

AK4951

24bit Stereo CODEC with MIC/HP/SPK-AMP

1. General Description

The AK4951 is a low power 24-bit stereo CODEC with a microphone, headphone and speaker amplifiers.

The AK4951 supports sampling frequency from 8kHz to 48kHz. It is suitable for a wide range of application from speech signal processing for narrowband, wideband and super wideband to sound signal processing for audio band.

The input circuits include a microphone amplifier, an automatic wind noise reduction filter of the proprietary algorithms and a high performance digital ALC (automatic level control) circuit, therefore the AK4951 can record with high-quality sound regardless of whether indoors or outdoors. In addition, the output circuits include a cap-less headphone amplifier with a negative voltage generated by charge pump circuit and a speaker amplifier with 1W output power. It is suitable for various products as well as portable applications with recording/playback function.

The AK4951 are available in a small 32-pin QFN (4mm x 4mm, 0.4mm pitch: AK4951EN) and a 32-pin BGA (3.5mm x 3.5mm, 0.5mm pitch: AK4951EG) packages saving mounting area on the board.

Application:

- IP Camera
- Digital Camera
- IC Recorder
- Tablet
- Wireless Headphone
- Headset

2. Features

1. Recording Functions

- Analog Input
(AK4951EN) 3 Stereo Single-ended inputs with Selectors
(AK4951EG) 2 Stereo and 1 Monaural Single-ended inputs with Selectors
- Microphone Amplifier: +30dB ~ 0dB, 3dB Step
- Microphone Power Supply: 2.0V or 2.4V, Noise Level= -108dBV
- Digital ALC (Automatic Level Control)
 - Setting Range: +36dB ~ -52.5dB, 0.375dB Step & Mute
- ADC Performance: S/(N+D): 83dB, DR, S/N: 88dB (MIC-Amp=+18dB)
S/(N+D): 85dB, DR, S/N: 96dB (MIC-Amp=0dB)
- Microphone Sensitivity Correction
- Automatic Wind Noise Reduction Filter
- 5-Band Notch Filter: Include Dynamic Gain Control
- Stereo Separation Emphasis Circuit
- Digital Microphone Interface

2. **Playback Functions**
 - **Digital ALC (Automatic Level Control)**
 - Setting Range: +36dB ~ -52.5dB, 0.375dB Step & Mute
 - **Sidetone Mixer & Volume Control (0dB ~ -18dB, 6dB Step)**
 - **Digital Volume Control**
 - +12dB ~ -89.5dB, 0.5dB Step & Mute
 - **Capacitor-less Stereo Headphone Amplifier**
 - HP-Amplifier Performance: S/(N+D): 75dB@20mW, S/N: 97dB
 - Output Power: 20mW@16Ω
 - Pop Noise Free at Power-ON/OFF
 - **Mono Speaker Amplifier (with Stereo Line Output Switch)**
 - Speaker Amplifier Performance: S/(N+D): 75dB@250mW, S/N: 90dB
 - BTL Output
 - Output Power:
 - (AK4951EN) 400mW@8Ω (SVDD=3.3V), 1W@8Ω (SVDD=5V)
 - (AK4951EG) 400mW@8Ω (AVDD=3.3V)
 - **Analog Mixing: BEEP Input**
3. **Power Management**
4. **Master Clock:**
 - (1) **PLL Mode**
 - Frequencies: 11.2896MHz, 12MHz, 12.288MHz, 13.5MHz, 24MHz, 27MHz (MCKI pin), 32fs or 64fs (BICK pin)
 - (2) **External Clock Mode**
 - Frequencies: 256fs, 384fs, 512fs or 1024fs (MCKI pin)
5. **Sampling Frequencies**
 - **PLL Master Mode:**
 - 8kHz, 11.025kHz, 12kHz, 16kHz, 22.05kHz, 24kHz, 32kHz, 44.1kHz, 48kHz
 - **PLL Slave Mode (BICK pin): 8kHz ~ 48kHz**
 - **EXT Master/Slave Mode:**
 - 8kHz ~ 48kHz (256fs, 384fs, 512fs), 8kHz ~ 24kHz (1024fs)
6. **Master/Slave Mode**
7. **Audio Interface Format: MSB First, 2's complement**
 - **ADC: 16/24bit MSB justified, 16/24bit I²S**
 - **DAC: 16/24bit MSB justified, 16bit LSB justified, 24bit LSB justified, 16/24bit I²S**

■ Handling of Unused Pin

Unused I/O pins must be processed appropriately as below.

Classification	Pin Name	Setting
Analog	MPWR, SPN, SPP, HPL, HPR, CP, CN, VEE, LIN1/DMDAT, RIN1/DMCLK, LIN2, RIN2, LIN3, RIN3/BEEP	Open

6. Absolute Maximum Ratings

(VSS1=VSS2=VSS3=0V; [Note 4](#))

Parameter		Symbol	min	max	Unit
Power Supplies	Analog	AVDD	-0.3	6.0	V
	Digital	DVDD	-0.3	2.5	V
	Digital I/O	TVDD	-0.3	6.0	V
	Speaker-Amp	SVDD	-0.3	6.0	V
Input Current, Any Pin Except Supplies		IIN	-	±10	mA
Analog Input Voltage (Note 5)		VINA	-0.3	AVDD+0.3	V
Digital Input Voltage (Note 6)		VIND	-0.3	TVDD+0.3	V
Operating Temperature (powered applied)		Ta	-40	85	°C
Storage Temperature		Tstg	-65	150	°C
Maximum Power Dissipation (Note 7)	AK4951EN	Pd	-	840	mW
	AK4951EG	Pd	-	340	mW

Note 4. All voltages are with respect to ground. VSS1, VSS2 and VSS3 must be connected to the same analog ground plane.

Note 5. LIN1, RIN1, LIN2, RIN2, LIN3 and RIN3/BEEP pins

Note 6. PDN, CCLK/SCL, CSN/SDA, CDTIO/CAD0, SDTI, LRCK, BICK and MCKI pins

Pull-up resistors at the SDA and SCL pins must be connected to a voltage in the range from TVDD or more to 6V or less.

Note 7. This power is the AK4951 internal dissipation that does not include power dissipation of externally connected speakers. The maximum junction temperature is 125°C and θ_{ja} (Junction to Ambient) is 42°C/W at JEDEC51-9 (2p2s) for the AK4951EN and 80°C/W at JEDEC51-9 (2p2s) for the AK4951EG. When $P_d = 840\text{mW}$ and the θ_{ja} is 42°C/W for the AK4951EN, the junction temperature does not exceed 125°C. When $P_d = 340\text{mW}$ and the θ_{ja} is 80°C/W for the AK4951EG, the junction temperature does not exceed 125°C. In this case, the AK4951 will not be damaged by its internal power dissipation. Therefore, the AK4951EN should be used in the condition of $\theta_{ja} \leq 42^\circ\text{C/W}$, and the AK4951EG should be used in the condition of $\theta_{ja} \leq 80^\circ\text{C/W}$.

WARNING: Operation at or beyond these limits may result in permanent damage to the device.

Normal operation is not guaranteed at these extremes.

7. Recommended Operating Conditions

[AK4951EN]

(VSS1=VSS2=VSS3 =0V; [Note 4](#))

Parameter		Symbol	min	typ	max	Unit
Power Supplies (Note 8)	Analog	AVDD	2.8	3.3	3.5	V
	Digital	DVDD	1.6	1.8	1.98	V
	Digital I/O (Note 9)	TVDD	1.6 or (DVDD-0.2)	1.8	3.5	V
	Speaker-Amp	SVDD	1.8	3.3	5.5	V

Note 4. All voltages are with respect to ground.

Note 8. The power-up sequence between AVDD, DVDD, TVDD and SVDD is not critical. The PDN pin must be “L” upon power up, and should be changed to “H” after all power supplies are supplied to avoid an internal circuit error.

Note 9. The minimum value is higher voltage between DVDD-0.2 and 1.6V.

*** When SVDD is powered ON and the PDN pin is “L”, AVDD, DVDD and TVDD can be powered ON/OFF. When TVDD is powered ON and the PDN pin is “L”, AVDD, DVDD and SVDD can be powered ON/OFF. The PDN pin must be set to “H” after all power supplies are ON, when the AK4951EN is powered-up from power-down state.**

Power Supplies (Note 10)	Analog & Speaker	AVDD	2.8	3.3	3.5	V
	Digital	DVDD	1.6	1.8	1.98	V
	Digital I/O (Note 11)	TVDD	1.6 or (DVDD-0.2)	1.8	3.5	V

Note 4. All voltages are with respect to ground.

Note 10. The power-up sequence between AVDD, DVDD and TVDD is not critical. The PDN pin must be “L” upon power up, and should be changed to “H” after all power supplies are supplied to avoid an internal circuit error.

Note 11. The minimum value is higher voltage between DVDD-0.2 and 1.6V.

*** When TVDD is powered ON and the PDN pin is “L”, AVDD and DVDD can be powered ON/OFF. The PDN pin must be set to “H” after all power supplies are ON, when the AK4951EG is powered-up from power-down state.**

* AKM assumes no responsibility for the usage beyond the conditions in this datasheet.

Note 26. The passband and stopband frequencies scale with fs (sampling frequency).

Note 27. A calculating delay time which is induced by digital filtering. This time is from the input of an analog signal to the setting of 24-bit data of both channels to the ADC output register. For the DAC, this time is from setting the 24-bit data of a channel from the input register to the output of analog signal. For the signal through the programmable filters (Microphone Sensitivity Correction + Automatic Wind Noise Reduction Filter + 1st order HPF + 1st order LPF + Stereo Separation Emphasis + 4-band Equalizer + ALC + 1-band Equalizer), the group delay is increased by 4/fs from the value above in both recording and playback modes if there is no phase change by the IIR filter.

■ System Clock

There are the following four clock modes to interface with external devices (Table 3, Table 4).

Mode	PMPLL bit	M/S bit	PLL3-0 bits	Figure
PLL Master Mode	1	1	Table 6	Figure 20
PLL Slave Mode (PLL Reference Clock: BICK pin)	1	0	Table 6	Figure 21
EXT Slave Mode	0	0	x	Figure 22
EXT Master Mode	0	1	x	Figure 23

PLL Slave Mode (PLL Reference Clock: BICK pin)	GND	Input (Selected by PLL3-0 bits)	Input (1fs)
EXT Slave Mode	Input Frequency of Table 12 (Selected by CM1-0 bits)	Input (≥ 32fs)	Input (1fs)
EXT Master Mode	Input Frequency of Table 15 (Selected by CM1-0 bits)	Output (Selected by BCKO bit)	Output (1fs)

Table 4. Clock pins state in Clock Mode

■ Master Mode/Slave Mode

The M/S bit selects either master or slave mode. M/S bit = “1” selects master mode and “0” selects slave mode. When the AK4951 is in power-down mode (PDN pin = “L”) and when exits reset state, the AK4951 is in slave mode. After exiting reset state, the AK4951 goes to master mode by changing M/S bit to “1”.

When the AK4951 is in master mode, the LRCK and BICK pins are a floating state until M/S bit becomes “1”. The LRCK and BICK pins of the AK4951 must be pulled-down or pulled-up by a resistor (about 100kΩ) externally to avoid the floating state.

M/S bit	Mode	
0	Slave Mode	(default)
1	Master Mode	

Table 5. Select Master/Slave Mode

■ PLL Mode

When PMPLL bit is “1”, a fully integrated analog phase locked loop (PLL) circuit generates a clock that is selected by PLL3-0 and FS3-0 bits. The PLL lock times, when the AK4951 is supplied stable clocks after PLL is powered-up (PMPLL bit = “0” → “1”) or the sampling frequency is changed, are shown in [Table 6](#).

Note 38. **Please note that the setting of the FS3-0 bits (Sampling Frequency) is different from the other modes, when the BICK pin is the PLL reference clock input.** The sampling frequency generated by PLL is the same sampling frequency of mode name.

■ PLL Unlock State

In this mode, LRCK and BICK pins go to “L” until the PLL goes to lock state after PMPLL bit = “0” → “1” (Table 10).

After the PLL is locked, a first period of LRCK and BICK may be invalid clock, but these clocks return to normal state after a period of 1/fs.

The BICK and LRCK pins do not output invalid clocks such as PLL unlock state by setting PMPLL bit to “0”. During PMPLL bit = “0”, these pins output the same clock as EXT master mode.

PLL State	BICK pin	LRCK pin
After PMPLL bit “0” → “1”	“L” Output	“L” Output
PLL Unlock (except the case above)	Invalid	Invalid
PLL Lock	Table 11	1fs Output

Table 10. Clock Operation at PLL Master Mode (PMPLL bit = “1”, M/S bit = “1”)

■ PLL Master Mode (PMPLL bit = “1”, M/S bit = “1”)

When an external clock (11.2896MHz, 12MHz, 12.288MHz, 13.5MHz, 24MHz or 27MHz) is input to the MCKI pin, the internal PLL circuit generates BICK and LRCK clocks. When the state of AK4951 is ADC power-down or Loopback mode, the output of BICK, LRCK and SDTO pins can be stopped by CKOFF bit. When CKOFF bit = “1”, BICK, LRCK and SDTO pins output “L”. The BICK output frequency is selected between 32fs or 64fs, by BCKO bit (Table 11).

Figure 20. PLL Master Mode

(default)

Table 11. BICK Output Frequency at Master Mode

■ PLL Slave Mode (PMPLL bit = “1”, M/S bit = “0”)

A reference clock of PLL is selected among the input clocks to the BICK pin. The required clock for the AK4951 is generated by an internal PLL circuit. Input frequency is selected by PLL3-0 bits (Table 6).

The BICK and LRCK inputs must be synchronized. The sampling frequency can be selected by FS3-0 bits (Table 7).

Figure 21. PLL Slave Mode (PLL Reference Clock: BICK pin)

■ EXT Slave Mode (PMPLL bit = “0”, M/S bit = “0”)

When PMPLL bit is “0”, the AK4951 becomes EXT mode. Master clock can be input to the internal ADC and DAC directly from the MCKI pin without internal PLL circuit operation. This mode is compatible with I/F of a normal audio CODEC. The external clocks required to operate this mode are MCKI (256fs, 384fs, 512fs or 1024fs), LRCK (fs) and BICK (≥ 32 fs). The master clock (MCKI) must be synchronized with LRCK. The phase between these clocks is not important. The input frequency of MCKI is selected by CM1-0 bits (Table 12) and the sampling frequency is selected by FS3-0 bits (Table 13).

Mode	CM1 bit	CM0 bit	MCKI Input Frequency	Sampling Frequency Range	
0	0	0	256fs	$8\text{kHz} \leq fs \leq 48\text{kHz}$	(default)
1	0	1	384fs	$8\text{kHz} \leq fs \leq 48\text{kHz}$	
2	1	0	512fs	$8\text{kHz} \leq fs \leq 48\text{kHz}$

The S/N of the DAC at low sampling frequencies is worse than at high sampling frequencies due to out-of-band noise. The out-of-band noise can be reduced by using higher frequency of the master clock. The S/N of the DAC output through HPL/HPR pins is shown in Table 14.

■ EXT Master Mode (PMPLL bit = “0”, M/S bit = “1”)

The AK4951 becomes EXT Master Mode by setting PMPLL bit = “0” and M/S bit = “1”. Master clock can be input to the internal ADC and DAC directly from the MCKI pin without the internal PLL circuit operation. The external clock required to operate the AK4951 is MCKI (256fs, 384fs, 512fs or 1024fs). The input frequency of MCKI is selected by CM1-0 bits (Table 15) and the sampling frequency is selected by FS3-0 bits (Table 16). When the state of AK4951 is ADC power-down or Loopback mode, the output of BICK, LRCK and SDTO pins can be stopped by CKOFF bit. When CKOFF bit = “1”, BICK, LRCK and SDTO pins output “L”. ■ System Reset

Upon power-up, the AK4951 must be reset by bringing the PDN pin = “L”. This reset is released when a dummy command is input after the PDN pin = “H”. This ensures that all internal registers reset to their initial value. Dummy command is executed by writing all “0” to the register address 00H (Figure 24). It is recommended to set the PDN pin to “L” before power up the AK4951.

In I²C Bus mode, the AK4951 does not return an ACK after receiving a slave address by a dummy command as shown in Figure 24. In the actual case, initializing cycle starts by 8 SCL clocks during the PDN pin = “H” regardless of the SDA line. Therefore, retry command is not required (Figure 25). Executing a write or read command to the other device that is connected to the same I²C Bus also resets the AK4951.

Figure 24. Dummy Command in I²C Bus Mode

Figure 25. Reset Completion for example

Figure 26. Dummy Command in 3-wire Serial Mode (AK4951EG)

The ADC starts an initialization cycle if the one of PMADL or PMADR is set to “1” when both of the PMADL and PMADR bits are “0”. The initialization cycle is set by ADRST1-0 bits (Table 19). During the initialization cycle, the ADC digital data outputs of both channels are forced to “0” in 2's complement. The ADC output reflects the analog input signal after the initialization cycle is finished. When using a digital microphone (PMDML/R bits = “0” → “1”), the initialization cycle is the same as ADC's.

Note 39. The initial data of ADC has offset data that depends on microphones and the cut-off frequency of HPF.
If this offset is not small, make initialization cycle longer by setting ADRST1-0 bits or do not use the first data of ADC outputs.

ADRST1-0 bits	Initialize Cycle				(default)
	Cycle	fs = 8kHz	fs = 16kHz	fs = 48kHz	
00	1059/fs	132.4ms	66.2ms	22ms	(default)
01	267/fs	33.4ms	16.7ms	5.6ms	
10	531/fs	66.4ms	33.2ms	11.1ms	
11	135/fs	16.9ms	8.4ms	2.8ms	

Table 19. ADC Initialization Cycle

The DAC is initialized by setting PMDAC bit “0” → “1”. The initialization cycle is 2/fs. Therefore, the DAC outputs signals after group delay period and 2/fs when power up the device. Normally, this group delay period or 2/fs initialization cycle mentioned above is absorbed by power-up time of amplifiers after the DAC (Headphone-amp, Lineout-amp and SPK-amp).

■ Audio Interface Format

Four types of data formats are available and selected by setting the DIF1-0 bits (Table 20). In all modes, the serial data is MSB first, 2's complement format. Audio interface formats are supported in both master and slave modes. LRCK and BICK are output from the AK4951 in master mode, but must be input to the AK4951 in slave mode. The SDTO is clocked out on the falling edge ("↓") of BICK and the SDTI is latched on the rising edge ("↑") of BICK.

Mode	DIF1 bit	DIF0 bit	SDTO (ADC)	SDTI (DAC)	BICK	Figure
0	0	0	24bit MSB justified	24bit LSB justified	$\geq 48\text{fs}$	Figure 27
1	0	1	24bit MSB justified	16bit LSB justified	$\geq 32\text{fs}$	Figure 28

3	1	1	I ² S Compatible	I ² S Compatible	$=32\text{fs or } \geq 48\text{fs}$	Figure 30

Table 20. Audio Interface Format

If 24-bit (16-bit) data, the output of ADC, is converted to 8-bit data by removing LSB 16-bit (8-bit), "−1" at 24-bit (16bit) data is converted to "−1" at 8-bit data. And when the DAC playbacks this 8-bit data, "−1" at 8-bit data will be converted to "−65536" at 24-bit ("−256" at 16-bit) data which is a large offset. This offset can be removed by adding the offset of "32768" at 24-bit ("128" at 16-bit) to 24-bit (16-bit) data before converting to 8-bit data.

■ ADC Mono/Stereo Mode

PMADL, PMADR, PMDML and PMDMR bits set mono/stereo ADC operation. When changing ADC operation and analog/digital microphone, PMADL, PMADR, PMDML and PMDMR bits must be set “0” at first. When DMIC bit = “1”, PMADL and PMADR bit settings are ignored. When DMIC bit = “0”, PMDML and PMDMR bit settings are ignored.

■ MIC/LINE Input Selector

The AK4951 has an input selector. INL1-0 and INR1-0 bits select LIN1/LIN2/LIN3 and RIN1/RIN2/RIN3, respectively. When DMIC bit = “1”, digital microphone input is selected regardless of INL1-0 and INR1-0 bits. Only the AK4951EN supports the LIN3 pin. INL bit must be set to “0” for the AK4951EG. RIN3 pin is shared with BEEP pin. When PMBP bit = “0”, RIN3 pin can be selected.

■ Microphone Gain Amplifier

The AK4951 has a gain amplifier for microphone input. It is powered-up by PMADL/R bit = "1". The gain of MIC-Amp is selected by the MGAIN3-0 bits. The typical input impedance is 30k Ω . A click noise may occur if the MIC-Amp gain is changed when both MIC-Amp and ADC (PMADL/R bits = "1") are powered up. High frequency characteristics are attenuated when MIC-Amp = +30dB. The attenuation amount of when MIC-Amp = +30dB is -0.5dB at 10kHz frequency and -1.5dB at 20kHz frequency comparing with when MIC-Amp = +18dB.

■ Microphone Power

When PMMP bit = "1", the MPWR1 or MPWR2 pin supplies the power for microphones. This output voltage is typically 2.4V @MICL bit = "0", and typically 2.0V @MICL bit = "1". The load resistance is minimum 1.0k Ω . In case of using two sets of stereo microphones, the load resistance is minimum 2k Ω for each channel. Any capacitor must not be connected directly to the MPWR1 and MPWR2 pins (Figure 31).

■ Digital Microphone

1. Connection to Digital Microphones

When DMIC bit is set to “1”, the LIN1 and RIN1 pins become DMDAT (digital microphone data input) and DMCLK (digital microphone clock supply) pins, respectively. The same voltage as AVDD must be provided to the digital microphone. The Figure 32 and Figure 33 show stereo/mono connection examples. The DMCLK clock is input to a digital microphone from the AK4951. The digital microphone outputs 1bit data, which is generated by $\Delta\Sigma$ Modulator using DMCLK clock, to the DMDAT pin. PMDML/R bits control power up/down of the digital block (Decimation Filter and Digital Filter). (PMADL/PMADR bits settings do not affect the digital microphone power management. Set PMMP = PMMICL/R bits to “0” when using a digital microphone.) The DCLKE bit controls ON/OFF of the output clock from the DMCLK pin. When the AK4951 is powered down (PDN pin= “L”), the DMCLK and DMDAT pins become floating state. Pull-down resistors must be connected to DMCLK and DMDAT pins externally to avoid this floating state.

Figure 32. Connection Example of Stereo Digital Microphone

Figure 33. Connection Example of Mono Digital Microphone

2. Interface

The input data channel of the DMDAT pin is set by DCLKP bit. When DCLKP bit = “1”, L channel data is input to the decimation filter if DMCLK = “H”, and R channel data is input if DMCLK = “L”. When DCLKP bit = “0”, R channel data is input to the decimation filter while DMCLK pin= “H”, and L channel data is input while DMCLK pin= “L”. The DMCLK pin only supports 64fs. It outputs “L” when DCLKE bit = “0”, and outputs 64fs when DCLKE bit = “1”. In this case, necessary clocks must be supplied to the AK4951 for ADC operation. The output data through “the Decimation and Digital Filters” is 24bit full scale when the 1bit data density is 0%~100%.

■ Digital HPF1

A digital High Pass Filter (HPF) is integrated for DC offset cancellation of the ADC input. The cut-off frequencies (f_c) of the HPF1 are set by HPFC1-0 bits. It is proportional to the sampling frequency (f_s) and the default value is 3.7Hz (@ $f_s = 48\text{kHz}$). HPFAD bit controls the ON/OFF of the HPF1 (HPF ON is recommended).

HPFC1 bit	HPFC0 bit	f_c			(default)
		$f_s=8\text{kHz}$	$f_s=16\text{kHz}$	$f_s=48\text{kHz}$

■ Microphone Sensitivity Correction

The AK4951 has linear microphone sensitivity correction function controlled by MGR7-0 bits. MGR7-0 bits must be set when PMADR bit = "0" or PMPFIL bit = "0".

MGR7-0 bits	MG_DATA	GAIN (dB)	Calculation	(default)

■ Automatic Wind Noise Reduction Filter

The AK4951 has an automatic wind noise reduction filter that is controlled by AHPF bit. The automatic wind noise reduction filter is ON when AHPF bit = “1”. It attenuates the wind noise when detecting a wind noise and adjusts the attenuation level dynamically. When AHPF bit = “0”, the audio data passes this block by 0dB gain. SENC2-0 bits control the wind noise detection sensitivity, and STG1-0 bits control the attenuation level of the maximum attenuation. SENC2-0 bits and STG1-0 bits must be set when AHPF bit = “0” or PMPF bit = “0”.

SENC2-0 bits	Sensitivity Level	
000	0.5	Low ↑
001	1.0	
010	1.5

■ Digital Programmable Filter Circuit

(1) High Pass Filter (HPF2)

This is composed 1st order HPF. The coefficient of HPF is set by F1A13-0 bits and F1B13-0 bits. HPF bit controls ON/OFF of the HPF2. When the HPF2 is OFF, the audio data passes this block by 0dB gain. The coefficient must be set when PMPFIL bit = "0" or HPF bit = "0". The HPF2 starts operation 4/fs (max) after when HPF bit = PMPFIL bit = "1" is set.

fs: Sampling Frequency

fc: Cutoff Frequency

Register Setting (Note 40)

HPF: F1A[13:0] bits =A, F1B[13:0] bits =B

(MSB=F1A13, F1B13; LSB=F1A0, F1B0)

$$A = \frac{1 / \tan (\pi f_c / f_s)}{1 + 1 / \tan (\pi f_c / f_s)}, \quad B = \frac{1 - 1 / \tan (\pi f_c / f_s)}{1 + 1 / \tan (\pi f_c / f_s)}$$

Transfer Function

$$H(z) = A \frac{1 - z^{-1}}{1 + Bz^{-1}}$$

The cut-off frequency must be set as below.

$$f_c / f_s \geq 0.0001 \quad (f_c \text{ min} = 4.8\text{Hz at } 48\text{kHz})$$

(2) Low Pass Filter (LPF)

This is composed with 1st order LPF. F2A13-0 bits and F2B13-0 bits set the coefficient of LPF. LPF bit controls ON/OFF of the LPF. When the LPF is OFF, the audio data passes this block by 0dB gain. The coefficient must be set when PMPFIL bit = "0" or LPF bit = "0". The LPF starts operation 4/fs (max) after when LPF bit = PMPFIL bit = "1" is set.

fs: Sampling Frequency

fc: Cutoff Frequency

Register Setting (Note 40)

LPF: F2A[13:0] bits =A, F2B[13:0] bits =B

(MSB=F2A13, F2B13; LSB=F2A0, F2B0)

$$A = \frac{1}{1 + 1 / \tan (\pi f_c / f_s)}, \quad B = \frac{1 - 1 / \tan (\pi f_c / f_s)}{1 + 1 / \tan (\pi f_c / f_s)}$$

Transfer Function

$$H(z) = A \frac{1 + z^{-1}}{1 + Bz^{-1}}$$

The cut-off frequency must be set as below.

$$f_c / f_s \geq 0.05 \quad (f_c \text{ min} = 2400\text{Hz at } 48\text{kHz})$$

(3) Stereo Separation Emphasis Filter (FIL3)

The FIL3 is used to emphasize the stereo separation of stereo microphone recording data and playback data. F3A13-0 bits and F3B13-0 bits set the filter coefficients of the FIL3. When F3AS bit = "0", the FIL3 performs as a High Pass Filter (HPF), and it performs as a Low Pass Filter (LPF) when F3AS bit = "1". FIL3 bit controls ON/OFF of the FIL3. When the stereo separation emphasis filter is OFF, the audio data passes this block by 0dB gain. The coefficient should be set when FIL3 bit or PMPFIL bit is "0". The FIL3 starts operation 4/fs(max) after when FIL3 bit = PMPFIL bit = "1" is set.

Transfer Function

$$H(z) = A \frac{1 - z^{-1}}{1 + Bz^{-1}}$$

The cut-off frequency must be set as below.

$$fc/fs \geq 0.0001 \text{ (fc min = 4.8Hz @fs=48kHz)}$$

2) In case of setting FIL3 as LPF

fs: Sampling Frequency

fc: Cutoff Frequency

K: Gain [dB] (0dB ≥ K ≥ -10dB)

Transfer Function

$$H(z) = A \frac{1 + z^{-1}}{1 + Bz^{-1}}$$

The cut-off frequency must be set as below.

$$fc/fs \geq 0.0001 \text{ (fc min = 4.8Hz @fs=48kHz)}$$

(4) Gain Compensation (EQ0)

Gain compensation is used to compensate the frequency response and the gain that is changed by the stereo separation emphasis filter. Gain compensation is composed of the Equalizer (EQ0) and the Gain (0dB/+12dB/+24dB). E0A15-0 bits, E0B13-0 bits and E0C15-0 bits set the coefficient of EQ0. GN1-0 bits set the gain (Table 32). EQ0 bit controls ON/OFF of EQ0. When EQ is OFF and the gain is 0dB, the audio data passes this block by 0dB gain. The coefficient should be set when EQ0 bit = "0" or PMPFIL bit = "0". The EQ0 starts operation $4/f_s(\text{max})$ after when EQ0 bit = PMPFIL bit = "1" is set.

f_s : Sampling Frequency

fc_1 : Polar Frequency

fc_2 : Zero-point Frequency

K: Gain [dB] (Maximum setting is +12dB.)

Register Setting (Note 40)

E0A[15:0] bits = A, E0B[13:0] bits = B, E0C[15:0] bits = C

(MSB=E0A15, E0B13, E0C15; LSB=E0A0, E0B0, E0C0)

$$A = 10^{K/20} \times \frac{1 + 1 / \tan(\pi fc_2 / f_s)}{1 + 1 / \tan(\pi fc_1 / f_s)}, \quad B = \frac{1 - 1 / \tan(\pi fc_1 / f_s)}{1 + 1 / \tan(\pi fc_1 / f_s)}, \quad C = 10^{K/20} \times \frac{1 - 1 / \tan(\pi fc_2 / f_s)}{1 + 1 / \tan(\pi fc_1 / f_s)}$$

Transfer Function

(5) 4-band Equalizer & 1-band Equalizer after ALC

This block can be used as equalizer or Notch Filter. 4-band equalizers (EQ2~EQ5) are switched ON/OFF independently by EQ2, EQ3, EQ4 and EQ5 bits. EQ1 bit controls ON/OFF switching of the equalizer after ALC (EQ1). When the equalizer is OFF, the audio data passes this block by 0dB gain. E1A15-0 bits, E1B15-0 bits and E1C15-0 bits set the coefficient of EQ1. E2A15-0 bits, E2B15-0 bits and E2C15-0 bits set the coefficient of EQ2. E3A15-0 bits, E3B15-0 bits and E3C15-0 bits set the coefficient of EQ3. E4A15-0 bits, E4B15-0 bits and E4C15-0 bits set the coefficient of EQ4. E5A15-0 bits, E5B15-0 bits and E5C15-0 bits set the coefficient of EQ5. The EQn (n=1, 2, 3, 4 or 5) coefficient must be set when EQn bit = "0" or PMPFIL bit = "0". EQn starts operation $4/fs(\text{max})$ after when EQn = PMPFIL bit = "1" is set.

Each EQ2 ~ 5 blocks have a gain controller (EQ2G ~ EQ5G) independently after the equalizer. EQnG5-0 bits (n = 2~5) setting is reflected by writing "1" to EQCn bit (n = 2~5). EQnG5-0 bits and EQCn bit (n=2~5) can be set during operation (EQn =PMPFIL bit="1").

(G_{2,3,4,5} = 1 or G)

$$h_n(z) = A_n \frac{1 - z^{-2}}{1 - B_n z^{-1} - C_n z^{-2}}$$

(n = 1, 2, 3, 4, 5)

The center frequency must be set as below.

$$0.003 < fo_n / fs < 0.497$$

When gain of K is set to "-1", this equalizer becomes a notch filter. When EQ2 ~EQ5 is used as a notch filter, central frequency of a real notch filter deviates from the above-mentioned calculation, if its central frequency of each band is near. The control soft that is attached to the evaluation board has functions that revises a gap of frequency and calculates the coefficient. When its central frequency of each band is near, the central frequency should be revised and confirm the frequency response.

Note 40. [Translation the filter coefficient calculated by the equations above from real number to binary code (2's complement)]

$$X = (\text{Real number of filter coefficient calculated by the equations above}) \times 2^{13}$$

X should be rounded to integer, and then should be translated to binary code (2's complement).
MSB of each filter coefficient setting register is sine bit.

Common Gain Sequence Examples

<When noise is generated>

(assuming the noise continues)

- (1) Set EQCn bit: "1" → "0" (Path Setting). The gain changes immediately by this setting.
- (2) Set EQnT1-0 bits: "xx" → "00" (Transition Time)
- (3) Set EQnG5-0 bits: "xxH" → "3FH" (Gain Setting; should be set to 0dB)

<When noise is stopped>

- (4) Set EQCn bit: "0" → "1" (Path Setting), EQnT1-0 bits Setting
(Transition Time: It should be set longer when noise is stopped.) (Note 41)
- (5) Set EQnG5-0 bits (Gain Setting)
The gain of EQn is changed after a transition time set by EQnT1-0 bits.

Note 41. When changing a path of EQC2-5 by setting EQC2-5 bits "0" → "1", the gain should be transitioned to 0dB before the settings. Otherwise, pop noise may occur on the path change.

■ ALC Operation

The ALC (Automatic Level Control) is operated by ALC block. When ADCPF bit is “1”, the ALC circuit operates for recording path, and the ALC circuit operates for playback path when ADCPF bit is “0”. ALC bit controls ON/OFF of ALC operation.

The ALC block consists of these blocks shown below. The ALC limiter detection level is monitored at the level detection2 block after EQ block. The level detection1 block also monitors clipping detection level (+0.53dBFS).

Figure 43. ALC Block

The polar (fc_1) and the zero point (fs_2) frequencies of EQ block are set by EQFC1-0 bits. Set ALCEQ bits according to the sampling frequency. When ALCEQ bit is OFF (ALCEQ bit = “1”), the level detection is not executed on this block.

1. ALC Limiter Operation

During ALC limiter operation, when either L or R channel output level exceeds the ALC limiter detection level (Table 36), the VOL value (same value for both L and R) is attenuated automatically by the amount defined by the ALC limiter ATT step (Table 37). (Once this ALC limiter operation is started, attenuation will be repeated sixteen times.)

After completing the attenuate operation, unless ALC bit is changed to “0”, the operation repeats when the input signal level exceeds ALC limiter detection level.

2. ALC Recovery Operation

ALC recovery operation wait for the WTM1-0 bits (Table 38) to be set after completing ALC limiter operation. If the input signal does not exceed “ALC recovery waiting counter reset level” (Table 36) during the wait time, ALC recovery operation is executed. The VOL value is automatically incremented by the setting value of RGAIN2-0 bits (Table 39) up to the set reference level (Table 40) in every sampling. When the VOL value exceeds the reference level (REF value), the VOL values are not increased. The recovery speed gets slower when the VOL peak level exceeds -12dBFS to make the recovery speed for low VOL level faster relatively.

When

“ALC recovery waiting counter reset level $\leq$ Output Signal $<$ ALC limiter detection level” during the ALC recovery operation, the waiting timer of ALC recovery operation is reset. When “ALC recovery waiting counter reset level $>$ Output Signal”, the waiting timer of ALC recovery operation starts.

ALC operations correspond to the impulse noise. When FRN bit = “0”, the impulse noise is input, the ALC recovery operation becomes faster than a normal recovery operation. When large noise is input to a microphone instantaneously, the quality of small level in the large noise can be improved by this fast recovery operation. The speed of fast recovery operation is set by RFST1-0 bits (Table 41). When FRN bit = “1”, the fast recovery does not operate though the impulse noise is input. Limiter amount of Fast recovery is set by FRATT bit (Table 42).

5. Example of registers set-up sequence of ALC Operation

The following registers must not be changed during ALC operation. These bits must be changed after ALC operation is stopped by ALC bit = "0". ALC output is "0" data until the AK4951 becomes manual mode after writing "0" to ALC bit.

LMTH2-0, WTM1-0, RGAIN2-0, REF7-0, RFST1-0, EQFC1-0, FRATT, FRN and ALCEQN bits

■ Input Digital Volume (Manual Mode)

The input digital volume becomes manual mode when ALC bit is set to “0” while ADCPF bit is “1”. This mode is used in the cases shown below.

1. After exiting reset state, when setting up the registers for ALC operation (LMTH and etc.)
2. When the registers for ALC operation (Limiter period, Recovery period and etc.) are changed.
For example; when the sampling frequency is changed.
3. When IVOL is used as a manual volume control.

IVL7-0 and IVR7-0 bits set the gain of the volume control (Table 46). Lch and Rch volumes are set individually by IVL7-0 and IVR7-0 bits when IVOLC bit = “0”. IVL7-0 bits control both Lch and Rch volumes together when IVOLC bit = “1”.

This volume has a soft transition function. Therefore no switching noise occurs during the transition. IVTM bit set the transition time (Table 47). When IVTM bit = “1”, it takes $944/f_s$ ($19.7\text{ms}@f_s=48\text{kHz}$) from F1H (+36dB) to 05H (-52.5dB). The volume is muted after transitioned to -72dB in the period set by IVTM bit when changing the volume from 05H (-52.5dB) to 00H (MUTE).

■ Output Digital Volume

The AK4951 has a digital output volume (205 levels, 0.5dB step, Mute). The volume is included in front of a DAC block. The input data of DAC is changed from +12 to -89.5dB or MUTE. DVL7-0 bits control both Lch and Rch volumes together when DVOLC bit = "1" (default). Lch and Rch volumes are set individually by DVL7-0 and DVR7-0 bits when DVOLC bit = "0". This volume has soft transition function. In automatic attenuation, the volume is attenuated by soft transition in 204/fs or 816/fs to reduce switching noises. When DVTM bit = "0", it takes 816/fs (17.0ms@fs=48kHz) from 00H (+12dB) to CCH (MUTE).

DVL7-0 bits DVR7-0 bits	Gain	Step

■ Soft Mute

Soft mute operation is performed in the digital domain. When the SMUTE bit is set “1”, the output signal is attenuated by $-\infty$ (“0”) from the value (ATT DATA) set by DVL/R7-0 bits during the cycle set by DVTM bit. When the SMUTE bit is returned to “0”, the mute is cancelled and the output attenuation gradually changes to ATT DATA from $-\infty$ during the cycle set by DVTM bit. If the soft mute is cancelled within the cycle set by DVTM bit after starting the operation, the attenuation is discontinued and returned to ATT DATA. The soft mute is effective for changing the signal source without stopping the signal transaction.

Figure 46. Soft Mute Function

- (1) The input signal is attenuated to $-\infty$ (“0”) in the cycle set by DVTM bit. When ATT DATA = +12dB (DVL/R7-0 bits = 00H), $816/fs = 17ms$ @ $fs=48kHz$, DVTM bit= “0”.
- (2) Analog output corresponding to digital input has group delay (GD).
- (3) If soft mute is cancelled before attenuating to $-\infty$, the attenuation is discounted and returned to the level set by DVL/R7-0 bits within the same cycle.

■ BEEP Input

When BEEPS bit is set to “1” during PMBP = PMSL = SPLSN bits = “1”, the input signal from the RIN3/BEEP pin is output to the speaker-amp (LOSEL bit = “0”) or stereo line output (LOSEL bit = “1”). When BEEPH bit is set to “1” during PMHPL or PMHPR bit = “1”, the input signal from the RIN3/BEEP pin is output to the stereo headphone amplifier. BPLVL3-0 bits set the gain of BEEP-Amp, and the total gain is defined according to SPKG1-0 bits setting. When the BEEP signal is output to the stereo headphone amplifier, AK4951 operates without the system clock. In order to operate the charge pump circuit, it is necessary to power up the internal oscillator (PMOSC bit = “1”).

When PMDAC bit = “1” and PMHPL bit or PMHPR bit = “1”, switching noise of connection between the BEEP generating circuit and headphone amplifier can be suppressed by soft transition. The transition time of ON/OFF switching is set by PTS1-0 bits. Soft transition Enable/Disable is controlled by MOFF bit. When this bit is “1”, soft transition is disabled and the headphone is switched ON/OFF immediately.

PTS1 bit	PTS0 bit	ON/OFF Time			
		8kHz ≤ fs ≤ 24kHz		24kHz < fs ≤ 48kHz	
0	0	64/fs	2.7~8ms	128/fs	2.7~5.3ms

Note 18. The maximum value is AVDD Vpp when BPVCM bit = “1”. However, a click noise may occur when the amplitude after BEEP-Amp is 0.5Vpp or more. (set by BPLVL3-0 bits)

Note 43. When the BEEP signal is output to the speaker amplifier and BPVCM bit = “1”, SVDD must be supplied 2.8V or more.

■ Charge Pump Circuit

The internal charge pump circuit generates negative voltage (VEE) from AVDD voltage. The VEE voltage is used for the headphone amplifier. The charge pump circuit starts operation when PMHPL or PMHPR bit = “1”. PMVCM bit must be set “1” to power up the charge pump circuit. When the BEEP signal is output to the stereo headphone amplifier without the system clock, the charge pump circuit can be operated using the internal oscillator by setting PMOSC bit = “1”. The operating frequency of the internal oscillator is 2.68MHz (typ) and the power up time of the internal oscillator is 1.1μs (typ).

The power-up time of the charge pump circuit is 12.1ms (max). The headphone amplifier and speaker amplifier will be powered up after the charge pump circuit is powered up (when PMHPL or PMHPR bit = “1”). The operating frequency of the charge pump circuit is dependent on the sampling frequency.

■ Headphone Amplifier (HPL/HPR pins)

The positive voltage of the headphone amplifier uses the power supply to the DVDD pin, therefore 150mA of the maximum power supply capacity is needed. The internal charge pump circuit generates negative voltage (VEE) from AVDD voltage. The headphone amplifier output is single-ended and centered around on VSS (0V). Therefore, the capacitor for AC-coupling can be removed. The minimum load resistance is 16Ω.

<External Circuit of Headphone Amplifier>

An oscillation prevention circuit (0.22μF±20% capacitor and 33Ω±20% resistor) should be put because it has the possibility that Headphone Amplifier oscillates in type of headphone.

Figure 48. External Circuit of Headphone

When PMHPL, PMHPR bits = “1”, headphone outputs are in normal operation. By setting PMHPL and PMHPR bits = “0”, the headphone-amps are powered-down completely. At that time, the HPL and HPR pins go to VSS voltage via the internal pulled-down resistor when HPZ bit = “0”. The pulled-down resistor is 10Ω (typ). Crosstalk can be reduced by bringing the HPL and HPR pins to Hi-Z state when it occurs on the path from speaker output to headphone output by enabling the speaker output in this pulled-down status of the HPL and HPR pins. The HPL and HPR pins become Hi-Z state by setting HPZ bit to “1” when PMHPL and PMHPR bit = “0”. The headphone-amps can be powered-up/down regardless the HPZ bit setting.

The power-up time of the headphone amplifiers is max. 34.2ms (internal oscillator: 66.2ms), and power-down is executed immediately.

PMVCM bit	PMHPL/R bits	HPZ bit	Mode	HPL/R pins	
x	0	0	Power-down & Mute	Pull-down by 10Ω (typ)	(default)
x	0	1	Power-down	Hi-Z	
1	1	0	Normal Operation	Normal Operation	
1	1	1	Normal Operation	Normal Operation	

Table 56. Headphone Output Status (x: Don't care)

■ Speaker Output (SPP/SPN pins, LOSEL bit = “0”)

When LOSEL bit = “0”, the DAC output signal is input to the speaker amplifier as mono signal $[(L+R)/2]$. The speaker amplifier has mono output as it is BTL capable. The gain and output level are set by SPKG1-0 bits. The output level depends on SVDD and SPKG1-0 bits setting.

SPKG1-0 bits	Gain	SPK-Amp Output Level (DAC Input =0dBFS, SVDD=3.3V)	(default)
00	+6.4dB	3.37V _{pp}	
01	+8.4dB	4.23V _{pp} (Note 44)	
10	+11.1dB	5.33V _{pp} (Note 44)	
11	+14.9dB	8.47V _{pp} (AK4951EN: SVDD=5.0V; Note 44)	

Note 44. The output level is calculated on the assumption that the signal is not clipped. However, in the actual case, the SPK-Amp output signal is clipped when DAC outputs 0dBFS signal. The SPK-Amp output level should be kept under 4.0V_{pp} (SVDD=3.3V) by adjusting digital volume to prevent clipped noise.

Table 57. SPK-Amp Gain

< Speaker-Amp Control Sequence >

The speaker amplifier is powered-up/down by PMSL bit. When PMSL bit is “0” at LOSEL bit = “0”, both SPP and SPN pins are pulled-down to VSS3 by 100kΩ (typ). When PMSL bit is “1” and SLPSN bit is “0” at LOSEL bit = “0”, the speaker amplifier enters power-save mode. In this mode, the SPP pin is placed in Hi-Z state and the SPN pin outputs SVDD/2 voltage (AK4951EN: Note 45) or AVDD/2 voltage (AK4951EG).

When the PMSL bit is “1” at LOSEL bit = “0” after the PDN pin is changed from “L” to “H”, the SPP and SPN pins rise up in power-save mode. In this mode, the SPP pin is placed in a Hi-Z state and the SPN pin goes to SVDD/2 voltage (AK4951EN: Note 45) or AVDD/2 voltage (AK4951EG). Because the SPP and SPN pins rise up in power-save mode, pop noise can be reduced. When the AK4951 is powered-down (PMSL bit = “0”), pop noise can also be reduced by first entering power-save-mode.

Note 45. When the SVDD more than 4.6V is supplied, the voltage cannot rise up to SVDD/2.

PMSL bit	SLPSN bit	Mode	SPP pin	SPN pin	(default)
0	x	Power-down	Pull-down to VSS3	Pull-down to VSS3	
1	0	Power-save	Hi-Z	SVDD/2 (AK4951EN: Note 45) AVDD/2 (AK4951EG)	
	1	Normal Operation	Normal Operation	Normal Operation	

Table 58 Speaker-Amp Mode Setting (x: Don't care)

Figure 49. Power-up/Power-down Timing for Speaker-Amp

■ Thermal Shutdown Function

When the internal temperature of the device rises up irregularly (e.g. Output pins of speaker-amp or headphone-amp are shortened), the speaker-amp, the headphone-amp and charge-pump circuit are automatically powered down and then THDET bit becomes "1" (thermal shutdown). When TSDSEL bit = "0" (default), the internal temperature goes down and the thermal shutdown is released, the speaker-amp, the headphone-amp and charge-pump circuit is powered up automatically and THDET bit returns to "0". When TSDSEL bit = "1", these blocks will not return to a normal operation until being reset by the PDN pin. THDET bit becomes "0" by this PDN pin reset.

■ Stereo Line Output (LOUT/ROUT pin, LOSEL bit = “1”)

When LOSEL bit is set to “1”, L and R channel signals of DAC are output in single-ended format via LOUT and ROUT pins. The stereo line output is valid at SVDD = 2.8~3.5V. The same voltage as AVDD must be supplied to the stereo lineout. When DACL bit is “0” at LOSEL = PMSL = SLPSN bits = “1”, output signals are muted and LOUT and ROUT pins output common voltage. The load impedance is 10kΩ (min.). When PMSL bit = “0” at LOSEL = SLPSN bits = “1”, the stereo line output enters power-down mode and the output is pulled-down to VSS3 by 100kΩ(typ). Pop noise at power-up/down can be reduced by changing PMSL bit when SLPSN bit = “0” at LOSEL bit = “1”. In this case, output signal line should be pulled-down to VSS by 22kΩ after AC coupled as Figure 51. Rise/Fall time is 300ms (max) when C=1μF and R_L=10kΩ. When LOSEL = PMSL = SLPSN bits = “1”, stereo line output is in normal operation.

LVCM1-0 bits set the gain of stereo line output.

Table 60. Stereo Lineout Volume Setting

Note 46. If the value of 22kΩ resistance at pop noise reduction circuit is increased, the power-up time of stereo line output is increased but the pop noise level is not decreased. Do not use a resistor less than 22kΩ at the pop noise reduction circuit since the line output drivability is minimum 10kΩ.

- (1) Set LOSEL bit = "1". Enable stereo line output.
- (2) Set PMSL bit = "1". Stereo line output exits power-down mode.
LOUT and ROUT pins rise up to common voltage. Rise time to 99% common voltage is 200ms (max. 300ms) when C=1μF.
- (3) Set SLPSN bit = "0" after LOUT and ROUT pins rise up. Stereo line output exits power-save mode.
Stereo line output is enabled.
- (4) Set SLPSN bit = "1". Stereo line output enters power-save mode.
- (5) Set PMSL bit = "0". Stereo line output enters power-down mode.
LOUT and ROUT pins fall down to 1% of the common voltage. Fall time is 200ms (max. 300ms) when C=1μF.
- (6) Set LOSEL bit = "0" after wait time (≥300ms). Disable stereo line output.

■ Regulator Block

The AK4951 integrates a regulator. The 3.3V (typ) power supply voltage from the AVDD pin is converted to 2.3V (typ) by the regulator and supplied to the analog blocks (MIC-Amp, ADC, DAC, BEEP). The regulator is powered up by PMVCM bit = "1", and powered down by PMVCM = "0". Connect a $2.2\mu\text{F}$ ($\pm 20\%$) capacitor to the REGFIL pin to reduce noise on AVDD.

■ Serial Control Interface

(1) I²C Bus Control Mode (AK4951EG: I2C pin = “H”)

The AK4951 supports the fast-mode I²C Bus (max: 400kHz). Pull-up resistors at the SDA and SCL pins must be connected to a voltage in the range from TVDD or more to 6V or less.

1. WRITE Operations

Figure 55 shows the data transfer sequence for the I²C Bus mode. All commands are preceded by a START condition. A HIGH to LOW transition on the SDA line while SCL is HIGH indicates a START condition (Figure 61). After the START condition, a slave address is sent. This address is 7 bits long followed by the eighth bit that is a data direction bit (R/W). The most significant six bits of the slave address are fixed as “001001” and the next bit is device address bit set by the CAD0 pin (Figure 56). If the slave address matches that of the AK4951, the AK4951 generates an acknowledge and the operation is executed. The master must generate the acknowledge-related clock pulse and release the SDA line (HIGH) during the acknowledge clock pulse (Figure 62). A R/W bit value of “1” indicates that the read operation is to be executed, and “0” indicates that the write operation is to be executed.

The second byte consists of the control register address of the AK4951. The format is MSB first, and those most significant 1bit is fixed to zero (Figure 57). The data after the second byte contains control data. The format is MSB first, 8bits (Figure 58). The AK4951 generates an acknowledge after each byte is received. Data transfer is always terminated by a STOP condition generated by the master. A LOW to HIGH transition on the SDA line while SCL is HIGH defines a STOP condition (Figure 61).

The AK4951 can perform more than one byte write operation per sequence. After receipt of the third byte the AK4951 generates an acknowledge and awaits the next data. The master can transmit more than one byte instead of terminating the write cycle after the first data byte is transferred. After receiving each data packet the internal address counter is incremented by one, and the next data is automatically taken into the next address. The address counter will “roll over” to 00H and the previous data will be overwritten if the address exceeds “4FH” prior to generating a stop condition.

The data on the SDA line must remain stable during the HIGH period of the clock. HIGH or LOW state of the data line can only be changed when the clock signal on the SCL line is LOW (Figure 63) except for the START and STOP conditions.

2. READ Operations

Set the R/W bit = “1” for the READ operation of the AK4951. After transmission of data, the master can read the next address’s data by generating an acknowledge instead of terminating the write cycle after the receipt of the first data word. After receiving each data packet the internal address counter is incremented by one, and the next data is automatically taken into the next address. The address counter will “roll over” to 00H and the data of 00H will be read out if the address exceeds “4FH” of Register map prior to generating a stop condition.

The AK4951 supports two basic read operations: CURRENT ADDRESS READ and RANDOM ADDRESS READ.

2-1. CURRENT ADDRESS READ

The AK4951 has an internal address counter that maintains the address of the last accessed word incremented by one. Therefore, if the last access (either a read or write) were to address “n”, the next CURRENT READ operation would access data from the address “n+1”. After receipt of the slave address with R/W bit “1”, the AK4951 generates an acknowledge, transmits 1-byte of data to the address set by the internal address counter and increments the internal address counter by 1. If the master does not generate an acknowledge but generates a stop condition instead, the AK4951 ceases the transmission.

Figure 59. Current Address Read

2-2. RANDOM ADDRESS READ

The random read operation allows the master to access any memory location at random. Prior to issuing the slave address with the R/W bit “1”, the master must first perform a “dummy” write operation. The master issues a start request, a slave address (R/W bit = “0”) and then the register address to read. After the register address is acknowledged, the master immediately reissues the start request and the slave address with the R/W bit “1”. The AK4951 then generates an acknowledge, 1 byte of data and increments the internal address counter by 1. If the master does not generate an acknowledge but generates a stop condition instead, the AK4951 ceases the transmission.

(2) 3-wire Serial Control Mode (Only the AK4951EG supports this interface)

Data read must be executed when READ bit = “1”.

1. Data Writing and Reading Modes on Every Address

One data is written to (read from) one address.

Internal registers may be written by using 3-wire serial interface pins (CSN, CCLK and CDTIO). The data on this interface consists of Read/Write, Register address (MSB first, 7bits) and Control data or Output data (MSB first, 8bits). Address and data is clocked in on the rising edge of CCLK and data is clocked out on the falling edge. Data writings become available on the rising edge of CSN. When reading the data, the CDTIO pin changes to output mode at the falling edge of 8th CCLK and outputs data in D7-D0. However this reading function is available only when READ bit = “1”. When READ bit = “0”, the CDTIO pin stays as Hi-Z even after the falling edge of 8th CCLK. The data output finishes on the rising edge of CSN. The CDTIO is placed in a Hi-Z state except when outputting the data at read operation mode. Clock speed of CCLK is 5MHz (max). The value of internal registers are initialized by the PDN pin = “L”.

Figure 64. Serial Control Interface Timing 1

2. Continuous Data Writing Mode

Address is incremented automatically and data is written continuously. This mode does not support reading. Writing to the address 0FH and 31H are ignored.

In this mode, registers are written by 3-wire serial interface pins (CSN, CCLK and CDTIO). The data on the 3-wire serial interface is 8 bit data, consisting of register address (MSB-first, 7bits) and control or output data (MSB-first, 8xN bits)). The receiving data is latched on a rising edge (“↑”) of CCLK. The first write data becomes effective between the rising edge (“↑”) and the falling edge (“↓”) of 16th CCLK. When the micro-processor continues sending CDTIO and CCLK clocks while the CSN pin = “L”, the address counter is incremented automatically and writing data becomes effective between the rising edge (“↑”) and the falling edge (“↓”) of every 8th CCLK. For the last address, writing data becomes effective between the rising edge (“↑”) of 8th CCLK and the rising edge (“↑”) of CSN. The clock speed of CCLK is 5MHz (max). The internal registers are initialized by the PDN pin = “L”.

Even through the writing data does not reach the last address; a write command can be completed when the CSN pin is set to “H”.

- Note 47. When CSN “↑” was written before “↑” of 8th CCLK in continuous data writing mode, the previous data writing address becomes valid and the writing address is ignored.
- Note 48. After 8bits data in the last address became valid, put the CSN pin “H” to complete the write command. If the CDTIO and CCLK inputs are continued when the CSN pin = “L”, the data in the next address, which is incremented, is over written.

0: Power Save Mode (default)

1: Normal Operation

When SLPSN bit is “0”, Stereo line output is in power-save mode. In this mode, the LOUT/ROUT pins output 1.5V or 1.3V. When PMSL bit = “1”, SLPSN bit is enabled. After the PDN pin is set to “L”, Stereo line output is in power-down mode since PMSL bit is “0”.

10. Recommended External Circuits

[AK4951EN]

Figure 66 shows the system connection diagram. An evaluation board (AKD4951EN) is available for fast evaluation as well as suggestions for peripheral circuitry.

Notes:

- VSS1, VSS2 and VSS3 of the AK4951EN must be distributed separately from the ground of external controllers.
- All digital input pins must not be allowed to float.
- When the AK4951EN is used in master mode, LRCK and BICK pins are floating before M/S bit is changed to "1". Therefore, a pull-up or pull-down resistor around 100kΩ must be connected to LRCK and BICK pins of the AK4951EN.
- The pull-up resistors of the SCL and SDA pins must be connected to a voltage in the range from TVDD or more to 6V or less.
- 0.1μF capacitors at power supply pins and 2.2μF capacitors between CP and CN pins, and between VEE and VSS2 pins should be ceramic capacitors. Other capacitors do not have specific types.

[AK4951EG]

Figure 67 shows the system connection diagram. An evaluation board (AKD4951EG) is available for fast evaluation as well as suggestions for peripheral circuitry.

Note:

- VSS1, VSS2 and VSS3 of the AK4951EN must be distributed separately from the ground of external controllers.
- All digital input pins must not be allowed to float.
- When the AK4951EG is used in master mode, LRCK and BICK pins are floating before M/S bit is changed to "1". Therefore, a pull-up or pull-down resistor around 100kΩ must be connected to LRCK and BICK pins of the AK4951EG.
- When the AK4951EG is used in I²C Bus mode, the I2C pin must be connected to TVDD and the pull-up resistors of the SCL and SDA pins must be connected to a voltage in the range from TVDD or more to 6V or less.
- 0.1μF capacitors at power supply pins and 2.2μF capacitors between CP and CN pins, and between VEE and VSS2 pins should be ceramic capacitors. Other capacitors do not have specific types.

Figure 67. System Connection Diagram (AK4951EG)

(3-wire Serial Mode: I2C pin = "L")

1. Grounding and Power Supply Decoupling

The AK4951 requires careful attention to power supply and grounding arrangements. AVDD and SVDD are usually supplied from the system's analog supply, and DVDD and TVDD are supplied from the system's digital power supply. If AVDD, DVDD, TVDD and SVDD are supplied separately, the power-up sequence is not critical. The PDN pin should be held "L" when power supplies are tuning on. The PDN pin is allowed to be "H" after all power supplies are applied and settled.

To avoid pop noise on headphone output and line output when power up/down, the AK4951 should be operated along the following recommended power-up/down sequence.

1) Power-up

- The PDN pin should be held "L" when power supplies are turning on. The AK4951 can be reset by keeping the PDN pin "L" for 200ns or longer after all power supplies are applied and settled.

2) Power-down

- Each of power supplies can be powered OFF after the PDN pin is set to "L".

VSS1, VSS2 and VSS3 of the AK4951 should be connected to the analog ground plane. System analog ground and digital ground should be wired separately and connected together as close as possible to where the supplies are brought onto the printed circuit board. Decoupling capacitors should be as close the power supply pins as possible. Especially, the small value ceramic capacitor is to be closest.

2. Internal Regulated Voltage Power Supply

REGFIL is a power supply of the analog circuit (typ. 2.3V). A $2.2\mu\text{F} \pm 20\%$ capacitor attached to the VSS1 pin eliminates the effects of high frequency noise. This capacitor should be placed as near as possible to the AK4951. No load current may be drawn from the REGFIL pin. All digital signals, especially clocks, should be kept away from the REGFIL pin in order to avoid unwanted coupling into the AK4951.

3. Reference Voltage

VCOM is a signal ground of this chip. A $2.2\mu\text{F} \pm 20\%$ capacitor attached to the VSS1 pin eliminates the effects of high frequency noise. This capacitor should be placed as near as possible to the AK4951. No load current may be drawn from the VCOM pin. All signals, especially clocks, should be kept away from the VCOM pin in order to avoid unwanted coupling into the AK4951. Attention must be paid to the printing pattern and the material of the capacitors to prevent superimposed noises and voltage drops since the VCOM voltage is the reference of many functions.

4. Charge Pump

$2.2\mu\text{F} \pm 20\%$ capacitors between the CP and CN pins, and the VEE and VSS2 pins should be low ESR ceramic capacitors. These capacitors must be connected as close as possible to the pins. No load current may be drawn from the VEE pin.

5. Analog Inputs

The microphone and line inputs support single-ended format. The input signal range scales with nominally at typ. 2.07V_{pp} (@ MGAIN = 0dB), centered around the internal signal ground (typ. 1.15V). Usually the input signal is AC coupled with a capacitor. The cut-off frequency is $f_c = 1/(2\pi RC)$.

5. Analog Outputs

The input data format for the DAC is 2's complement. The output voltage is a positive full scale for 7FFFFFFH (@24bit) and a negative full scale for 800000H (@24bit). The ideal output is VCOM voltage for 000000H (@24bit data). The headphone output is single-ended and centered around VSS (0V). There is no need for AC coupling capacitors. The speaker amplifier (SPP and SPN pins) is BTL output, and they should be connected directly to a speaker. There is no need for AC coupling capacitors. The stereo line outputs (LOUT and ROUT pins) are single-ended and centered on 1.5V (LVCM0 bit = "1": default). These pins must be AC-coupled using a capacitor.

11. Control Sequence

■ Clock Set Up

When ADC, DAC or Programmable Filter is powered-up, the clocks must be supplied. Turn off the power management bits first when switching the master clock. The power management bits should be turned on after the master clock is stabilized.

1. PLL Master Mode

Figure 68. Clock Set Up Sequence (1)

<Sequence>

- (1) After Power Up: PDN pin “L” → “H”
“L” time of 200ns or more is needed to reset the AK4951.
- (2) After Dummy Command (Addr:00H, Data:00H) input, DIF1-0, PLL3-0, FS3-0, BCKO and M/S bits must be set during this period.
- (3) Power Up VCOM and Regulator: PMVCM bit = “0” → “1”
VCOM and Regulator must first be powered-up before the other block operates. Power up time is 2.0ms (max) when the capacitance of an external capacitor for the VCOM and the REGFIL pin is 2.2μF each.
- (4) PLL starts after PMPLL bit changes from “0” to “1” and MCKI is supplied from an external source, and PLL lock time is 5ms (max)
- (5) The AK4951 starts to output the LRCK and BICK clocks after the PLL became stable. Then normal operation starts.

2. PLL Slave Mode (BICK pin)

Figure 69. Clock Set Up Sequence (2)

<Sequence>

- (1) After Power Up: PDN pin "L" → "H"
 "L" time of 200ns or more is needed to reset the AK4951.
- (2) After Dummy Command (Addr:00H, Data:00H) input, DIF1-0, PLL3-0, and FS3-0 bits must be set during this period.
- (3) Power Up VCOM and Regulator: PMVCM bit = "0" → "1"
 VCOM and Regulator must first be powered-up before the other block operates. Power up time is 2.0ms (max) when the capacitance of an external capacitor for the VCOM and the REGFIL pin is 2.2μF each.
- (4) PLL starts after the PMPLL bit changes from "0" to "1" and PLL reference clock (BICK pin) is supplied. PLL lock time is 2ms (max) when BICK is a PLL reference clock.
- (5) Normal operation starts after that the PLL is locked.

3. EXT Slave Mode

Figure 70. Clock Set Up Sequence (3)

<Sequence>

- (1) After Power Up: PDN pin "L" → "H"
"L" time of 200ns or more is needed to reset the AK4951.
- (2) After Dummy Command (Addr:00H, Data:00H) input, DIF1-0, CM1-0 and FS3-0 bits must be set during this period.
- (3) Power Up VCOM and Regulator: PMVCM bit = "0" → "1"
VCOM and Regulator must first be powered-up before the other block operates. Power up time is 2.0ms (max) when the capacitance of an external capacitor for the VCOM and the REGFIL pin is 2.2μF each.
- (4) Normal operation starts after the MCKI, LRCK and BICK are supplied.

4. EXT Master Mode

Figure 71. Clock Set Up Sequence (4)

<Sequence>

- (1) After Power Up: PDN pin "L" → "H"
"L" time of 200ns or more is needed to reset the AK4951.
- (2) MCKI is supplied.
- (3) After Dummy Command (Addr:00H, Data:00H) input, DIF1-0, CM1-0, BCKO and FS3-0 bits are set. M/S bit should be set to "1". Then LRCK and BICK are output.
- (4) Power Up VCOM and Regulator: PMVCM bit = "0" → "1"
VCOM and Regulator must first be powered-up before the other block operates. Power up time is 2.0ms (max) when both capacitances of an external capacitor for the VCOM and REGFIL pins are 2.2μF each.

■ Microphone Input Recording (Stereo)

Figure 72. Microphone Input Recording Sequence

<Sequence>

This sequence is an example of ALC setting at $f_s = 48\text{kHz}$. For changing the parameter of ALC, please refer to Table 44. At first, clocks should be supplied according to "Clock Set Up" sequence.

- (1) Set up a sampling frequency (FS3-0 bits). When the AK4951 is in PLL mode, Microphone, ADC and Programmable Filter of (12) must be powered-up in consideration of PLL lock time after a sampling frequency is changed.
- (2) Set up Microphone Amp and Microphone Power. (Addr = 01H)
- (3) Set up Input Signal. (Addr = 03H)
- (4) Set up FRN, FRATT and ADRST1-0 bits (Addr = 09H)
- (5) Set up ALC mode. (Addr = 0AH, 0BH)
- (6) Set up REF value at ALC (Addr = 0CH)
- (7) Set up IVOL value at ALC operation start (Addr = 0DH)
- (8) Set up Auto HPF (Addr = 1AH)
- (9) Programmable Filter ON/OFF Setting (Addr: 1BH, 1CH, 30H)
- (10) Set up Programmable Filter Path: PFSDO bit = ADCPF bit = "1" (Addr = 1DH)
- (11) Set up Coefficient Programmable Filter (Addr: 1EH ~ 2FH, 32H ~ 4FH)
- (12) Power Up Microphone Amp, ADC and Programmable Filter: PMADL = PMADR = PMPFIL bits = "0" → "1"
 The initialization cycle time of ADC is $1059/f_s = 22\text{ms}$ @ $f_s = 48\text{kHz}$, ADRST1-0 bit = "00". ADC outputs "0" data during the initialization cycle. After the ALC bit is set to "1", the ALC operation starts from IVOL value of (7).
- (13) Power Down Microphone Amp, ADC and Programmable Filter: PMADL = PMADR = PMPFIL bits = "1" → "0"
- (14) ALC Disable: ALC bit = "1" → "0"

■ Digital Microphone Input (Stereo)

Figure 73. Digital Microphone Input Recording Sequence

<Sequence>

This sequence is an example of ALC setting at fs=48kHz. For changing the parameter of ALC, please refer to [Table 44](#). At first, clocks should be supplied according to "Clock Set Up" sequence.

- (1) Set up a sampling frequency (FS3-0 bits). When the AK4951 is PLL mode, Digital Microphone of (11) and Programmable Filter of (10) must be powered-up in consideration of PLL lock time after a sampling frequency is changed.
- (2) Set up FRN, FRATT and ADRST1-0 bits (Addr = 09H)
- (3) Set up ALC mode. (Addr = 0AH, 0BH)
- (4) Set up REF value for ALC (Addr = 0CH)
- (5) Set up IVOL value at ALC operation start (Addr = 0DH)
- (6) Set up Auto HPF. (Addr = 1AH)
- (7) Set up Programmable Filter ON/OFF (Addr = 1BH, 1CH, 30H)
- (8) Set up Programmable Filter Path: PFSDO bit = ADCPF bit = "1" (Addr = 1DH)
- (9) Set up Coefficient of Programmable Filter (Addr:1EH ~ 2FH, 32H ~ 4FH)
- (10) Power Up Programmable Filter: PMPFIL bit = "0" → "1"
- (11) Set Up & Power Up Digital Microphone: DMIC = PMDMR = PMDML bits = "0" → "1"
 The initialization cycle time of ADC is 1059/fs=22ms@ fs=48kHz, ADRST1-0 bit = "00". ADC outputs "0" data during initialization cycle. After the ALC bit is set to "1", the ALC operation starts from IVOL value of (5).
- (12) Power Down Digital Microphone: PMDMR =PMDML bits = "1" → "0"
- (13) Power Down Programmable Filter: PMPFIL bit = "1" → "0"
- (14) ALC Disable: ALC bit = "1" → "0"

■ Headphone Amplifier Output

Figure 74. Headphone-Amp Output Sequence

<Sequence>

At first, clocks should be supplied according to "Clock Set Up" sequence.

- (1) Set up the sampling frequency (FS3-0 bits). When the AK4951 is PLL mode, the Headphone Amplifier and DAC of (4) must be powered-up in consideration of PLL lock time after the sampling frequency is changed.
- (2) Set up the digital output volume (Addr = 13H)
- (3) Set up Programmable Filter Path: PFDAC1-0, ADCPF and PFSDO bits (Addr = 1DH)
- (4) Power up DAC and Headphone Amplifier: PMDAC = PMHPL = PMHPR bits = "0" → "1"
 When PMHPL = PMHPR bits = "1", the charge pump circuit is powered-up. The power-up time of Headphone Amplifier block is 34.2ms (max).
- (5) Power down DAC and Headphone Amplifier: PMDAC = PMHPL = PMHPR bits = "1" → "0"

■ Beep Signal Output from Headphone Amplifier

1. Power down DAC → Headphone Amplifier

Figure 75. "BEEP-Amp → Headphone-Amp" Output Sequence

<Sequence>

Clock input is not necessary when the AK4951 is operating only on the path of "BEEP-Amp → Headphone-Amp".

- (1) Power up VCOM and BEEP Amplifier: PMVCM = PMBP bit = "0" → "1"
Beep Amplifier is powered-up after rise-up VCOM. Power up time for VCOM is 2ms (max).
- (2) Power up Oscillator: "0" → "1"
Set up the path of BEEP-Amp → Headphone-Amp: BEEPH bit = "0" → "1"
- (3) Power up Headphone Amplifier: PMHPL bit or PMHPR bit = "0" → "1"
Period (3) should be set according to the time constant of a capacitor and a resistor that are connected to the BEEP pin. Pop noise may occur if the Headphone-Amp output is enabled before the BEEP-Amp input is stabilized. The BEEP-Amp is powered up after VCOM voltage rise. The maximum rise-up time of VCOM is 2msec.
e.g. R=86kΩ(max), C=0.1μF: Recommended Wait Time (max.): 2msec + 10τ = 88ms or more
The power-up time of Headphone Amplifier block is 66.2ms (max).
- (4) Power down Headphone Amplifier: PMHPL = PMHPR bits = "1" → "0"
- (5) Power down Oscillator: PMOSC bit = "1" → "0"
Disable the path of BEEP → Headphone-Amp: BEEPH bit = "1" → "0"
- (6) Power down VCOM and BEEP Amplifier: PMVCM = PMBP bits = "1" → "0"

2. Power up DAC → Headphone Amplifier

Figure 76. "BEEP-Amp → Headphone-Amp" Output Sequence

<Example>

At first, clocks should be supplied according to "Clock Set Up" sequence, and Headphone Amplifier output should be started according to "Headphone Amplifier Output" sequence.

(1) Power up BEEP Amplifier: PMBP bit = "0" → "1"

(2) BEEP output: BEEPH bit = "0" → "1"

After the transition time set by PTS1-0 bits, BEEP output starts.

(3) BEEP stop: BEEPH bit = "1" → "0"

(4) Power down BEEP Amplifier: PMBP bit = "1" → "0"

■ Speaker Amplifier Output

Figure 77. Speaker-Amp Output Sequence

Example:

PLL Master Mode
Audio I/F Format: I2S Compatible
Sampling Frequency: 48KHz
Output Digital Volume: 0dB
ALC: Enable
Programmable Filter OFF

<Sequence>

At first, clocks must be supplied according to “Clock Set Up” sequence.

- (1) Set up a sampling frequency (FS3-0 bits). When the AK4951 is in PLL mode, DAC, Programmable Filter and Speaker-Amp of (11) must be powered-up in consideration of PLL lock time after a sampling frequency is changed.
- (2) Set up the path of DAC → SPK-Amp: DACS bit = “0” → “1”
- (3) SPK-Amp gain setting: SPKG1-0 bits = “00” → “01”
- (4) Set up FRN, FRATT and ADRST1-0 bits (Addr = 09H)
- (5) Set up ALC mode (Addr = 0AH, 0BH)
- (6) Set up REF value of ALC (Addr = 0CH)
- (7) Set up IVOL value of ALC operation start (Addr = 0DH)
- (8) Set up the output digital volume. (Addr = 13H)
- (9) Set up Programmable Filter Path: PFDAC1-0 bits=“01”, PFSDO=ADCPF bits=“0” (Addr = 1DH)
- (10) Enter Speaker-Amp Output Mode: LOSEL bit = “0”
- (11) Power up DAC, Programmable Filter and Speaker-Amp: PMDAC=PMPFIL=PMSL bits=“0”→“1”
- (12) Exit the power-save mode of Speaker-Amp: SLPSN bit = “0” → “1”
- (13) Enter Speaker-Amp Power Save Mode: SLPSN bit = “1” → “0”
- (14) Disable the path of DAC → SPK-Amp: DACS bit = “1” → “0”
- (15) Power down DAC, Programmable Filter and speaker: PMDAC=PMPFIL=PMSL bits= “1”→“0”

■ Beep Signal Output from Speaker Amplifier

Figure 78. "BEEP-Amp → Speaker-Amp" Output Sequence

<Sequence>

Clock input is not necessary when the AK4951 is operating only on the path of "BEEP-Amp" → "SPK-Amp".

- (1) Enter Speaker-Amp Output Mode: LOSEL bit = "0"
- (2) Power up VCOM, MIN-Amp and Speaker: PMVCM = PMBP = PMSL bits = "0" → "1"
- (3) Set up the path of BEEP → SPK-Amp: BEEPS bit = "0" → "1"
- (4) Exit the power save mode of Speaker-Amp: SLPSN bit = "0" → "1"
Period (3) should be set according to the time constant of a capacitor and a resistor that are connected to the BEEP pin. Pop noise may occur if the SPK-Amp output is enabled before the BEEP-Amp input is stabilized. The BEEP Amp is powered up after VCOM voltage rise. The maximum rise-up time of VCOM is 2msec.
- (5) Enter Speaker-Amp Power-save mode: SLPSN bit = "1" → "0"
- (6) Power Down BEEP-Amp and Speaker: PMBP = PMSL bits = "1" → "0"
- (7) Disable the path of BEEP → SPK-Amp: BEEPS bit = "1" → "0"

■ Stop of Clock

When ADC, DAC or Programmable Filter is powered-up, the clocks must be supplied.

1. PLL Master Mode

Example:

Audio I/F Format: I2S Compatible (ADC & DAC)
BICK frequency at Master Mode: 64fs
Input Master Clock Select at PLL Mode: 12MHz

Figure 79. Clock Stopping Sequence (1)

<Sequence>

- (1) Power down PLL: PMPLL bit = "1" → "0"
- (2) Stop an external master clock.
