

Power Doubler Hybrid Module ADCA3952

Mini-Circuits 7

75Ω 45 to 1218 MHz

FEATURES

Total composite power: 73.3 dBmV High power gain: 25.0 dB at 1218 MHz Excellent linearity Very low distortion Composite triple beat: -80 dBc typical Composite second-order: -78 dBc typical Carrier to intermodulation noise: 58 dB typical Low noise figure: 3 dB at 45 MHz and 4 dB at 1218 MHz Unconditionally stable Transient and surge protection Configurable current: 250 mA to 490 mA at 24 V

APPLICATIONS

45 MHz to 1218 MHz community access television (CATV) infrastructure amplifier systems Remote physical layer (PHY) DOCSIS 3.1 compliant

GENERAL DESCRIPTION

The Mini-Circuits' ADCA3952 is a power doubler hybrid module packaged in the industry-standard SOT-115J package. The device achieves high RF output, up to 73.3 dBmV total composite power with 9 dB tilt, by using advanced circuit design techniques, such as gallium arsenide (GaAs), pseudomorphic high electron transistor (pHEMT), and gallium nitride (GaN) HEMT technologies. The dc current can be adjusted externally for optimum distortion performance vs. power consumption over a range of output levels. The ADCA3952 provides high gain, simplifying the design and manufacturing of DOCSIS 3.1[™] infrastructure equipment.

This part was acquired by Mini-Circuits from Analog Devices on April 12, 2024.

ABSOLUTE MAXIMUM RATINGS

DOCSIS 3.1

Table 3.

Parameter	Rating
Vcc	
DC Supply over Voltage (5 Minute)	28 V
RF Input Voltage (RFINPUT), Single Tone	75 dBmV
IADJ Voltage (V _{IADJ})	−1 V to +26 V
Operating Temperature Range	
T _A	−30°C to +85°C −30°C to +100°C
T _{FLANGE}	-30°C to +100°C
Storage Temperature (Ts) Range	-40°C to +100°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

THEORY OF OPERATION

DOCSIS 3.1

The ADCA3952 is a 75 Ω input and output matched module designed for CATV applications. The ADCA3952 uses cascode field effect transistor (FET) feedback amplifiers in a Class A, push pull configuration. The bottom half of the cascode stages are implemented in a single die, linear FET process that minimizes parasitics, thereby enabling higher gain. The top devices in the cascodes are implemented using a linear GaN process able to swing high RF voltages. The frequency of operation is from 45 MHz to 1218 MHz.

Internally, the ADCA3952 module uses a balun to convert the input signal to a balanced signal that feeds the active stages. An output impedance transformer and balun combination converts the balanced GaN signals to an unbalanced 75 Ω output. The output transformer also feeds the dc to the active stages and cancels second-order distortion products coming from the active devices.

The module has a bias control pin (IADJ) that can set the dc current consumption from low bias to the full bias of the device by connecting a resistor from the IADJ pin to ground or by the use of a positive voltage.

The ADCA3952 is unconditionally stable and includes transient and surge protection circuits for robust operation in systems targeting DOCSIS 3.1 and legacy DOCSIS standards.

APPLICATIONS INFORMATION

Basic connections for operating the ADCA3952 are shown in Figure 14. Both the INPUT pin (Pin 1) and the OUTPUT pin (Pin 9) of the ADCA3952 are matched to 75 Ω . The VCC pin (Pin 5) requires 24 V for typical operation. It is recommended to leave the IADJ pin (Pin 4) open for full bias operation. For bias control on the ADCA3952 supply current, apply an external control voltage between -0.6 V and +1 V at the IADJ pin. Figure 12 illustrates the typical supply current over the control voltages at the IADJ pin of the ADCA3992.

In systems that require the bias current to be lower than the default but it is not critical, a resistor can be placed between the IADJ pin (Pin 4) and ground to set the current (see Figure 15). Figure 13 illustrates the typical supply current of the ADCA3952 in this configuration for a range of resistor values between 100 Ω and 40 k Ω .

Mini-Circuits 75 Ω 45 to 1218 MHz

DOCSIS 3.1

The ADCA3952 employs a versatile circuit design, allowing system designers to configure the supply voltage at the VCC connection (Pin 5) and the bias control voltage at the IADJ connection (Pin 4) to optimize the power dissipation in any given application. Figure 16 illustrates the modulation error ratio performance trade-off for different bias current configurations.

Figure 16. Modulation Error Ratio RMS vs. Current Setpoint for Various Frequencies, Bias = 24 V, 35°C, 9 dB Tilt, Total Composite Power = 72.0 dBmV
