- In the event a problem which may affect industrial property or any other rights of us or a third party is encountered during the use of information described in these circuit, we shall not be liable for any such problem, nor grant a license therefore.

Note

1. Please use this IC within the stated absolute maximum ratings.
The IC is liable to malfunction should the ratings be exceeded.
2. Due to restrictions on the package power dissipation, the output current value may not be satisfied.
Attention should be paid to the power dissipation of the package when the output current is large or the voltage between Iinput and Output is high.
3. The output capacitor is required between output and GND to prevent oscillation.
4. The ESR of capacitor must be defined in ESR stability area.
It is possible to use a ceramic capacitor without ESR resistance for output.
The ceramic capacitor must be used more than 0.47 μ F and B temperature characteristics.
5. The wire of VDD and GND is required to print full ground plane for noise and stability.
6. The input capacitor must be connected a distance of less than 1cm from input pin.
7. It is able to oscillation when you use the capacitor with intense capacitance change such as micro.
Please evaluate IC in the set.
8. In case the output voltage is above the input voltage, the overcurrent flow by internal parastic diode from output to input.
In such application, the external bypass diode must be connected between output and input pin.
9. This IC will limit the output current with the overcurrent protection circuit when the overcurrent and the output do short-circuit.
However, IC generates heat because of the substrate and use conditions and there is a possibility of destroying it exceeding a permissible loss.
The characteristic changes depending on the substrate condition.
Please evaluate IC in the set.

About Power Dissipation

The Power dissipation change if board to mount IC change because radiative heat fix at board.
It is reference data below, Evaluate IC in the set.

■ SC-82ABB

1. PC Board of glass epoxy

Board size 110mm×40mm t=0.8mm

Power dissipation 330mW Ta=25℃

2. JEDEC51-7 standard (4 layer FR-4 board)

Board size 114.3mm×76.2mm t=1.6mm Copper foil area 80%

Power dissipation 650mW Ta=25℃

■ SOT-25A

1. PC Board of glass epoxy

Board size 60mm×40mm t=1.6mm Copper foil area 60%

Power dissipation 350mW Ta=25℃

2. JEDEC51-7 standard (4 layer FR-4 board)

Board size 114.3mm×76.2mm t=1.6mm Copper foil area 80%

Power dissipation 700mW Ta=25℃

It is recommended to layout the VIA for heat radiation in the GND pattern of reverse (of IC) when there is the GND pattern in the inner layer (in using multiplayer substrate).
By increasing these copper foil pattern area of PCB, Power dissipation improves.

About Power Dissipation

The thermal shut down circuit is not composed in MM3416.

So IC is able to be destroyed if the IC's heat more than power dissipation when output resistance is half short($1.8\sim 3.6\Omega$).

Evaluate IC in the set.

The current limit characteristic of MM3416($V_o=4.0V$) is shown below.

Output voltage is about 1.0V when output is half short($1.8\sim 3.6\Omega$).

Be care of destruction by great heat in area that Output voltage is about 1.0V.

The current limit operate in this area (half short $1.8\sim 3.6\Omega$).
Be care of IC's heat is great.
