

130-in-1 Electronic Playground

KIT-14314

DESCRIPTION

FEATURES

DOCUMENTS

- Easy-to-read, illustrated lab-style manual included.
- Learn basic principles of electricity, electronics, physics and magnetism!
- Comes with built-in speaker, 7-segment LED display, two fully integrated circuits and rotary controls.

I had so much fun with Radio Shack's version as a kid! If you have a child showing an interest in electronics, this is a perfect gift.

YES!!!! I still have my 60in1 and 200in1 Radio Shack kit from the mid 80's. Many great hours were spent on those old sprig kits developing my electronic skills as a kid! So glad to see sparkfun selling this.

That remember the RADIOSHACK kits :)

Wow this great. I remember several years ago you guys made one with an arduino built in as a concept. You should totally do that, with say an arduino pro mini, to make it a little easier to use.

sorry, but I've got a dissenting opinion here. Sure! I had some fun with a kit like this as a kid but it really was poor at teaching electronics. I had this kit and nothing else and because of my lack of progress I went to school to be a mechanical engineer. Now in my 40's and making huge progress in electronics thanks to Sparkfun, the internet, blogs, etc. I don't see how this kit could have taught me so much.

As an example, the first circuit in the book has a transistor. Even in my college electrical 101 we did not cover transistors (separate topic actually). This topic is too advanced as a starting point. Another example, the explanation about diodes on page 7 states there are silicone and germanium diodes. Why does a beginner need to know this?

The turning point for me was putting together a simple circuit to set a specific amount of current through an led. To get this to work you have to absorb the concept of the forward voltage drop and of course employ ohm's law. After I understood that, went to transistors for higher current and I was off and running.

I think the kit is ok to play with but I would not rely on it for teaching a beginner.

I agree with you on a lot of this. I had one of these and it was great for getting working projects. Horrible for learning why the circuits worked. I haven't had a chance to look at the new manuals, but I'm hoping things have improved. If not there are now a lot of resources online that weren't there when we were kids. I think if you are already interested finding those resources shouldn't be too hard.

This is a big problem I have with lots of electronic kits. They do very little to explain how circuits work. In fact I'm more comfortable with an Arduino board than I am a transistor. I can fathom how logic works, and so long as I have instructions as to how to hook up a sensor or whatever I can make things work.

But figuring out how to make an led blink with regular electronic components I have no clue.

I was fortunate enough to have a Lectorn kit, which did work up in a logical fashion, showing how the various components worked. I still remember the thrill of taking apart a capacitor charging circuit, looking at the capacitor, putting it back together, pressing the switch, and hearing the "click" in the earphone as the capacitor discharged. It gave me a very hands-on understanding of what the various parts actually did, and built on that to show how circuits were built from them. When I'm explaining things to other people, it becomes clear how valuable that basic knowledge is.

In fact cutting out the nand gate and putting in a pro mini would be a very worthy upgrade. Of course you would then need a new "project booklet"

In 2003, CU student Nate Seidle fried a power supply in his dorm room and, in lieu of a way to order easy replacements, decided to start his own company. Since then, SparkFun has been committed to sustainably helping our world achieve electronics literacy from our headquarters in Boulder, Colorado.

No matter your vision, SparkFun's products and resources are designed to make the world of electronics more accessible. In addition to over 2,000 open source components and widgets, SparkFun offers curriculum, training and online tutorials designed to help demystify the wonderful world of embedded electronics. We're here to help you start something.
