Robo:Bit Mk2 - buggy for the micro:bit

This little buggy can be assembled very quickly using only a screwdriver. No soldering is required.

Contents:

- Robo:Bit robotics controller PCB
- Fixings pack (battery holder, screws, mounting pillars, caster, etc.)

- 2 x Motors with pre-fitted connection wires (no soldering required)
- **micro:bit not included, [click here](#) if you need to pick one up!**

Using the basic kit you can learn about:

- Controlling motors with simple Forwards / Reverse controls
- Controlling the speed of motors in both directions using PWM
- Use a second micro:bit with the easy-to-use radio software to control the buggy
- Use the motion sensor on the micro:bit to detect collision with obstacles and avoid them

With the optional [Ultrasonic Distance Sensor](#) (not included):

- Detect when obstacles get close and change the program to avoid the obstacles
- "Follow-Me" program that tries to stay a certain distance from the object in front

With the optional [Line Follower Sensor Pack](#) (not included):

- Use the 2 line sensors either side of the non-reflective line to detect the line and keep the buggy on track
- Write more complex programs that behave as required if you meet a T-Junction or crossing of lines
- Compare different line following strategies - create a race-track and see which strategy is fastest
- In combination with the distance sensor, make it avoid obstacles on the track and then re-acquire the line
