High capacity up to 10 A PC board terminal type

FEATURES
- 10 A high capacity realized for PC board terminal (when using heat sink)
- Vertical types with SIL terminal arrangement and flat types are available.
- Built-in snubber circuit prevents malfunction due to noise.
- Safety standards
  - C-UL (UL508) certified
  - VDE (EN60950-1) reinforced insulation certified

TYPICAL APPLICATIONS
- Printing machines
- Terminal equipment of data processing
- NC machines
- Packing machines
- Automatic ticket punchers

REFERENCE DATA

1-1. Load current vs. ambient temperature characteristics
(3A Type)
Part No.: AQ1298 and AQ1398

Allowable ambient temperature: -30 to +80°C

1-2. Load current vs. ambient temperature characteristics
(10A Type)
Part No.: AQ1208

Tested condition:
When attached to a heat sink, use a heat conductive compound,
(Ex. Momentive Performance Materials Inc. YG6111 or TSK5303) of
similar coating to improve cooling.

2. Non-repetitive surge current vs. carrying time* (3A and 10A Types)
Part No.: AQ1298, AQ1398 and AQ1208

No. of cycles at 60 Hz

3. Input current vs. input voltage characteristics (3 A and 10 A types)
Part No.: AQ1298, AQ1398 and AQ1208

4-1. Load current vs. ambient temperature characteristics for adjacent mounting (3 A vertical type)
Part No.: AQ1298

4-2. Load current vs. ambient temperature characteristics for adjacent mounting (10 A type)
Part No.: AQ1208 (without heat sink)

*The above chart shows non-repetitive maximum rating. If a surge current is applied repeatedly, please keep it approximately 50% or less than the values shown in the above graph.

NOTES

For cautions for use, please read “CAUTION FOR USE OF SOLID STATE RELAYS”.

Cautions for use AQ1 relays

To avoid applying mechanical stress on the main unit and molded section of the solid state relay, radio pliers should be used to grasp the terminals between the point of bending and the molded case when making the bends.

Thermal design

When a heat sink is mounted on the 10 A type

The heat sink (AQ1801) or a radiator which can make good contact should be used. If a heat sink is used in which the contact condition is bad, a heat conducting compound should be used to improve the heat radiation. (Ex. Momentive Performance Materials Inc. YG6111 or TSK5303) The compound should be applied between the heat sink and the AQ1.

Recommended Temperature Controllers

Space saving requiring only a depth of 56 mm

<table>

Note: For detailed product information about temperature controllers, please refer to our website:
URL https://industrial.panasonic.com/ac/e/

Please refer to "the latest product specifications" when designing your product.
• Requests to customers:
https://industrial.panasonic.com/ac/e/salespolicies/
Cautions for Use of Solid State Relays

SAFETY WARNINGS

• Do not use the product under conditions that exceed the range of its specifications. It may cause overheating, smoke, or fire.
• Do not touch the recharging unit while the power is on. There is a danger of electrical shock.

Be sure to turn off the power when performing mounting, maintenance, or repair operations on the relay (including connecting parts such as the terminal socket and socket).

• Check the connection diagrams in the catalog and be sure to connect the terminals correctly.
If the device is energized with short circuit or any wrong connection, it may cause unexpected malfunction, abnormal heat or fire.

Cautions for Use of Solid State Relays

1. Derating design
Derating is a significant factor for reliable design and product life. Even if the conditions of use (temperature, current, voltage, etc.) of the product are within the absolute maximum ratings, reliability may be lowered remarkably when continuously used in high load conditions (high temperature, high humidity, high current, high voltage, etc.). Therefore, please derate sufficiently below the absolute maximum ratings and evaluate the device in the actual condition.
Moreover, regardless of the application, if malfunctioning can be expected to pose high risk to human life or to property, or if products are used in equipment otherwise requiring high operational safety, in addition to designing double circuits, that is, incorporating features such as a protection circuit or a redundant circuit, safety testing should also be carried out.

2. Applying stress that exceeds the absolute maximum rating
If the voltage or current value for any of the terminals exceeds the absolute maximum rating, internal elements will deteriorate because of the overvoltage or overcurrent. In extreme cases, wiring may melt, or silicon P/N junctions may be destroyed. Therefore, the circuit should be designed in such a way that the load never exceed the absolute maximum ratings, even momentarily.

3. Phototriac coupler
The phototriac coupler is designed solely to drive a triac. As a condition, the triac must be powered beforehand.

4. Unused terminals
1) Phototriac coupler
The No. 3 terminal is used with the circuit inside the device. Therefore, do not connect it to the external circuitry. (6 pins)
2) AQ-H
The No. 5 terminal is connected to the gate. Do not directly connect No. 5 and 6 terminals.

5. Short across terminals
Do not short circuit between terminals when device is energized, since there is possibility of breaking of the internal IC.

6. When used for the load less than rated
An SSR may malfunction if it is used below the specified load. In such an event, use a dummy resistor in parallel with the load.

Load Specifications

<table>

</tr>
<tr>
<td>AQ-J All models</td>
<td>50 mA</td>
</tr>
<tr>
<td>AQ-A All models</td>
<td>100 mA</td>
</tr>
</tbody>
</table>

7. Noise and surge protection at the input side
1) Phototriac coupler and AQ-H
If reverse surge voltages are present at the input terminals, connect a diode in reverse parallel across the input terminals and keep the reverse voltages below the reverse breakdown voltage.
Typical circuits are below shown.

< Phototriac coupler (6-pin)>  

2) SSR
A high noise surge voltage applied to the SSR input circuit can cause malfunction or permanent damage to the device. If such a high surge is anticipated, use C or R noise absorber in the input circuit.
Typical circuits are below shown.

8. Recommended input current of Phototriac coupler and AQ-H
Design in accordance with the recommended operating conditions for each product. Since these conditions are affected by the operating environment, ensure conformance with all relevant specifications.
Cautions for Use of Solid State Relays

9. Ripple in the input power supply
If ripple is present in the input power supply, observe the following:
1) Current-sensitive type (Phototriac Coupler, AQ-H)
(1) For LED forward current at Emin, please maintain the value mentioned at “Recommended input current.”
(2) Please make sure the LED forward current for Emax. is no higher than 50 mA.
2) Voltage-sensitive type (AQ-G, AQ1, AQ8, AQ-J, AQ-A)
(1) The Emin. should exceed the minimum rated control voltage
(2) The Emax. should not exceed the maximum rated control voltage

10. When the input terminals are connected with reverse polarity

<table>
<thead>
<tr>
<th>Product name</th>
<th>If the polarity of the input control voltage is reversed</th>
</tr>
</thead>
<tbody>
<tr>
<td>AQ1, AQ-J, AQ-A (AC)</td>
<td>Reversing the polarity will not cause damage to the device, due to the presence of a protection diode, but the device will not operate.</td>
</tr>
<tr>
<td>AQ-H, AQ-G, AQ8, AQ-A (DC)</td>
<td>Reversing the polarity may cause permanent damage to the device. Take special care to avoid polarity reversal or use a protection diode in the input circuit.</td>
</tr>
</tbody>
</table>

11. Noise and surge protection at the output side

1) Phototriac coupler and AQ-H
The figure below shows an ordinary triac drive circuit. Please add a snubber circuit or varistor, as noise/surge on the load side could damage the unit or cause malfunctions.
Typical circuits are shown below.

**<Phototriac coupler SOP4 and DIP4 types>**

**<Phototriac coupler DIP6 type>**

**<AQ-H>**

Note: Connection of an external resister, etc., to terminal No. 5 (gate) is not necessary.

2) SSR
(1) AC output type
A high noise surge voltage applied to the SSR load circuit can cause malfunction or permanent damage to the device. If such a high surge is anticipated, use a varistor across the SSR output.

(2) DC output type
If an inductive load generates spike voltages which exceed the absolute maximum rating, the spike voltage must be limited. Typical circuits are shown below.

3) Clamp diode and snubber circuit can limit spike voltages at the load side. However, long wires may cause spike voltages due to inductance. It is recommended to keep wires as short as possible to minimize inductance.
4) Output terminals may become conductive although the input power is not applied, when a sudden voltage rise is applied to it even when the relay is off. This may occur even if voltage rise between terminals is less than the repetitive peak OFF-state voltage. Therefore, please perform sufficient tests with actual conditions.
5) When controlling loads in which the voltage and current phases differ, a sudden voltage rise is applied during turn-off, and the triac sometimes does not turn off. Please conduct sufficient tests using actual equipment.
6) When controlling loads using zero-cross voltage types in which the voltage and current phases differ, the triac sometimes does not turn on regardless of the input state, so please conduct sufficient tests using actual equipment.

12. Cleaning (for PC board mounting type)
Cleaning the solder flux should use the immersion washing with an organic solvent. If you have to use ultrasonic cleaning, please adopt the following conditions and check that there are no problems in the actual usage.
- Frequency: 27 to 29kHz
- Ultrasonic output: No greater than 0.25W/cm² (Note)
- Cleaning time: 30s or less
- Cleanser used: Asahiklin AK-225
- Others: Float PC board and the device in the cleaning solvent to prevent from contacting the ultrasonic vibrator.

**Note:** Applies to unit area ultrasonic output for ultrasonic baths

13. Notes for mounting (for PC board mounting type)
1) When different kinds of packages are mounted on PC board, temperature rise at soldering lead is highly dependent on package size. Therefore, please set the lower temperature soldering condition than the conditions of item “14. Soldering”, and confirm the temperature condition of actual usage before soldering.
2) When mounting condition exceeds our recommendation, the device characteristics may be adversely affected. It may occur package crack or bonding wire breaking because of thermal expansion unconformity and resin strength reduction. Please contact our sales office about the propriety of the condition.
3) Please confirm the heat stress by using actual board because it may be changed by board condition or manufacturing process condition
4) Solder creepage, wettability, or soldering strength will be affected by the mounting condition or used soldering type. Please check them under the actual production condition in detail.
5) Please apply coating when the device returns to a room temperature.
14. Soldering

1) When soldering surface-mount terminals, the following conditions are recommended.

(1) IR (Infrared reflow) soldering method
(Recommended condition reflow: Max. 2 times, measurement point: soldering lead)

\[ T_1 = 150 \text{ to } 180^\circ \text{C} \] \[ 302 \text{ to } 356^\circ \text{F} \]
\[ T_2 = 230^\circ \text{C} \] \[ 446^\circ \text{F} \]
\[ T_3 = 240 \text{ to } 250^\circ \text{C} \] \[ 464 \text{ to } 482^\circ \text{F} \]
\[ t_1 = 60 \text{ to } 120 \text{ s} \]
\[ t_2 = 30 \text{ to } 60 \text{ s} \]
\[ t_3 = 10 \text{ s} \]

(2) Other soldering methods

Other soldering methods (VPS, hot-air, hot plate, laser heating, pulse heater, etc.) affect the relay characteristics differently, please evaluate the device under the actual usage.

(3) Soldering iron method

Tip temperature: 350 to 400°C \[ 662 \text{ to } 752^\circ \text{F} \]
Wattage: 30 to 60 W
Soldering time: within 3 s

2) When soldering standard PC board terminals, the following conditions are recommended.

(1) DWS soldering method
(Recommended condition number of times: Max. 1 time, measurement point: soldering lead)

\[ T_1 = 120^\circ \text{C} \] \[ 248^\circ \text{F} \]
\[ T_2 = 260^\circ \text{C} \] \[ 500^\circ \text{F} \]
\[ t_1 = 60 \text{ to } 120 \text{ s} \]
\[ t_2 = 30 \text{ to } 60 \text{ s} \]
\[ t_3 = 10 \text{ s} \]

(2) Other dip soldering method (recommended condition: 1 time)

Preheating: Max. 120°C \[ 248^\circ \text{F} \], within 120 s, measurement point: soldering lead
Soldering: Max. 260°C \[ 500^\circ \text{F} \], within 5 s*, measurement area: soldering temperature

*Phototriac coupler and AQ-H: within 10 s

(3) Manual soldering method

Tip temperature: 350 to 400°C \[ 662 \text{ to } 752^\circ \text{F} \]
Wattage: 30 to 60 W
Soldering time: within 3 s

* We recommend one with an alloy composition of Sn3.0Ag0.5Cu.

15. Others

1) If an SSR is used in close proximity to another SSR or heat-generating device, its ambient temperature may exceed the allowable level. Carefully plan SSR layout and ventilation.
2) Terminal connections should be made by referring to the associated wiring diagram.
3) For higher reliability, check device quality under actual operating conditions.
4) To prevent the danger of electrocution, turn off the power supply when performing maintenance. Although AQ-A (DC output type) is constructed with insulation for the input/output terminals and the rear aluminum plate, the insulation between the input/output and the rear aluminum plate is not UL approved.

16. Transportation and storage

1) Extreme vibration during transport may deform the lead or damage the device characteristics. Please handle the outer and inner boxes with care.
2) Inadequate storage condition may degrade soldering, appearance, and characteristics. The following storage conditions are recommended:
   - Temperature: 0 to 45°C \[ 32 \text{ to } 113^\circ \text{F} \]
   - Humidity: Max. 70%RH
   - Atmosphere: No harmful gasses such as sulfuric acid gas, minimal dust.
3) Storage of Phototriac coupler (SOP type)

In case the heat stress of soldering is applied to the device which absorbs moisture inside of its package, the evaporation of the moisture increases the pressure inside the package and it may cause the package blister or crack. This device is sensitive to moisture and it is packed in the sealed moisture-proof package. Please make sure the following condition after unsealing.
   - Please use the device immediately after unsealing.
     (Within 30 days at 0 to 45°C \[ 32 \text{ to } 113^\circ \text{F} \] and Max. 70%RH)
   - If the device will be kept for a long time after unsealing, please store in the another moisture-proof package containing silica gel. (Please use within 90 days.)

17. Water condensation

Water condensation occurs when the ambient temperature changes suddenly from a high temperature to low temperature at high humidity, or the device is suddenly transferred from a low ambient temperature to a high temperature and humidity. Condensation causes the failures such as insulation deterioration. Panasonic Corporation does not guarantee the failures caused by water condensation.

The heat conduction by the equipment the SSR is mounted may accelerate the water condensation. Please confirm that there is no condensation in the worst condition of the actual usage. (Special attention should be paid when high temperature heating parts are close to the SSR.)

Snubber Circuit

1. Reduce dv/dt

An SSR used with an inductive load can accidentally fire due to a high load voltage rise rate (dv/dt), even though the load voltage is below the allowable level (inductive load firing). Our SSRs contain a snubber circuit designed to reduce dv/dt and prevent this ringing. Moreover, a good non-inductive resistance for R is required. Carbon film resistors or metal film resistors are often used. For general applications, the recommended values are C = 0.1 μF and R = 20 to 100 Ω. There are cases of resonance in the inductive load, so the appropriate care must be taken when making your selections.

2. Selecting the snubber constants

1) C selection

The charging coefficient tau for C of the SSR circuit is shown in formula (1): $\tau = (R+R) \times C$.

By setting formula (1) so that it is below dv/dt value you have: $C = \frac{0.632Vv}{(dv/dt) \times (R+R)}$.

By setting $C = 0.1$ to 0.2 μF, dv/dt can be controlled to between nV/µs and nV/µs or lower. For the condenser, use either an MP condenser metallized polyester film. For the 100 V line, use a voltage between 250 and 400 V, and for the 200 V line, use a voltage between 400 and 600 V.

2) R selection

If there is no resistance R (the resistance R controls the discharge current from condenser C), at turn-on of the SSR, there will be a sharp rise in dv/dt and the high peak value discharge current will begin to flow. This may cause damage to the internal elements of the SSR. Therefore, it is always necessary to insert a resistance R. In normal applications, for the 100 V line, have R = 10 to 100 Ω and for the 200 V line, have R = 20 to 100 Ω. (The allowable discharge current at turn on will differ depending on the internal elements of the SSR.) The power loss from R, written as P, caused by the discharge current and charging current from C, is shown in formula (3) below. For the 100 V line, use a power of 1/2 W, and for the 200 V line, use a power above 2 W.

$$P = \frac{C \times V \times f}{2}$$

f = Power supply frequency

Also, at turn-off of the SSR, a ringing circuit is formed with the condenser C and the circuit inductance L, and a spike voltage is generated at both terminals of the SSR. The resistance R serves as a control resistance to prevent this ringing. Moreover, a good non-inductive resistance for R is required. Carbon film resistors or metal film resistors are often used.
Thermal Design

SSRs used in high-reliability equipment require careful thermal design. In particular, junction temperature control has a significant effect on device function and life time. The rated load current for PC board-mounting SSRs is defined as the maximum current allowable at an ambient temperature of 40°C (104°F) and under natural cooling. If the ambient temperature exceeds the SSRs derating temperature point (40°C to 104°F (30°C to 38°C)), load current derating in accordance with the load current vs temperature diagram becomes necessary.

If adjacent devices act as heat sources, the SSR should be located more than 10 mm away from those devices.

For information on external heat sinks for our SSRs and their mounting method, refer to “Data and Cautions for Use for respective relay”.

Protection Circuit

High-reliability SSR circuits require an adequate protection circuit, as well as careful study of the characteristics and maximum ratings of the device.

1. Over-Voltage Protection

The SSR load power supply requires adequate protection against over-voltage errors from various causes. The methods of over-voltage protection include the following:

1) Use devices with a guaranteed reverse surge withstand voltage (controlled avalanche devices, etc.)

2) Suppress transient spikes

Use a switching device in the secondary circuit of a transformer or use a switch with a slow opening speed.

Example of ZNR (Panasonic)

Choosing the rated voltage of the ZNR

(1) Peak supply voltage

(2) Supply voltage variation

(3) Degradation of ZNR characteristic (1 mA±10%)

(4) Tolerance of rated voltage (±10%)

For application to 100 V AC lines, choose a ZNR with the following rated voltage:

\[
(1) \times (2) \times (3) \times (4) \times (100 \times \sqrt{2}) \times 1.1 \times 1.1 \times 1.1 = 188 \text{ (V)}
\]

2. Over-Current Protection
An SSR circuit operated without overcurrent protection may result in damage to the device. Design the circuit so the device’s rated junction temperature is not exceeded for a continuous overload current.
(e.g. Surge current into a motor or light bulb)
The surge-on current rating applies to over-current errors which occur less than several tens of times during the service life of a semiconductor device. A protection coordination device is required for this rating.
Methods of over-current protection include the following:
1) Suppressing over-currents
Use a current limiting reactor in series with the load power supply.
2) Use a current shut-off device
Use a current limiting fuse or circuit breaker in series with the load power supply.

### Load Type Description

1. Heaters (Resistive load)
The SSR is best suited to resistive loads. Noise levels can be drastically lowered with zero-crossing switching.

2. Lamps
Tungsten or halogen lamps draw a high inrush current when turned on (approximately 7 to 8 times the steady state current for zero-crossing SSRs; approximately 9 to 12 times, in the worst case, for random type SSRs). Choose an SSR so the peak of the inrush current does not exceed 50% of the SSR surge-on current.

3. Solenoids
AC-driven solenoid contactors or solenoid valves also draw inrush current when they are activated. Choose an SSR such that the peak of the inrush current does not exceed 50% of the SSR surge-on current. For small solenoid valves and AC relays in particular, a leakage current may cause the load to malfunction after the SSR turns off. In such an event, use a dummy resistor in parallel with the load.

* Using an SSR below the specified load

4. Motors load
When starting, an electric motor draws a symmetrical AC starting current some 5 to 8 times the steady-state load current, superimposed on a DC current. The starting time during which this high starting current is sustained depends on the capacities of the load and load power supply. Measure the starting current and time under the motor’s actual operating conditions and choose an SSR so the peak of the starting current does not exceed 50% of the SSR surge-on current.
When the motor load is deactivated, a voltage exceeding the load supply voltage is applied to the SSR due to counter-EMF. This voltage is approximately 1.3 times the load supply voltage for induction motors, and approximately 2 times that for synchronous motors.

5. Capacitive load
A capacitive load (switching regulator, etc.) draws an inrush current to charge the load capacitor when the SSR turns on. Choose an SSR so the peak of the inrush current does not exceed 50% of the SSR surge-on current. A timing error of up to one cycle can occur when a switch used in series with the SSR is opened or closed. If this is a problem, use an inductor (200 to 500 μH) in series to the SSR to suppress dv/dt error.

6. Other electronic equipment
In general, electronic equipment uses line filters in the primary supply circuit. The capacitors used in the line filters may cause the SSR to malfunction due to dv/dt turn on when the equipment is turned on or off. In such an event, use an inductor (200 to 500 μH) in series with the SSR to suppress dv/dt turn on.
### Cautions for Use of Solid State Relays

#### Conditions Become More Harsh if Plug-In or Inch-In is Performed

- Conditions become more harsh if plug-in or inch-in is performed since state transitions are repeated.
- When using a relay to control a DC motor and brake, the on time inrush current, steady-state current and off time brake current differ depending on whether the load to the motor is free or locked. In particular, with non-polarized relays, when using from B contact of from contact for the DC motor brake, mechanical life might be affected by the brake current. Therefore, please verify current at the actual load.

#### Note on Inductance

- Since inductance is great, the arc lasts longer when power is cut.
- The contact may become easily worn.

#### Capacitive Load

- 1 to 2 cycles (1/60 to 1/30 seconds)
- 1/2 to 2 cycles (1/120 to 1/30 seconds)
