively.

### 6.22.1 Functional description

The TXD and RXD registers are double-buffered to enable some degree of uninterrupted data flow in and out of the SPI master.

The SPI master does not implement support for chip select directly. Therefore, the CPU must use available GPIOs to select the correct slave and control this independently of the SPI master. The SPI master supports SPI modes 0 through 3.

| Mode      | Clock polarity | Clock phase     |
|-----------|----------------|-----------------|
|           | CPOL           | CPHA            |
| SPI_MODE0 | 0 (Leading)    | 0 (Active high) |
| SPI_MODE1 | 0 (Leading)    | 1 (Active low)  |
| SPI_MODE2 | 1 (Trailing)   | 0 (Active high) |
| SPI_MODE3 | 1 (Trailing)   | 1 (Active low)  |

Table 97: SPI modes

### 6.22.1.1 SPI master mode pin configuration

The different signals SCK, MOSI, and MISO associated with the SPI master are mapped to physical pins.

This mapping is according to the configuration specified in the PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers respectively. If the CONNECT field of a PSEL.xxx register is set to Disconnected, the associated SPI master signal is not connected to any physical pin. The PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers and their configurations are only used as long as the SPI master is enabled, and retained only as long as the device is in ON mode. PSEL.SCK, PSEL.MOSI, and PSEL.MISO must only be configured when the SPI master is disabled.

To secure correct behavior in the SPI, the pins used by the SPI must be configured in the GPIO peripheral as described in [GPIO configuration](#) on page 384 prior to enabling the SPI. The SCK must always be connected to a pin, and that pin's input buffer must always be connected for the SPI to work. This configuration must be retained in the GPIO for the selected I/Os as long as the SPI is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| SPI master signal | SPI master pin            | Direction | Output value        |
|-------------------|---------------------------|-----------|---------------------|
| SCK               | As specified in PSEL.SCK  | Output    | Same as CONFIG.CPOL |
| MOSI              | As specified in PSEL.MOSI | Output    | 0                   |
| MISO              | As specified in PSEL.MISO | Input     | Not applicable      |

Table 98: GPIO configuration

### 6.22.1.2 Shared resources

The SPI shares registers and other resources with other peripherals that have the same ID as the SPI. Therefore, the user must disable all peripherals that have the same ID as the SPI before the SPI can be configured and used.

Disabling a peripheral that has the same ID as the SPI will not reset any of the registers that are shared with the SPI. It is therefore important to configure all relevant SPI registers explicitly to secure that it operates correctly.

See the Instantiation table in [Instantiation](#) on page 22 for details on peripherals and their IDs.

### 6.22.1.3 SPI master transaction sequence

An SPI master transaction is started by writing the first byte, which is to be transmitted by the SPI master, to the TXD register.

Since the transmitter is double buffered, the second byte can be written to the TXD register immediately after the first one. The SPI master will then send these bytes in the order they are written to the TXD register.

The SPI master is a synchronous interface, and for every byte that is sent, a different byte will be received at the same time. This is illustrated in [SPI master transaction](#) on page 385. Bytes that are received will be moved to the RXD register where the CPU can extract them by reading the register. The RXD register is double buffered in the same way as the TXD register, and a second byte can therefore be received at the

same time as the first byte is being extracted from RXD by the CPU. The SPI master will generate a READY event every time a new byte is moved to the RXD register. The double buffered byte will be moved from RXD-1 to RXD as soon as the first byte is extracted from RXD. The SPI master will stop when there are no more bytes to send in TXD and TXD+1.

Figure 142: SPI master transaction

The READY event of the third byte transaction is delayed until B is extracted from RXD in occurrence number 3 on the horizontal lifeline. The reason for this is that the third event is generated first when C is moved from RXD-1 to RXD after B is read.

The SPI master will move the incoming byte to the RXD register after a short delay following the SCK clock period of the last bit in the byte. This also means that the READY event will be delayed accordingly, see [SPI master transaction](#) on page 386. Therefore, it is important that you always clear the READY event, even if the RXD register and the data that is being received is not used.

Figure 143: SPI master transaction

## 6.22.2 Registers

| Base address | Peripheral | Instance | Description  | Configuration |
|--------------|------------|----------|--------------|---------------|
| 0x40003000   | SPI        | SPI0     | SPI master 0 | Deprecated    |
| 0x40004000   | SPI        | SPI1     | SPI master 1 | Deprecated    |
| 0x40023000   | SPI        | SPI2     | SPI master 2 | Deprecated    |

Table 99: Instances

| Register     | Offset | Description                                                   |
|--------------|--------|---------------------------------------------------------------|
| EVENTS_READY | 0x108  | TXD byte sent and RXD byte received                           |

  ## 6.22.3 Electrical specification

### 6.22.3.1 SPI master interface electrical specifications

| Symbol          | Description                                            | Min. | Typ. | Max.            | Units |
|-----------------|--------------------------------------------------------|------|------|-----------------|-------|
| $f_{SPI}$       | Bit rates for SPI <sup>26</sup>                        |      |      | 8 <sup>27</sup> | Mbps  |
| $t_{SPI,START}$ | Time from writing TXD register to transmission started |      | 1    |                 | μs    |

### 6.22.3.2 Serial Peripheral Interface (SPI) Master timing specifications

| Symbol            | Description                                 | Min.           | Typ. | Max.           | Units |
|-------------------|---------------------------------------------|----------------|------|----------------|-------|
| $t_{SPI,CSCK}$    | SCK period                                  | 125            |      |                | ns    |
| $t_{SPI,RSCK,LD}$ | SCK rise time, standard drive <sup>28</sup> |                |      | $t_{RF,25pF}$  |       |
| $t_{SPI,RSCK,HD}$ | SCK rise time, high drive <sup>28</sup>     |                |      | $t_{HRF,25pF}$ |       |
| $t_{SPI,FSCK,LD}$ | SCK fall time, standard drive <sup>28</sup> |                |      | $t_{RF,25pF}$  |       |
| $t_{SPI,FSCK,HD}$ | SCK fall time, high drive <sup>28</sup>     |                |      | $t_{HRF,25pF}$ |       |
| $t_{SPI,WHSCK}$   | SCK high time <sup>28</sup>                 | $(t_{CSCK}/2)$ |      |                |       |
|                   |                                             | $- t_{RSCK}$   |      |                |       |
| $t_{SPI,WLSCK}$   | SCK low time <sup>28</sup>                  | $(t_{CSCK}/2)$ |      |                |       |
|                   |                                             | $- t_{FSCK}$   |      |                |       |
| $t_{SPI,SUMI}$    | MISO to CLK edge setup time                 | 19             |      |                | ns    |
| $t_{SPI,HMI}$     | CLK edge to MISO hold time                  | 18             |      |                | ns    |
| $t_{SPI,VMO}$     | CLK edge to MOSI valid                      |                |      | 59             | ns    |
| $t_{SPI,HMO}$     | MOSI hold time after CLK edge               | 20             |      |                | ns    |

<sup>26</sup> High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

<sup>27</sup> The actual maximum data rate depends on the slave's CLK to MISO and MOSI setup and hold timings.

<sup>28</sup> At 25 pF load, including GPIO capacitance, see [GPIO electrical specification](#).

Figure 144: SPI master timing diagram

## 6.23 SPIM — Serial peripheral interface master with EasyDMA

The SPI master can communicate with multiple SPI slaves using individual chip select signals for each slave.

Listed here are the main features for the SPIM:

- EasyDMA direct transfer to/from RAM
- SPI mode 0-3
- Individual selection of I/O pins
- Optional D/CX output line for distinguishing between command and data bytes

Figure 145: SPIM — SPI master with EasyDMA

### 6.23.1 SPI master transaction sequence

An SPI master transaction is started by triggering the START task. When started, a number of bytes will be transmitted/received on MOSI/MISO.

The following figure illustrates an SPI master transaction.

Figure 146: SPI master transaction

The ENDTX is generated when all bytes in buffer [TXD.PTR](#) on page 404 are transmitted. The number of bytes in the transmit buffer is specified in register [TXD.MAXCNT](#) on page 404. The ENDRX event will be generated when buffer [RXD.PTR](#) on page 403 is full, meaning the number of bytes specified in register [RXD.MAXCNT](#) on page 403 have been received. The transaction stops automatically after all bytes have been transmitted/received. When the maximum number of bytes in the receive buffer is larger than the number of bytes in the transmit buffer, the contents of register [ORC](#) on page 407 will be transmitted after the last byte in the transmit buffer has been transmitted.

The END event will be generated after both the ENDRX and ENDTX events have been generated.

The SPI master can be stopped in the middle of a transaction by triggering the STOP task. When triggering the STOP task, SPIM will complete the transmission/reception of the current byte before stopping. A STOPPED event is generated when the SPI master has stopped.

If the ENDTX event has not already been generated when the SPI master has come to a stop, the ENDTX event will be generated even if all bytes in the buffer [TXD.PTR](#) on page 404 have not been transmitted.

If the ENDRX event has not already been generated when the SPI master has come to a stop, the ENDRX event will be generated even if the buffer [RXD.PTR](#) on page 403 is not full.

A transaction can be suspended and resumed using the SUSPEND and RESUME tasks. When the SUSPEND task is triggered, the SPI master will complete transmitting and receiving the current ongoing byte before it is suspended.

### 6.23.2 D/CX functionality

Some SPI slaves, for example display drivers, require an additional signal from the SPI master to distinguish between command and data bytes. For display drivers this line is often called D/CX.

SPIM provides support for such a D/CX output line. The D/CX line is set low during transmission of command bytes and high during transmission of data bytes.

The D/CX pin number is selected using [PSELDCX](#) on page 406 and the number of command bytes preceding the data bytes is configured using [DCXCNT](#) on page 406.

It is not allowed to write to the [DCXCNT](#) on page 406 during an ongoing transmission.

Figure 147: D/CX example. SPIM.DCXCNT = 1.

### 6.23.3 Pin configuration

The SCK, CSN, DCX, MOSI, and MISO signals associated with SPIM are mapped to physical pins according to the configuration specified in the PSEL.n registers.

The contents of registers [PSEL.SCK](#) on page 401, [PSEL.CSN](#) on page 402, [PSELD CX](#) on page 406, [PSEL.MOSI](#) on page 402, and [PSEL.MISO](#) on page 402 are only used when SPIM is enabled, and retained only as long as the device is in System ON mode. The PSEL.n registers can only be configured when SPIM is disabled. Enabling/disabling is done using register [ENABLE](#) on page 401.

To ensure correct behavior, the pins used by SPIM must be configured in the GPIO peripheral as described in [GPIO configuration](#) on page 394 before SPIM is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| SPI master signal | SPI master pin                                        | Direction | Output value        | Comments |
|-------------------|-------------------------------------------------------|-----------|---------------------|----------|
| SCK               | As specified in <a href="#">PSEL.SCK</a> on page 401  | Output    | Same as CONFIG.CPOL |          |
| CSN               | As specified in <a href="#">PSEL.CSN</a> on page 402  | Output    | Same as CONFIG.CPOL |          |
| DCX               | As specified in <a href="#">PSELD CX</a> on page 406  | Output    | 1                   |          |
| MOSI              | As specified in <a href="#">PSEL.MOSI</a> on page 402 | Output    | 0                   |          |
| MISO              | As specified in <a href="#">PSEL.MISO</a> on page 402 | Input     | Not applicable      |          |

Table 101: GPIO configuration

Some SPIM instances do not support automatic control of CSN, and for those the available GPIO pins need to be used to control CSN directly. See [Instances](#) on page 396 for information about what features are supported in the various SPIM instances.

SPIM supports SPI modes 0 through 3. The clock polarity (CPOL) and the clock phase (CPHA) are configured in register [CONFIG](#) on page 405.

| Mode      | Clock polarity  | Clock phase  |
|-----------|-----------------|--------------|
|           | CPOL            | CPHA         |
| SPI_MODE0 | 0 (Active High) | 0 (Leading)  |
| SPI_MODE1 | 0 (Active High) | 1 (Trailing) |
| SPI_MODE2 | 1 (Active Low)  | 0 (Leading)  |
| SPI_MODE3 | 1 (Active Low)  | 1 (Trailing) |

Table 102: SPI modes

### 6.23.4 EasyDMA

SPIM implements EasyDMA for accessing RAM without CPU involvement.

The SPIM peripheral implements the following EasyDMA channels.

| Channel | Type   | Register Cluster |
|---------|--------|------------------|
| TXD     | READER | TXD              |
| RXD     | WRITER | RXD              |

Table 103: SPIM EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 44.

The .PTR and .MAXCNT registers are double-buffered. They can be updated and prepared for the next transmission immediately after having received the STARTED event.

The SPI master will automatically stop transmitting after TXD.MAXCNT bytes have been transmitted and RXD.MAXCNT bytes have been received. If RXD.MAXCNT is larger than TXD.MAXCNT, the remaining transmitted bytes will contain the value defined in the ORC register. If TXD.MAXCNT is larger than RXD.MAXCNT, the superfluous received bytes will be discarded.

The ENDRX/ENDTX event indicate that EasyDMA has finished accessing respectively the RX/TX buffer in RAM. The END event gets generated when both RX and TX are finished accessing the buffers in RAM.

If several AHB bus masters try to access the same AHB slave at the same time, AHB bus congestion might occur, and the behaviour of the EasyDMA channel will depend on the SPIM instance. Refer to [Instances](#) on page 396 for information about what behaviour is supported in the various instances.

### 6.23.5 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

## 6.23.6 Registers

| Base address | Peripheral | Instance | Description  | Configuration                                                                                                                                                                                                                                                                    |
|--------------|------------|----------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0x40003000   | SPIM       | SPIM0    | SPI master 0 | Not supported: > 8 Mbps data rate, CSNPOL register, DCX functionality, IFTIMING.x registers, hardware CSN control (PSEL.CSN), stalling mechanism during AHB bus contention. Recommended GPIOs for SCK signal for 8 Mbps data rate, see Pin assignments section for your package. |
| 0x40004000   | SPIM       | SPIM1    | SPI master 1 | Not supported: > 8 Mbps data rate, CSNPOL register, DCX functionality, IFTIMING.x registers, hardware CSN control (PSEL.CSN), stalling mechanism during AHB bus contention. Recommended GPIOs for SCK signal for 8 Mbps data rate, see Pin assignments section for your package. |
| 0x40023000   | SPIM       | SPIM2    | SPI master 2 | Not supported: > 8 Mbps data rate, CSNPOL register, DCX functionality, IFTIMING.x registers, hardware CSN control (PSEL.CSN), stalling mechanism during AHB bus contention. Recommended GPIOs for SCK signal for 8 Mbps data rate, see Pin assignments section for your package. |
| 0x4002F000   | SPIM       | SPIM3    | SPI master 3 |                                                                                                                                                                                                                                                                                  |

Table 104: Instances

| Register       | Offset | Description                                                                                                                                                             |

### 6.23.6.13 STALLSTAT

Address offset: 0x400

Stall status for EasyDMA RAM accesses. The fields in this register are set to STALL by hardware whenever a stall occurs and can be cleared (set to NOSTALL) by the CPU.

  | A                | RW RXDELAY |          | [7..0]                                                                                | Sample delay for input serial data on MISO. The value specifies the number of 64 MHz clock cycles (15.625 ns) delay from the the sampling edge of SCK (leading edge for CONFIG.CPHA = 0, trailing edge for CONFIG.CPHA = 1) until the input serial data is sampled. As an example, if RXDELAY = 0 and CONFIG.CPHA = 0, the input serial data is sampled on the rising edge of SCK. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| $t_{\text{SPIM,HMI}}$     | CLK edge to MISO hold time                         | 18                                           |      |                              | ns            |
| $t_{\text{SPIM,VMO}}$     | CLK edge to MOSI valid, SCK frequency $\leq 8$ MHz |                                              |      | 59                           | ns            |
| $t_{\text{SPIM,VMO,HS}}$  | CLK edge to MOSI valid, SCK frequency $> 8$ MHz    |                                              |      | 8                            | ns            |
| $t_{\text{SPIM,HMO}}$     | MOSI hold time after CLK edge                      | 20                                           |      |                              | ns            |

<sup>29</sup> High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

<sup>30</sup> At 25 pF load, including GPIO pin capacitance, see [GPIO electrical specification](#).

Figure 148: SPIM timing diagram

## 6.24 SPIS — Serial peripheral interface slave with EasyDMA

SPI slave (SPIS) is implemented with EasyDMA support for ultra-low power serial communication from an external SPI master. EasyDMA, in conjunction with hardware-based semaphore mechanisms, removes all real-time requirements associated with controlling the SPI slave from a low priority CPU execution context.

Figure 149: SPI slave

The SPIS supports SPI modes 0 through 3. The CONFIG register allows setting CPOL and CPHA appropriately.

| Mode      | Clock polarity  | Clock phase       |
|-----------|-----------------|-------------------|
|           | CPOL            | CPHA              |
| SPI_MODE0 | 0 (Active High) | 0 (Trailing Edge) |
| SPI_MODE1 | 0 (Active High) | 1 (Leading Edge)  |
| SPI_MODE2 | 1 (Active Low)  | 0 (Trailing Edge) |
| SPI_MODE3 | 1 (Active Low)  | 1 (Leading Edge)  |

Table 106: SPI modes

### 6.24.1 Shared resources

The SPI slave shares registers and other resources with other peripherals that have the same ID as the SPI slave. Therefore, you must disable all peripherals that have the same ID as the SPI slave before the SPI slave can be configured and used.

Disabling a peripheral that has the same ID as the SPI slave will not reset any of the registers that are shared with the SPI slave. It is important to configure all relevant SPI slave registers explicitly to secure that it operates correctly.

The Instantiation table in [Instantiation](#) on page 22 shows which peripherals have the same ID as the SPI slave.

### 6.24.2 EasyDMA

The SPIS implements EasyDMA for accessing RAM without CPU involvement.

The SPIS peripheral implements the following EasyDMA channels.

| Channel | Type   | Register Cluster |
|---------|--------|------------------|
| TXD     | READER | TXD              |
| RXD     | WRITER | RXD              |

Table 107: SPIS EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 44.

If RXD.MAXCNT is larger than TXD.MAXCNT, the remaining transmitted bytes will contain the value defined in the ORC register.

The END event indicates that EasyDMA has finished accessing the buffer in RAM.

### 6.24.3 SPI slave operation

SPI slave uses two memory pointers, RXD.PTR and TXD.PTR, that point to the RXD buffer (receive buffer) and TXD buffer (transmit buffer) respectively. Since these buffers are located in RAM, which can be accessed by both the SPI slave and the CPU, a hardware based semaphore mechanism is implemented to enable safe sharing.

See [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 411.

Before the CPU can safely update the RXD.PTR and TXD.PTR pointers, it must first acquire the SPI semaphore. The CPU can acquire the semaphore by triggering the ACQUIRE task and then receiving the ACQUIRED event. When the CPU has updated the RXD.PTR and TXD.PTR pointers the CPU must release the semaphore before the SPI slave will be able to acquire it. The CPU releases the semaphore by triggering

the RELEASE task. This is illustrated in [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 411. Triggering the RELEASE task when the semaphore is not granted to the CPU will have no effect.

The semaphore mechanism does not, at any time, prevent the CPU from performing read or write access to the RXD.PTR register, the TXD.PTR registers, or the RAM that these pointers are pointing to. The semaphore is only telling when these can be updated by the CPU so that safe sharing is achieved.

The semaphore is by default assigned to the CPU after the SPI slave is enabled. No ACQUIRED event will be generated for this initial semaphore handover. An ACQUIRED event will be generated immediately if the ACQUIRE task is triggered while the semaphore is assigned to the CPU.

The SPI slave will try to acquire the semaphore when CSN goes low. If the SPI slave does not manage to acquire the semaphore at this point, the transaction will be ignored. This means that all incoming data on MOSI will be discarded, and the DEF (default) character will be clocked out on the MISO line throughout the whole transaction. This will also be the case even if the semaphore is released by the CPU during the transaction. In case of a race condition where the CPU and the SPI slave try to acquire the semaphore at the same time, as illustrated in lifeline item 2 in [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 411, the semaphore will be granted to the CPU.

If the SPI slave acquires the semaphore, the transaction will be granted. The incoming data on MOSI will be stored in the RXD buffer and the data in the TXD buffer will be clocked out on MISO.

When a granted transaction is completed and CSN goes high, the SPI slave will automatically release the semaphore and generate the END event.

As long as the semaphore is available, the SPI slave can be granted multiple transactions one after the other. If the CPU is not able to reconfigure the TXD.PTR and RXD.PTR between granted transactions, the same TX data will be clocked out and the RX buffers will be overwritten. To prevent this from happening, the END\_ACQUIRE shortcut can be used. With this shortcut enabled, the semaphore will be handed over to the CPU automatically after the granted transaction has completed. This enables the CPU to update the TXPTR and RXPTR between every granted transaction.

If the CPU tries to acquire the semaphore while it is assigned to the SPI slave, an immediate handover will not be granted. However, the semaphore will be handed over to the CPU as soon as the SPI slave has released the semaphore after the granted transaction is completed. If the END\_ACQUIRE shortcut is enabled and the CPU has triggered the ACQUIRE task during a granted transaction, only one ACQUIRE request will be served following the END event.

The MAXRX register specifies the maximum number of bytes the SPI slave can receive in one granted transaction. If the SPI slave receives more than MAXRX number of bytes, an OVERFLOW will be indicated in the STATUS register and the incoming bytes will be discarded.

The MAXTX parameter specifies the maximum number of bytes the SPI slave can transmit in one granted transaction. If the SPI slave is forced to transmit more than MAXTX number of bytes, an OVERREAD will be indicated in the STATUS register and the ORC character will be clocked out.

The RXD.AMOUNT and TXD.AMOUNT registers are updated when a granted transaction is completed. The TXD.AMOUNT register indicates how many bytes were read from the TX buffer in the last transaction. This does not include the ORC (over-read) characters. Similarly, the RXD.AMOUNT register indicates how many bytes were written into the RX buffer in the last transaction.

The ENDRX event is generated when the RX buffer has been filled.

Figure 150: SPI transaction when shortcut between END and ACQUIRE is enabled

#### 6.24.4 Pin configuration

The CSN, SCK, MOSI, and MISO signals associated with the SPI slave are mapped to physical pins according to the configuration specified in the PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers respectively. If the CONNECT field of any of these registers is set to Disconnected, the associated SPI slave signal will not be connected to any physical pins.

The PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers and their configurations are only used as long as the SPI slave is enabled, and retained only as long as the device is in System ON mode. See [POWER — Power supply](#) on page 61 chapter for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs and use the configuration in their respective OUT bit field and PIN\_CNFG[n] register. PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO must only be configured when the SPI slave is disabled.

To secure correct behavior in the SPI slave, the pins used by the SPI slave must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 412 before enabling the SPI slave. This is to secure that the pins used by the SPI slave are driven correctly if the SPI slave itself is temporarily disabled, or if the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the SPI slave is to be recognized by an external SPI master.

The MISO line is set in high impedance as long as the SPI slave is not selected with CSN.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| SPI signal | SPI pin                   | Direction | Output value   | Comment                                      |
|------------|---------------------------|-----------|----------------|----------------------------------------------|
| CSN        | As specified in PSEL.CSN  | Input     | Not applicable |                                              |
| SCK        | As specified in PSEL.SCK  | Input     | Not applicable |                                              |
| MOSI       | As specified in PSEL.MOSI | Input     | Not applicable |                                              |
| MISO       | As specified in PSEL.MISO | Input     | Not applicable | Emulates that the SPI slave is not selected. |

Table 108: GPIO configuration before enabling peripheral

## 6.24.5 Registers
