

DUAL 1:3 LOW-JITTER ANY-FORMAT BUFFER/LEVEL TRANSLATOR

Features

- Two independent banks of 3 differential or 6 LVCMOS outputs
- Ultra-low additive jitter: 45 fs rms
- Wide frequency range: dc to 725 MHz
- Any-format input with pin selectable output formats: LVPECL, low power LVPECL, LVDS, CML, HCSL, LVCMOS
- Synchronous output enable
- Output clock division: /1, /2, /4
- Low output-output skew: 25 ps
- Loss of signal (LOS) monitors for loss of input clock
- Independent V_{DD} and V_{DDO} : 1.8/2.5/3.3 V
- Selectable LVCMOS drive strength to tailor jitter and EMI performance
- Small size: 32-QFN (5 mm x 5 mm)
- RoHS compliant, Pb-free
- Industrial temperature range: -40 to +85 °C

Applications

- High-speed clock distribution
- Ethernet switch/router
- Optical Transport Network (OTN)
- SONET/SDH
- PCI Express Gen 1/2/3
- Storage/Servers
- Telecom
- Industrial
- SyncE, 1588
- Backplane clock distribution

Description

The Si53308 is an ultra low jitter dual 1:3 any-format buffer with pin-selectable output clock signal format and divider selection. The Si53308 utilizes Silicon Laboratories' advanced CMOS technology to fanout clocks from dc to 725 MHz with guaranteed low additive jitter, low skew, and low propagation delay variability. The Si53308 features minimal cross-talk and provides superior supply noise rejection, simplifying low jitter clock distribution in noisy environments. Independent core and output bank supply pins provide integrated level translation without the need for external circuitry.

2. Functional Description

The Si53308 is a low-jitter, low-skew, dual 1:3 differential output buffer. The device has a universal input that accepts most common differential or LVCMOS input signals. Each output bank features control pins to select signal format, output enable, output divider setting and LVCMOS drive strength.

Figure 2. Functional Block Diagram

2.1. Universal, Any-Format Input

The Si53308 has a universal input stage that enables simple interfacing to a wide variety of clock formats, including LVPECL, low-power LVPECL, LVCMOS, LVDS, HCSL, and CML. Tables 15 and 16 summarize the various ac- and dc-coupling options supported by the device. For the best high-speed performance, the use of differential formats is recommended. For both single-ended and differential input clocks, the fastest possible slew rate is recommended as low slew rates can increase the noise floor and degrade jitter performance. Though not required, a minimum slew rate of 0.75 V/ns is recommended for differential formats and 1.0 V/ns for single-ended formats. See “AN766: Understanding and Optimizing Clock Buffer’s Additive Jitter Performance” for more information.

2.2. Input Bias Resistors

Internal bias resistors ensure a differential output low condition in the event that the clock inputs are not connected. The noninverting input is biased with a 18.75 k Ω pulldown to GND and a 75 k Ω pullup to V_{DD}. The inverting input is biased with a 75 k Ω pullup to V_{DD}.

Figure 6. Input Bias Resistors

2.3. Universal, Any-Format Output Buffer

The Si53308 has highly flexible output drivers that support a wide range of clock signal formats, including LVPECL, low power LVPECL, LVDS, CML, HCSL, and LVCMOS. SFOUTX[1] and SFOUTX[0] are 3-level inputs that can be pin-strapped to select the Bank A or Bank B clock signal formats. This feature enables the device to be used for format translation in addition to clock distribution, minimizing the number of unique buffer part numbers required in a typical application and simplifying design reuse. For EMI reduction applications, four LVCMOS drive strength options are available for each V_{DDO} setting.

Table 17. Output Signal Format Selection

***Note:** SFOUTX are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin is internally biased to V_{DD}/2.

2.4. Synchronous Output Enable

The Si53308 features a synchronous output enable (disable) feature for input frequencies between 1 MHz and 725 MHz. Output enable is sampled and synchronized on the falling edge of the input clock. This feature prevents runt pulses from being generated when the outputs are enabled or disabled.

When OE is low, Q is held low and $\bar{Q}$ is held high for differential output formats. For LVCMOS output format options, both Q and $\bar{Q}$ are held low when OE is set low. The device outputs are enabled when the output enable pin is unconnected. See Table 10 for output enable and output disable times.

2.5. Flexible Output Divider

The Si53308 provides optional clock division in addition to clock distribution. The divider setting for each bank of output clocks is selected via 3-level control pins as shown in the table below. Leaving the DIVx pins open will force a divider value of 1 which is the default mode of operation.

Note: When using the on-chip clock divider, a minimum input clock slew rate of 30 mV/ns is required.

*Note: DIVx are 3-level input pins. Tie low for "0" setting. Tie high for "1" setting. When left open, the pin is internally biased to VDD/2.	

2.6. Output Enable Logic

Each 1:3 output has an independent clock input (CLK0/CLK1) and an output enable pin. Table 19 summarizes the input and output clock based upon the state of the input clock and the OE pin.

Table 19. Input Clock and Output Enable Logic

CLK	OE ¹	Q ²
L	H	L
H	H	H
X	L	L ³
Notes: 1. Output enable active high. 2. On the next negative transition of CLK0 or CLK1. 3. Single-end: Q = low, $\bar{Q}$ = low. Differential: Q = low, $\bar{Q}$ = high.		

2.7. Loss of Signal (LOS) Indicator

The LOS0 and LOS1 indicators are used to check for the presence of input clocks CLK0 and CLK1, respectively, for input frequencies between 1 MHz and 725 MHz. The LOS0 and LOS1 pins are checked prior to selecting that clock input or are polled to check for the presence of the currently selected input clock. In the event that an input clock is not present, the associated LOSx pin will assume a logic high (LOSx = 1) state. When a clock is present at the associated input clock pin, the LOSx pin will assume a logic low (LOSx = 0) state.

Note: LOS has a lower frequency specification (1 MHz).

2.8. Power Supply (V_{DD} and V_{DDOX})

The device includes separate core (V_{DD}) and output driver supplies (V_{DDOX}). This feature allows the core to operate at a lower voltage than V_{DDO} , reducing current consumption in mixed supply applications. The core V_{DD} supports 3.3 V, 2.5 V, or 1.8 V. Each output bank has its own V_{DDOX} supply, supporting 3.3 V, 2.5 V, or 1.8 V.

V_{DDOA} is the power supply for Q0, $\overline{Q0}$, Q1, $\overline{Q1}$, Q2, $\overline{Q2}$ and V_{DDOB} is the power supply for Q3, $\overline{Q3}$, Q4, $\overline{Q4}$, Q5, $\overline{Q5}$, as shown in Figure 2, “Functional Block Diagram,”.

2.9. Output Clock Termination Options

The recommended output clock termination options are shown below. Unused outputs can be left floating. Do not short unused outputs to ground.

2.9.1. LVC MOS Output Termination To Support 1.5 V and 1.2 V

LVC MOS clock outputs are natively supported at 1.8, 2.5, and 3.3 V. However, 1.2 V and 1.5 V LVC MOS clock outputs can be supported via a simple resistor divider network that will translate the buffer's 1.8 V output to a lower voltage, as shown in Figure 10 below.

1.5 V LVC MOS: R₁ = 43 ohms, R₂ = 300 ohms, I_{OUT} = 12mA
1.2 V LVC MOS: R₁ = 58 ohms, R₂ = 150 ohms, I_{OUT} = 12mA

2.11. Typical Phase Noise Performance

Each of the following three figures shows three phase noise plots superimposed on the same diagram.

Source Jitter: Reference clock phase noise.

Total Jitter (SE): Combined source and clock buffer phase noise measured as a single-ended output to the phase noise analyzer and integrated from 12 kHz to 20 MHz.

Total Jitter (Diff'l): Combined source and clock buffer phase noise measured as a differential output to the phase noise analyzer and integrated from 12 kHz to 20 MHz. The differential measurement as shown in each figure is made using a balun. See Figure 1 on page 10.

Note: To calculate the total RMS phase jitter when adding a buffer to your clock tree, use the root-sum-square (RSS).

The total jitter is a measure of the source plus the buffer's additive phase jitter. The additive jitter (rms) of the buffer can then be calculated (via root-sum-square addition).

2.13. Power Supply Noise Rejection

The device supports on-chip supply voltage regulation to reject noise present on the power supply, simplifying low jitter operation in real-world environments. This feature enables robust operation alongside FPGAs, ASICs and SoCs and may reduce board-level filtering requirements. For more information, see “AN491: Power Supply Rejection for Low Jitter Clocks”.

3. Pin Description: 32-Pin QFN

Table 24. Pin Descriptions

Pin	Name	Type*	Description
1	DIVA	I	Output divider control pin for Bank A. Three-level input control. Internally biased at VDD/2. Can be left floating or tied to ground or VDD.
2	SFOUTA[1]	I	Output signal format control pin for Bank A. Three-level input control. Internally biased at VDD/2. Can be left floating or tied to ground or VDD.
3	SFOUTA[0]	I	Output signal format control pin for Bank A. Three-level input control. Internally biased at VDD/2. Can be left floating or tied to ground or VDD.
4	$\overline{Q0}$	O	Output clock 0 (complement).
5	Q0	O	Output clock 0.
6	GND	GND	Ground.
7	VDD	P	Core voltage supply. Bypass with 1.0 μ F capacitor and place close to the VDD pin as possible.
*Note: Pin types are: I = input, O = output, P = power, GND = ground.			

Table 24. Pin Descriptions (Continued)

Pin	Name	Type*	Description
8	NC	I	No connect.
9	LOS0	O	The LOS0 status pin indicates whether a clock is present (LOS0 = 0) or not present (LOS0 = 1) at the CLK0 pin.
10	CLK0	I	Input clock 0.
11	$\overline{\text{CLK0}}$	I	Input clock 0 (complement). When CLK0 is driven by a single-ended input, connect $\overline{\text{CLK0}}$ to VDD/2.
12	OEA	I	Output enable—Bank A. When OE = high, the Bank A outputs are enabled. When OE = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OE is set low. OEA contains an internal pull-up resistor.
13	OEB	I	Output enable—Bank B. When OE = high, the Bank B outputs are enabled. When OE = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OE is set low. OEB contains an internal pull-up resistor.
14	CLK1	I	Input clock 1.
15	$\overline{\text{CLK1}}$	I	Input clock 1 (complement). When CLK1 is driven by a single-ended input, connect $\overline{\text{CLK1}}$ to VDD/2.
16	LOS1	O	The LOS1 status pin indicates whether a clock is present (LOS1 = 0) or not present (LOS1 = 1) at the CLK1 pin.
17	V _{REF}	O	Reference voltage.
18	V _{DDOA}	P	Output Clock Voltage Supply—Bank A (Outputs: Q0 to Q2). Bypass with 1.0 μF capacitor and place as close to the V _{DDOA} pin as possible.
19	V _{DDOB}	P	Output Clock Voltage Supply—Bank B (Outputs: Q3 to Q5). Bypass with 1.0 μF capacitor and place as close to the V _{DDOB} pin as possible.
20	$\overline{\text{Q5}}$	O	Output clock 5 (complement).
21	Q5	O	Output clock 5.
22	SFOUTB[0]	I	Output signal format control pin for Bank B. Three-level input control. Internally biased at VDD/2. Can be left floating or tied to ground or V _{DD} .
23	SFOUTB[1]	I	Output signal format control pin for Bank B. Three-level input control. Internally biased at VDD/2. Can be left floating or tied to ground or V _{DD} .
