ISOLATION CHARACTERISTICS

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

2. Test voltage must be applied within dv/dt rating.
3. This is static dv/dt. Commutating dv/dt is function of the load−driving thyristor(s) only.
4. All devices are guaranteed to trigger at an I_F value of less than or equal to the max I_{FT} specification. For optimum operation over temperature and lifetime of the device, the LED should be biased with an I_F that is at least 50% higher than the maximum I_{FT} specification. The I_{FT} should not exceed the absolute maximum rating of 60 mA. Example: For FODM3053M, the minimum I_F bias should be 5 mA x 150% = 7.5 mA.

TYPICAL APPLICATION INFORMATION

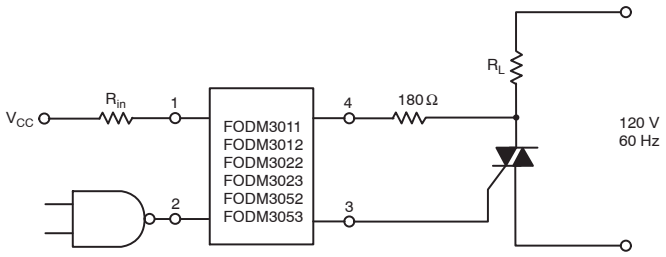

Figure 8. Resistive Load

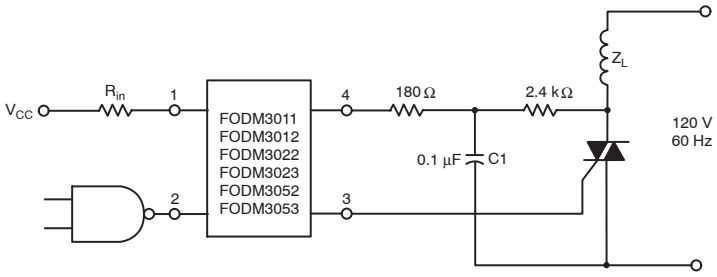

Figure 9. Inductive Load with Sensitive Gate Triac (IGT ≤ 15 mA)

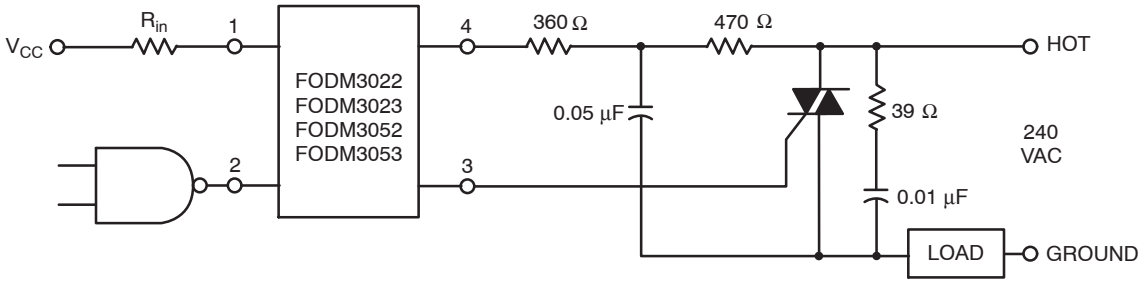

In this circuit the “hot” side of the line is switched and the load connected to the cold or ground side. The 39 Ω resistor and 0.01 μF capacitor are for snubbing of the trisc, and the 470 Ω resistor and 0.05 μF capacitor are for snubbing the coupler. These components may or may not be necessary depending upon the particular and load used.
