

EiceDRIVER™ 2EDi product family

Fast, robust, dual-channel, functional and reinforced isolated MOSFET gate-driver with accurate and stable timing

Description

The EiceDRIVER™ 2EDi is a family of fast dual-channel isolated MOSFET gate-driver ICs providing functional (2EDFx) or reinforced (2EDSx) input-to-output isolation by means of coreless transformer (CT) technology. Due to high driving current, excellent common-mode rejection and fast signal propagation, 2EDi is particularly well suited for driving medium- to high-voltage MOSFETs (CoolMOST™, OptiMOS™, CoolSiC™, CoolGaN™) in fast-switching power systems.

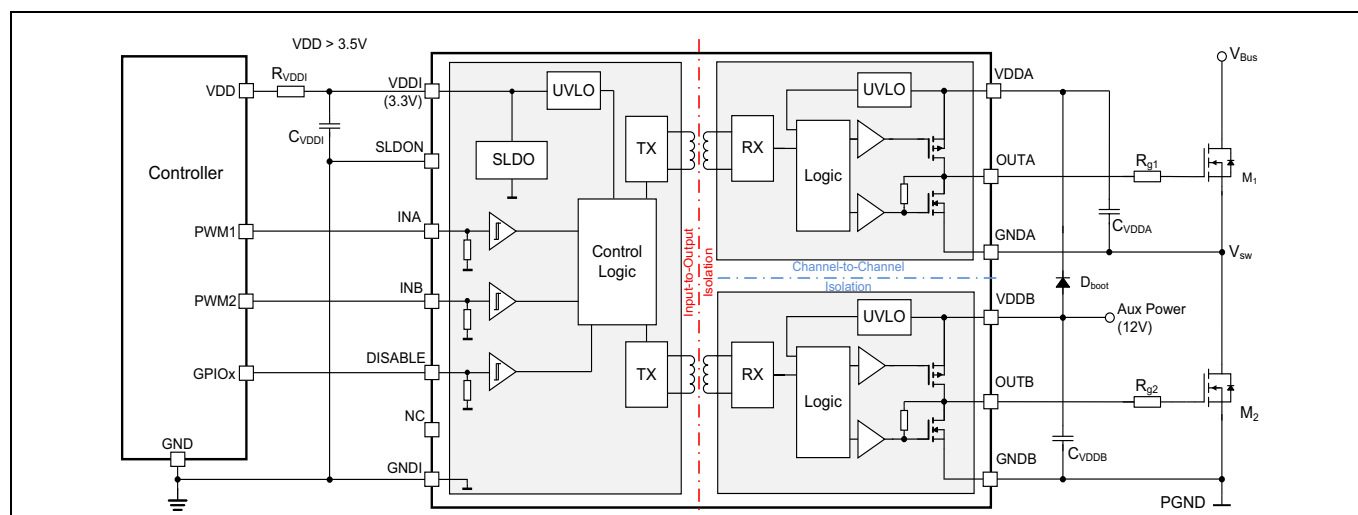

Features

- 4 A/8 A or 1 A/2 A source/sink output current
- Up to 10 MHz PWM switching frequency
- PWM signal propagation delay typ. 37 ns with
 - 3 ns channel-to-channel mismatch
 - +7/-6 ns propagation delay variance
- Common Mode Transient Immunity CMTI >150 V/ns
- Fast safety turn-off in case of input side Undervoltage Lockout (UVLO)
- Output supply voltage from 4.5 V to 20 V with 4 V or 8 V UVLO threshold
- Wide temperature operating range $T_j = -40^{\circ}\text{C}$ to $+150^{\circ}\text{C}$
- RoHS compliant wide /narrow-body (WB/NB) DSO16 and 5 mm × 5 mm LGA packages
- Fully qualified according to JEDEC for Industrial Applications

Isolation and safety certificates

- **2EDSx with reinforced isolation:**
 - DIN V VDE V 0884-10 (2006-12) compliant with $V_{\text{IOTM}} = 8 \text{ kV}_{\text{pk}}$ and $V_{\text{IOSM}} = 6.25 \text{ kV}_{\text{pk}}$ (tested at $10 \text{ kV}_{\text{pk}}$)
 - Certified according to UL1577 (Ed. 5) opto-coupler component isolation standard with $V_{\text{ISO}} = 5700 \text{ V}_{\text{RMS}}$
 - Certified according to DIN EN IEC 62368-1 and corresponding CQC certificates
- **2EDFx with functional isolation:** Production test with $1.5 \text{ kV}_{\text{DC}}$ for 10 ms

Potential applications

- Server, telecom and industrial SMPS
- Synchronous rectification, brick converters, UPS and battery storage
- EV charging industry automation, motor drives and power tools

Description

1 Description

The gate drivers of the EiceDRIVER™ 2EDi product family are designed for fast-switching, medium to high power systems with MOSFET switches. They are optimized for high timing accuracy over temperature and production spread. The reliable accurate timing simplifies system design and provides better power conversion efficiency.

The 2EDSx, 2EDFx dual-channel reinforced (safe) and functional isolated product variants are available with different drive strengths: 4 A/8 A for low-ohmic power MOSFETs, 1 A/2 A for higher R_{on} MOSFETs or slower switching transients (EMI). The 1 A/2 A reinforced isolation driver can also be used as a PWM Data Coupler in combination with a non-isolated boost gate driver such as 1EDNx 4 A/8 A placed in closest proximity to the Superjunction power switches.

Two independent and galvanically isolated gate driver channels ensure that all 2EDi versions can be used in any possible configuration of low- and high-side switches.

Improved system robustness is supported by min. 150 V/ns Common Mode Transient Immunity (CMTI), PWM inputs with 18 ns noise filter, UVLO on output side including a safety self-lock-down of driver outputs in case of input UVLO ($V_{DDI} < 3$ V), PWM outputs with up to 5 A peak reverse current capability and an intrinsically robust gate driver design.

1.1 EiceDRIVER™ 2EDi product family device overview

Table 1 EiceDRIVER™ 2EDi product family device overview

Part number ¹⁾	Package	Source/sink current	UVLO	Input-to-output isolation

1) For device ordering information and device marking see [Chapter 7.1, Table 30](#)

2) Tested according to VDE0884-10 specifications with certification no longer available due to standard expiration

3) EN 62368-1 only applies to 2EDS8265H and 2EDS8165H

The 2EDi product table is provided as a first quick device selection guide; more detailed specifications are provided in the product features, package dimension and testing chapters of this datasheet.

Find current information on configurations and application notes under www.infineon.com/2EDi

Description

1.2 Input-to-output isolation testing

- 2EDSx Reinforced isolation (2EDSx in WB PG-DSO-16-30 package), for details see [Table 25](#) to [Table 28](#).
 - 8 kV_{pk} transient isolation voltage applied according to DIN V VDE V 0884-10 (2006-12)
 - 10 kV_{pk} surge isolation tested with 25 positive and 25 negative pulses according to VDE-0884-10
- Functional isolation (2EDFx in NB PG-DSO-16-11 and PG-TFLGA-13-4 packages), for details see [Table 20](#) to [Table 22](#)
 - Production test with 1.5 kV_{DC} for 10 ms

1.3 Channel-to-channel isolation testing

- The functional isolation between the two channels are verified by the following tests
 - Sample test with 1.5 kV_{DC} for 10 ms (NB PG-DSO-16-11, WB PG-DSO-16-30)
 - Sample test with 0.65 kV_{DC} for 10 ms (PG-TFLGA-13-4)

1.4 Application overview and system block diagram

2EDi gate drivers are perfectly suited to substitute bulky pulse transformers and drive power MOSFETs in half-bridge configuration as depicted in [Figure 1](#).

The input side is usually powered by the same power supply as the PWM controllers (VDDI = 3.3 V or VDDI > 3.5 V if SLDO is activated). The output-side gate driver voltages VDDA, VDDB are generated by separate isolated auxiliary supplies. In some topologies like LLC, the high side driver supply VDDA can be generated via a bootstrapping circuitry.

For further application implementation guidance please refer to dedicated application notes.

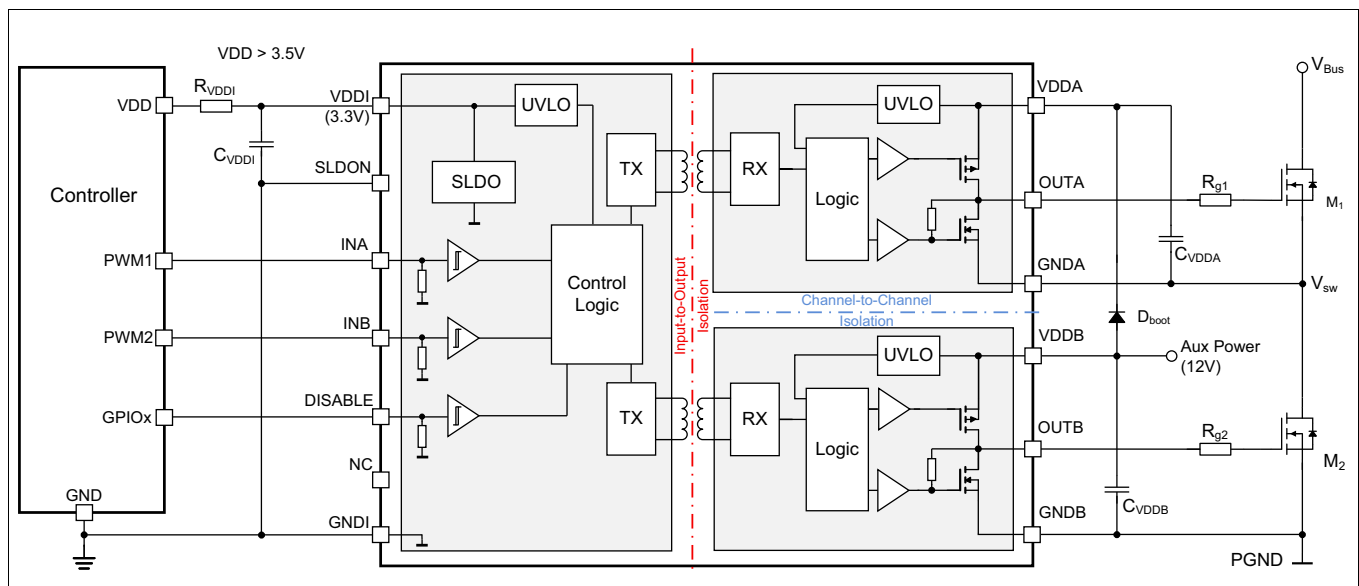

Figure 1 Typical application with 5 V controller and bootstrapped high-side VDDA

Pin configurations by device type

2 Pin configurations by device type

Functional behavior and electrical characteristics are independent of package configuration.

The pin configurations for the different package variants 2EDFxx75F, 2EDF7x75K and 2EDSxx65H are outlined in [Figure 2](#).

Figure 2 Pin configuration DSO-16 and LGA-13 packages (2EDF7x75F, 2EDF7x75K and 2EDF8x65H)
 (Top view, figure is not to scale)

Pin configurations by device type

For package drawing details see [Chapter 7 Package](#).

Table 2 Pin description for dual-channel input mode (with DISABLE, SLDON)

Pin# DSO	Pin# LGA	Symbol	Description
1	2	INA	Digital CMOS/TTL logic signal input for channel A with internal pull-down resistor to GNDI If channel is not used it is recommended to connect pin to GNDI (see Chapter 3.4)
2	3	INB	Digital CMOS/TTL logic signal input for channel B with internal pull-down resistor to GNDI If channel is not used it is recommended to connect pin to GNDI (see Chapter 3.4)
3	7	VDDI	Supply voltage (input side) 3.3 V (Internal SLDO available) It is recommended to place a bypass capacitor from VDDI to GNDI (see Chapter 3.3.1)
4	1	GNDI	Ground input side (all signals on input side are referenced to this pin) (see Chapter 3.3.1)
5	5	DISABLE	Digital CMOS/TTL logic input for both channels A and B; logic input high disables both output channels Internal pull-down resistor (see Chapter 3.4)
6	6	N.C.	Not connected; keep pin floating
7	-	N.C.	Not connected; keep pin floating
8	4	SLDON	Default 3.3 V supply selected, if N.C. or connected to VDDI If SLDON pin is connected to GNDI, SLDO is activated and a supply voltage higher than 3.5 V can be used (see Chapter 3.3.1) Internal pull-up resistor to VDDI; hard-wired PCB connection recommended
9	8	GNDB	Ground for output channel B
10	9	OUTB	Output gate driver for channel B
11	10	VDDDB	Supply voltage for output channel B It is recommended to place a bypass capacitor from VDDDB to GNDB (see Chapter 3.3.2)
12	N.P.	N.C.	Not present; not connected; for channel-to-channel isolation
13	-	N.C.	Not connected; for channel-to-channel isolation
14	11	GNDA	Ground for output channel A
15	12	OUTA	Output gate driver for channel A
16	13	VDDA	Supply voltage for output channel A It is recommended to place a bypass capacitor from VDDA to GNDA (see Chapter 3.3.2)

3 Functional description

3.1 Block diagram

A simplified functional block diagram for the the EiceDRIVER™ 2EDi gate-driver family is given in [Figure 3](#).

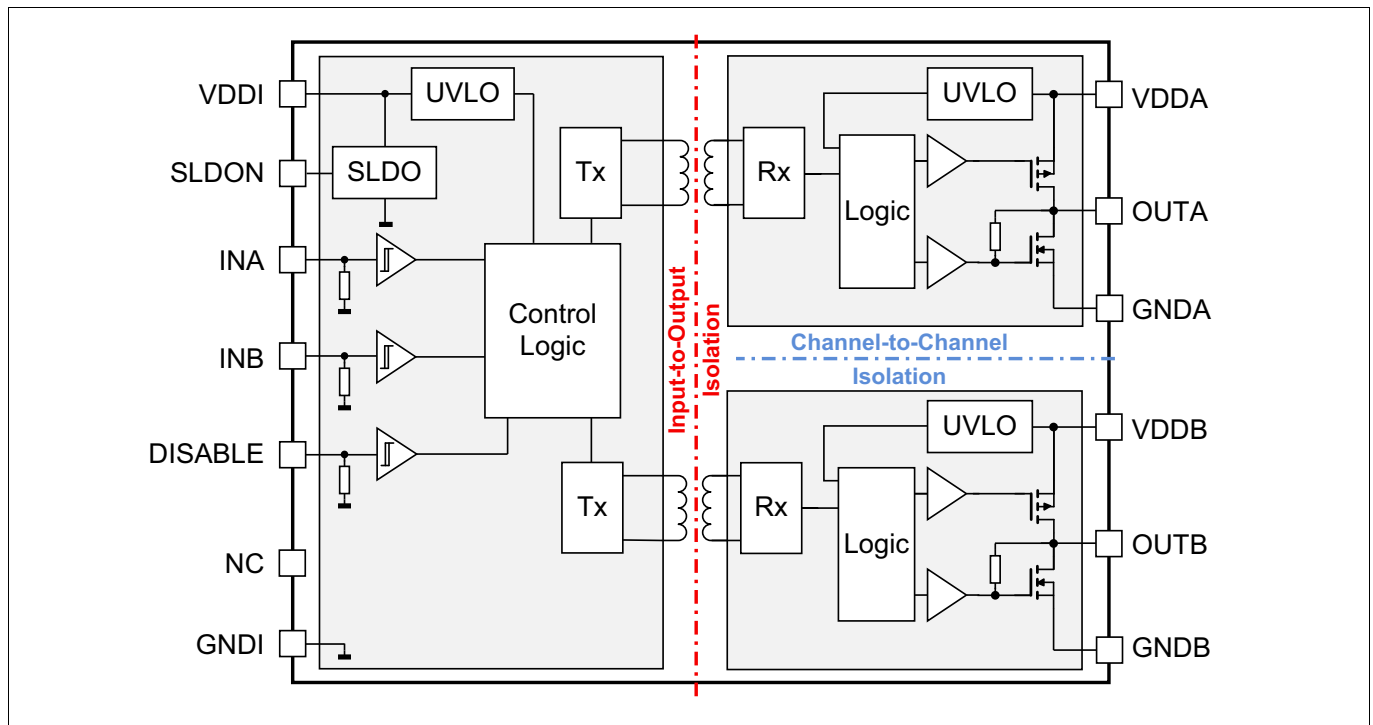

Figure 3 EiceDRIVER™ 2EDi product family block diagram

3.2 Input-to-output isolation

All EiceDRIVER™ 2EDi dual-channel isolated products are tested in accordance with their respective isolation class.

- **2EDFx for functional isolation**, typically used as primary-side controlled galvanically isolated driver.
Device part numbers: 2EDF7275K and 2EDFxxxxF (2EDF7275F, 2EDF8275F, 2EDF9275F, 2EDF7175F)
- **2EDSx for reinforced safe isolation**, typically used as secondary-side controlled isolated gate driver.
Device part numbers: 2EDSxxxxH (2EDS7165H, 2EDS8165H, 2EDS9265H, 2EDS8265H)

In combination with the different package dimensions and material characteristics, e.g. WB DSO-16 wide-body (PG-DSO-16-30), NB DSO-16 narrow-body (PG-DSO-16-11) or LGA - 13 at 5mm × 5mm (PG-TFLGA-13-4) the maximum input-to-output and channel-to-channel creepage and clearance distances and the possible working voltages of the IC as a semiconductor component are defined (see [Table 17](#) to [Table 28](#))

Note: The achievable system isolation depends on PCB design, materials, manufacturing- and working environment. It is the customer's obligation to verify that the outlined semiconductor component isolation of the 2EDSx, 2EDFx device fits to application, manufacturing, working environment and end system safety requirement standards.

Functional description

3.2.1 Typical applications by isolation type

Isolated gate drivers are typically deployed in the following applications.

Table 3

Isolation type	Potential applications
Functional	<ul style="list-style-type: none"> High-power hard-switching high-voltage PFC, Vienna Rectifier, Totem Pole PFC or Synchronous Rectification Driving switches with Kelvin source connection (4-pin package) Secondary-side control in low voltage isolated DC/DC topologies and brick converters
Reinforced	<ul style="list-style-type: none"> Secondary-side control of high voltage SJ-MOSFETs in LLC or PS-ZVS Primary-side controlled synchronous rectification 1 A/2 A PWM data-/signal-coupler for local boost gate drivers

3.3 Supply voltages

Three different power domains with independent internal power management are utilized to supply the input chip and the two output drivers. An undervoltage lockout functionality (UVLO) in each domain enables a defined startup and ensures a robust operation under all conditions.

3.3.1 Input-side power supply

The input side is powered via VDDI with nominal 3.3 V. For using the device with a supply voltage > 3.5 V the on-chip switched low-dropout regulator (SLDO) must be activated and an external shunt resistor R_{VDDI} has to be connected to VDDI.

It is recommended to use a ceramic bypass capacitor (10 nF - 22 nF) between VDDI and GNDI.

The SLDO is activated if the pin SLDON is connected to GNDI. A hard-wired connection is recommended.

The SLDO regulates the current through an external resistor R_{VDDI} connected between the external supply voltage V_{DD} and pin VDDI as depicted in **Figure 1** to generate the required voltage drop. For proper operation it has to be ensured that the current through R_{VDDI} always exceeds the maximum supply current I_{VDD} of the input chip (see **Figure 7**).

Thus, R_{VDDI} has to fulfill:

$$R_{VDDI} < (V_{DD} - 3.3) / I_{VDD, \max}$$

A typical choice for $V_{DD} = 12 \text{ V}$ is $R_{VDDI} = 3 \text{ k}\Omega$, resulting in sufficient margin between resistor current and VDDI operating current. Dynamic current peaks are eliminated by a blocking cap (10 to 22 nF) between VDDI and GNDI.

The total power consumption of 2EDi is dominated by the output side and depends on switching frequency, gate resistor and gate charge, while for typical switching frequencies the input supply current stays relatively constant (see **Figure 6** to **Figure 7**).

3.3.2 Output-side power supply

Each gate driver channel has to be powered separately. It is recommended to use a ceramic bypass capacitor (minimum value $20 \times C_{iss}$ of MOSFET) from VDDA to GNDA and from VDDB to GNDB in close proximity to the device.

The operating supply voltage can range from 4.5 V to 20 V for each gate drive channel.

The minimum gate driver turn-on voltage is set by the device Undervoltage Lockout (UVLO) to protect the power MOSFETs from operating in the saturation region.

Devices with 4 V, 8 V and 13 V UVLO thresholds for the output supply are currently available (see **Chapter 1.1**).

Functional description

3.4 Input configurations

The inputs INA and INB control two independent PWM channels. The input signal is transferred non-inverted to the corresponding gate driver outputs OUTA and OUTB. All inputs are compatible with LV-TTL threshold levels and provide a hysteresis of typ. 0.8 V. The hysteresis is independent of the supply voltage VDDI.

The PWM inputs are internally pulled down to a logic low voltage level (GNDI). In case the PWM-controller signals have an undefined state during the power-up sequence, the gate driver outputs are forced to the "off"-state (low).

If the DISABLE input is "high", this unconditionally drives both channel outputs to "low" regardless of the state of INA or INB.

Table 4 Logic table

Inputs					Gate Drive Output	
DISABLE	INA	INB	UVLO input side ¹⁾	UVLO output side ¹⁾	OUTA	OUTB
x	x	x	active	x	L	L
x	x	x	x	ch A/B active	L	L
L	x	L	inactive	ch A activ, ch B inactive	L	L
L	x	H	inactive	ch A active, ch B inactive	L	H
L	L	x	inactive	ch A inactive, ch B active	L	L
L	H	x	inactive	ch A inactive, ch B active	H	L
H	x	x	inactive	ch A/B inactive	L	L
L	L	L	inactive	ch A/B inactive	L	L
L	L	H	inactive	ch A/B inactive	L	H
L	H	H	inactive	ch A/B inactive	H	H

1) "inactive" means that VDD is above UVLO threshold voltage (normal operation)

"active" means that UVLO disables the gate driver output stages

3.5 Driver outputs

The two rail-to-rail output stages, realized with complementary PMOS, NMOS transistors, are able to provide the necessary sourcing and sinking current and shoot-through protection and active current limitation have been implemented with a very low on-resistance (see [Table 14](#)). The use of a p-channel sourcing transistor PMOS is crucial for achieving true rail-to-rail behavior without any source follower voltage drop.

Gate Drive Outputs OUTA, OUTB are held actively low in case of floating inputs or during startup or power down as long as the UVLO thresholds are not exceeded.

3.6 Undervoltage Lockout

3.6.1 Input-side UVLO

During startup (rise of the input-side supply), as long as VDDI is below UVLO, no data is transferred to the output side. All gate driver outputs are held low (Safety Lock-down at startup).

When VDDI exceeds the UVLO level, the PWM input signal is transferred to the output side. If the output side is ready (not in UVLO condition), the output reacts according to the logic input. At any time, if the VDDI voltage drops below the UVLO threshold, an immediate “switch-to-low” command is sent to all output channels. The gate driver outputs are held low (Safety Lock-down is active at missing VDDI supply).

3.6.2 Output-side UVLO

The Undervoltage Lockout function (UVLO) ensures that the output can be switched to its high level only if the gate driver supply voltage exceeds the UVLO threshold voltage. Thus it can be guaranteed, that the power switch transistors always stay within their Safe Operating Area (SOA). Otherwise a too low driving voltage could cause the power MOSFET to enter its saturation (ohmic) region with potentially destructive power dissipation.

The UVLO of each channel VDDA/VDDDB is controlled independently. There is no feedback to the input side.

3.7 Data transmission input-side to output-side

Coreless Transformer (CT) based communication modules situated on the input die are used for signal transfer between input and output devices. A proven high-resolution pulse repetition scheme in the transmitter combined with a watchdog time-out at the receiver side enables recovery from communication fails and ensures safe system shutdown in failure cases.

Device characteristics

4 Device characteristics

The absolute maximum ratings are listed in **Table 5**. Stresses beyond these values may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

4.1 Absolute maximum ratings

Table 5 Absolute maximum ratings

Parameter	Symbol	Values			Unit	Note or Test Condition

		Min.	Typ.	Max.		
Undervoltage Lockout (UVLO) turn on threshold V_{DDA} , V_{DDB}	UVLO_ CM _{on}	4.0	4.2	4.4	V	–
Undervoltage Lockout (UVLO) turn off threshold V_{DDA} , V_{DDB}	UVLO_ CM _{off}	–	3.9	–	V	–
UVLO threshold hysteresis V_{DDA} , V_{DDB}	UVLO_ CM _{hys}	0.2	0.3	0.4	V	–

Table 13 Logic inputs INA, INB and DISABLE (see Figure 10)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Input voltage threshold for transition LH	V_{INH}	1.65	2.0	2.35	V	–
Input voltage threshold for transition HL	V_{INL}	–	1.2	–	V	–
Input voltage threshold hysteresis	V_{IN_hys}	0.4	0.8	1.2	V	–
Input pull-down resistor	R_{IN}	–	150	–	kΩ	–

Device characteristics

Table 14 Static output characteristics 4 A/8 A devices (see Figure 9)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
High-level (Sourcing) Output Resistance	R_{on_SRC}	0.42	0.85	1.6	Ω	$I_{SNK} = 50 \text{ mA}$
Peak Sourcing Output Current	I_{SRC_pk}	–	4	¹⁾	A	–
Low-level (Sinking) Output Resistance	R_{on_SNK}	0.18	0.35	0.75	Ω	$I_{SRC} = 50 \text{ mA}$
Peak Sinking Output Current	I_{SNK_pk}	²⁾	-8	–	A	–

1) Actively limited by design at approx. $5.2 A_{pk}$, parameter is not subject to production test - specified by design/characterization

2) Actively limited by design at approx. $-10.2 A_{pk}$, parameter is not subject to production test - specified by design/characterization

Table 15 Static output characteristics 1 A/2 A devices (see Figure 9)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
High-level (Sourcing) Output Resistance	R_{on_SRC}	1.4	3.1	5.8	Ω	$I_{SNK} = 50 \text{ mA}$
Peak Sourcing Output Current	I_{SRC_pk}	–	1	¹⁾	A	–
Low-level (Sinking) Output Resistance	R_{on_SNK}	0.6	1.2	2.5	Ω	$I_{SRC} = 50 \text{ mA}$
Peak Sinking Output Current	I_{SNK_pk}	²⁾	-2	–	A	–

1) Actively limited by design at approx. $1.3 A_{pk}$, parameter is not subject to production test - specified by design/characterization

2) Actively limited by design at approx. $-2.6 A_{pk}$, parameter is not subject to production test - specified by design/characterization

Table 16 Dynamic characteristics (see Figure 4 and Figure 13)

$T_{J,max} = 125^\circ\text{C}$, $C_{LOAD} = 1.8 \text{ nF}$ for 4 A/8 A version, $C_{LOAD} = 0.47 \text{ nF}$ for 1 A / 2 A version

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
INA- /INB-to-output turn-on / turn-off propagation delay	t_{PDOn}, t_{PDOff}	31	37	44	ns	4 A/8 A version
INA- /INB-to-output turn-on propagation delay	t_{PDOn}	31	37	44	ns	1 A/2 A version
INA- /INB-to-output turn-off propagation delay	t_{PDOff}	29	35	44	ns	1 A/2 A version
DISABLE-to-output turn-on/-off propagation delay	$t_{PDDISoff}, t_{PDDISoff}$	–	–	100	ns	–
Output turn-on propagation delay mismatch between channels	Δt_{PDOn}	–	–	3	ns	INA, INB shorted
Rise time	t_{rise}	–	6.5	$12^{1)}$	ns	–

Device characteristics

Table 16 Dynamic characteristics (see [Figure 4](#) and [Figure 13](#)) (cont'd)

$T_{J,max} = 125^{\circ}\text{C}$, $C_{LOAD} = 1.8 \text{ nF}$ for 4 A/8 A version, $C_{LOAD} = 0.47 \text{ nF}$ for 1 A / 2 A version

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Fall time	t_{fall}	–	4.5	$8^{1)}$	ns	–
Minimum input pulse width that changes output state	t_{PW}	–	18	–	ns	–
Input-side start-up time ¹⁾	$t_{START,VDDI}$	–	7	–	μs	see Figure 5
Input-side deactivation time ¹⁾	$t_{STOP,VDDI}$	–	255	–	ns	see Figure 5
Output-side start-up time ¹⁾	$t_{START,VDDA/B}$	–	5	–	μs	see Figure 5
Output-side deactivation time ¹⁾	$t_{STOP,VDDA/B}$	–	110	–	ns	see Figure 5

1) Not subject to production test - specified by design

Device characteristics

4.5 Functional and reinforced isolation specifications

Each individual part number and package variant has its own safety isolation characteristic due to package dimension and respective isolation test voltages and methods applied. The table heading references each unique part number.

For reinforced safety, the regulatory tests described in the component and system standards are applied by Infineon. For functional isolation, the outlined in-house test methods have been applied.

As soon as the regulatory certificates are available, the reference and or documents will become available for public download on the Infineon website www.infineon.com/2EDi

Note: Final creepage and clearance of component, must be verified in conjunction with PCB design layout and manufacturing choice like PCB material (CTI), stubs, grooves, lacquer which might increase or reduce safety distances. Meeting the isolation requirements on system level is therefore the responsibility of the application owner.

4.5.1 Functional isolation specifications

4.5.1.1 Functional isolation of devices in PG-TFLGA-13-4 package

The PG-TFLGA-13-4 package is available for 2EDF7275K. The isolation related parameters are shown in [Table 17](#), [Table 18](#) and [Table 19](#); for a component with basic or reinforced safety approval, choose a different part number.

Table 17 Functional isolation input-to-output (PG-TFLGA-13-4)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Functional isolation test voltage	V_{IO}	1500	–	–	V_{DC}	Impulse test >10 ms, production tested
Maximum isolation working voltage	V_{IOWM}	460	–	–	V_{RMS}	according to IEC 60664-1 (PD 2; MG II)
Package clearance	CLR	–	3.4	–	mm	Shortest distance over air, from any input pin to any output pin
Package creepage	CPG	–	3.4	–	mm	Shortest distance over surface, from any input pin to any output pin
Common Mode Transient Immunity	CMTI	150	–	–	V/ns	According to DIN V VDE V0884-11, static and dynamic test
Capacitance input-to-output	C_{IO}	–	2	–	pF	¹⁾
Resistance input-to-output	R_{IO}	–	>1000	–	MΩ	³⁾

1) Not subject to production test - specified by design

Device characteristics

Table 18 Package characteristics (PG-TFLGA-13-4)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Comparative Tracking Index of package mold	CTI	400	–	600	V	According to DIN EN 60112 (VDE 0303-11)
Material group	–	–	II	–	–	according to IEC 60112

Table 19 Functional isolation channel-to-channel (PG-TFLGA-13-4)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Functional isolation test voltage	$V_{\text{Ch2Ch-DC-Test}}$	650	–	–	V_{DC}	Impulse test > 10 ms; sample tested
Package creepage	CPG	–	1.0	–	mm	Shortest distance over surface, from output pin Ch1-GND to output pin Ch2-VDD

4.5.1.2 Functional isolation of devices in NB PG-DSO-16-11 package

The PG-DSO-16-11 package is available for 2EDF7175F, 2EDF9275F, 2EDF7275F and 2EDF8275F. The isolation related parameters are shown in [Table 20](#), [Table 21](#) and [Table 22](#).

Table 20 Input-to-output isolation specification (NB PG-DSO-16-11)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Functional isolation test voltage	V_{IO}	1500	–	–	V_{DC}	Impulse test > 10 ms, sample tested
Maximum isolation working voltage	V_{IOWM}	510	–	–	V_{RMS}	according to IEC 60664-1 (PD2; MG II)
Package clearance	CLR	–	4.0	–	mm	Shortest distance over air, from any input pin to any output pin
Package creepage	CPG	–	4.0	–	mm	Shortest distance over surface, from any input pin to any output pin
Common Mode Transient Immunity	CMTI	150	–	–	V/ns	According to DIN V VDE V0884-11, static and dynamic test
Capacitance input-to-output	C_{IO}	–	2	–	pF	1)
Resistance input-to-output	R_{IO}	–	>1000	–	MΩ	3)

1) Not subject to production test - specified by design

Device characteristics

Table 21 Package characteristics (NB PG-DSO-16-11)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Comparative Tracking Index of package mold	CTI	400	–	600	V	According to DIN EN 60112 (VDE 0303-11)
Material group	–	–	II	–	–	According to IEC 60112

Table 22 Channel-to-channel isolation (NB PG-DSO-16-11)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Functional isolation test voltage	$V_{\text{Ch2Ch-DC-Test}}$	1500	–	–	V_{DC}	Impulse test >10 ms; sample tested
Package Creepage	CPG	–	2.5	–	mm	Shortest distance over surface, from output pin Ch1-GND to output pin Ch2-VDD

4.5.2 Reinforced isolation of devices in WB PG-DSO-16-30 package

The PG-DSO-16-30 package is available for 2EDS8265H, 2EDS9265H, 2EDS8165H and 2EDS7165H. The safety related certifications are listed in [Table 23](#), [Table 24](#) and the isolation related parameters are shown in [Table 25](#) to [Table 29](#).

Table 23 Component safety-related certificates for WB PG-DSO-16-30

Certification	Issuing certification body	Certification status	Certification number
DIN V VDE V 0884-10	VDE	Certified ¹⁾	40043864
UL1577, CSA No.5A	UL	Certified	E311313

1) Certification no longer available due to standard expiration

Table 24 System safety-related certifications for WB PG-DSO-16-30

Certification	Issuing certification body	Certification status	Certification number
DIN EN 62368-1 (VDE 0868-1) ¹⁾	VDE	Certified	40050289
GB 4943.1-2022	CQC	Certified	CQC23001416212 ²⁾
GB 4943.1-2022	CQC	Certified	CQC23001416211 ³⁾
IEC 62368-1	CQC	Certified	CN64553 ³⁾
IEC 62368-1	CQC	Certified	CN64554 ²⁾

1) EN 62368-1 only applies to 2EDS8265H and 2EDS8165H

2) Only applies to 2EDS8265H and 2EDS9265H

3) Only applies to 2EDS8165H and 2EDS7165H

Device characteristics

**Table 25 Input-to-output isolation specification according to DIN V, VDE0884-10 (2016-06)¹⁾
in WB PG-DSO-16-30**

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Maximum transient isolation voltage	V_{IOTM}	8000	–	–	V_{pk}	Qualification for $t = 60$ s; production test with $V_{IOTM} > 10 \text{ kV}_{pk}$ for $t = 1$ s
Maximum repetitive peak isolation voltage	V_{IORM}	1420	–	–	V_{pk}	Time Dependent Dielectric Breakdown test method
Maximum isolation working voltage	V_{IOWM}	1420 1000	– –	– –	V_{DC} V_{RMS}	
Partial discharge voltage	V_{PD}	4500	–	–	V_{pk}	Test sequence: 10.2 kV_{pk} for $t = 1$ s followed by partial discharge $4.5 \text{ kV}_{pk} > 1.875 \times V_{IOWM}$, $Q_{PD} < 5 \text{ pC}$; production test
Maximum surge isolation voltage	V_{IOSM}	6250	–	–	V_{pk}	$V_{IOSM_test} = 1.6 \times V_{IOSM} > 10 \text{ kV}_{pk}$; sample tested ²⁾
Package clearance	CLR	–	8.0	–	mm	From any input pin to any output pin
Package creepage	CPG	–	8.0	–	mm	From any input pin to any output pin
Overvoltage category per IEC 60664-1 table F.1	–	I	–	IV		Rated mains voltage $\leq 150 \text{ V}_{RMS}$
		I	–	III		$\leq 300 \text{ V}_{RMS}$
		I	–	II		$\leq 600 \text{ V}_{RMS}$
Capacitance input-to-output	C_{IO}	–	2	–	pF	–
Resistance input-to-output	R_{IO}	–	>1000	–	MΩ	–
Common Mode Transient Immunity	CMTI	150	–	–	V/ns	According to DIN V VDE V0884-11, static and dynamic test

1) VDE encompasses former VDE0884-10, IEC60747-5-5 (opto-coupler standard)

2) Surge pulse tests applied according to IEC60065-10.1 (Ed 8.0 2014), 61000-4-5, 60060-1; waveforms (1.2 μs slope, 50 μs decay)

Table 26 Reinforced isolation package characteristics (in WB PG-DSO-16-30)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Comparative Tracking Index of package mold	CTI	400	–	600	V	According to DIN EN 60112 (VDE 0303-11)
Material group	–	–	II	–	–	According to IEC 60112
Pollution degree	–	–	2	–	–	–
Climatic category	–	–	40/125/21	–	–	–

Device characteristics

Table 27 Reinforced input-to-output isolation according to UL1577 Ed 5 (in WB PG-DSO-16-30)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Withstand isolation voltage	V_{ISO}	5700	–	–	V_{RMS}	$V_{ISO} = 5700 V_{RMS}$ for $t = 60$ s (qualification); $V_{ISO} > 1.2 \times V_{RMS} = 6840$ V for $t = 1$ s (production test)

Table 28 Functional isolation channel-to-channel (in WB PG-DSO-16-30)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Functional isolation test voltage	$V_{Ch2Ch-DC-test}$	1500	–	–	V_{DC}	Impulse Test >10 ms; sample tested
Package creepage	CPG	–	2.5	–	mm	Shortest distance over surface, from Output pin Ch1-GND to output pin Ch2-VDD

4.5.3 Safety-limiting values

Table 29 Reinforced isolation safety-limiting values as outlined in VDE-0884-10 (WB PG-DSO-16-30)

Parameter	Side	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Safety supply power	Input chip	–	–	20.0	mW	$R_{thJA} = 59$ K/W ¹⁾ , $T_{amb} = 25^{\circ}\text{C}$, $T_J = 150^{\circ}\text{C}$
	Output A	–	–	1050	mW	
	Output B	–	–	1050	mW	
	Total	–	–	2120	mW	
Safety supply currents	Output A	–	–	87.5	mA	$R_{thJA} = 59$ K/W ¹⁾ , $V_{DDA}/V_{DDB} = 12$ V, $T_{amb} = 25^{\circ}\text{C}$, $T_J = 150^{\circ}\text{C}$
	Output B	–	–	87.5	mA	
	Output A	–	–	53.5	mA	$R_{thJA} = 59$ K/W, $V_{DDA}/V_{DDB} = 20$ V, $T_{amb} = 25^{\circ}\text{C}$, $T_J = 150^{\circ}\text{C}$
	Output B	–	–	53.5	mA	
Safety temperature	T_s	–	–	150	$^{\circ}\text{C}$	$T_s = T_{J,max}$

1) Calculated with the R_{th} of WB PG-DSO-16-30 package (see [Table 6](#))

According to VDE0884-10 and UL1577, safety-limiting values define the operating conditions under which the isolation barrier can be guaranteed to stay unaffected. This corresponds with the maximum allowed junction temperature, as temperature-induced failures might cause significant overheating and eventually damage the isolation barrier.

Timing diagrams

5 Timing diagrams

Figure 4 depicts rise, fall and delay times for 2EDi 4 A/8 A. Besides, the effect of an activated dead time control (resistor connected to pin DTC) is indicated.

Figure 4 Propagation delays, rise, fall and dead time

Figure 5 illustrates the UVLO behavior. It depicts the reaction time to UVLO events when the supply crosses the UVLO thresholds during rising or falling transitions (power-up, power-down, supply noise).

Figure 5 UVLO behavior, start-up and deactivation time (unloaded output)

Typical characteristics

6 Typical characteristics

$V_{DDA} = V_{DDB} = 12\text{ V}$, $V_{DDI} = 3.3\text{ V}$, $T_{\text{amb}} = 25^\circ\text{C}$ and no load unless otherwise noted.

Package

7 Package

The following package versions are available.

- An NB PG-DSO-16-11 package with typ. 4 mm creepage input to output
- An area optimized 5 × 5 mm² PG-TFLGA-13-4
- A WB PG-DSO-16-30 package with typ. 8 mm creepage input to output

Note: For further information on package types, recommendation for board assembly, please go to:

With respect to any examples, hints or any typical values stated herein and/or any information regarding the application of the product, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights of any third party.

In addition, any information given in this document is subject to customer's compliance with its obligations stated in this document and any applicable legal requirements, norms and standards concerning customer's products and any use of the product of Infineon Technologies in customer's applications.

The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer's technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (www.infineon.com).

Please note that this product is not qualified according to the AEC Q100 or AEC Q101 documents of the Automotive Electronics Council.

WARNINGS

Due to technical requirements products may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies office.

Except as otherwise explicitly approved by Infineon Technologies in a written document signed by authorized representatives of Infineon Technologies, Infineon Technologies' products may not be used in any applications where a failure of the product or any consequences of the use thereof can reasonably be expected to result in personal injury.
