The MC74VHC373/MC74VHCT373A is an advanced high speed CMOS octal latch with 3−state output fabricated with silicon gate CMOS technology. The device achieves high speed operation similar to equivalent Bipolar Schottky TTL while maintaining CMOS low power dissipation.

The MC74VHC373/MC74VHCT373A is an 8−bit D−type latch controlled by a latch enable input and an output enable input. When the output enable is high, the 8 outputs are in high impedance state.

The MC74VHC373 inputs are compatible with standard CMOS levels while the MC74VHCT373A inputs are compatible with TTL levels. The MC74VHCT373A can be used as a level converter for interfacing 3.3 V to 5.0 V, because it has full 5.0 V CMOS level output swings.

The internal circuit is composed of three stages, including a buffer output which provides high noise immunity and stable output. The MC74VHC373 and MC74VHCT373A input structures tolerate voltages up to 5.5 V, allowing the interface of 5 V systems to 3 V systems.

The MC74VHCT373A output structures provide protection when V_{CC} = 0 V. These output structures help prevent device destruction caused by supply voltage − input/output voltage mismatch, battery backup, hot insertion, etc.
