

Dual-Channel Voltage Detector

Features

- Two Independent Voltage Detectors in One Package
- Highly Accurate: $\pm 2\%$
- Low Power Consumption: 2.0 μA , typical
- Channel 1 Detect Voltage: 3.0V, 4.5V
- Channel 2 Detect Voltage: 2.7V
- Operating Voltage: 1.5V to 10.0V
- Output Configuration: N-Channel Open-Drain
- Space-Saving 5-Pin SOT-23 Package

Typical Applications

- Battery Life Monitors and Recharge Voltage Monitors
- Memory Battery Backup Circuitry
- Power-On Reset Circuits
- Power Failure Detection
- Delay Circuitry

Package Type

Description

The TC52 consists of two independent low-power voltage detectors in a space-saving 5-pin SOT-23 package. Typical supply current consumption is only 2 μA at an input voltage of 2V. The voltage detection threshold settings are factory-programmed and guaranteed to $\pm 2\%$ accuracy. The TC52 is available with open drain (NMOS) configurations. Small-size, high-precision, low-supply current, and low installed cost makes the TC52 the ideal voltage detector for a wide variety of voltage monitoring applications.

5-Pin SOT-23	100 mW
Operating Temperature Range.....	-40°C to +85°C
Storage Temperature Range	-40°C to +125°C

† **Notice:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 2-1](#).

TABLE 2-1: PIN FUNCTION TABLE

Pin No. (5-Pin SOT-23)	Symbol	Description
1	V_{OUT1}	Detector #1 output
2	V_{IN}	Supply voltage input, detect voltage 1
3	GND	Ground terminal
4	V_{IN2}	Detect voltage 2
5	V_{OUT2}	Detector #2 output

3.0 DETAILED DESCRIPTION

In normal steady-state operation and for either channel, when $V_{IN} > V_{DET^-}$, the output is high, see [Figure 3-1](#). (In the case of the TC52N, this is an open-drain condition.) If and when the input falls below V_{DET^-} , the output pulls down (Logic 0) to V_{SS} . Generally, V_{OUT} can pull down to within 0.5V of V_{SS} at rated output current and input voltages. (Also see [Section 1.0, Electrical Characteristics](#)).

The output, V_{OUT} , stays valid until the input voltage falls below the minimum operating voltage, V_{INMIN} , of 0.7V. Below this minimum operating voltage, the output is undefined. During power-up or anytime V_{IN} has fallen below V_{INMIN} , V_{OUT} will remain undefined until V_{IN} rises above V_{INMIN} , at which time the output becomes valid. V_{OUT} is maintained in its active low state while $V_{INMIN} < V_{IN} < V_{DET^+}$. ($V_{DET^+} = V_{DET^-} + V_{HYST}$). If and when the input rises above V_{DET^+} , the output will assume its inactive state (open-drain for TC52N).

FIGURE 3-1: Timing Diagram.

4.0 APPLICATION INFORMATION

Pin 2 (V_{IN1}) acts as both the input to Voltage Detector #1 and the power supply input for the chip. As such, always assign V_{IN1} to monitor voltages between 1.5V and 10V. Failure to do this will result in unreliable detector operation due to an out-of-tolerance supply voltage. In high-noise environments, it may be necessary to install a small input bypass capacitor (0.01 μ F to 0.1 μ F) from V_{IN1} to ground to minimize on-chip power supply noise.

NOTES:

APPENDIX A: REVISION HISTORY

Revision E (February 2015)

- Updated device status to Obsolete.

Revision D (August 2013)

The following is the list of modifications:

1. Updated the detect voltage values in **"Features"**.
2. Updated the **"Package Type"** drawing.
3. Updated **Section 5.0, "Packaging Information"** with the latest package specification drawings.
4. Updated the **"Product Identification System"** section.

Revision C (December 2012)

- Added a note to each package outline drawing.

Revision B (May 2002)

- Undocumented changes.

Revision A (March 2001)

- Original Release of this Document.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
