

## SLLIMM nano - 2<sup>nd</sup> series IPM, 3-phase inverter, 6 A, 600 V short-circuit rugged IGBT

N2DIP-26L type L

### Features

- IPM 6 A, 600 V, 3-phase IGBT inverter bridge including 3 control ICs for gate driving and freewheeling diodes
- 3.3 V, 5 V, 15 V TTL/CMOS input comparators with hysteresis and pull-down/pull-up resistors
- Internal bootstrap diode
- Optimized for low electromagnetic interference
- Undervoltage lockout
- Short-circuit rugged TFS IGBT
- Shutdown function
- Interlocking function
- Op-amp for advanced current sensing
- Comparator for fault protection against overcurrent
- Isolation ratings of 1500 V<sub>rms</sub>/min.
- NTC (UL 1434 CA 2 and 4)
- Up to  $\pm 2$  kV ESD protection (HBM C = 100 pF, R = 1.5 k $\Omega$ )
- UL recognition: UL 1557, file E81734

### Applications

- 3-phase inverters for motor drives
- Dish washers
- Washing machines
- Refrigerator compressors
- Fans

### Description

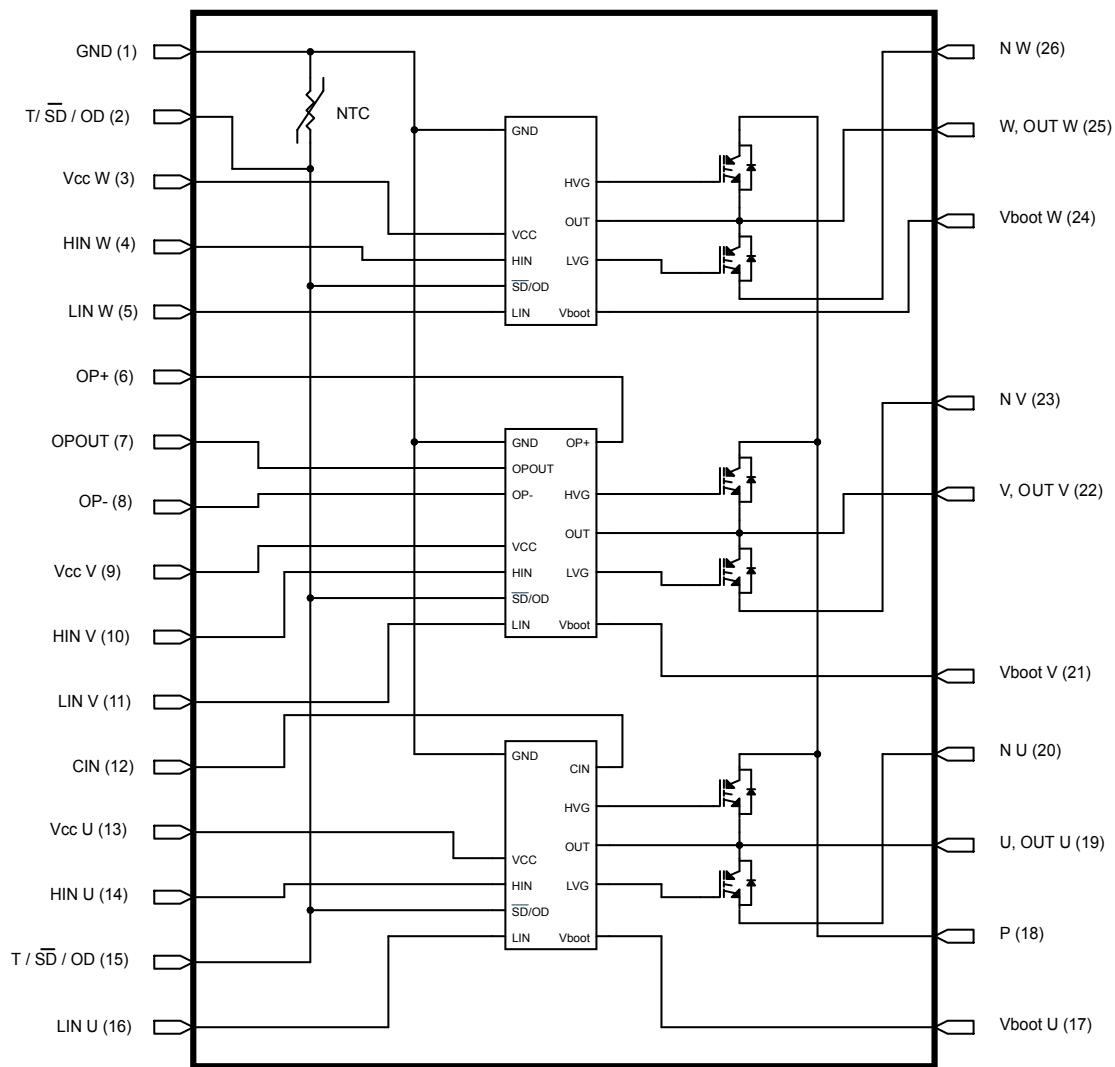

This second series of SLLIMM (small low-loss intelligent molded module) nano provides a compact, high-performance AC motor drive in a simple, rugged design. It is composed of six improved short-circuit rugged trench gate fieldstop IGBTs with freewheeling diodes and three half-bridge HVICs for gate driving, providing low electromagnetic interference (EMI) characteristics with optimized switching speed. The package is designed to allow a better and more easily screwed-on heat sink, and is optimized for thermal performance and compactness in built-in motor applications or other low power applications where assembly space is limited. This IPM includes a completely uncommitted operational amplifier and a comparator that can be used to design a fast and efficient protection circuit. SLLIMM is a trademark of STMicroelectronics.

## 4 Shutdown function

The device is equipped with three half-bridge IC gate drivers and integrates a comparator for fault detection. The comparator has an internal voltage reference  $V_{REF}$  connected to the inverting input, while the non-inverting input pin (CIN) can be connected to an external shunt resistor for current monitoring. Since the comparator is embedded in the U IC gate driver, in case of fault it disables directly the U outputs, whereas the shutdown of V and W IC gate drivers depends on the RC value of the external SD circuitry, which fixes the disabling time.

For an effective design of the shutdown circuit, please refer to Application note AN4966.

**Figure 10. Shutdown timing waveforms**

GADG250120171515FSR

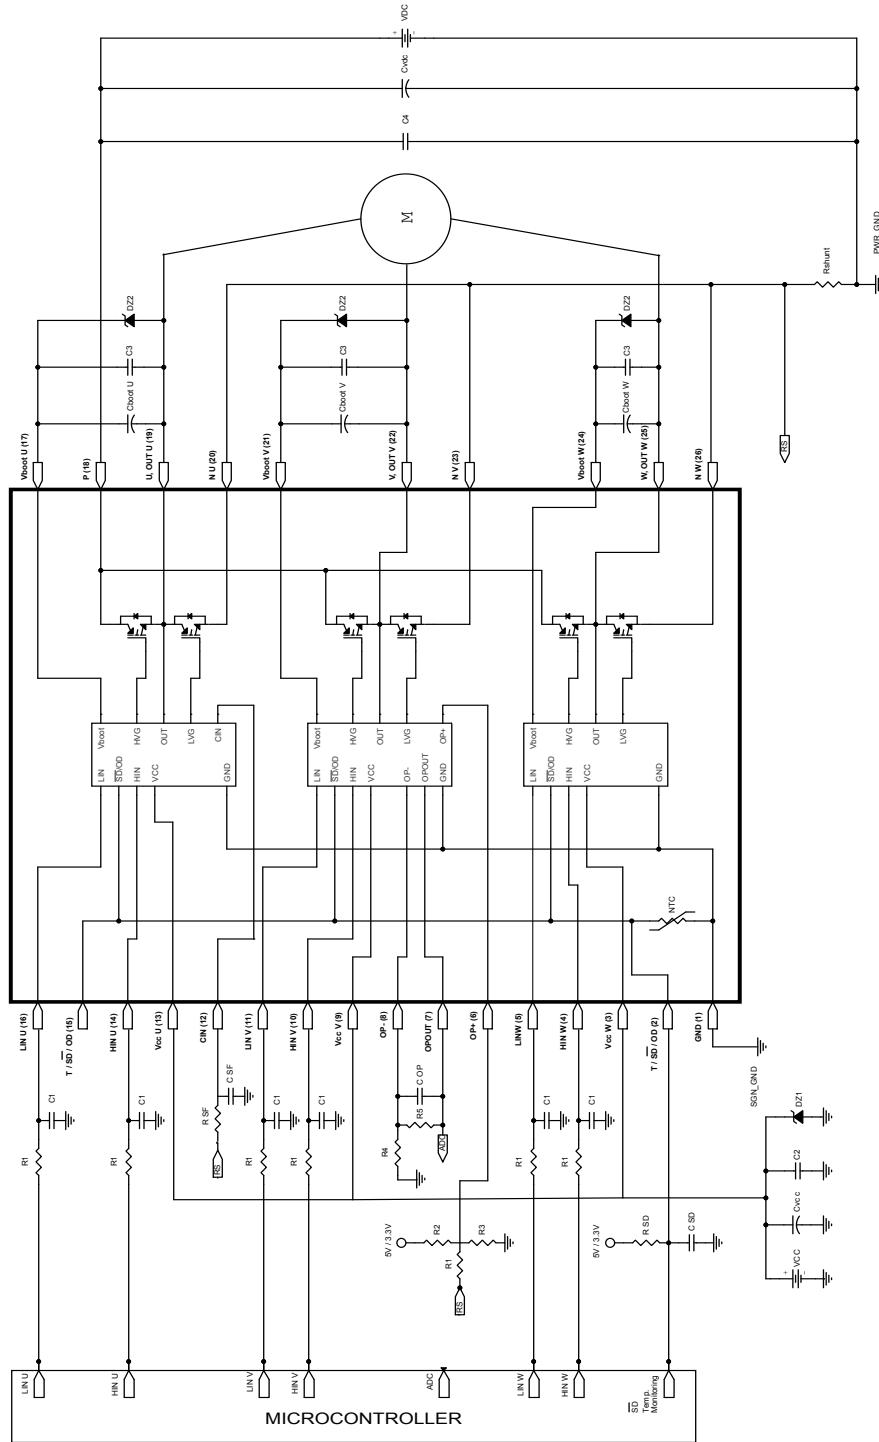

$R_{SD}$  and  $C_{SD}$  external circuitry must be designed to ensure  $V_{on} < V_{il}$  &  $V_{off} > V_{ih}$

Please refer to AN4966 for further details.

\*  $R_{NTC}$  to be considered only when the NTC is internally connected to the  $T/\bar{S}D/OD$  pin.

## 5.1

## Guidelines

- Input signals HIN, LIN are active high logic. A  $375\text{ k}\Omega$  (typ.) pull-down resistor is built-in for each input. To avoid input signal oscillation, the wiring of each input should be as short as possible, and the use of RC filters ( $R_1, C_1$ ) on each input signal is suggested. The filters should be with a time constant of about 100 ns and placed as close as possible to the IPM input pins.
- The use of a bypass capacitor  $C_{VCC}$  (aluminum or tantalum) can reduce the transient circuit demand on the power supply. Also, to reduce any high-frequency switching noise distributed on the power lines, a decoupling capacitor  $C_2$  (100 to 220 nF, with low ESR and low ESL) should be placed as close as possible to the  $V_{CC}$  pin and in parallel with the bypass capacitor.
- The use of an RC filter ( $R_{SF}, C_{SF}$ ) is recommended to prevent protection circuit malfunction. The time constant ( $R_{SF} \times C_{SF}$ ) should be set to 1  $\mu\text{s}$  and the filter must be placed as close as possible to the  $C_{IN}$  pin.
- The  $\overline{SD}$  is an input/output pin (open-drain type if it is used as output). A built-in thermistor NTC is internally connected between the  $\overline{SD}$  pin and GND. The voltage  $V_{SD-GND}$  decreases as the temperature increases, due to the pull-up resistor  $R_{SD}$ . In order to keep the voltage always higher than the high-level logic threshold, the pull-up resistor should be set to 1  $\text{k}\Omega$  or 2.2  $\text{k}\Omega$  for 3.3 V or 5 V MCU power supply, respectively. The capacitor  $C_{SD}$  of the filter on  $\overline{SD}$  should be fixed no higher than 3.3 nF in order to assure the  $\overline{SD}$  activation time  $\tau_A \leq 500\text{ ns}$ . Besides, the filter should be placed as close as possible to the  $\overline{SD}$  pin.
- The decoupling capacitor  $C_3$  (from 100 to 220 nF, ceramic with low ESR and low ESL), in parallel with each  $C_{boot}$ , filters high-frequency disturbance. Both  $C_{boot}$  and  $C_3$  (if present) should be placed as close as possible to the U, V, W and  $V_{boot}$  pins. Bootstrap negative electrodes should be connected to U, V, W terminals directly and separated from the main output wires.
- To avoid overvoltage on the  $V_{CC}$  pin, a Zener diode (Dz1) can be used. Similarly on the  $V_{boot}$  pin, a Zener diode (Dz2) can be placed in parallel with each  $C_{boot}$ .
- The use of the decoupling capacitor  $C_4$  (100 to 220 nF, with low ESR and low ESL) in parallel with the electrolytic capacitor  $C_{VDC}$  is useful to prevent surge destruction. Both capacitors  $C_4$  and  $C_{VDC}$  should be placed as close as possible to the IPM ( $C_4$  has priority over  $C_{VDC}$ ).
- By integrating an application-specific type HVIC inside the module, direct coupling to the MCU terminals without an opto-couplers is possible.
- Low-inductance shunt resistors have to be used for phase leg current sensing.
- In order to avoid malfunctions, the wiring on N pins, the shunt resistor and  $PWR\_GND$  should be as short as possible.
- The connection of  $SGN\_GND$  to  $PWR\_GND$  on one point only (close to the shunt resistor terminal) can reduce the impact of power ground fluctuation.

These guidelines ensure the specifications of the device for application designs. For further details, please refer to the relevant application note.
