

PSoC™ 4 MCU with AIROC™ Bluetooth® LE

Based on Arm® Cortex®-M0

General description

PSoC™ 4 is a scalable and reconfigurable platform architecture for a family of programmable embedded system controllers with an Arm® Cortex®-M0 CPU. It combines programmable and reconfigurable analog and digital blocks with flexible automatic routing. The PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE product family, based on this platform, is a combination of a microcontroller with an integrated Bluetooth® Low Energy, also known as Bluetooth® Smart, radio and subsystem (BLESS), compliant with Bluetooth® 4.2 specifications. The other features include digital programmable logic, high-performance analog-to-digital conversion (ADC), opamps with comparator mode, and standard communication and timing peripherals. The PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE products will be fully upward compatible with members of the PSoC™ 4 platform for new applications and design needs. The programmable analog and digital subsystems allow flexibility and in-field tuning of the design.

Features

- 32-bit MCU subsystem
 - 24-MHz Arm® Cortex®-M0 CPU with single-cycle multiply
 - Up to 256 KB of flash with read accelerator
 - Up to 32 KB of SRAM
- Bluetooth® LE radio and subsystem
 - 2.4-GHz RF transceiver with Bluetooth® LE 4.2 support and 50-Ω antenna drive
 - Digital PHY
 - Link layer engine supporting master and slave modes
 - RF output power: -18 dBm to +3 dBm
 - RX sensitivity: -89 dBm
 - RX current: 16.4 mA
 - TX current: 15.6 mA at 0 dBm
 - Received Signal Strength Indication (RSSI): 1-dB resolution
- Programmable analog
 - Two opamps with reconfigurable high-drive external and high-bandwidth internal drive, comparator modes, and ADC input buffering capability; can operate in Deep-Sleep mode.
 - 12-bit, 806 ksps SAR ADC with differential and single-ended modes; channel sequencer with signal averaging
 - Two current DACs (IDACs) for general-purpose or capacitive sensing applications on any pin
 - Two low-power comparators that operate in Deep-Sleep mode
- Power management
 - Active mode: 1.7 mA at 3-MHz flash program execution
 - Deep-Sleep mode: 1.3 µA with watch crystal oscillator (WCO) on
 - Hibernate mode: 150 nA with RAM retention
 - Stop mode: 60 nA
- Capacitive sensing
 - Capacitive sigma-delta (CSD) provides best-in-class SNR (> 5:1) and liquid tolerance
 - Infineon-supplied software component makes capacitive-sensing design easy
 - Automatic hardware-tuning algorithm (SmartSense)
- Segment LCD drive
 - LCD drive supported on all pins (common or segment)
 - Operates in Deep-Sleep mode with four bits per pin memory

Features

- Serial communication
 - Two independent runtime reconfigurable serial communication blocks (SCBs) with reconfigurable I²C, SPI, or UART functionality
- Timing and pulse-width modulation
 - Four 16-bit timer, counter, pulse-width modulator (TCPWM) blocks
 - Center-aligned, Edge, and Pseudo-random modes
 - Comparator-based triggering of Kill signals for motor drive and other high-reliability digital logic applications
- Up to 36 programmable GPIOs
 - 7 mm × 7 mm 56-pin QFN package
 - 3.51 mm × 3.91 mm 68-ball CSP package
 - Any GPIO pin can be CAPSENSE™, LCD, analog, or digital
 - Two overvoltage-tolerant (OVT) pins; drive modes, strengths, and slew rates are programmable
- PSoC™ Creator design environment
 - Integrated design environment (IDE) provides schematic design entry and build (with analog and digital automatic routing)
 - API components for all fixed-function and programmable peripherals
- Industry-standard tool compatibility
 - After schematic entry, development can be done with Arm®-based industry-standard development tools

Block diagram

Block diagram

The PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE devices include extensive support for programming, testing, debugging, and tracing both hardware and firmware.

The Arm® SWD interface supports all programming and debug features of the device.

Complete debug-on-chip functionality enables full-device debugging in the final system using the standard production device. It does not require special interfaces, debugging pods, simulators, or emulators. Only the standard programming connections are required to fully support debugging.

The PSoC™ Creator IDE provides fully integrated programming and debugging support for the PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE devices. The SWD interface is fully compatible with industry-standard third-party tools. With the ability to disable debug features, very robust flash protection, and allowing customer-proprietary functionality to be implemented in on-chip programmable blocks, the PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE family provides a level of security not possible with multi-chip application solutions or with microcontrollers.

Debug circuits are enabled by default and can only be disabled in firmware. If not enabled, the only way to re-enable them is to erase the entire device, clear flash protection, and reprogram the device with the new firmware that enables debugging.

Additionally, all device interfaces can be permanently disabled (device security) for applications concerned about phishing attacks due to a maliciously reprogrammed device or attempts to defeat security by starting and interrupting flash programming sequences. Because all programming, debug, and test interfaces are disabled when maximum device security is enabled, PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE with device security enabled may not be returned for failure analysis. This is a trade-off the PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE allows the customer to make.

1 Functional definition

1.1 CPU and memory subsystem

1.1.1 CPU

The Cortex®-M0 CPU in the PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating. It mostly uses 16-bit instructions and executes a subset of the Thumb-2 instruction set. This enables fully compatible binary upward migration of the code to higher-performance processors such as Cortex®-M3 and M4. The implementation includes a hardware multiplier that provides a 32-bit result in one cycle. It includes a nested vectored interrupt controller (NVIC) block with 32 interrupt inputs and a wakeup interrupt controller (WIC). The WIC can wake the processor up from the Deep-Sleep mode, allowing power to the main processor to be switched off when the chip is in the Deep-Sleep mode. The Cortex®-M0 CPU provides a nonmaskable interrupt (NMI) input, which is made available to the user when it is not in use for system functions requested by the user.

The CPU also includes an SWD interface, which is a 2-wire form of JTAG; the debug configuration used for PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE has four break-point (address) comparators and two watchpoint (data) comparators.

1.1.2 Flash

The PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE device has a 128/256-KB flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The flash block is designed to deliver with 0 WS access time at 24 MHz. The flash accelerator delivers 85% of single-cycle SRAM access performance on average. Part of the flash module can be used to emulate EEPROM operation if required.

During flash erase and programming operations (the maximum erase and program time is 20 ms per row), the Internal Main Oscillator (IMO) will be set to 48 MHz for the duration of the operation. This also applies to the emulated EEPROM. System design must take this into account because peripherals operating from different IMO frequencies will be affected. If it is critical that peripherals continue to operate with no change during flash programming, always set the IMO to 48 MHz and derive peripheral clocks by dividing down from this frequency.

1.1.3 SRAM

SRAM memory is retained during Hibernate.

1.1.4 SROM

The 8-KB supervisory ROM contains a library of executable functions for flash programming. These functions are accessed through supervisory calls (SVC) and enable in-system programming of the flash memory.

1.2 System resources

1.2.1 Power system

The power system is described in detail in the “**Power**” section on page 26. It provides an assurance that the voltage levels are as required for the respective modes, and can either delay the mode entry (on power-on reset (POR), for example) until voltage levels are as required or generate resets (brownout detect (BOD)) or interrupts when the power supply reaches a particular programmable level between 1.8 V and 4.5 V (low-voltage detect (LVD)). PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE operates with a single external supply (1.71 V to 5.5 V without radio and 1.9 V to 5.5 V with radio). The device has five different power modes; transitions between these modes are managed by the power system. PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE provides Sleep, Deep-Sleep, Hibernate, and Stop low-power modes. See the *Technical Reference Manual* for more details.

1.2.2 Clock system

The PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE clock system is responsible for providing clocks to all subsystems that require clocks and for switching between different clock sources without glitching. In addition, the clock system ensures that no metastable conditions occur.

The clock system for PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE consists of the internal main oscillator (IMO), the internal low-speed oscillator (ILO), the 24-MHz external crystal oscillator (ECO) and the 32-kHz watch crystal oscillator (WCO). In addition, an external clock may be supplied from a pin.

1.2.3 IMO clock source

The IMO is the primary source of internal clocking in PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE. It is trimmed during testing to achieve the specified accuracy. Trim values are stored in nonvolatile latches (NVL). Additional trim settings from flash can be used to compensate for changes. The IMO default frequency is 24 MHz and it can be adjusted between 3 MHz to 48 MHz in steps of 1 MHz. The IMO tolerance with Infineon-provided calibration settings is $\pm 2\%$.

1.2.4 ILO clock source

The ILO is a very-low-power oscillator, which is primarily used to generate clocks for the peripheral operation in the Deep-Sleep mode. ILO-driven counters can be calibrated to the IMO to improve accuracy. A software component is provided, which does the calibration.

1.2.5 External crystal oscillator (ECO)

The ECO is used as the active clock for the Bluetooth® LE SS to meet the ± 50 -ppm clock accuracy of the Bluetooth® 4.2 Specification. PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE includes a tunable load capacitor to tune the crystal-clock frequency by measuring the actual clock frequency. The high-accuracy ECO clock can also be used as a system clock.

1.2.6 Watch crystal oscillator (WCO)

The WCO is used as the sleep clock for the BLESS to meet the ± 500 -ppm clock accuracy of the Bluetooth® 4.2 Specification. The sleep clock provides an accurate sleep timing and enables wakeup at the specified advertisement and connection intervals. The WCO output can be used to realize the real-time clock (RTC) function in firmware.

1.2.7 Watchdog timer

A watchdog timer is implemented in the clock block running from the ILO or from the WCO; this allows the watchdog operation during Deep-Sleep and generates a watchdog reset if not serviced before the timeout occurs. The watchdog reset is recorded in the Reset Cause register. With the WCO and firmware, an accurate real-time clock (within the bounds of the 32-kHz crystal accuracy) can be realized.

Figure 2 PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE MCU clocking architecture

The HFCLK signal can be divided down (see [Figure 2](#)) to generate synchronous clocks for the UDBs, and the analog and digital peripherals. There are a total of 12 clock dividers for PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE: ten with 16-bit divide capability and two with 16.5-bit divide capability. This allows the generation of 16 divided clock signals, which can be used by peripheral blocks. The analog clock leads the digital clocks to allow analog events to occur before the digital clock-related noise is generated. The 16-bit and 16.5-bit dividers allow a lot of flexibility in generating fine-grained frequency values and are fully supported in PSoC™ Creator.

1.2.8 Reset

PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE can be reset from a variety of sources including a software reset. Reset events are asynchronous and guarantee reversion to a known state. The reset cause is recorded in a register, which is sticky through resets and allows the software to determine the cause of the reset. An XRES pin is reserved for an external reset to avoid complications with the configuration and multiple pin functions during power-on or reconfiguration. The XRES pin has an internal pull-up resistor that is always enabled.

1.2.9 Voltage reference

The PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE reference system generates all internally required references. A one-percent voltage reference spec is provided for the 12-bit ADC. To allow better signal-to-noise ratios (SNR) and better absolute accuracy, it is possible to bypass the internal reference using a REF pin or use an external reference for the SAR. See [Table 21](#) for details.

1.3 Bluetooth® smart radio and subsystem

PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE incorporates a Bluetooth® Smart subsystem that contains the Physical Layer (PHY) and Link Layer (LL) engines with an embedded AES-128 security engine. The physical layer consists of the digital PHY and the RF transceiver that transmits and receives GFSK packets at 1 Mbps over a 2.4-GHz ISM band, which is compliant with Bluetooth® Smart Bluetooth® Specification 4.2. The baseband controller is a composite hardware and firmware implementation that supports both master and slave modes. Key protocol elements, such as HCI and link control, are implemented in firmware. Time-critical functional blocks, such as encryption, CRC, data whitening, and access code correlation, are implemented in hardware (in the LL engine).

The RF transceiver contains an integrated balun, which provides a single-ended RF port pin to drive a 50-Ω antenna via a matching/filtering network. In the receive direction, this block converts the RF signal from the antenna to a digital bit stream after performing GFSK demodulation. In the transmit direction, this block performs GFSK modulation and then converts a digital baseband signal to a radio frequency before transmitting it to air through the antenna.

The Bluetooth® smart radio and subsystem (BLESS) requires a 1.9-V minimum supply (the range varies from 1.9 V to 5.5 V).

Key features of BLESS are as follows:

- Master and slave single-mode protocol stack with logical link control and adaptation protocol (L2CAP), attribute (ATT), and security manager (SM) protocols
- API access to generic attribute profile (GATT), generic access profile (GAP), and L2CAP
- L2CAP connection-oriented channel
- GAP features
 - Broadcaster, Observer, Peripheral, and Central roles
 - Security mode 1: Level 1, 2, 3, and 4
 - Security mode 2: Level 1 and 2
 - User-defined advertising data
 - Multiple bond support
- GATT features
 - GATT client and server
 - Supports GATT sub-procedures
 - 32-bit universally unique identifier (UUID)
- Security Manager (SM)
 - Pairing methods: Just works, Passkey Entry, Out of Band, and Numeric Comparison
 - Authenticated man-in-the-middle (MITM) protection and data signing
 - LE secure connections (Bluetooth® 4.2 feature)
- Link layer (LL)
 - Master and Slave roles
 - 128-bit AES engine
 - Encryption
 - Low-duty cycle advertising
 - LE ping
 - LE data packet length extension (Bluetooth® 4.2 feature)
 - Link layer privacy (with extended scanning filter policy, Bluetooth® 4.2 feature)
- Supports all SIG-adopted Bluetooth® LE profiles

1.4 Analog blocks

1.4.1 12-bit SAR ADC

The 12-bit, 806 ksp/s SAR ADC can operate at a maximum clock rate of 14.508 MHz and requires a minimum of 18 clocks at that frequency to do a 12-bit conversion.

The block functionality is augmented for the user by adding a reference buffer to it (trimmable to $\pm 1\%$) and by providing the choice of three internal voltage references, V_{DD} , $V_{DD}/2$, and V_{REF} (nominally 1.024 V), as well as an external reference through a REF pin. The sample-and-hold (S/H) aperture is programmable; it allows the gain bandwidth requirements of the amplifier driving the SAR inputs, which determine its settling time, to be relaxed if required. System performance will be 65 dB for true 12-bit precision if appropriate references are used and system noise levels permit it. To improve the performance in noisy conditions, it is possible to provide an external bypass (through a fixed pin location) for the internal reference amplifier.

The SAR is connected to a fixed set of pins through an 8-input sequencer. The sequencer cycles through the selected channels autonomously (sequencer scan) and does so with zero switching overhead (that is, the aggregate sampling bandwidth is equal to 806 ksp/s whether it is for a single channel or distributed over several channels). The sequencer switching is effected through a state machine or through firmware-driven switching. A feature provided by the sequencer is the buffering of each channel to reduce CPU interrupt-service requirements. To accommodate signals with varying source impedances and frequencies, it is possible to have different sample times programmable for each channel. Also, the signal range specification through a pair of range registers (low- and high-range values) is implemented with a corresponding out-of-range interrupt if the digitized value exceeds the programmed range; this allows fast detection of out-of-range values without having to wait for a sequencer scan to be completed and the CPU to read the values and check for out-of-range values in software.

The SAR is able to digitize the output of the on-chip temperature sensor for calibration and other temperature-dependent functions. The SAR is not available in Deep-Sleep and Hibernate modes as it requires a high-speed clock (up to 18 MHz). The SAR operating range is 1.71 V to 5.5 V.

Figure 3 SAR ADC system diagram

1.4.2 Opamps (CTBm block)

PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE has two opamps with comparator modes, which allow most common analog functions to be performed on-chip, eliminating external components. PGAs, voltage buffers, filters, transimpedance amplifiers, and other functions can be realized with external passives saving power, cost, and space. The on-chip opamps are designed with enough bandwidth to drive the sample-and-hold circuit of the ADC without requiring external buffering.

1.4.3 Temperature sensor

PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE has an on-chip temperature sensor. This consists of a diode, which is biased by a current source that can be disabled to save power. The temperature sensor is connected to the ADC, which digitizes the reading and produces a temperature value by using a Infineon-supplied software that includes calibration and linearization.

1.4.4 Low-power comparators

PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE has a pair of low-power comparators, which can also operate in Deep-Sleep and Hibernate modes. This allows the analog system blocks to be disabled while retaining the ability to monitor external voltage levels during low-power modes. The comparator outputs are normally synchronized to avoid metastability unless operating in an asynchronous power mode (Hibernate) where the system wake-up circuit is activated by a comparator-switch event.

1.5 Fixed-function digital

1.5.1 Timer/counter/PWM block

The timer/counter/PWM block consists of four 16-bit counters with user-programmable period length. There is a capture register to record the count value at the time of an event (which may be an I/O event), a period register which is used to either stop or auto-reload the counter when its count is equal to the period register, and compare registers to generate compare value signals which are used as PWM duty cycle outputs. The block also provides true and complementary outputs with programmable offset between them to allow the use as deadband programmable complementary PWM outputs. It also has a kill input to force outputs to a predetermined state; for example, this is used in motor-drive systems when an overcurrent state is indicated and the PWMs driving the FETs need to be shut off immediately with no time for software intervention.

1.5.2 Serial Communication Blocks (SCB)

PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE has two SCBs, each of which can implement an I²C, UART, or SPI interface.

I²C mode: The hardware I²C block implements a full multi-master and slave interface (it is capable of multimaster arbitration). This block is capable of operating at speeds of up to 1 Mbps (Fast-Mode Plus) and has flexible buffering options to reduce the interrupt overhead and latency for the CPU. It also supports EzI²C that creates a mailbox address range in the memory of PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE and effectively reduces the I²C communication to reading from and writing to an array in the memory. In addition, the block supports an 8-deep FIFO for receive and transmit, which, by increasing the time given for the CPU to read the data, greatly reduces the need for clock stretching caused by the CPU not having read the data on time. The FIFO mode is available in all channels and is very useful in the absence of DMA.

The I²C peripheral is compatible with I²C Standard-mode, Fast-mode, and Fast-Mode Plus devices as defined in the NXP I²C-bus specification and user manual (UM10204). The I²C bus I/O is implemented with GPIOs in open-drain modes.

SCB1 is fully compliant with Standard-mode (100 kHz), Fast-mode (400 kHz), and Fast-Mode Plus (1 MHz) I²C signaling specifications when routed to GPIO pins P5.0 and P5.1, except for hot swap capability during I²C active communication. The remaining GPIOs do not meet the hot-swap specification (V_{DD} off; draw < 10- μ A current) for Fast mode and Fast-Mode Plus, I_{OL} spec (20 mA) for Fast-Mode Plus, hysteresis spec ($0.05 \times V_{DD}$) for Fast mode and Fast-Mode Plus, and minimum fall-time spec for Fast mode and Fast-Mode Plus.

- GPIO cells, including P5.0 and P5.1, cannot be hot-swapped or powered up independent of the rest of the I²C system.
- The GPIO pins P5.0 and P5.1 are overvoltage-tolerant but cannot be hot-swapped or powered up independent of the rest of the I²C system.
- Fast-Mode Plus has an I_{OL} specification of 20 mA at a V_{OL} of 0.4 V. The GPIO cells can sink a maximum of 8 mA I_{OL} with a V_{OL} maximum of 0.6 V.

- Fast mode and Fast-Mode Plus specify minimum Fall times, which are not met with the GPIO cell; the Slow-Strong mode can help meet this spec depending on the bus load.

UART mode: This is a full-feature UART operating at up to 1 Mbps. It supports automotive single-wire interface (LIN), infrared interface (IrDA), and SmartCard (ISO7816) protocols, all of which are minor variants of the basic UART protocol. In addition, it supports the 9-bit multiprocessor mode that allows the addressing of peripherals connected over common RX and TX lines. Common UART functions such as parity error, break detect, and frame error are supported. An 8-deep FIFO allows much greater CPU service latencies to be tolerated.

SPI mode: The SPI mode supports full Motorola SPI, TI Secure Simple Pairing (SSP) (essentially adds a start pulse that is used to synchronize SPI Codecs), and National Microwire (half-duplex form of SPI). The SPI block can use the FIFO for transmit and receive.

1.6 GPIO

PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE has 36 GPIOs. The GPIO block implements the following:

- Eight drive-strength modes:
 - Analog input mode (input and output buffers disabled)
 - Input only
 - Weak pull-up with strong pull-down
 - Strong pull-up with weak pull-down
 - Open drain with strong pull-down
 - Open drain with strong pull-up
 - Strong pull-up with strong pull-down
 - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTTL)
- Pins 0 and 1 of Port 5 are overvoltage-tolerant Pins
- Individual control of input and output buffer enabling/disabling in addition to drive-strength modes
- Hold mode for latching the previous state (used for retaining the I/O state in Deep-Sleep and Hibernate modes)
- Selectable slew rates for dV/dt-related noise control to improve EMI

The pins are organized in logical entities called ports, which are 8-bit in width. During power-on and reset, the blocks are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix (HSIOM) is used to multiplex between various signals that may connect to an I/O pin. Pin locations for fixed-function peripherals are also fixed to reduce internal multiplexing complexity (these signals do not go through the DSI network). DSI signals are not affected by this and any pin may be routed to any UDB through the DSI network.

Data output and pin-state registers store, respectively, the values to be driven on the pins and the states of the pins themselves. Every I/O pin can generate an interrupt if so enabled and each I/O port has an interrupt request (IRQ) and interrupt service routine (ISR) vector associated with it (5 for PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE since it has 4.5 ports).

1.7 Special-function peripherals

1.7.1 LCD segment drive

PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE has an LCD controller, which can drive up to four commons and up to 32 segments. It uses full digital methods to drive the LCD segments requiring no generation of internal LCD voltages. The two methods used are referred to as digital correlation and PWM.

The digital correlation method modulates the frequency and levels of the common and segment signals to generate the highest RMS voltage across a segment to light it up or to keep the RMS signal zero. This method is good for STN displays but may result in reduced contrast with TN (cheaper) displays.

The PWM method drives the panel with PWM signals to effectively use the capacitance of the panel to provide the integration of the modulated pulse-width to generate the desired LCD voltage. This method results in higher power consumption but can result in better results when driving TN displays. LCD operation is supported during Deep-Sleep mode, refreshing a small display buffer (four bits; one 32-bit register per port).

1.7.2 CAPSENSE™

CAPSENSE™ is supported on all pins in PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE through a capacitive sigma-delta (CSD) block that can be connected to any pin through an analog mux bus that any GPIO pin can be connected to via an Analog switch. CAPSENSE™ function can thus be provided on any pin or group of pins in a system under software control. A component is provided for the CAPSENSE™ block to make it easy for the user.

The shield voltage can be driven on another mux bus to provide liquid-tolerance capability. Liquid tolerance is provided by driving the shield electrode in phase with the sense electrode to keep the shield capacitance from attenuating the sensed input.

The CAPSENSE™ block has two IDACs which can be used for general purposes if CAPSENSE™ is not being used (both IDACs are available in that case) or if CAPSENSE™ is used without liquid tolerance (one IDAC is available).

2 Pinouts

Table 1, **Table 2**, and **Table 3** show pin list for 56-pin QFN, 68-ball WLCSP, and 76-ball WLCSP packages of PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE respectively. Port 2 consists of the high-speed analog inputs for the SAR mux. All pins support CSD CAPSENSE™ and analog mux bus connections.

High-speed I/O matrix (HSIOM) is a group of high-speed switches that routes GPIOs to the resources inside the device. These resources include CAPSENSE™, TCPWMs, I²C, SPI, UART, and LCD. HSIOM_PORT_SELx are 32-bit-wide registers that control the routing of GPIOs. Each register controls one port; four dedicated bits are assigned to each GPIO in the port. This provides up to 16 different options for GPIO routing as shown in [Table 4](#).

Pinouts

The possible pin connections are shown for all analog and digital peripherals (except the radio, LCD, and CSD blocks, which were shown in [Table 1](#)). A typical system application connection diagram is shown in [Figure 4](#).

Figure 4 System application connection diagram

3 Power

The PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE device can be supplied from batteries with a voltage range of 1.9 V to 5.5 V by directly connecting to the digital supply (VDDD), analog supply (VDDA), and radio supply (VDDR) pins. Internal LDOs in the device regulate the supply voltage to the required levels for different blocks. The device has one regulator for the digital circuitry and separate regulators for radio circuitry for noise isolation. Analog circuits run directly from the analog supply (VDDA) input. The device uses separate regulators for Deep-Sleep and Hibernate (lowered power supply and retention) modes to minimize the power consumption. The radio stops working below 1.9 V, but the device continues to function down to 1.71 V without RF. Note that VDDR must be supplied whenever VDDD is supplied.

Bypass capacitors must be used from VDDx (x = A, D, or R) to ground. The typical practice for systems in this frequency range is to use a capacitor in the 1-μF range in parallel with a smaller capacitor (for example, 0.1 μF). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be simulated to design and obtain optimal bypassing.

Table 6 Power supply

Power supply	Bypass capacitors
VDDD	0.1-μF ceramic at each pin plus bulk capacitor 1 μF to 10 μF.
VDDA	0.1-μF ceramic at each pin plus bulk capacitor 1 μF to 10 μF.
VDDR	0.1-μF ceramic at each pin plus bulk capacitor 1 μF to 10 μF.
VCCD	1-μF ceramic capacitor at the VCCD pin.
VREF (optional)	The internal bandgap may be bypassed with a 1-μF to 10-μF capacitor.

4 Development support

The PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE family has a rich set of documentation, development tools, and online resources to assist you during your development process. See [PSoC™ 4 MCU with AIROC™ Bluetooth® LE](#) to find out more.

4.1 Documentation

A suite of documentation supports the PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE family to ensure that you can find answers to your questions quickly. This section contains a list of some of the key documents.

Software user guide: A step-by-step guide for using PSoC™ Creator. The software user guide shows you how the PSoC™ Creator build process works in detail, how to use source control with PSoC™ Creator, and much more.

Component datasheets: The flexibility of PSoC™ allows the creation of new peripherals (Components) long after the device has gone into production. Component datasheets provide all of the information needed to select and use a particular Component, including a functional description, API documentation, example code, and AC/DC specifications.

Application notes: PSoC™ application notes discuss a particular application of PSoC™ in depth; examples include creating standard and custom Bluetooth® LE profiles. Application notes often include example projects in addition to the application note document.

Technical reference manual (TRM): The TRM contains all the technical detail you need to use a PSoC™ device, including a complete description of all PSoC™ registers. The TRM is available in the Documentation section at [PSoC™ 4 MCU](#).

4.2 Online

In addition to print documentation, the PSoC™ forums connect you with fellow PSoC™ users and experts in PSoC™ from around the world, 24 hours a day, 7 days a week.

4.3 Tools

With industry standard cores, programming, and debugging interfaces, the PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE family is part of a development tool ecosystem. See the [PSoC™ Creator](#) for the latest information on the revolutionary, easy to use PSoC™ Creator IDE, supported third party compilers, programmers, debuggers, and development kits.

5 Electrical specifications

5.1 Absolute maximum ratings

Table 7 Absolute maximum ratings^[1]

Spec ID#	Parameter	Description	Min	Typ	Max	Unit	Details/ conditions
SID1	V _{DDD_ABS}	Analog, digital, or radio supply relative to V _{SS} (V _{SSD} = V _{SSA})	−0.5	–	6	V	Absolute max
SID2	V _{CCD_ABS}	Direct digital core voltage input relative to V _{SSD}	−0.5	–	1.95	V	Absolute max
SID3	V _{GPIO_ABS}	GPIO voltage	−0.5	–	V _{DD} +0.5	V	Absolute max
SID4	I _{GPIO_ABS}	Maximum current per GPIO	−25	–	25	mA	Absolute max
SID5	I _{GPIO_in- jection}	GPIO injection current, Max for V _{IH} > V _{DD} , and Min for V _{IL} < V _{SS}	−0.5	–	0.5	mA	Absolute max, current injected per pin
BID57	ESD_HBM	Electrostatic discharge human body model	2200 ^[2]	–	–	V	
BID58	ESD_CDM	Electrostatic discharge charged device model	500	–	–	V	
BID61	LU	Pin current for latch-up	−200	–	200	mA	

Note

- Usage above the absolute maximum conditions listed in [Table 7](#) may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods of time may affect device reliability. The maximum storage temperature is 150°C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below absolute maximum conditions but above normal operating conditions, the device may not operate to specification.
- This does not apply to the RF pins (ANT, XTALI, and XTALO). RF pins (ANT, XTALI, and XTALO) are tested for 500-V HBM.

5.2 Device level specifications

All specifications are valid for $-40^{\circ}\text{C} \leq T_A \leq 105^{\circ}\text{C}$, except where noted. Specifications are valid for 1.71 V to 5.5 V, except where noted.

Note

- It can take as much as 20 milliseconds to write to flash. During this time, the device should not be reset, or flash operations will be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.

6.1 Ordering code definitions

PSoC™ 4 devices follow the part numbering convention described in the following table. All fields are single-character alphanumeric (0, 1, 2, ..., 9, A, B, ..., Z) unless stated otherwise.

The part numbers are of the form CY8C4ABCDEF-XYZ where the fields are defined as follows.

Example

CY8C

4: PSoC™ 4

1: 4100 Family

2: 24 MHz

8: 256 KB

LQ: QFN

FN: WLCSP

I: Industrial

Q: Extended Industrial

BL483: Attributes

The field values are listed in the following table.

Field	Description	Values	Meaning
CY8C	Cypress prefix		
4	Architecture	4	PSoC™ 4
A	Family within architecture	1	PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE family
B	CPU speed	2	24 MHz
C	Flash capacity	7, 8	128KB, 256KB respectively
DE	Package code	FN	WLCSP
		LQ	QFN
F	Temperature range	I	Industrial 85°C
		Q	Extended Industrial 105°C
XYZ	Attributes code	BL400-BL499	Bluetooth® 4.1 compliant
		BL500-BL599	Bluetooth® 4.2 compliant

Packaging

Figure 5 56-pin QFN 7 mm × 7 mm × 0.6 mm

The center pad on the QFN package must be connected to ground (V_{SS}) for the proper operation of the device.

7.1 WLCSP compatibility

The PSoC™ 4XXX-BLE family has products with 128 KB (16KB SRAM) and 256 KB (32KB SRAM) Flash. Package pin-outs and sizes are identical for the 56-pin QFN package but are different in one dimension for the 68-ball WLCSP.

The 256KB Flash product has an extra column of balls which are required for mechanical integrity purposes in the Chip-Scale package. With consideration for this difference, the land pattern on the PCB may be designed such that either product may be used with no change to the PCB design.

Figure 6 shows the 128KB and 256 KB Flash CSP packages.

Figure 6 128-KB and 256-KB Flash CSP packages

The rightmost column of (all NC, No Connect) balls in the 256K Bluetooth® LE WLCSP is for mechanical integrity purposes. The package is thus wider (3.2 mm versus 2.8 mm). All other dimensions are identical. Infineon will provide layout symbols for printed circuit board (PCB) layout.

The scheme in **Figure 6** is implemented to design the PCB for the 256K Bluetooth® LE package with the appropriate space requirements thus allowing use of either package at a later time without redesigning the PCB.

TTL	transistor-transistor logic
TX	transmit
UART	Universal Asynchronous Transmitter Receiver, a communications protocol
WOL	write once latch, see also NVL
WRES	watchdog timer reset
XRES	external reset I/O pin
XTAL	crystal
UDB	universal digital block
USB	Universal Serial Bus
USBIO	USB input/output, PSoC™ pins used to connect to a USB port
VDAC	voltage DAC, see also DAC, IDAC
WDT	watchdog timer

9 Document conventions

9.1 Units of measure

Table 63 Units of measure

Symbol	Units of measure
°C	degrees Celsius
dB	decibel
dBm	decibel-milliwatts
fF	femtofarads
Hz	hertz
KB	1024 bytes
kbps	kilobits per second
Khr	kilohour
kHz	kilohertz
kΩ	kilo ohm
ksps	kilosamples per second
LSB	least significant bit
Mbps	megabits per second
MHz	megahertz
MΩ	mega-ohm
Msps	megasamples per second
μA	microampere
μF	microfarad
μH	microhenry
μs	microsecond
μV	microvolt
μW	microwatt
mA	milliampere
ms	millisecond
mV	millivolt
nA	nanoampere
ns	nanosecond
nV	nanovolt
Ω	ohm
pF	picofarad
ppm	parts per million
ps	picosecond
s	second
sps	samples per second
sqrtHz	square root of hertz
V	volt

Revision history

Document revision	Date	Description of changes
**	2018-02-22	New datasheet
*A	2021-06-16	Updated datasheet to IFX template. Changed title to “PSoC™ 4 CY8C41xx-BL MCU with AIROC™ Bluetooth® LE Family Datasheet”.
*B	2023-03-29	Updated to the latest template Added Table 3 for 76-ball WLCSP package Removed the following part numbers from Table 57 : CY8C4128FNI-BL543, CY8C4128FNI-BL553, CY8C4128FNI-BL563, CY8C4128FNI-BL583, and CY8C4128FNI-BL593
