# **ON Semiconductor**®

# To learn more about ON Semiconductor, please visit our website at <u>www.onsemi.com</u>

Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (\_), the underscore (\_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (\_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at <a href="https://www.onsemi.com">www.onsemi.com</a>. Please email any questions regarding the system integration to <a href="https://www.onsemi.com">Fairchild\_questions@onsemi.com</a>.

SEMICONDUCTOR

# 74VCX16373 Low Voltage 16-Bit Transparent Latch with 3.6V Tolerant Inputs and Outputs

#### **General Description**

The VCX16373 contains sixteen non-inverting latches with 3-STATE outputs and is intended for bus oriented applications. The device is byte controlled. The flip-flops appear to be transparent to the data when the Latch Enable (LE) is HIGH. When LE is LOW, the data that meets the setup time is latched. Data appears on the bus when the Output Enable ( $\overline{OE}$ ) is LOW. When  $\overline{OE}$  is HIGH, the outputs are in a high impedance state.

The 74VCX16373 is designed for low voltage (1.2V to 3.6V)  $V_{CC}$  applications with I/O compatibility up to 3.6V.

The 74VCX16373 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

#### Features

- 1.2V to 3.6V V<sub>CC</sub> supply operation
- 3.6V tolerant inputs and outputs
- t<sub>PD</sub> (I<sub>n</sub> to O<sub>n</sub>)

3.0 ns max for 3.0V to 3.6V V<sub>CC</sub>

Power-off high impedance inputs and outputs

October 1997

Revised June 2005

- Support live insertion and withdrawal (Note 1)
- Static Drive (I<sub>OH</sub>/I<sub>OL</sub>) ±24 mA @ 3.0V V<sub>CC</sub>
- Uses proprietary noise/EMI reduction circuitry
- Latch-up performance exceeds 300 mA
- ESD performance:
  - Human body model > 2000V Machine model > 200V
- Also packaged in plastic Fine-Pitch Ball Grid Array (FBGA) (Preliminary)

Note 1: To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pull-up resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

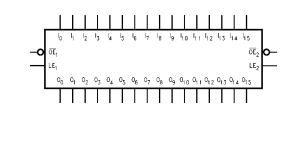

## **Ordering Code:**

Order Number	Package Number	Package Description
74VCX16373G (Note 2)(Note 3)	BGA54A (Preliminary)	54-Ball Fine-Pitch Ball Grid Array (FBGA), JEDEC MO-205, 5.5mm Wide
74VCX16373MTD (Note 3)	MTD48	48-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide

Note 2: Ordering Code "G" indicates Trays.

Note 3: Devices also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

#### **Functional Description**

The 74VCX16373 contains sixteen edge D-type latches with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of the other. Control pins can be shorted together to obtain full 16-bit operation. The following description applies to each byte. When the Latch Enable (LE<sub>n</sub>) input is HIGH, data on the  ${\rm I}_{\rm n}$  enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time

its I input changes. When  $LE_n$  is LOW, the latches store information that was present on the l inputs a setup time preceding the HIGH-to-LOW transition on  $LE_n$ . The 3-STATE outputs are controlled by the Output Enable  $(\overline{OE}_n)$  input. When  $\overline{OE}_n$  is LOW the standard outputs are in the 2-state mode. When  $\overline{\text{OE}}_n$  is HIGH, the standard outputs are in the high impedance mode but this does not interfere

#### Logic Diagram

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

## Absolute Maximum Ratings(Note 4)

Supply Voltage (V <sub>CC</sub> )	-0.5V to +4.6V
DC Input Voltage (VI)	-0.5V to +4.6V
Output Voltage (V <sub>O</sub> )	
Outputs 3-STATED	-0.5V to +4.6V
Outputs Active (Note 5)	–0.5V to V <sub>CC</sub> +0.5V
DC Input Diode Current ( $I_{IK}$ ) $V_I < 0V$	–50 mA
DC Output Diode Current (I <sub>OK</sub> )	
$V_{O} < 0V$	–50 mA
$V_{O} > V_{CC}$	+50 mA
DC Output Source/Sink Current	
(I <sub>OH</sub> /I <sub>OL</sub> )	±50 mA
DC V <sub>CC</sub> or GND Current per	
Supply Pin (I <sub>CC</sub> or GND)	±100 mA
Storage Temperature Range ( $T_{STG}$ )	-65°C to +150°C

Recommended Operatin Conditions (Note 6)	g
Power Supply	
Operating	1.2V to 3.6V
Input Voltage	-0.3V to +3.6V
Output Voltage (V <sub>O</sub> )	
Output in Active States	0.0V to $V_{CC}$
Output in "OFF" State	0.0V to 3.6V
Output Current in I <sub>OH</sub> /I <sub>OL</sub>	
$V_{CC} = 3.0V$ to 3.6V	±24 mA
$V_{CC} = 2.3V$ to 2.7V	±18 mA
V <sub>CC</sub> = 1.65V to 2.3V	±6 mA
$V_{CC} = 1.4V$ to 1.6V	±2 mA
V <sub>CC</sub> = 1.2V	±100 mA
Free Air Operating Temperature (T <sub>A</sub> )	-40°C to +85°C

Minimum Input Edge Rate ( $\Delta t/\Delta V$ )

#### $V_{IN} = 0.8V$ to 2.0V, $V_{CC} = 3.0V$ 10 ns/V

Note 4: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 5:  $\mathrm{I}_\mathrm{O}$  Absolute Maximum Rating must be observed.

Note 6: Floating or unused inputs must be held HIGH or LOW.
